If an observer were watching for the onset of scurvy and had in mind, among other things, the psychiatric aspect, the first symptom noticed would probably be an emotional or temperamental change—the victim becomes more argumentative, more irritable, likelier to take affront, more inclined to pessimistic interpretations. At this stage it would seem that no physical examination could reveal any gross sign of the coming trouble nor would the patient be likely to admit that there was a mental change. As full development of scurvy draws nearer, the mental condition changes from aggressive and argumentative irritability to pessimism. Then appears a slight and thereafter steadily growing disinclination to physical effort; and similarly with mental effort, particularly in that the patient more and more often finds himself in a "what's the use" mood. Now comes the first symptom that a patient will notice, but only if watchful. It is that when he jumps up from a sitting or lying position he will stagger momentarily, though not enough to feel it as a dizzy spell. It will not be many days, however, until this is recognized as dizziness, and likely the patient will fall back into the seat from which he has just risen.

Stefansson responded to this as follows:

Stefansson Wrote:
From our point of view this last is putting the cart before the horse. To us the quarrelsomeness of the patient, the fault-finding, suspicion, lack of energy amounting to what some nowadays call "a breakdown in will power," are symptoms or results of the disease; to the seventeenth and eighteenth centuries these were causes of the disease. We think that a man is cranky, suspicious, lazy, because he already has scurvy; they thought that men who were lazy, cranky, and suspicious were thereby predisposed to contraction of the disease. On that reasoning the doctors classified as preventives such things as exercise, cultivation of a cheerful disposition, music, parlor games, any suitable entertainment
Doesn't this sound eerily similar to how they classify obese people today? The experts today say that those who are lazy and who do not exercise will be predisposed to obesity. From our perspective, these people already have the metabolic disorder which causes the person to be lazy and non-energetic. They then become obese or manifest other symptoms of metabolic syndrome.

If you read closely what Stefansson is writing about scurvy, you can see evidence of all the diseases of civilization. In this case, they all happen very quickly. In the regular diseases, they happen slowly. The teeth are the first symptom after sluggishness appears.

Stefansson Wrote:
Death is from hemorrhage, usually of the digestive tract or lungs. No doubt sudden deaths from scurvy are from ruptured blood vessels in the brain.

Chronically-high insulin leads to complications in all these areas as well. Alzheimer's and dementia manifest themselves very close to this. Diabetics are far more likely to develop heart disease, cancer and dementia than the non-diabetic population.

How about this:

Stefansson Wrote:
One woman I remember in particular, who was a delicate Nordic blonde in appearance, looked especially dainty and ethereal at the beginning of her treatment, more so than she did later when she had partly recovered. Looking at such a patient, it was difficult to understand how scurvy could have received its Shakespearean connotation; but that connotation would be easy for one who confuses the disease we are here describing with some other which is characterized by a scurfy or scabby appearance of the skin.

They even had "Thin Man's Scurvy" like we have with Thin Man's Diabetes.

And finally:

Stefansson Wrote:
There is the further striking similarity that only now and then are we told by the older writers that fresh meat will cure scurvy, but we are constantly told that fresh vegetables are a cure. However, the idea fresh never got a very strong hold. For instance, in the nineteenth century the usual view of lime juice or lemon juice as an antiscorbutic was that the efficacy depended on acidity. Accordingly, in the reports of polar expeditions there is frequent reference to the acid content of the antiscorbutics carried, but mention of the age or comparative freshness of the juice occurs rarely, if ever. In seventeenth- and eighteenth-century theory of scurvy causation, a canvass of the literature reveals great variety and
ingenuity. The precepts which most frequently crop up are that the leader of an expedition must see to it that his men are cleanly, that they exercise in the fresh air, that they have plenty of sunlight, that they are kept in good spirits by suitable entertainment—views still held as to the general preservation of health, though discarded as particularly applicable to scurvy.

These are basically the same recommendations for every chronic disease today. Eat a low-fat diet and get plenty of exercise. Eat your fruits and vegetables, limit red meat, and all will be well. This might keep you from scurvy, but you get the diseases of civilization in some form or another at some point in your life.

I find the parallels fascinating. What do you think?

Charles

**RE: Zero Carb / Meat and Water** - FatGirlOnAtkins - 08-11-2008 02:25 PM

Well, it's been almost 3 weeks on zc for me. Except for a couple of instances (which I instantly regretted) I have been so so good. I can't believe how easy it is to stick with this. My clothes are looser... and the worst thing- my scale is broken and I can't tell how much I've lost. It's so so nice to put on something that was tight a couple of weeks ago and now it fits. I am NEVER hungry! After 4 or 5 hours I'm thinking "I guess I should eat something". I don't miss the cravings at all!!!!

**RE: Zero Carb / Meat and Water** - Loops - 08-11-2008 02:44 PM

FGOA -

that is great news! I am still going strong with giving up my cheese - although I did have a single oz of goat cheese a couple of days ago, but nothing since. Still having the cream though and stuff like lettuce and some nuts so I'm still not on zc. I just enjoy reading all the posts - maybe one day I'll be convinced to try it again.

**RE: Zero Carb / Meat and Water** - C-Dunc - 08-11-2008 04:23 PM

Charles Wrote:
Yes, I generally agree with this. The thing is, sometimes there are things going on that we're unaware of. This is the perfect segue to what I wanted to share today. I am 154.4 today, which is my lowest weight since I got out of the Navy in April 1995. Because I used salt and seasonings, I ate quite a bit more than I should have. In short, I think I was engaged in an overfeeding experiment. Don't get me wrong, I'm not jumping on the calorie bandwagon. I'm re-enforcing the need to follow one's hunger.

There are many things that we eat which will confuse our hunger. Carbohydrates are one of those things and a very bad one, but cheese and things like that can be too. For instance, I can eat two Hardees' Monster Thickburgers if you put cheese on them. If you remove the cheese, I can't eat but one of them and will struggle to finish it today. Also, if you eat meat which is too lean, you can eat more of it than necessary.
I really appreciate you taking the time to form a response to me. And thanks for the welcome.

I am the same way with hamburgers with/without cheese. In my opinion, the hamburger tastes better with cheese on it and I think that is definitely a reason I would eat a second burger. I know that I can eat a lot of cheese at a sitting, but not much meat in comparison. I don't know if the minimal carb in cheese triggers greater appetite via insulin but that could be a factor. Also, the sodium in cheese could cause me to eat more cheese by itself, or more hamburgers due to cheese being on them.

In sum, possible contributions to the confusion of hunger: tastes better with cheese, a bit of carb, and the higher sodium (versus the meat/burger) in the cheese.

Charles Wrote:
If I only eat meat on my zero-carb diet, I can probably make my weight climb to 158 but not much higher. I will continue to have my six pack, but I may need to wear pants with a 29 or 30-inch waist. My main fat tissue is in my thighs. They are the first things to grow when I put on weight and I can immediately feel it in my pants. My waist will stay small.

So to answer your question, it really depends on where a person primarily stores fat. If you store it in your stomach, then your six pack might not remain if you overfeed and gain four pounds. I would think it would still pretty much be there, but it really depends.

The overfeeding and the gaining is contrasted with the eating until sated and letting your body "do its thing." But even if one overfeeds one time by eating THREE of those Monster burgers with cheese, methinks they would be so extremely sated for a while and would still eat less than if they overfed with carbs, say, a half gallon of ice cream.

Basically, what I'm trying to say here is that not only is it easier to overfeed on a high carb/high fat meal, it causes more fat gain than if you were just to overfeed a bit with the zero (well, not quite since there was cheese) carb diet. Also, it is way easier (due to insulin I think) to overfeed with carbs than to overfeed by adding cheese to your otherwise zero carb hamburger. With carbs, the sense of hunger is so warped and confused that in many (all?) cases, the eating of a carbohydrate snack/meal

Quote:
"has as much to do with hunger as an alcoholic reaching for a bottle of liquor has to do with thirst" (Rob Faigin, Natural Hormonal Enhancement, p. 101).

Chris Wrote:
Another question I am curious to know the answer to, is that knowing your body, could you eat enough to get to 170-180 lbs on zero carb and still maintain the six-pack?

Charles Wrote:
I don't think I could eating the foods I eat now. To do it, I would have to add salt and dairy. I don't think my six-pack would be there at 170 or 180 though, but then again, if I really worked my abs in the gym throughout the overfeeding, perhaps it would.

I weighed 145 on Thursday, August 7th. It was on that morning that I began the meat and water diet that is advocated here on this thread. I have not weighed myself yet, but I may tomorrow at the gym. Sometimes I think of what is the heaviest I could get while remaining lean enough that all six abdominal muscles are very visible. I doubt I could get to even 170 without sacrificing leanness. I am a couple short of a six-pack at 145 and so if this meat and water diet takes me down to a ripped 130 for example, then I don't know if I would really like 130 (at around 5-4"). Charles, you had said *somewhere* in this
large thread that your muscles appear bigger due to their leanness. That reminds me of one guy I read about who lost 20 pounds and he looked bigger at his new 180 than he did at his old 200.

Exactly! My arms look very muscular (or defined) to most people, but it's not that I necessarily have any bigger muscles than others, just less body fat to cover them.

I remember reading a personal trainer's comments about his wife. When she lost 20 lbs of fat, people commented that she was too "big". When she was heavier and the muscles were hidden, she was "ok".

RE: Zero Carb / Meat and Water - C-Dunc - 08-11-2008 04:52 PM

Charles Wrote:
C-Dunc Wrote:
GM: In terms of carb tolerance and insulin sensitivity, how do you feel about the subject of the leaner one gets, the more carbs he or she can start to add back into his diet without worrying about fat gaining/regaining?

JV: I think you're right on. The reason you should start thinking about reducing carbs in the first place is that you want to lose body fat or you have metabolic problems associated with insulin resistance. **If you're already ripped and have a high degree of insulin sensitivity you'll be able to tolerate more carbs.**

I'd emphasize that there's a lot of heterogeneity among people in terms of how they respond to carbohydrates. Each person probably needs to dial in to their ideal carb intake that works for them at any given time. The point is to start thinking about carbs more than dietary fat as opposed to the other way around.

Basic biochemistry and metabolism would predict that carbs have a dominate effect on metabolism due to the close connection with insulin. Building on this notion, our research points to the idea that dietary fat plays a relatively passive role, and detrimental effects of fat will generally be seen only in the presence of high carbohydrate which, via insulin, determines the metabolic fate of ingested fat.

Again, in the real world, some people will need to restrict carbs more than others to kick into fat burning mode, and others will be able to tolerate more carbs without observing adverse effects.

This is part of the problem even in the low-carb community. Whether you're ripped and fit is a very poor marker for the metabolic disorder. We need to understand that this same disorder is responsible for ALL the diseases of civilization. Obesity is just one of many. Because of this, one should NEVER increase carbs regardless of the "ability to tolerate more" without affecting weight or fitness level.

This is serious business and doesn't get nearly enough attention as it should.
Your experiences and your results on this zero carb diet, plus the research that you cite from men such as Taubes are some of the reasons why I decided to embark on a long-term zero carb journey. Any lingering reservations about this type of diet are only due to an influenced mindset that may like more muscle and scale weight. But if I am lean and healthy, even at a smaller muscled 130 or whatever, then I must be content with what my metabolism, genetics, etc., dictate I should weigh. I still tend to lean a lot toward the mindset that says that if I am lean and healthy, then who cares if I weigh less. Hence, a bit of obvious back-and-forth going on with me.

**RE: Zero Carb / Meat and Water - C-Dunc - 08-11-2008 05:47 PM**

**Quote:**

"Eat every few hours irrespective of whether you are hungry. Each between-meal interval does not have to be the exact same duration, *but no interval should be longer than 4 hours.* Whether you designate a particular feeding a "meal" or a "snack" is mere semantics. What matters is that you **eat to prevent hunger rather than eating in response to hunger.** Should you find that you have no desire to eat within 4 hours after your last meal/snack, fine--simply eat a small snack like a handful of nuts, or a tablespoon of peanut butter, or a few slices of cheese or sliced turkey, or a protein shake. In other words, *desire to eat influences the size of the feeding NOT whether or not you feed*" (Rob Faigin, Natural Hormonal Enhancement, p. 190).

Now, from a purely fat-losing perspective, it seems like Charles's prescription of eating only when hungry and not eating when not hungry, is superior. A couple of quick questions, Charles:

1) Where did you read about your particular frequency of feeding idea?
2) And how is it better than Faigin's regarding some relevant things, especially fat-loss?

I'll just say that on a zero carb, meat and water diet, I would rather follow Charles's recommendations than Faigin's, even if the fat-loss might be the same. By extrapolating a bit from what I've read of Faigin, he would say that if you wait until hunger to strike, you might overeat. And so, this way you become proactive, rather than reactive. I say "extrapolating" because Faigin makes this meal frequency recommendation in the context of a cyclic (one carb meal every 3rd and 4th day) diet. More from Faigin:

**Quote:**

"By eating when you are *not* hungry, you are being proactive and guaranteeing that hunger will stay away for another few hours. If you do this perpetually, you'll never be hungry.

If, however, you allow more than 4 hours to elapse without eating, you relinquish control. In this scenario, you are, in effect, sitting back and waiting for hunger to strike--*you are letting the enemy in the door.* Under the influence of an appetite surge, your eating decisions are likely to become distorted. Don't make matters unnecessarily difficult for yourself--get with the program" (Faigin, p. 190).

If I apply what Faigin says here to the zero carb regimen, then I would say perhaps Faigin would think that due to this appetite surge, you may double the amount of hamburgers eaten. This preemptive strike against hunger is accomplished by eating when not hungry. This and so, the argument is that going this route you would eat less. Not sure about that, but the reason why I would prefer Charles's to Faigin's is that with Faigin you are giving your body some fuel when it was not ready for it--and thus would seem to hinder fat loss. It seems that your body was just fine using its own fat stores for fuel when you were
NOT hungry, so why mess that up? With insulin as much out of the picture as possible, I don't think the appetite would be as crazy as Faigin might think it would be.

RE: Zero Carb / Meat and Water - Loops - 08-12-2008 06:36 AM

Hi -

I gained whilst eating a lot (6-7oz a day probably) of cheese on close to zero carbs awhile back - the cheese had 0.1g of carb per 100g. I could have gained for other reasons - but anyway...the point is, I have read that the casein in cheese stimulates insulin secretion - hyperlipid had a link to the study on his site somewhere in the comments. However, most proteins raise insulin levels, and the numbers for cheese were compared to cream, which doesn't have much protein. So I don't know whether the study is very informative. It could be that it stimulates much more than meat, but there don't seem to be any studies. Also I suppose we have to remember that glucagon is also released from protein.

What am I going on about here? Sorry - just answering my own ponderings I think. Anyway I have heard other people having problems on zero carb with cheese - usually the people that can't seem to shift any bodyfat, and end up gaining etc. whatever plan they follow.

RE: Zero Carb / Meat and Water - Loops - 08-12-2008 06:37 AM

Actually I think it's only some amino acids that raise insulin. Please somebody clear this up for me.

RE: Zero Carb / Meat and Water - jeepifer - 08-12-2008 06:53 AM

If caffeine raises insulin levels, which is bad, what can we do to help "wake up" on days where we're dragging?

I am SO tired today and had some leftover diet Mt. Dew at my desk. I don't normally drink coffee, and have been giving up the diet sodas, but I just had to do something...

RE: Zero Carb / Meat and Water - caroline - 08-12-2008 07:02 AM

C Dunc,

I can't answer to the specifics of the second part of your thoughts--but as for the first, I prefer to only eat when hungry as well. Years of blood sugar and the idea that I should eat "often" had me going in the other direction. I found that once I low carbed, and got acclimated, even if I wait too long--which before would have set of MAJOR eating binge, not it's not a big deal. The other night I studied for a million hours and ate very early in the day. By the time I got to Trader Joes (also would have been a nightmare before--shopping when hungry)--I was hungry. I opened some mac nuts and ate some, but not tons. The point being, my hunger even when it is overdue, is nowhere near the intensity of before. And further, I can keep pushing it off without shakes, brain issues, etc. I think it's much healthier if you don't have health issues that mandate forced meals--to eat when hungry. There you have it.

RE: Zero Carb / Meat and Water - suzannyea - 08-12-2008 07:42 AM
I have just come to accept that some day I will be tired and some days I will be full of energy. On days when I am tired, I just deal and try to take it slower.

RE: Zero Carb / Meat and Water - daveo - 08-12-2008 09:02 AM

Charles Wrote:
feckless Wrote:
i think the bear said his BS stayed around 100! does anybody else know what their average blood sugar is?

Sorry, feckless, I don't measure my blood sugar. It sounds like you should add more lean. The more I read Stefansson the more I want to make my own pemmican and just eat it. Either way, the suggested ratio seems to be 2 pounds of lean to 1 pound of fat. I'm going to get some pork fat or some beef tallow to make sure I can always observe this ratio. Then, if you have leaner cuts, you can ensure there is plenty of fat.

I also add bacon to my ground beef and don't waste much of the fat.

Regards,
Charles

Charles,

You mentioned in some other posts that you have stopped eating salt. Doesn't eating salty bacon cause the same problems as putting salt on your food? Or have you found some extremely ow sodium bacon? If so, where? I love bacon but have been avoiding it due to the salt.

Thanks,
Dave

RE: Zero Carb / Meat and Water - KimPossible - 08-12-2008 09:41 AM

Hey everyone! I cannot believe how many pages I'm going to have to catch up on! 50 or so?? EEK!

Briefly...I did well on about 2 days of my vacation, but when you are the guest and not responsible for the food, it's hard to demand ground beef. :-P So off the zero carb train I went...it is interesting, b/c I didn't have much of a reaction to the bread in the sandwiches, but when I had fried seafood OMG--it absolutely made me sick to my stomach. It was an interesting experience and it echoed what Charles said about 45 pages back:

"That means when you go zero-carb for a while and switch back, you shouldn't expect it to be easy."

No it wasn't. And it was even harder for me to get back on..which I am now. I am starting school Monday and food is the last thing I am wanting to worry about. On Zero Carb, I didn't. There were no cravings, no thinking about my next meal, nothing. With carbs in the mix, it is a complete 180 from that.

Here's to meat and water! :-}
oh, and I'm not getting on that stupid scale so that I can feel really bad and indulge THAT crazy cycle. I will know when I've lost...I can feel it.

RE: Zero Carb / Meat and Water - Charles - 08-12-2008 09:51 AM

C-Dunc Wrote:

That's right. I can actually lift more now at 155 than I could at 207. My muscles aren't "bigger" but they are more defined even though I'm smaller. Men's Health makes a similar comment somewhere as well.

Regards,

Charles

RE: Zero Carb / Meat and Water - KimPossible - 08-12-2008 09:55 AM

I am currently on page 152 re: pregnancy and low carb "risks." Not being a doctor myself, of course, and risking that this has already been said, I have to comment that it is ridiculous to debate here the benefits of low carb and/or zero carb on our bodies and then say that we need carbs in our diets to nourish our babies? Why wouldn't they thrive on the same nutrition? To say that one is going to eat "normally" and THEN go on a low carb diet insinuates that it is just a tool to lose weight, NOT a life-style change. If this is the way we truly believe we should eat FOR LIFE, then having babies is included in that.

back to reading! ;-)
peers? No sugar in the house causes them to freak out and gorge at other people's houses. (And mind you, our friends and family are all too happy to oblige them! They think it's absurd that we encourage our children to eat fat and meat.) They whine and complain that they don't get soda, etc... They see their friends eating it and being thin and "healthy" and they just don't get it. I remember when I was a child and my parents forced me to wear my seatbelt, and all my friends to do so in our car as well. This was back in the 80's when that was unheard of, so I was horrified. I could have cared less if it was for my own safety, yadda, yadda. It was different and weird and embarassing. It kills me to do the same thing to my children. And don't get me started on school lunches.... Ugh.

Thoughts?

RE: Zero Carb / Meat and Water - MAC - 08-12-2008 10:38 AM

cbnebraska Wrote:
If low/no carb is the optimum diet for adults, why not for children? Everyone always says things like ... kids can handle the carbs...their bodies can process them...they need the energy...they're burning them off so quickly...they aren't fat... blah, blah, blah. But none of these responses has a thing to do with optimum health versus adequate health.

Yeah, kids can handle the carbs until they can't. I was a skinny kid until age 11 and then I got chubby. Wish my parents had kept the carbs out of my life at that age.

RE: Zero Carb / Meat and Water - Charles - 08-12-2008 10:39 AM

Faigen Wrote:
What matters is that you eat to prevent hunger rather than eating in response to hunger.

I differ with this because of Alfred Pennington and Jacque LeMagnen's work on hyperinsulinemia, among others. According to the alternative hypothesis of obesity, obesity is a compensatory reaction to internal starvation. The cells are unable to get to the vast supply of fuel being stored in adipose tissue. Therefore, the body compensates by restricting the flow of nutrients (triglycerides) into the fat tissue (like a garden hose) which increases the flow of nutrients to the cells. That was Pennington's theory.

In reality, the presence of glucose phosphate causes triglycerides to form which are bigger than fatty acid molecules. Because of esterification, they create the small slow down in metabolism that leads to fat storage.

If that's the case that hunger is driven by the cells, and consequently the drive to fatten, then obese and lean individuals are both at "equilibrium". In other words, they both eat the amount of food to keep this equilibrium which is actually regulated by the body.

Overfeeding results from eating food which does not supply the expected nutrients in the proper amounts. For instance, it would take 3.3 pounds of wheat bread for a 176-pound person to equal what they would get from 3/4's of a pound of meat. We all know that we can eat more lean meat than we can fatty protein because the fat fills us up quicker. According to LeMagnen, it's not so much that fat is more filling, as it is that our body can more readily assimilate the fuel from fatty sources than it can from non-fatty substances which tends to shut off our hunger faster.

Similarly, LeMagnen found that when rats were given watered down food (soup), they would continue
to eat until they reached the caloric requirement regardless of the quantity.

Therefore, to cure the metabolic disorder, a person would need to eat fat and protein to appetite to satisfy the cellular demand. They might initially eat more food, but over time the appetite would match the needs of the cells and maintain equilibrium at a lower rate due to the increased flow of nutrients. That's not the "set-point" hypothesis, but the effect of fat metabolism.

So eating more than the cell's requirement at a single meal only means that the person will be full for a longer period of time. It doesn't mean that they will gain more weight. It's possible some will gain weight by overfeeding, but as soon as they stop the overfeeding, the weight will likely vanish quicker than it came as Ethan Sims found out in his overfeeding experiments.

Chris Wrote:
Where did you read about your particular frequency of feeding idea?

From putting all that I read in Taubes, Stefansson and other sources (such as the Randle and Krebs cycles), together. Claude Bernard's notion of homeostasis is the critical idea.

Chris Wrote:
2) And how is it better than Faigin's regarding some relevant things, especially fat-loss?

I don't know all of Faigen's ideas about fat loss, but the science suggests to me that weight is regulated by the body, not by the brain, just like internal temperature, blood pressure, pulse rate, nutrient level, vitamin level, etc. All animals are lean unless they have a good reason not to be and I think we're very similar. We're not supposed to fatten without reason. Children grow based on their hormones, not their appetites. Pregnant women fatten because the sex hormones mobilize fatty acids at a slower rate to ensure enough fat is stored. The same can be said of hibernators. The severe mentally ill patients stop eating to keep the internal environment constant and anorexics don't eat due to low insulin.

Therefore, my recommendation is to basically eat nutrient-dense real food and stay out of the body's way. If you eat the foods that agree with your metabolism, fat-loss will automatically occur without the need for any intervention because your body wants you to be lean. Of course, this is all regulated by hormones so out of whack hormones can change the environment such that hormones cannot mobilize fat like they should.

Faigen Wrote:
"By eating when you are not hungry, you are being proactive and guaranteeing that hunger will stay away for another few hours. If you do this perpetually, you'll never be hungry.

I don't disagree with this in theory. LeMagnen found this as well in his experiments. If we eat a lot of food, we can hold off hunger for longer periods of time. This is a very valuable tool to have. We can plan for long journeys and the scarcity of food supply by eating as much as we want to hold off hunger for long periods of time.

How often you eat doesn't have much to do with long-term fat loss in my opinion. Again, weight is regulated by the body, not the frequency of feeding. As you can tell, I'm not with the "intermittant fasting" camp. It's axiomatic that if we increase energy consumption, our body will respond with increased energy output. If we restrict energy consumption, our body will respond with decreased energy output. Greenwood's studies on LPL, the "gatekeeper hypothesis" clearly shows why exercise is not the treatment for obesity we think it is.
Faigen Wrote:
If, however, you allow more than 4 hours to elapse without eating, you relinquish control. In this scenario, you are, in effect, sitting back and waiting for hunger to strike—"you are letting the enemy in the door." Under the influence of an appetite surge, your eating decisions are likely to become distorted. Don't make matters unnecessarily difficult for yourself--get with the program" (Faigin, p. 190).

Now there might be more to this situation. For instance, if you are eating carbohydrates then your insulin may be out of whack. In this case, you still want to follow your hunger but you cannot add carbohydrates or you will remain in the vicious cycle of hypersecretion. Hyperinsulinemia will indeed distort your eating decisions but you can control it by not eating carbohydrates over time. That's what the zero-carb path is all about, in my opinion.

Faigen's approach would lead to fat loss by arresting hunger because if you wait for hunger -- i.e. the anticipatory insulin surge, that invokes a period of fatty acid storage and the more of these you have during the course of a day, the more fat will be stored. Perhaps he's trying to circumvent that and that may be an option.

However, on a zero-carb diet, when you're not hungry, you're usually not hungry at all. When I'm sated, the thought of more meat is revolting so I couldn't eat when I'm not hungry. However, if you haven't reached this point on the zero-carb path, this is certainly possible to be able to eat without being truly hungry.

Honestly, I don't think it's really possible to eat when you're truly not hungry. I think that it's a matter of degrees and if you can get yourself to eat fat and protein, you must be hungry on some level.

Chris Wrote:
with Faigin you are giving your body some fuel when it was not ready for it--and thus would seem to hinder fat loss. It seems that your body was just fine using its own fat stores for fuel when you were NOT hungry, so why mess that up? With insulin as much out of the picture as possible, I don't think the appetite would be as crazy as Faigin might think it would be.

This is true, but the zero-carb regimen alone doesn't automatically translate into low-insulin and no hunger. We have to understand that when you begin zero-carb, your insulin is still as out of control as it's been. The goal is to bring it under control. It certainly doesn't start out that way. If Stefansson is right, six months of consistent zero-carb is about the time it takes to get insulin under control. The markers are about 5 or 6 hours between meals, sleeping through the night (5-7 hours depending on age), and controlled hunger.

It's easy to see why many would fail at such an approach but just because it's difficult, doesn't mean that it's not effective. For many of us, that's what it's going to take. All I can say is that it gets easier every single day.

Regards,
Charles

RE: Zero Carb / Meat and Water - jeepifer - 08-12-2008 10:42 AM

Their bodies function the same way as adults. I feed my children as low carb as possible, not to have them lose weight, but to keep them away from blood sugar spikes and insulin issues.
suzanneyea Wrote:
I have just come to accept that some day I will be tired and some days I will be full of energy. On days when I am tired, I just deal and try to take it slower.

Right. Well, this is where Stefansson has me so fascinated. He says that shouldn't be the case. He says that fatigue is a sign of fat-hunger. Therefore, I've been making sure to have extra fat with each meal to make sure I get enough. I now understand the coconut oil fascination. I prefer to use beef and pork fat. I find I cannot eat ground beef now without bacon or at least covered in fat. It has to be "greasy" or I don't want it.

By the way, you coconut lovers, the Tocalauans ate a diet of fish and coconut for centuries and did not suffer from any of the diseases of civilization. If you really like coconut, you might be on to something.

Back to the fat, it doesn't have to be that much, according to Stefansson. The fat should just equal to 1/2 of the lean. If you eat two pounds of sirloin in a day, you should have 1 pound of fat. Obviously, the sirloin will have some fat, depending on how much they trimmed it, and then some extra fat from bacon or pork or even tallow would make it perfect. Eating this way should take care of the energy issues.

It appears there may be a level between "rabbit starvation" and "fat-hunger" that we've discovered.

Regards,

Charles

You mentioned in some other posts that you have stopped eating salt. Doesn't eating salty bacon cause the same problems as putting salt on your food? Or have you found some extremely low sodium bacon? If so, where? I love bacon but have been avoiding it due to the salt.

Hey, Dave.

I stopped shaking it on foods and using seasonings and the like. It's true that bacon is salty and some other meats but I rationalize that the fat makes it worth it. I'm not avoiding it altogether, but I don't consciously reach for it. I ask for ribs plain, hamburger plain, etc. I used to put salt on everything.

I use the Hormel uncured bacon from Wal-Mart and I have attached a PDF that has the nutritional info. I generally eat 4 slices at breakfast. How does this compare with other bacon in terms of sodium content?

I see where you are coming from. I've never been a big salt eater myself (I don't generally shake it on everything), but I love bacon, sausage, and the meats at Brazilian Steakhouses, all of which are very salty. Just still trying to figure out what I should and shouldn't be eating. The more choices I have the better, but at the same time I don't want to derail myself. I will say that the first time I lost significant weight eating low carb (though not zero carb), I ate a TON of all of the above. I guess I'll have to test and see how quickly I get hungry again with and without those foods.

I do know from experience that if I go to a Brazilian Steakhouse for lunch and eat all I can, I definitely have no interest in dinner that night 😛

Why wouldn't they thrive on the same nutrition? To say that one is going to eat "normally" and THEN go on a low carb diet insinuates that it is just a tool to lose weight, NOT a life-style change. If this is the way we truly believe we should eat FOR LIFE, then having babies is included in that.
cbnebraska Wrote:
This was back in the 80's when that was unheard of, so I was horrified. I could have cared less if it was for my own safety, yadda, yadda. It was different and weird and embarassing. It kills me to do the same thing to my children. And don't get me started on school lunches.... Ugh.

Thoughts?

Hey Cynthia, welcome to the ZC thread!

I guess I have to share you with the rest of the forum, now huh? 😊

I have these same issues at home but it's a little easier now than it used to be. My children are also all lean but I kind of take the approach that I want their level of carbohydrate consumption to be a very weighted choice. If I started out zero-carb with them as infants, then I would be more willing to demand compliance. Since I didn't, we gradually removed carbohydrates until now they are very scarce. For instance, we only cook meat at home and we've been phasing out vegetables. When the children eat with me, they eat how I do. If my wife cooks vegetables, they tend to stay on the table and no one eats them. What a waste!

When we go out to Golden Corral, I let them have a real sugar desert if they want. They usually opt for the cheesecake or something not too sweet. I am also aware that when they go to friend's houses, they get some carbohydrates.

They take their lunch to school and they tend to go low carb then. They get lunch meats, cheeses, nuts, and water. We're always tweaking the lunch menu. You can tell a big difference in their hunger levels. They used to be hungry every 10 minutes. Now, they can go several hours without the need to eat and that's a wonderful thing.

The thing is, I try to talk to them often about nutrition so they will choose this for themselves. They all witnessed my 65-pound weight loss and their friend's parents comment on this to them as well. I share Stefansson with them, I explain to my teens that eating carbohydrates in your youth can cause your children to need braces when you have them. I demonstrate to my teenager that his acne is directly related to his carbohydrate consumption.

I also find that when they return from friend's houses or parties, they tell me how something they tried was far too sweet, or my 11 year-old daughter tells me how she notices when her skinny friends wear the bare-midriff shirts, she can see the little fat on their lower backs above their hips that they can't seem to get rid of.

I probably make them crazy with all the discussion, but I tell them that no one ever spoke to me this way. They feel like they know what to do if they run into trouble later in life. The trouble is always trying to convince them that they have to take action today before there is trouble.

I am satisfied that they eat correctly the vast majority of the time and I can't really worry about those times they are out of my sight. Either way, I know they consume 80 pounds less per year than I did.
when I was their age, so there's hope!

Regards,

Charles

I think you should continue to eat those foods, I really do. I would have no qualms about eating at a Brazilian steakhouse! If it wasn't so expensive, I would eat there every day.

I just noticed that adding salt and seasonings made me eat more than I would without it and Stefansson's observations convinced me that it's not necessary to consume salt so I just quit adding it.

I have noticed that I can taste so many differences in the meats now that I didn't notice before. I love smoked meats and just the natural flavors in the different types of meat. I used to make all my meat taste the same by using the same few seasonings. Now, I can appreciate the many differences.

I do understand that there is a lot of salt in meats, but that's fine as long as I'm not adding to them.

**RE: Zero Carb / Meat and Water - feckless - 08-12-2008 11:50 AM**

question: if my blood sugar is staying in a narrow/low range (it's almost always 75-85) is that an indication that my insulin levels are in check?

here are some observations in case it's useful to anyone. my glucose monitor allows me to do 'experiments':

a candy with sugar alcohols quickly shot my blood sugar up 20 points, which is the most dramatic response to anything i've eaten in nearly four weeks at near zero carb. will never touch them again!

caffeine raises my BS only about 5 points, but does cause intense sugar cravings, so not sure what the mechanism of those cravings are. also, since i added that cup of tea in, i have not lost anymore weight.

red wine had no effect whatsoever on BS levels -it was combined with high fat meal.

in other areas, sleep is good, but shorter. energy is still not 'there' but yet when i get on the treadmill, i am able to do 30 minutes with no problem, which is what charles described. still i would like to 'feel' energetic, and hope that comes soon. also, i find i need much less water and yet my skin/body seems to stay hydrated.

75-85 blood glucose is normal range. You would need an oral glucose tolerance test with insulin levels to find out your real response to carbs and your insulin levels but you would have to carbs up (>150 grams/day) for 3 days prior to the test to not produce skewed results. If you are really interested have your doctor do a fasting blood glucose test with serum insulin levels.

Normal after a high carb meal is no higher than 120 mg/dl. Hard to say if your insulin levels are in check but they seem normal as your blood glucose is normal.
Yep, Charles, I found my way over. Thoroughly enjoying the discussions!

Thanks for the words on the kids. I'm working on my approach with them, and with my husband, since he's one of the ones saying the things like "they'll be fine..", etc.. He eats very low carb, but he just doesn't want to tackle it with the kids. It's mostly in my lap, so I'm working on it. I'm glad you mentioned what you pack your kids too because that's a huge stumbling block for me.

What are you all using to test your glucose levels? It sounds like there is no easy way to actually test you insulin levels, right? One would just have to assume that if your glucose goes up, the insulin will follow to eradicate it? Do I understand correctly that the amount of insulin any one person's body secrets to combat the glucose could vary immensely even when eating the exact same food as someone else? Hence, fat storage or no fat storage, overweight or not overweight. Skinny people's bodies secret very little of it, heavier secrets more of it.

Sorry to sound so simplistic. I just want to get this straight so that when I try to explain it to others, I'm using easy enough language. I get questioned so often and I feel like I understand for myself but can't necessarily explain it well enough to someone else.

Thanks--

Cynthia

Hi everybody! TOM is here so I am up 1lb, but that's OK, I expected it. After eating this way for about 6 months, there is NO WAY I would cheat, it is just not worth it. We spent the weekend out of town w/ friends during 4th of July. When I couldn't eat meat I had a salad. I felt horrible (gassy & bloated) all weekend. I would rather not eat and be a little hungry, than feel like that.

Right. Well, this is where Stefansson has me so fascinated. He says that shouldn't be the case. He says that fatigue is a sign of fat-hunger. Therefore, I've been making sure to have extra fat with each meal to make sure I get enough. I now understand the coconut oil fascination. I prefer to use beef and pork fat. I find I cannot eat ground beef now without bacon or at least covered in fat. It has to be "greasy" or I don't want it.

I am finding this is true for me too. If I eat enough fat at breakfast I won't have to eat for the rest of the day and I have plenty of energy. We are going to be staying w/ friends over labor day weekend. Do I dare bring my jar of beef fat to drown my breakfast in!? LOL!

I cut salt out about 3 months ago because I read it can slow down fat mobilization. I just noticed this weekend I don't like bacon anymore! It is too salty. I like it as a seasoning, like wrapped around a scallop or a chicken thigh, but not by its self. As Charles mentioned I too am beginning to notice the different flavors of meat. I am craving the meat & spices not the salt. I mixed some fresh crushed garlic & fresh chopped oregano to my morning ground beef, kind of a ground beef sausage, it is really good! A nice change from plain beef. I even notice the different flavors of pork fat vs beef fat.

I have yet to find a good zero carb seasoning. I found a few rub recipes on the internet and just picked
up the ingredients today. If they are any good I'll post them.

Speaking of Brazilian restaurants, I just found a very easy zero carb Brazilian pork rib recipe. It was really good! I will post it over in the recipe section later tonight.

People use a blood glucose monitor to measure blood glucose unless they get this from a test given by their doctor. Never heard of an off the shelf way to measure insulin. Normal people have an insulin response proportionate to the carbs (glucose) they take in. Protein creates a rise in blood glucose but is counter acted by glucagon.

See this site to learn more about blood glucose than you probably want to know: [http://www.phlaunt.com/diabetes/](http://www.phlaunt.com/diabetes/)

RE: Zero Carb / Meat and Water - *jeepifer* - 08-12-2008 01:48 PM
And it's compounded by the fact that there is no standard for insulin like there is for lipid panels, so what you get at one lab may be different at another lab, from the same blood draw.

**RE: Zero Carb / Meat and Water - MAC - 08-12-2008 01:53 PM**

jeepifer Wrote:

This is true. If you were to take an oral glucose tolerance test with insulin being tested for every draw you would be able to tell a few things. Dr. Mary Vernon in the Atkins Diabetes Revolution book says insulin at 1 hr that is 5 times your fasting insulin level indicates that you have insulin resistance (IR). Also fasting insulin > 10 indicates insulin resistance. There are some other levels of insulin at other time frames that indicate insulin resistance.

**RE: Zero Carb / Meat and Water - Kristi31 - 08-12-2008 01:55 PM**

I've been strictly zero-carbing and eating high-fat, probably around 80% for almost 2 weeks now. My energy levels are better now but ketones still high in urine...to be expected. It takes AT LEAST 2 weeks to adapt.

I found a butcher that sells FRESH meat in bulk (cryovac) WITH trimmings. They also deliver, extra charge only $5 per order.

I personally don't feel very comfortable eating ground beef everyday (frozen, grinding) and pork fat (trichinosis), as I've been doing for the last week and so. I also think it's healthier to stick to herbivores and not omnivores/carnivores due to parasites. In the wild, carnivores eat almost exclusively herbivores and there must be a reason for that. This may also explain why certain religions prohibit the eating of pork. My reasoning could be wrong but I prefer to be safe than sorry even if there's a 0.000001% chance.

So...I plan to buy some brisket or shortribs (beef), depending on how fatty they are. I don't want them too fatty either, I need my protein! Not very expensive either. The brisket is $4.75/lb. I forgot to ask about shortribs. If neither is too fatty, I'll ask for beef fat. Hopefully, it'll all work out. I'll let you know how it goes...I'm going there now...ciao!

You're exactly right. The food is secondary. The insulin secretion is primary and that varies wildly. Your second point is also correct. Taubes cited studies, of course, that show clearly that the obese have much higher levels of circulating insulin than lean people.

It's possible to get a test in the doctor's office that will provide your "whole body" insulin number, but
it's irrelevant because what you really need to know is what is your level of insulin resistance in your muscle tissue. That's where insulin tries to put the glucose you consume. If it's unsuccessful, then your blood sugar is higher. You should know that insulin is out of whack long before blood sugar registers as high. The insulin is the tougher measurement and no one looks at that usually until some other symptom of the metabolic disorder has manifested itself, such as obesity, hypertension, or even diabetes.

Regards,

Charles

Sounds like a good plan, Kristelle! (The comments that follow do not agree or disagree with you. It's just an excuse to talk Stefansson! 🤓)

I've been thinking about this too since reading *Fat of the Land*. I know what religion says about pork, but I can't get past the myriad groups that Stefansson mentioned who got fat basically any way they could and were quite healthy for their efforts.

Stefansson Wrote:
In view of beliefs that remain strangely current, it is worth emphasizing that we liked our meat as fat in July as in January. This ought not to surprise Americans (though it usually does), for they know or have heard that fat pork is a staple and relished food of the Negro in the Deep South. Our Negro literature is rich with the praise of opossum fat. Nor did Negroes develop the taste for fats in our southern states; for Carl Akeley brought from tropical Africa such yarns of fat-gorging as have not yet been surpassed from the Arctic. A frequent complaint of travelers in Spain is against foods that swim in oil, and there are similar complaints when we visit rural Latin America. In Puerto Rico, cracklings are sold like candy. So we really know, when we stop to think, that many if not most tropical people like greasy food. (I return to this topic in the chapter "Living on the Fat of the Land.")

When I go to our local Golden Corral that actually has good pork ribs, you can see people lined up to get them but they also have three types of bread on their plate. The poor people think the ribs are bad for them when it's actually the bread.

The greasier, the better!

Regards,
This is true, but the zero-carb regimen alone doesn't automatically translate into low-insulin and no hunger. We have to understand that when you begin zero-carb, your insulin is still as out of control as it's been. The goal is to bring it under control. It certainly doesn't start out that way. If Stefansson is right, six months of consistent zero-carb is about the time it takes to get insulin under control. The markers are about 5 or 6 hours between meals, sleeping through the night (5-7 hours depending on age), and controlled hunger.

Yes, yes, yes! I was on the Zone Diet for 11 years, then Atkins Induction for 6 months, now zero carb for 6 weeks and I still don't have my insulin under control. How do I know? I still feel hypoglycemic sometimes which means I am still hyperinsulimic. A few times I have gone 6 hours not eating (during the day), but most of the time I feel like my blood sugar is very low between 4-5 hours. So I just keep eating that darn fatty meat.

However, I do not wake up hungry any more! But right after my morning cup of coffee (with coconut oil only) I'm starving. So the coffee is definately making me secrete lots of insulin. I think its because I've been drinkin a cup right before breakfast for so many years I have conditioned myself to release insulin upon drinking it.

You know how many times on these forums I have said I was giving up coffee?

Skinny people's bodies secret very little of it, heavier secrets more of it.

Well, I have always been average weight and I think I have been hyperinsulimic since childhood. I often felt hypoglycemic and thought that's what I had. But Charles has conviced me that is was hyperinsulemia causing the low blood sugar symptoms. So, I have always secreted lots of insulin and was always relatively thin. But the hyperinsulemia caught up to me last year at age 42 when I suddenly started gaining weight quickly. Now I am hyperinsulemic and insulin resistant!

It's easy to see why many would fail at such an approach but just because it's difficult, doesn't mean that
it's not effective. For many of us, that's what it's going to take. All I can say is that it gets easier every single day.

Regards,

Charles

I rarely have any problems with sleeping through the night, and in the past there were only occasional times that I would wake up before the 5-7 hours, and that was only to use the bathroom; and I was not hungry. Hunger was controlled but I think I think when eating carbs I would be hungry about 2-3 hours after having something with carbs in it.

I have not been on zero-carb long (6 or 7 days I think), and so obviously I am nowhere near the adaptation of which Stefansson speaks. Today, at work, I was not hungry at all between meals, but I felt very strong cravings for carbs to raise what felt like low blood sugar. I was a bit light-headed and felt "out of it" (zombie-like). I assume this is the brain trying to function on low blood glucose--working through this horrible low carb brain fog or something--until it makes the transition to using ketones. I felt better after eating some more grease saturated hamburgers, but I must say I was close to eating some carbs to get rid of the hunger-less YET terrible feeling. As I type this, I feel okay after eating a couple of fatty burgers, and while I am sated I still don't feel so great. Not so much brain-fog now, but something else--like if I went to the gym and worked out hard I might faint or something.

---

**RE: Zero Carb / Meat and Water** - **caroline** - 08-12-2008 03:14 PM

I have been doing vlcarb (meat with occasional nuts-no veges or fruit) (cheese and eggs and butter) for about 3 months and low carb for 5. I have really seen appetite, ability to go without food etc. change in the past few weeks. (I have seen progress all along but more recently, a bigger change). It does take time but I was a non-stop eater, never slept through the night and now I maybe get up once and sleep really well (except if I am obsessing about something--but that's a different issue!! LOL)

Have hope--if it can happen to someone like me who was a compulsive eater, non-stop eater, totally fixated on food and always low blood sugar--it can happen to you!

---

**RE: Zero Carb / Meat and Water** - **Ell.lee** - 08-12-2008 03:45 PM

I'm relieved to hear others reporting that it takes a long time to see changes in hyperinsulin symptoms as I've been feeling a little frustrated and angry with myself. Six weeks vlc - 1 week zero carb (and prior to that 5 years strict Berstein's 30 carbs) and so far the only change is I've gained 5 pounds. My blood sugars are still elevated, I'm still shakey and lightheaded after meals. I have been able to cut down to two meals a day and I'm learning to eat fats, but I am impatient and would love to see some results! Maybe if I was heavy and could see weight loss it would be a tangible result - I've about had enough of gaining now too. Sorry for the mini rant. Maybe I need to cut calories or protein. I don't know. Just want to be healthier.

---

**RE: Zero Carb / Meat and Water** - **Kristi31** - 08-12-2008 04:39 PM

So I finally bought a whole brisket, it's freakin' HUGE!!! Cryovaced and not trimmed. One side is fatter than the other so I'll probably cut a piece from each side at each meal, eat the fatter portion until I'm satiated and then continue eating the leaner part. I think the fatty portion is called the point while the
leaner portion is called the flat brisket. They also had short ribs but they didn't look as fatty. The butcher told me to go for brisket if I wanted fatty.

What blood sugar numbers are you seeing?

RE: Zero Carb / Meat and Water - Daryl - 08-12-2008 07:07 PM

Some random info on blood sugar and insulin, from Dr Ron Rosedale:

Quote:
Cells become insulin resistant because they are trying to protect themselves from the toxic effects of high insulin. They down regulate their receptor activity and number of receptors so that they don't have to listen to that noxious stimuli all the time. It is like having this loud, disgusting music played and you want to turn the volume down.

You might think of insulin resistance as similar to sitting in a smelly room and pretty soon you don't smell it anymore because you get desensitized.

You can think about it, it's not that you are not thinking about it anymore. But if you walk out of the room and then come back in, the smell is back, which means you get resensitized.

If your cells are exposed to insulin at all, they get a little bit more resistant to it. So the pancreas just puts out more insulin. I saw a patient today whose blood sugar was 102 and her insulin was 90! She wasn't sure if she was fasting or not, but I've seen other patients where their blood sugar was under 100 and their fasting insulin has been over 90.

That is a fasting insulin. I'm not sure how many people are familiar with seeing fasting insulins, but if I drank all the glucose I could possibly drink my insulin would never go above probably 40. So she was extremely insulin resistant.

What was happening was that she was controlling her blood sugar. Statistically she was not diabetic or even impaired glucose tolerant. Her glucose is supposedly totally normal. But her cells aren't listening to insulin; she just has an exceptionally strong pancreas.

Her islet cells that produce insulin are extremely strong and are able to compensate for that insulin resistance by producing thirty times more insulin than what my fasting insulin is. And just by mass action her pancreas is yelling so loud that her cells are able to listen, but they are not going to listen forever. Her pancreas is not going to be able keep up that production forever.
Once her production of insulin starts slowing down, or her resistance goes up any more, then her blood sugar goes up and she becomes a diabetic. For many years, decades before that, her insulin levels have been elevated but have never been checked.

This is one thing that I try to keep in mind; I managed to normalize my blood sugar with VLC dieting; I feel like I've been given a second chance by the man upstairs. Every time I'm tempted to eat off plan (like today, being offered some peanut butter fudge 😁), I tell myself that those little binges might be my undoing one day, and end up blowing out my pancreas.

RE: Zero Carb / Meat and Water - kherring - 08-12-2008 07:39 PM

So, I am new here. I have been lurking forever and decided last wednesday to start zero carb. I have a tough time getting steak down for some reason. We have a ton of pork in our freezer so I started with that. I have been eating two pork chops for breakfast lunch and dinner since last wednesday and a ton of water (a gallon a day). I am up 5 lbs.

WHAT THE HECK?

What am I doing wrong and I am excited to join the board...😊

Kellie

RE: Zero Carb / Meat and Water - KimPossible - 08-12-2008 09:04 PM

Hi Kellie! Glad you've come out of lurkdom!! I don't know why you'd be up, but I do have a question...

why so much water? Are you drinking to thirst or are you making yourself drink a lot? Not sure that would have anything to do with it...Charles will have an opinion/idea, I'm sure, but a gallon seems excessive/borderline dangerous.

RE: Zero Carb / Meat and Water - Kristi31 - 08-12-2008 09:26 PM

I agree with Kim, you may be drinking far too much. Drink when thirsty! Also, how fatty are these pork chops? You want most of your calories to come from fat, not protein.

RE: Zero Carb / Meat and Water - jeepifer - 08-13-2008 05:40 AM

How the heck can someone gain 10 lbs in a week? OMG. I am so depressed.

RE: Zero Carb / Meat and Water - twilight - 08-13-2008 05:48 AM

jeepifer Wrote:

**RE: Zero Carb / Meat and Water - kherring - 08-13-2008 06:20 AM**

The reason I drink so much water is that I don't want to get constipated eating this way. I know it's a major side effect. The problem is, it's not working and I am barely going to the bathroom (tmi, I know)

So, what fattier meats are you guys all eating? I run out this morning to get some and hope it works.

What are you doing for constipation?

---

**RE: Zero Carb / Meat and Water - suzanneya - 08-13-2008 06:37 AM**

Quote:

Not true. LC keeps you very regular without outside assistance. I also believed that I needed something to keep me regular and tried things like flax. I was wrong, once I stopped taking flax and fiber and let my body self regulate, I was perfect. It did take some time, but it worked. I have a teaspoon of coconut oil in my morning coffee, that will without fail keep everything regular.

I eat a lot of ground beef and steak cause I like them best. Eat the meat you like. I also tend to eat those cause they are cheapest.

My salt update:
As some of you know I had a big salt addiction and it has been about two weeks woithout any added salt and I do not miss the taste on my steak anymore! The ground beef was never a problem. I have also found that a touch of coconut oil to my meat gives it a nice flavor.

---

**RE: Zero Carb / Meat and Water - kherring - 08-13-2008 06:54 AM**

Interesting that you never had a problem being regular. That is always my biggest problem when I do LC or zero carb. Hmmmm, wonder what is going on? I do know that everything I have read about zero carb mentions constipation being an issue also so I'm not sure what the answer is.
RE: Zero Carb / Meat and Water - MAC - 08-13-2008 07:03 AM

kherring Wrote:

According to Dr. Eades in Protein Power regarding constipation on a low carb diet:

"If you are eating carbs, make sure you eat those with a high fiber content. Take a fiber supplement if necessary but this should be short term. Increase fluid intake and take one or two capsules of fish oil."

As others suggest, up the fat. Your body will make itself regular even on zero carb.

RE: Zero Carb / Meat and Water - daveo - 08-13-2008 07:11 AM

Also, be sure you are actually constipated. Eating meat only causes a MUCH lower volume of elimination than a mixed diet. It is very possible to mistake just not needing to go for constipation.

RE: Zero Carb / Meat and Water - suzanneyea - 08-13-2008 07:13 AM

Charles? Can you jump in here with your knowledge on this issue.

Whenever you change your diet you have to give your body a chance to adjust. As long as you are eating enough fat and not too much cheese there will not be a problem. I have been doing ZC for almost 6 mos and have no problems at all.

RE: Zero Carb / Meat and Water - jeepifer - 08-13-2008 07:53 AM

I agree with the others -- up the fat or take fish oil / coconut oil and things will, ahem, move on through! Fiber and capsules and such only bind me up. Ick.

deedum Wrote:
However, I do not wake up hungry any more! But right after my morning cup of coffee (with coconut oil only) I'm starving. So the coffee is definately making me secrete lots of insulin. I think its because I've been drinkin a cup right before breakfast for so many years I have conditioned myself to release insulin upon drinking it.
You know how many times on these forums I have said I was giving up coffee?

You should know that it's not just the coffee in the morning. Remember, we are hyperphagic so we store fat during the day and we use it to live on at night. The diabetic community calls this Dawn Syndrome. It's normal for all of us to have insulin secretions in the morning as our metabolism slows to store more fat, thus prompting us to eat. Thus, eating carbohydrates in the morning is the worse thing that can be done because it immediately goes to storage.

If you're going to eat them, I would make it around mid-day so you have time to possibly mobilize them and certainly not before bed!

Regards,

Charles

C-Dunc Wrote:
I felt better after eating some more grease saturated hamburgers, but I must say I was close to eating some carbs to get rid of the hunger-less YET terrible feeling. As I type this, I feel okay after eating a couple of fatty burgers, and while I am sated I still don't feel so great. Not so much brain-fog now, but something else--like if I went to the gym and worked out hard I might faint or something.

This is the classic hyperinsulinemia that LeMagnen informed us about in his studies. See GCBC at 445. At a time when you should be living off of your long-term fuel supply in your circulation, your pancreas secretes insulin between meals. Insulin completely clears the bloodstream of any and all nutrients thus prompting you to eat. You eat greasy hamburgers but the muscles have been primed to burn glucose due to the high insulin levels in the circulation. Unfortunately, none is coming because the liver and muscles will not relase their glycogen. This is the vicious cycle you've heard about.

This is what people mistakenly call hypoglycemia. Hypoglycemia was a term invented by Louis Newburg a long time ago and had a different meaning. He used the term to explain why insulin could cause fattening because he didn't believe it was possible. He thought insulin made a person ravenous to eat too many calories because he believed people were fat because they ate too much and didn't run marathons.

Back to the cycle... You eat greasy hamburgers, no glucose is coming and the liver and muscles will not give up the glycogen stored within them so you feel the shakes, the brain fog, etc, because your fat tissue and muscles are directly linked to, guess what, your central nervous system! These powerful signals are telling you to eat glucose because of the high insulin.

Therefore, you have to continue eating the greasy hamburgers to train your body not to expect glucose. This is difficult and is similar to fighting an addiction. That's why this thing is so hard for people to handle.

Welcome to the forum, Kellie!

Well, there is nothing wrong with pork chops, but they are very lean. I agree with Kim on the water thing. That does sound quite dangerous. Are you taking medications of some sort?

What were you eating before the pork chops? What low carb plan were you following?

Do these pork chops hold you over until the next meal?

Do you sleep through the night?

What other issues are going on in your body, i.e., thyroid, endometriosis, etc?

It is necessary to understand quite a bit more about you in order to determine possibly what caused you to gain 5 pounds from 6 pork chops per day.

Either way, if you enjoy the pork chops and your hunger is controlled, don't stop eating them just yet. Don't change until we learn more about what's going on.

Regards,
Charles

suzanneyea Wrote:
Charles? Can you jump in here with your knowledge on this issue.

I don't have anything to add. You all are on top of it. Pretty soon, I'll be able to ride off into the sunset knowing that people are giving great advice based on science and experience and not just mere speculations.

I am quite regular as well. If I had a dollar for every person who swore I was constipated.....or who believes that fiber is so necessary...

I've recently picked up some pure fat (salt and water cured) from Wal-Mart and I add it to my pork meals. It is absolutely fantastic. I just melt it and put it in a dish and dip my fatty meat right in it. It's fantabulous! (Is that a word?) I have some here at the office so at lunch (whenever that is...) I'll warm up my pork steak in my toaster oven and melt the fat with it and just enjoy!
I did the same with chicken fat. I baked thigh and leg quarters last night and put the chicken fat in a dish and dipped the chicken, including the skin, in the hot fat. Man, that was some good eatin'. A year ago, I would never have done this.

It takes a very determined effort, but everyone can overcome their conditioning and achieve great health.

Regards,

Charles

RE: Zero Carb / Meat and Water - cbnebraska - 08-13-2008 09:04 AM

A very simple to understand logic that I throw out when people seem fascinated that I don't get constipated even though I avoid all grains and get no fiber. If you want to keep something free flowing, should you toss in some sawdust or keep it well oiled? Everyone goes "oh, I see". To anyone who is ever constipated on this diet -- EAT MORE FAT!!!

I am intrigued by all of you talking about coconut oil. Tell me more? Can I find it at Wal-Mart or do I need to go to a "health market" type grocery store isle? If so, is it cheaper on-line? What do you put it in? Does it make things taste like coconut? I just searched for it on Amazon and there are some books about the "cocunut oil miracle" or something like that. Worth reading?

Thanks!

So by continuing to deprive the body of glucose by eating fatty meat, you can train the body to not put out as much insulin. This will allow the fatty acids to be burned for fuel and weight to be lost in the process. Do I have that right?

And it takes 3 weeks or so to get fully keto-adapted. So to re-introduce carbs/sugars during this time is counter productive and will set you (and your insulin levels) back to square one.
RE: Zero Carb / Meat and Water - **kherring** - 08-13-2008 09:11 AM

Charles,

I was eating badly before. Like a normal unhealthy diet. Pasta's, mexican food, sushi (with the rice), burgers, etc. I had lost 30 lbs 4 years ago doing zero carb (not intentionally) and all I ate was plain chicken wings and a steak here and there(not intentionally, it's just what was the easiest to make at that time in my life).

I take no medications and am not hungry at all between my meals. I am sleeping better than I have in years and have no more insomnia. I have no issues going on with my body other than being 35 lbs (155) over weight (I was 150 last Wednesday).

I'm heading out to the grocery store now for some fattier meat and I'll pop a few fish oil that I have in my pantry. 😊

What do you think the issue could be?

Thanks for the welcome everyone and I look forward to being here. 😊

Right, just like the treatment for any other addiction, if you think about it. If you abstain from alcohol long enough, your body stops looking for it, at least to a big degree. By the same token, the smell of alcohol can really torture a long-time alcoholic...So we might need to stay out of the fresh bread store for a few years! 😊

Jenn Wrote:

Ketoadaptation is just that, your body adapting to using fat for energy and ketones in place of glucose for most of the tissues that use it. That doesn't have anything to do with insulin, however. Your body will still hypersecrete some but it should begin to get better.

The "little bit won't hurt" mentality will doom your effort at controlling your insulin and put you back in the ketoadaptation process where you are wasting ketones since you provided some glucose even though your body created ketones out of fat for this purpose. The adaptation process is hard on your body and makes you feel like you have no energy as your body adapts. It's best to just adapt and stay there than keep going back and forth.

Regards,

Charles

In my opinion, you can save the money on the fish oil and just buy some more meat. I don't take any supplements or vitamins of any kind. Your Omega 3s will improve once you eliminate the sources of excessive Omega 6, the oils and stuff.

Kellie Wrote:
What do you think the issue could be?

Each time you go zero-carb it may not be as easy as the last time. It's not so much about the number of carbohydrates you eat, as it is your insulin resistance. That could have gotten worse since you stopped before.

The chicken wings and the occasional steak thing might be a good clue. If you ate those foods before and they worked for you, there's no reason not to eat them now. I'm suspect of chicken wings because most of them are fried in vegetable oil these days and then the sauces that people use are loaded with bad things. However, if you make them yourself, that's another story. Either way, you ate what you ate then and it worked so I might go back to them and the occasional steak, as long as these are foods you enjoy.

The 5 pounds could be anything. I wouldn't be overly concerned with that. If you got to 150 by cutting your calories, then it's only natural that your body reclaimed those pounds because that's what it is supposed to do.

I would certainly recommend that you only drink water to thirst. Don't go about just drinking until you reach a gallon.

How tall are you and what do you think you should weigh?

Charles

RE: Zero Carb / Meat and Water - poo123 - 08-13-2008 09:42 AM

Well just checking in. Things are good. My husband is still doing low carb and feels great and still losing slowly. Yeah for him. My weight is holding fine. My body is changing, the inner tube around my middle and my face are a lot smaller. That is really cool. I am drinking my coconut oil daily. I really like
it. I take 4 tablespoons and mix it with warm water and add the smallest amount of splenda and drink it down. I am regular, (granted the amount has decreased since I don't eat all that much) and its all fine. I have bunches of energy and I have a great positive attitude. No cheating at all... Keep up the good work everyone...

I don't know that I like this part. You were losing until you added the coconut oil mixture, if I remember correctly and that seems to be the only thing that has changed. Not only that but I want to make sure you are in fact eating. You're not going to lose more if you don't eat. I know I told you to eat when hungry, which you should, but make sure the majority of your fat is coming from your meals, not the coconut oil drink.

I'm certainly not a fan of Splenda in any amount. The fact that the drink is sweetened has effects on insulin secretion so I think you should go without it for a week and see what happens. If it's truly good for you, then you won't miss it.

What do you think?

Charles

I don't remember a name on it. It just said "pork fat." It was in the meat section in one of the big bins across from the pork. They sell a bunch of it in a pack and there are two kinds, sugar cured and salt cured. I would get the "salt-cured" obviously. It was about $3 or $4.

Regards,

Charles

Cool, isn't it? I find I have more energy (a feeling of). After my half-marathon races, I make it a priority to rest so I didn't lift Monday or run this morning. I don't get to go back to the gym until tomorrow night and run on Sunday. I'm already wanting to go...
Charles, I am eating twice a day. For lunch I have a pork steak cooked with butter. (12:30pm) For supper I have 73/27 ground beef cooked with butter usually around 1lb (10:00pm) And I drink some water during the day. Thats it. I have NO desire for food at all. I am eating at those times because that is when a actually feel hungry. I will drop the coconut oil and just use it on my skin and see what happens. I love to see my body changing but to be honest I am FAT and I would really like to see the numbers go down. I am sticking with this no matter what, so lets give no coconut oil a shot. I am willing to do anything. If you want me eating butter by the sticks, stand on my head I don't care I will do it.....alison

Travis--

I am so right there with you! Coffee, butter and meat. (If I could add one more thing to my list, I'd add 1 Tbp whole cream each day in my 3 cups of coffee.) I could seriously do fine with just these things!! I wonder if eating just these things would cause me to lose weight?

I am 5' 5.5" and weigh between 147 & 150. I wear a size 6/8 pant and have the waist taken in because I'm smaller there than in the thighs. I am athletic and lift heavy weights for a woman. Everyone always says I have very little fat on me, and I tend to believe them since I can't pinch anything anywhere, but I would love to get that honey super thin look so many women get. I just don't think it's in the cards for me? I've resigned myself to this, but...... it would still be nice........

I need to get to the grocery store and get some really fatty meat. We've been making turkey sausage, chicken thighs, lean hamburgers, salmon and eggs. The only thing we have on hand that's fatty is some beef brisket. I will go get some more fatty stuff after work tonight. This may be the first step.

poo123 Wrote:

Please, I'm not accusing you of anything, I just think that when you added the cocounut drink, you stopped losing.

You might try what I'm doing and that's adding some more pork fat to your pork steak. For lunch today, I took some of the fatback I purchased and melted it in my toaster oven. The salt stayed in the pan and I poured the fat into a bowl. I dipped my pork steak in the fat with each bite and it was marvelous.

The butter should be fine, but I have my suspicions about dairy which I can't really explain. The 73/27 is great but just use the juices from the ground beef and leave out the butter. Try this for a week or two and let's see what happens.

Alison Wrote:

I understand. I don't want you to eat butter sticks or stand on your head, but I want you to get the fat primarily from the meats instead of from dairy. The fact that your body is changing is also a good sign and we can't discount that. The problem is on the inside, not the outside, so it's great to see that we're progressing. Your hair is probably shinier, your skin radiant and other observations.

Let's give non-dairy and non-coconut a shot and see what happens.

Regards,

Charles

Congratulations! You said "weight up to 110", where are you now?
I got on the scale at the gym and it was around 107, with my sneakers on. EEK! I am a little over 5'5, so, I am too thin. I love shrimp and chicken, but have dropped the shrimp and limited the chicken (I do not like skin either) I am trying to eat ground beef and steak, but I am hoping that adding the fat will help too.

What is this pure fat product called? I'm looking for more fat also.
It is usually called Salt Pork and usually found in the cured meats section or where they have the tongue & tripe & stuff. I'm with Travis! - everything is better w/ butter! I am now dipping all of my meats in to some kind of fat too, reminds me of dipping lobster into butter, Yummy!
How do you cook brisket? Isn't it a tough cut that has to cooked forever?

RE: Zero Carb / Meat and Water - Charles - 08-13-2008 02:16 PM

Dana Wrote:

That's where the convection roast comes in. I never knew what I gem I bought my wife several years ago.... so easy, even a caveman can do it! 😁

By the way, I've also seen pork fat referred to as "fat back." It's just strips of fat in a package that just requires refrigeration. You take a couple and add them to your pan or heat them seperately until they liquify. Poor the fat into something (unless you want the salt as well) and dip away. Stefansson would eat the fat first and then the lean. I prefer my fat with my lean. If you start to get a little nauseated with too much fat, then that's a good sign that you have plenty. Just eat more lean and back off the fat a little and you should feel just grand!

RE: Zero Carb / Meat and Water - Nicola - 08-13-2008 02:34 PM

I believe that animal fat (not butter) is best like Charles. I have followed many "humans" (you don't have to be a doctor, just be interested in our make-up, before agriculture) over many forums, blogs...

Eggs will not have been easy to find (birds lay eggs in the spring - not like modern "soya and grain chicken"), wild meat will have had healthy fat (light yellow, not white, salt or suger cured!!!) and we should try are best to eat healthy meat and fat.

I go (I don't care how many km I have to ride!!!) to farms for suet. Marrow is a nice change and every now and again I have some brain (for healthy fat). Once a week I ride to Waldshut (Germany) to get my Argentine beef (they will eat a natural diet of grass, not like the European) because Switzerland is very pricey.

We also know that fat is best raw - but as we all live in our own body and mind...not all worry about or consider this!

On one of the forums a person, who has been eating just beef&fat and a little organs for over 3 years, has a journal all about pemmican (yellow tallow from grass fed beef vs. white tallow from grain fed beef) and many blood tests... with higher fat vs. lower fat!

So commercial meat and fat is not the deal.

I hear you and I don't doubt that anything you say is accurate. However, hopefully eating an all meat diet gives you most of the health benefits. Being a realist, I know that such things as eating raw fat, brains, marrow, organs, and having to track down grass-fed beef, while probably ideal, will not fit my lifestyle and there is no chance I will stick with it for life.

It looks like you have lost about 17 lbs in 6 weeks or so. That's phenomenal. Your body can only burn so much fat in a given amount of time.

Quote:
I believe that animal fat (not butter) is best like Charles.
Butter is animal fat.

The link from CSUchico about grass fed beef is a good example of how the augment against grain fed vs grass fed gets messed up.

I occasionally get my meat from CSU Chico's meat lab. (they sell it to the public on thurs & fridays) It is not 100% grass fed.

Most of our friends are ranchers & farmers. I never heard of anybody feeding grain to their cows from birth. It is too expensive. The ranchers go to great lengths to "pasture" their cows. In the summer the cows are trucked 50 or more miles up into the cooler part of the mountains where the grass stays green, then they truck them back down the hill before it snows. Can you imagine how much it must cost to truck herds of cows up into the mountains? It is cheaper than feeding grain. Most beef IS grass feed for most of its life, as it is at the CSU Chico farm. Then they feed grain before slaughter to fatten up the cow. The grain makes the meat and fat taste much better. Cows that were not finished off with grain are true grass fed. True grass-fed beef is awful! It is gamey and the fat tastes rancid.

These experiments at Chico farm were done on a cow that was raised on grain and a cow that was grass fed only. That is unrealistic. Commercial ranchers cannot afford to raise their cows on grain only.

I just don't buy that grass fed beef is much better nutritionally than store bought beef. All I know is I eat a lot of commercial beef & fat and I feel great!

**RE: Zero Carb / Meat and Water - caroline - 08-13-2008 03:56 PM**

Great point, Dana!

I love hearing this kind of info. because I am very focused on economizing for my family. This makes me feel great!

---

**RE: Zero Carb / Meat and Water - Kristi31 - 08-13-2008 05:55 PM**

I agree with Dana and besides, herbivores will make up what's missing in their diet...they are THAT efficient, YES! The difference in nutrition is so minimal as to be insignificant.

Once keto-adapted, if you have weight to lose, you will not be hungry until all the fat that is undesirable is used up for energy, as glucose, fatty acids and ketones. Once you reach your desirable weight, hunger will strike...until the next time when all that dietary fat is used up. And so on. So, if you are much above your healthy weight (established by your body, not by you), you may not feel hunger for days...who knows?! I suggest you eat when you truly feel hungry, not just for the sake of eating.

In ketosis, you will have cravings for carbs or protein, the latter being especially likely if formerly relying on protein for glucose. No matter how much you eat, the cravings will come and go until cells adapt to ketones. Also, you may have some craving for fat more frequently than in a keto-adapted state as fatty acids mobilization is somewhat reduced due to slowing down of body activity (similar to calorie restriction). Ketosis is real tough and is a time of strong cravings. If you get through it, the rewards are endless!
On a ZC or LC diet where protein and carbs (or protein alone) provide enough glucose, you will be hungry for protein (and carbs) from time to time and will have easy access to fatty acids for energy. But relying on protein for glucose may slow you down (from the energy it takes for conversion) and lead to a less than optimal state of health. You want to either rely mostly on ketones or carbs, not proteins for energy. Your cells are also still relying on glucose so when carbs are closeby and when you're hungry, beware! Overall, not an optimal state to be in.

On a high-carb low-fat diet (or high-protein low-fat), you will be hungry for carbs (or protein) from time to time. Problem is that fatty acid energy will be low. Fat hunger or the craving for fats should occur.

With high-protein/low-fat, insulin will not be high and protein will NOT be converted to fat such that you definitly need to eat fat to resolve the issue. You will have exhausted your fat reserves and be extremely thin.

With high-carb/low-fat, insulin is high and carbs do get converted to fat. Whereas in the above, you cannot get at fatty acids because there are none left and too little in the diet, in this particular scenario, there is plenty of fatty acids available but less accessible because insulin is stimulated frequently by periodic carb consumption. And of course, very little fatty acids coming from the diet. The solution, like in the above, is to eat more fat. So in either case, increasing fat is imperative.

If you are still too heavy (realistically) or too thin, check to see if you are spilling ketones. If you are, then wait until no more are spilled. If you aren't spilling, INCREASE fat intake until you start spilling ketones. Then wait again until no more is spilled. Ideally, you want no ketones in your urine, plenty of energy, no constipation, good skin, good sleep, no hunger and a healthy weight.

I truly believe that we can all reach our desirable weight, no matter how old, how obese, what our sex is, but only if we truly stick with (and are fully committed to) a zero-carb diet consisting of only WATER, ANIMAL FAT (including perhaps butter and cream but preferably pure animal fats like pork fat, suet, marrow, etc.) and ANIMAL MEAT. Nothing else, not even salt as it can interfere with fat metabolism...

---

**RE: Zero Carb / Meat and Water - 08-13-2008 08:55 PM**

Hey guys! Quick check in to say I'm not struggling anymore...it's as if my body is welcoming the familiar feeling of NO carbs. I already feel 95% better. I did check the scale this a.m.: 171 which is up 9 from my pre-vacation weight...my feeling is that it will come off quickly. I can already feel it! :-) I absolutely love this WOE! 😊

I had a thought today--I ate to hunger, haven't cut out cheese or a bit of condiments yet...ended up eating 4 hamburger patties (73/27) with cheese and a bit of mayo, mustard, and LC bbq sauce...but my thought is was that enough? I don't want to force it but I don't want to be low in calories. Should I worry? Or let it go...I absolute DETEST tracking intake and love the eat to hunger/satiety way of thinking....just wondering...

---

**RE: Zero Carb / Meat and Water - 08-13-2008 10:00 PM**

Eat to appetite. As long as your are feeling good, have plenty of energy, losing weight (or at a desirable weight already) and find that overall, physically and psychologically, things are going well, then there needs no change.

As for the mayo, try to do your own instead of buying those with soy or canola oil. Healthier for you.
Don't overdo cheese as it can constipate and try as much as possible to keep it simple and stick to animal fats.

Happy you're feeling better and again, don't worry about the calories, just how you feel! Take care, Kim.

---

**RE: Zero Carb / Meat and Water**

Charles Wrote:
Ketoadaptation is just that, your body adapting to using fat for energy and ketones in place of glucose for most of the tissues that use it. That doesn't have anything to do with insulin, however. Your body will still hypersecrete some but it should begin to get better.

The "little bit won't hurt" mentality will doom your effort at controlling your insulin and put you back in the ketoadaptation process where you are wasting ketones since you provided some glucose even though your body created ketones out of fat for this purpose. The adaptation process is hard on your body and makes you feel like you have no energy as your body adapts. It's best to just adapt and stay there than keep going back and forth.

I'm 32 years of age now, and when I was around 19-20 I tried Mauro Dipasquale's Anabolic Diet--a diet geared to bodybuilder types. I did a 14 day induction of basically meat, cheese, and eggs. Even back at a "young 19" I had the low energy, brain fog, etc., going on, albeit to a MUCH lesser degree. So, it appears that even at 19: "slight hyperinsulinemia." But at 32: hyperinsulinemia significantly heightened.

So, a little over ten years ago, with the Anabolic Diet, it was not the "little bit won't hurt" mentality BUT the "a lot won't hurt" since after the 2-day carb fest you go back to your zero carb on Mon-Fri. After the 14 day induction followed by the two days of lotsa carbs, followed by the 5 days of virtually zero carb, followed by 2 days lotsa carbs, and continuing the 5 and 2 cycle for about 6 months or so. And despite this continual 5 and 2 cycle (back and forth) I had plenty of energy.

Take this scenario: A person gets ketoadapted. They go "back and forth" with a 6 day zero, 1 day carbs. They do not suffer any ill effects insofar as energy and brain (focus, mental clarity,etc.) are concerned. But if I remember correctly, even a 6 and 1 would not be optimal, *even if* one had plenty of energy and focus due to the other health concerns that are NOT felt or perceived in the way mental focus and physical energy is.

Pork sparebits ribs can be done in one of two ways according to the ones I bought and cooked last week.
1. Put the ribs in boiling water and then simmer for 45 minutes. Then put them on a grill for 4 per
minutes per side. 2. Bake at 375 for 1 1/2 hours and then coat with 'sauce' (low carb of course or a spice
rub) and then back in the oven for an additional 30 minutes at 425. The instructions were on the
packages of pork spareribs I bought.

RE: Zero Carb / Meat and Water - Kristi31 - 08-14-2008 07:07 AM

Keto-adaptation would not occur on such a cyclical diet.

First, one usually needs more than 2 weeks to become adapted to ketones. So, I doubt those on a cyclical
diet are adapted. Their cells are still adapted to glucose.

Second, carb days would derail the process of keto-adaptation and make it impossible to achieve. One
would go in and out of ketosis. OR just remain glucose-dependent (protein or carb). Personally, I don't
think it's a good idea. The days (1-3) that follow "carb-day", you will probably feel good and then not so
good unless you are eating much protein which would allow you to get all the glucose needed.

I suspect you felt good all along because you relied on glucose (carbs and protein mostly) and were
never in ketosis. I think it's unnecessary to follow a cyclical diet because once keto-adapted, your
endurance and strength can actually benefit while keeping in top shape and very healthy. You just have
to get through the transition period.

Muscles appear bigger when insulin is present because glycogen reserves in muscles increase,
"ballooning the muscle". Increased fat deposition also adds to the bulk.

I generally smoke those kinds of meats, but if I did them in the oven I would cook them low n' slow,
maybe 225 degrees. Ribs would take maybe 4 hours or so. Brisket will be a lot longer but it depends on
weight. When I smoke a brisket it can be a 12 hour affair 🙄. A meat thermometer would help, preferably
a remote one. Brisket will slice well at appx 175-185 degrees and pull closer to 200 (I think, I'll look it
up and edit this if those #s are off). Cover with foil to keep as much moisture in as possible.

I have one of these:

http://www.amazon.com/Weber-2820-Smokey-Mountain-
Cooker/dp/B00004U9VA/ref=pd_bbs_sr_1?ie=UTF8&s=home-garden&qid=1218722899&sr=8-1

and one of these:

There is definitely an investment involved, but if you love these kinds of meats it is worth it, and think about how much you can save eating awesome Brisket and Pork Shoulder, both of which are extremely cheap, fatty, and make great BBQ 😊

Charles, I think that perhaps your post 1816 answers the above scenario:

Quote:
Honestly, I don't have too much to comment on regard Thib. Cycling in and out of the ketoadaptation zone doesn't sound like fun at all. The real benefits of zero-carb don't manifest themselves for a food couple of months after reaching ketosis. I don't find much beneficial about merely "being in ketosis."

He is interested in muscle building, which does not interest me. I have very lean muscle and I'm not at all puffy. It seems that in order to get bigger and really sculpt a bodybuilder's physique, one would need to do as Thib and incorporate this sort of regimen. I can't comment on the healthiness of such an approach because I don't know of a population that does this nor have I studied the life span of bodybuilders who do this.

I think that one can be sufficiently muscular while eating a proper diet and with moderate weight training they can look pretty spectacular. However, for competitions and the like, perhaps they would need to cycle which I don't recommend.

By the same token, to run marathons and qualify for the Boston Marathon, it may take some amount of carbohydrates to do that well. I don't think that's healthy so therefore, I would not be interested in running the Boston Marathon. The end does not necessarily justify the means, in my opinion.

And so, there are no studies or whatever that demonstrate that once a week carb meals or infrequent all out loads are unhealthy. There is no "disease of civilization" with regard to infrequent "carbing-up."
Those who advocate periodic carb loading say that carbs are only problematic when taken in large quantities, frequently--and that is painfully obvious to us, but not so obvious to those who adhere to a diet like unto Food Pyramid recommendations.

A cited benefit of a carb load is that it allegedly boosts the T3 (thyroid hormone) that they say declines on a long-term zero/low carb diet. Proof that low carb lowers T3 is that weight comes piling back on after going back to a higher carb diet. Any diet (say "they") that lowers T3 is not a viable means of achieving lasting fat loss. They think meat and water would lower T3 (long term; not short term), and so they would have people to do periodic carb loads to boost T3 and hence, continue losing fat. But I say what if one continues losing fat on zero carb for 6 months, and then stagnates at 6 months and one day? Should he or she carb up or should they try "tweaking" some other things within the zero carb parameters? I'm not sure.

For Faigin and Dipasquale specifically, they desire to OPTIMIZE insulin's anabolic muscle-building
effects through a periodic carb-load while avoiding the lipogenic (fat accumulating) effect of the chronically elevated insulin that accompanies the average diet of American civilization. In sum, the goal in muscle building/fat losing is the minimize the bad of insulin, while maximizing the good--hence the concept of "insulin optimization."

I lean more toward the mindset of muscle-building. BUT NOT to the degree of bodybuilding competitions or even to the degree of "looking like I lift weights" *specifically* for bodybuilding. I wrestled in high school and even now I look like a fairly muscled wrestler at a height of 5'4" 145 pounds. Assuming I lose no muscle mass on perpetual zero-carb, I would probably look a bit bigger at an extremely lean (shredded) 130. I don't really care about whether it is a bodybuilders physique or a Olympic wrestling physique. For even some pro basketball players are quite lean and heavily muscled.

Just curious to find out which artificial sweeteners stall the least amount of people? I've switched to liquid saccharin for my coffee, but I've heard erythritol is the least likely to affect blood sugar. However, I cannot find erythritol anywhere. I am working myself very close to zero carbs, but I am going to try to do it while still having my 2 morning cups of coffee and 1 afternoon iced coffee. I put a tiny bit of sweetener in each cup, as well as I almost Tbsp. of whole cream. Everything else, I can give up.

So, could I get a poll? Which sweetener stalls you? Also, should I put coconut oil or whole cream in it and why? I don't have anything to measure my glucose, so I thought maybe if there's a clear favorite, I'd switch to that.

Thanks!
Cynthia

I'm completely avoiding sweeteners, but I can tell you that in the past when I lost a lot of weight low
carbing, I drank Diet Coke like nobody's business and had no problems. I'm avoiding it now to get rid of
a taste for sweet flavors.

Splenda, however, seems to be no different that sugar to my body. I get cravings and I feel like I just ate
a high carb meal if I use Splenda.

kherring Wrote:
Interesting that you never had a problem being regular. That is always my biggest problem when I do
LC or zero carb. Hmmm, wonder what is going on? I do know that everything I have read about zero
carb mentions constipation being an issue also so I'm not sure what the answer is.

I have the same problems the first couple of weeks, but for some reason once my body adapts,
everything goes as well as before. Exercise always helps, too. But the constipation issues never last
more than a week for me.

Cynthia,
Its not the chemical composition of the sweetener that causes stalls. Its the body's conditioned response to the taste of sweetness that causes the stalls. Your body tastes "sweet" and your pancreas releases insulin because its conditioned to do so regardless of what that sweetness is made of. That is why Charles recommends no sweetness (in foods, that is)

RE: Zero Carb / Meat and Water - Charles - 08-14-2008 11:09 AM

Dana Wrote:
I just don't buy that grass fed beef is much better nutritionally than store bought beef. All I know is I eat a lot of commercial beef & fat and I feel great!

I couldn't have said it better!

Just to add a little what Dana said, Stefansson, in Not by Bread Alone states that it's very difficult to make nutrition arguments based on types of fat or meat. No one disputes the health of those Inuit that ate Caribou and gnawed on the bones and even ate occasional organ meats. However, for every one of them, there were others who never ate Caribou and only ate fish. They were just as healthy and their teeth were just as beautiful. Even the Caribou eaters did not eat that meat all year, and they would go a year without it and eat seal or whatever else was available. The point is, they were all healthy to the same degree.

Just because some grass fed "may" (which I'm not positive) be more nutritious, that doesn't mean that grain-finished meat is not nutritious. Just like Dana, I eat a lot of it and feel just great.

Regards,
Charles

Charles, I didn't want my post to sound bitchy. I think you are wonderful and will follow your advice without question.

No problem, Alison. You can bitch to me all you want 😊 Oh, and you SHOULD always question and even argue everything I write. That's a very good thing and you should never feel like you can't disagree. I argue strongly, but I'm not infallible (I don't even know if I spelled that word right!)

Okay, I am not talking about Alison at this point...I'm writing in general!

I wrote about this in my journal today, but I want to say here as well that weight is not the marker for good health. Obesity gets a bad rap because obese people tend to get the other diseases of civilization faster than the rest of us, especially since they usually don't correct their diet.

However, it's possible to live a long and healthy life on the correct diet and you may or may not get skinny for all your efforts. However, what if you stave off all the other diseases of civilization in the process? Isn't that much better? I have to believe it is. I know it's tempting to throw your hands up and say "what's the use" if you're not losing weight but the alternative could be much worse.

Too much weight is not the issue, it's too much insulin. Work to correct that and you may or may not get lean. But I have to believe that you'll be better in the long run. You'll be the most beautiful large person with beautiful hair, white teeth, clear skin, clear thinking, a great libido, well-rested, active, and have a good optimistic disposition which is needed in our world.

Former smokers are faced with the same possibilities. They may gain weight when they stop but they realize that life is more important.

Regards,
Charles

C-Dunc Wrote:
And so, there are no studies or whatever that demonstrate that once a week carb meals or infrequent all out loads are unhealthy. There is no "disease of civilization" with regard to infrequent "carbing-up."
Those who advocate periodic carb loading say that carbs are only problematic when taken in large quantities, frequently--and that is painfully obvious to us, but not so obvious to those who adhere to a diet like unto Food Pyramid recommendations.

A cited benefit of a carb load is that it allegedly boosts the T3 (thyroid hormone) that they say declines on a long-term zero/low carb diet. Proof that low carb lowers T3 is that weight comes piling back on after going back to a higher carb diet. Any diet (say "they") that lowers T3 is not a viable means of achieving lasting fat loss. They think meat and water would lower T3 (long term; not short term), and so they would have people to do periodic carb loads to boost T3 and hence, continue losing fat. But I say what if one continues losing fat on zero carb for 6 months, and then stagnates at 6 months and one day? Should he or she carb up or should they try "tweaking" some other things within the zero carb parameters? I'm not sure.
My major problem with all of this just has to do with the metabolic syndrome. Weight is just one of the many symptoms involved so each time you "carb up" how can you be so sure that the only effect involves fat mobilization? We really don't know the effects of high insulin. I know chronically high insulin is bad, but the real question is should insulin ever be so elevated?

If you were coming from 100 years of history where your people never ate carbohydrates and then you "carbed up" you could make reasonable predictions about what should happen. However, because we inherit a lot of our insulin problems I would be hard pressed to test the voracity of a carbup routine without knowing every variable.

I'd like to think that whenever I carb up, I can just go back to zero-carb and everything will be fine. Well, this last time I ate some carbs it took several weeks to get down to my low weight and I found this wildly disconcerting. I'm afraid to do that again and have no plans to repeat the experiment.

It used to take 70 pounds of sugar a year to manifest the diseases in a brand new population transitioning to what we call "civilized." I suspect it would take far less for us to develop disease today since we're far removed from the 1800s when sugar consumption rose sharply.

Regards,

Charles

Thanks, Suzanne!

I also wanted to report that this is my third day with the added fats routine and I have to tell you all, I woke up with so much energy today. This is absolutely awesome! I never thought my energy was that bad, but I would get sluggish from time to time. Well, now I'm raring to go to the gym with my son tonight. I have all this energy.

Monday and Tuesday, I was pretty sore from my race, especially in my hamstrings. Today, they feel great.

Don't worry about the salt-cured pork fat. When I heat it in my toaster oven, the salt stays with the main piece of fat on the pan. The rest just turns to a beautiful golden liquid and I pour it into a dish. It's not at all salty. Dip the meat in on each bite and enjoy.

Even my dog is enjoying his zero-carb diet. The last bag of Nutro was his last. For past week, he's been eating raw ground beef and meat scraps and bones from whatever we eat as a family. His teeth are sparkling, his energy is good and every time he sees me, he's jumping up looking for some meat. I treat him like an Alaskan sled dog!

Look at those eyes!

Wow he's really cute Charles!
I think your new avatar pic is amazing as well - such an inspiration - you look like a pro athlete! Suzanne's avatar is the same - totally ripped and lean.

I have a new little spanner to throw into the works if that's ok! I love discussing this stuff here - so please don't throw me out.

Have you heard of the Banta diet? The author claims that ANY food can be ketogenic, as long as it's fat quantity is at least 1.5 times the weight of both protein and carbs added together. For instance, if you ate 100g of protein, in order to be able to eat that food and be able to have fat loss without caloric restriction, you need to eat at least 150g of fat with it.

The same goes for carbs - 30g of carb needs at least 45g of fat for the food to be ketogenic. She is of course taking the opinion that the glucose from protein can impact weight loss and needs to be countered by fat. However, as we have seen with both yourself and Suzanne, weightloss can occur on a high protein zero carb diet.

So....

I've thrown out this idea at other forums - can't get much feedback. It all sounds a bit dubious, especially since it would be totally against the low-carb ideal to say you can eat a high carb food, mix it with tons of fat and still lose weight, but maybe she has a point about the ratios.

Here we are discussing how fat is important - we see Lex who has been zero carbing for a long time on a lot of protein and moderate fat, suddenly begin to get into 'ketosis' i.e. peeing ketones once tons of fat is added (80%), which is odd, seeing as Bear maintains that gluconogenesis simply doesn't happen.

I also note some authors (a good example being Kwasniewski) claiming that gluconogenesis does indeed happen and needs to be controlled for good health (i.e. eat lots of fat instead).

Who is right? Does it even matter if the carbs are low enough? It shouldn't, but what if it does?

I wish someone would have an outright answer. Anecdotal experiences don't seem to show much in common. For instance I know both you and Suzanne and a few others on this forum are having great success simply cutting out all of the carbs, but I also know a few other people on other forums that didn't have any success on zero carb, and gained weight/fat. One of those people (I won't name them as I don't have their permission to talk about this) did zero carb for 3 years and gained 15 pounds. I don't think she was cheating or doing weird stuff like AS either.

What gives? Do I sound like a broken record? Apologies!

Loops

There is a quote from Gary Taubes in another thread (probably in the GCBC sub-forum) that you may be low carb and never get to your ideal weight because of metabolic defects that cannot be overcome.
Sorry to be so harsh but that may be true. Which is why it is more important to stress the health benefits of low carbing rather than the weight loss.

Loops Wrote:

He doesn't maintain it doesn't happen only that someone must actually be starving to make it happen. That is, no food is consumed period.

Loops Wrote:
Have you heard of the Banta diet? The author claims that ANY food can be ketogenic, as long as it's fat quantity is at least 1.5 times the weight of both protein and carbs added together.

Well, I looked at the website for this diet and it doesn't look all that dissimilar from other low carb diets. They are borrowing off of William Banting's name and the popular term, "banting" as a tribute to the Englishman.

I don't really buy the logic of the ketogenic food. The point of ketone bodies is that they are created out of fatty acids to provide fuel to those tissues that can use them. Of course, when carbohydrates are
absent from the diet, ketones make up the difference but that's really a backwards way of looking at it. Ketones provide what they provide. When glucose is present, our bodies use these tissues to use that glucose first in order to get back to the ketones which are preferred.

There is ample evidence that our brains and other tissues run far more efficiently on ketones than they do on glucose so it's not at all a stretch to say that ketones are preferred. It is a disservice to say that ketones replace carbohydrates.

Therefore, I can't see how a carbohydrate would ever be considered ketogenic. It can not be by definition. Now, if you increase your fats in response to having more carbohydrates in your diet, you're only going to put on that much more weight. Everyone, including Dr. George Bray, will agree that fats and carbohydrates together are a deadly duo. In fact, if you do eat carbohydrates, you probably should eat less fat to avoid serious weight gain.

Loops Wrote:
However, as we have seen with both yourself and Suzanne, weightloss can occur on a high protein zero carb diet.

Suzanne and I are NOT on a high protein diet. We are on a high-fat diet. Our protein is really quite moderate.

Loops Wrote:

Ratios are really irrelevant. They are never considered by those populations that eat them, if you notice. It's always outsiders that analyze the diet and say, "so and so is eating X% fat and X% protein." It's not at all natural to look at a piece of food and say, oh, this is 600 calories so I'll eat this much. What is so wrong with relying on hunger? I agree that it may be out of whack at first, but it will adjust over time and regulate as its supposed to.

Loops Wrote:

We can't explain Lex's issue but to me it doesn't really matter whether he's doing that or not. The real issue is that a person needs to get ketoadapted to realize the benefits of a zero-carb diet. Kristelle made the observation that many people spend much time in ketosis but not very much time being ketoadapted. She urged people to just take the plunge and get ketoadapted and don't worry about ketosis after that point. I agree wholeheartedly. I have only rarely tested my strips. They don't mean much in the overall scheme of things. If I tested today and found that I spill ketones in my urine, I would just say, okay. What does that really mean?

Loops Wrote:
I also note some authors (a good example being Kwasniewski) claiming that gluconogenesis does indeed happen and needs to be controlled for good health (i.e. eat lots of fat instead).

Why? If the Inuit and Masai (and the rest of us) eat a high fat diet and enjoy good health, then we are consuming what is, by definition, a healthy diet, period. You cannot solely examine the diet to determine
how healthy it is. Examine those eating it to see whether you find any deficiencies or poor health. Since Suzanne, Dana and I (among others) are in great health, then the assumption should be that we are eating what is by definition, a healthy diet.

I'm not saying gluconeogenesis happens or doesn't happen, I'm just saying that it's quite irrelevant. We talk about it to try and explain how a person gets what we believe to be the necessary amount of glucose on a zero-carb diet, but it's obviously not important. I mean, really.

Loops Wrote:
Who is right? Does it even matter if the carbs are low enough? It shouldn't, but what if it does?

As I've said ad nauseum, looking at carbohydrates and ratios is missing the forest for the trees. Carbohydrates are not the problem, chronically high insulin is the problem. If you don't have much insulin resistance, your body can efficiently remove them from your system without storing them. However, there is no easy way to tell whether you're insulin resistant without other markers. The damage happens long before weight gain. Some people never gain weight, only the lucky ones.

There is absolutely nothing wrong with being overweight and healthy. If you eat to control your insulin, you will gain a health advantage regardless of whether or not you lose weight. That is the most important thing. Everything else is truly irrelevant.

Loops Wrote:
For instance I know both you and Suzanne and a few others on this forum are having great success simply cutting out all of the carbs, but I also know a few other people on other forums that didn't have any success on zero carb, and gained weight/fat. I don't think she was cheating or doing weird stuff like AS either.

That's because by your criteria, everyone has to be like Suzanne and I to prove that zero-carb "works." I would suggest that you need to alter your criteria about what works. If your friend ate zero-carb consistently for three years and gained 15 pounds, then they won't lose weight on any other plan either. They can stop eating and starve themselves by going on a hunger strike, but they will still be fat at the end of such a plan. There is another reason they gained 15 pounds and I'm positive that there is something else going on in their body that they are not sharing with you. I guarantee there is.

Loops Wrote:
What gives? Do I sound like a broken record? Apologies!

There is no need to apologize. I understand why you have questions and problems with all of this. You don't like fatty things due to your own conditioning and you want to find something that works more with you rather than you working with it. I appreciate that and I wish life were that easy, but unfortunately, it isn't.

I realize that zero-carb turns many things that we hold dear completely on their side and makes the lines blurry. However, I also believe that in order to be successful at something, one has to go and find others who have been successful at a particular venture and emulate them. If I want to be good with money, I need to go find some people who are handling theirs and do likewise. By the same token, if I want to see what a healthy diet looks like, I need to go find healthy people and eat like them.

It does no good to sit amongst those who merely theorize about what should happen. If you listen to them, then we all have overworked kidneys, fatigued adrenals, low calcium, deficiency diseases, bad
teeth and no energy. However, you know that isn't the case.

The Inuit men, international explorers, Native Americans, and fur traders ate a half-pound of fat along with a pound and a third of lean per day and they drank water. These were the ones who engaged in hard work and took long journeys. If I want to be successful on zero-carb, this is my starting point, period. There is nothing else to try.

Will it be hard? Yes. Will it be boring? Yes. Will it make me dislike my food? Probably. Will I be healthier even if I don't lose weight? Why not, they were!

For me, there are no other considerations. We can haggle over how much glucose the body needs or whatever, but at the end of the day, all of this is meaningless. It's all about eating the best diet for health and in my opinion, history, epidemiology and some impressive science suggests that this is it.

Regards,

Charles

Charles, I love to see how huskys rip up their raw meat...

http://www.shirleys-wellness-cafe.com/animals.htm

...and when cows get fed sugar beet (grain, soya, antibiotics...), then this will add to their milk, meat, fat (not that we should be drinking this milk); children, baby's, adolescent and adults can/do show a reaction in some form...but our mind is powerfull with answers to confirm us all is normal.

I am shore, that adding antibiotics to pigs food (to promote growth and efficient use of food) and all the rest of man made agriculture is why our world is turning in to all the ill health and unjust life.

http://www.energybulletin.net/node/34991

Charles, you have a grate character and that is what we love about you - grass or grain fed!

**RE: Zero Carb / Meat and Water - nyteez - 08-14-2008 03:20 PM**

Hi Everybody! I think the magic key is FAT! So many people are fat phobic and just don't get this. I was doing zero carb for 4 months and didn't lose anything until I started eating way more fat than I would ever allow myself, and cut out eggs. I don't know what it is with the fat, you just have to try it and see for yourself. It is like jet fuel! I haven't had this much energy since my 20's.

Isn't it great Charles? Have you noticed a difference in your running since adding fat? I felt like I could run for days this morning.

Measuring makes me crazy. With my ground beef & sausage breakfast I add about 1 T of butter and 1 T of tallow or lard. So, there is about 1/3cup of juices & fat that I eat in a bowl with the meat. Meat is about 1 cup or so. I don't eat anything until about 7pm now. My dinner isn't as fatty because I am afraid I won't sleep LOL!

Even if Carbs mixed with fat would produce the same results as meat & fat, I wouldn't do it. Carbs are just bad and there is scientific proof of that. The body does not need to ingest carbs and the little carbs we do need for certain cells our bodies can manufacture from protein.

I ask a butcher for pig fat and beef fat. You guys must have places around that cut their own meat. They throw most of the fat away, so they just give it to me. I cut it up into stew size chunks and put it in the crock pot for about 2 days. Then pour it into mason jars. It's really easy. If you don't have a crock pot you can do it in the oven. Put the fat chunks in an oven proof pot and set the oven to 250. It takes all day.

Cute dog Charles! I also feed my dogs raw meat, eggs & bones every day. Everybody comments on how white their teeth are.
I'm on my way to finding my abs!

RE: Zero Carb / Meat and Water - **Kristi31** - 08-14-2008 03:35 PM

I personally think that almost everyone, with a very very few exceptions, who is KETOADAPTED can reach a healthy weight. But you have to be willing to go through that period of transition, NOT cheat, be 100% committed. Stick to a simple diet and not try to sneak in this or that. If people gain weight on zero-carb, I blame ketosis not insulin. Once keto-adapted, that weight will melt like butter under the hot desert sun.

If you rely on protein gluconeogenesis, you will also lose weight. I know...been there and was really, really thin...too thin. That's the problem. Unhealthy weight and in general, not feeling your best.

Suzanne IS on a high-protein/moderate fat diet, at least until a few days ago. I remember her saying that she ate up to 300 grams of protein daily and usually 70 grams of fat. Definetly not a high fat/moderate protein diet. I also suspect that Charles may have been running on glucose before with higher protein and that now, with the increased fat, he may be spilling ketones and entering ketosis. One way to find out...check the ketones.

Loops, either consume just enough carbs to not be in ketosis, eating the remaining as mostly fat ans some protein OR be committed to keto-adaptation. If low-carb doesn't work for you, then ketoadaptation is the only healthy way you'll reach a desirable weight. No other way. You choose.

You don't like fatty things due to your own conditioning and you want to find something that works more with you rather than you working with it. I appreciate that and I wish life were that easy, but unfortunately, it isn't.

Hi Charles -

this comes up because awhile back in the thread Suzanne stated she was eating over 300g of protein and something like 70g of fat a day - that is high protein. And you yourself stated originally that we should just eat as much of the meat that we like - if it is not fatty enough, just to eat as much as satisfies to get enough fat. I know recently you've started adding fat, and I'm not here to split hairs about who said what when and whatever - so if I misquoted Suzanne I'm sorry - and obviously high fat is much better.

Also, I have been eating a VERY high fat diet for the past 3 years. I really hate to be misinterpreted as the next person! I have no fear of fat - I have been low-very low carb and eating around 75-80% of my food as fat for the whole of this time. I LOVE fatty foods. I have NO FEAR of them.

And so I'm off to eat chicken with butter.

RE: Zero Carb / Meat and Water - Loops - 08-14-2008 03:49 PM

Yeah Kristi as usual I think you're on the money there.

I think I'm just going to throw away my scales from now on. If things get really out of hand and none of
my clothes fit then I will give up zero carb. If that happens I will report! I doubt it though. Yeah health first and sod the weight loss. If it doesn't happen on zero carb, it probably won't happen for any length of time on any other plan either.

Oh yeah and no excess salt or anything. I'm sure that screws with potassium and magnesium balance.

**RE: Zero Carb / Meat and Water** - Kristi31 - 08-14-2008 04:05 PM

Loops,

It WILL HAPPEN on zero-carb if you are KETOADAPTED. I suspect you have never been keto-adapted. Zero-carb means no artificial stuff, no nothing except meat, animal fats and water. The question is...are you willing to do that for the rest of your life. You decide.

How long does it take most people to keto-adapt? I don't feel run down or flu-like or anything, but I am certainly not energetic yet. I just feel like I could go for a nap all the time 😴

---

**RE: Zero Carb / Meat and Water** - nyteez - 08-14-2008 05:24 PM

It takes anywhere from 2 weeks to 6 weeks. Are you spilling ketones? What is your diet like? How much protein relative to fat? Any carbs?

---

**RE: Zero Carb / Meat and Water** - Kristi31 - 08-14-2008 05:38 PM

Speaking of Keto-adapted. I have been testing w/ keto strips for 6 mos. They were always showing moderate ketones. I quit checking for months, but checked this morning just to see and they were the darkest purple! So, I am throwing ketones like crazy! LOL!

Quote:

Funny you should mention this. I got the results of my lab tests back yesterday. I haven't gone over them with my Dr. yet so I don't understand all of them but I have been taking thyroid hormones since I was 22 years old (since I am 74 that's a long time) however last year I began having a allergic reaction to them, so I simply quit taking them. I hadn't had any for six months about and ask the Dr to do the tests without the thyroid. They came out well within the normal range. I have been low carbing for several years but near zero only lately and I gave up all soy products and started coconut oil. I am very pleased and I expect my Dr to be shocked. My T3 was low last test even with thyroid medication.
That's fantastic rozi! I love hearing how low carb gets people off medications and on their way to better health.

There is zero carb and then there is zero carb. Some people can eat cheese, eggs and a few nuts in zero carb. I cannot and I suspect those who are not losing or even gaining are eating those foods. The true test of Zero carb is mostly fat & meat.

This is my 2nd week of meat & fat only and I am down 6lbs. Proly would have been more if it wasn't for TOM. I gained 2lbs monday, but lost them and am back on track today. I feel thinner LOL! I am betting I am down another 1/2lb tomorrow. Whoo hoo! (gotta fit in that dress 😁)

It took me exactly 5 weeks. Got loads of energy now. But I am still hyperinsulemic.

No idea if I'm spilling Ketones, I'm not using sticks. Diet is.. well for example today was 73/27 Ground Beef with the fat poured over it, with bacon and the grease mixed in too. Steak, fatty cuts of pork, and water are about it besides that. No dairy, no carbs, no vegetables. I'll be doing some chicken with the skin too, mainly thighs.

RE: Zero Carb / Meat and Water - suzanneeya - 08-15-2008 02:43 AM

Quote:
Suzanne IS on a high-protein/moderate fat diet, at least until a few days ago. I remember her saying that she ate up to 300 grams of protein daily and usually 70 grams of fat. Definetly not a high fat/moderate protein diet.

Actually, like Charles, I have made changes to my diet recently. I have started cooking in fatback too, which replaced the bacon fat I used to cook in. My protein probably is still over 300, but my fat has
definitely been increasing. Also, the ratio I gave was not an exact measurement, but something I plugged into fitday to get an idea. My diet is about being healthy. I eat the meat that is on sale that day, so my fat level might vary, as will my protein. I do not like the idea of measuring fat or protein levels, I eat till I am satisfied. It works for me cause I feel great emotionally and physically, but my weight is not ideal either, I find I look too thin a lot of times, but it seems to be the weight my body settles at.

RE: Zero Carb / Meat and Water - cbnebraska - 08-15-2008 03:34 AM

I am really finding it difficult to get the extra fat you all talk about. I certainly don't lack in energy and I need very little sleep (I pop out of bed on 6 hours), but I would like to up the fat percentage of my intake and see if I drop any weight. I eat plenty of protein, but it's fairly lean. I bought some bacon but with my busy schedule I don't even have the time to cook the stuff! My husband does one very large grill session every 2 weeks and we split the meat into 2 very large tupperware containers and freeze one and put one in the fridge. We reheat this meat for meals by popping it in the microwave. Throughout the week we may have 2 dinners where he cooks fresh - usually shrimp or fish. I've gotta get this one figured out. I haven't had time to get to the grocery store to search out some extra meat fat either. ARGH!!

About the sweeteners, I got the feeling that Splenda is out and Equal is back into my coffee. I had quit the Equal because I read somewhere that it's toxic, especially when heated, or some such crap. Someone said it wasn't about blood sugar for artificial sweeteners, but about sweet cravings. I don't seem to have the sweet cravings, so do you think it's okay to use a little sweetener? I've cut it back to less than 1/2 packet in my cup. And, with the coffee, is the problem the caffeine addiction or something else in the coffee? I am going to cut back to half calf for a while and then back it off to no caf, but I just love the taste of coffee!! I'm not sure if I'm addicted to the caffeine or not, it's the taste I enjoy each morning.

Cynthia

Cynthia
I try to shoot for zero usage on the sweeteners, if I dont make it I will go for the stevia or the splenda. Equal is scary. I am drinking my coffee mixed with coconut oil this morning 2nd day in a row, I like it.

Scott

RE: Zero Carb / Meat and Water - suzanneyea - 08-15-2008 05:30 AM

I cannot do splenda at all, I can feel my body react to it almost immediately. I am down to half a
package of equal in my coffee with heavy cream (less than a teaspoon) and coconut oil. I am also making my coffee weaker every week.

**RE: Zero Carb / Meat and Water - lynnopes - 08-15-2008 05:48 AM**

Hello

I have many questions about the zero carb lifestyle so maybe some of you kind folks could help me:

1) Can you do zero carb like the Bear where he eats eggs and cheese and some cream but no veggies? Anyone here doing that?

2) Where is the evidence that we don't need veggies? Studies etc? My dad died of a brain tumour and my mother has cancer also. So I have eaten a LOT of non starchy vegetables for years along with my low carb diet to ward off cancer. What about the phytochemicals that can only be found in veggies?

3) Is zero carb something you have to do for the whole rest of your life if you do it? Does anyone here ever have a higher carb meal for a special occasion such as Christmas? From what I am reading one should either zero carb or eat a high fat, adequate protein diet with carbs around 60 so one is not in ketosis. Am I understanding this correctly? Also does a zero carb diet not heal the body somewhat so that one's pancreas produces less insulin? Therefore after a time could one progress back to low carb?

4) I have PCOS and went off my metformin recently and gained 8lbs in six weeks. I even gained weight on my thighs which was extremely odd since I am an apple and when I gain weight it goes to my belly and breasts. I never had lower body weight even at my heaviest. I am still battling to get rid of 5 of those pounds that snuck up on me. I was eating between 20-30 carbs when I was off my metformin. This was a huge reduction for me as on my metformin I had been eating 60-80. So I am terrified of going off it again and gaining loads of weight. Is there anyone here who zero carb and is coming off their metformin?

5) Any former vegetarians here? A lot of you seem to really enjoy meat. I eat meat because it's healthy and because my body craves it if I don't get it. However I can't honestly say I enjoy meat. Not like I enjoy dairy or veggies.

6) What is the rationale behind zero carb? I thought the body produced little insulin when eating veggies. On an all meat diet one still produces insulin also so is there a big difference in amounts produced on zero carb as opposed to low carb induction? Does the body run on fat or ketones on low carb ketogenic? Does the body run on fat only on zero carb?

Thanks very much for reading this essay!

I agree, Scott. I haven't drank coffee for 11 days now. I miss the taste.....had it everyday since around age 10 and I'm now 52. I, fortunately, did not use sweeteners in mine....only coconut oil, as well. It
wasn't hard to drop it, like I thought it would be. My reason for the change is to give myself the opportunity to go absolute zero carb on meat and water only. After the end of my 100 day challenge, I am going to try it again to see if any and what effect it may have on my system.

If sweeteners don't cause you any problems, Cynthia, then why stop them. Will aspartame cause some form of dementia or other unwanted health problem down the road....I sure don't know.

Charles, I love to see how huskys rip up their raw meat...

Thanks, Nicola. I will check out the link. I know my dog runs out to his food in the morning where he used to just tip over the bowl and stare at us. He would eventually eat, but it was clear he didn't much care for his dog food. Now, he waits a second until I walk away and he devours his meat! Good dog...

Nicola Wrote:
I am shore, that adding antibiotics to pigs food (to promote growth and efficient use of food) and all the rest of man made agriculture is why our world is turning in to all the ill health and unjust life.

I wrote about this in a private message to someone yesterday. You may be right about antibiotics, but I think there is more to it than just that. When Keys and Benedict did their starvation studies on the conscientious objectors, their 1800 calorie high-carb diet had them cutting off body parts and going insane. I tend to think that today's crazy people are more influenced by their diet than they are the antibiotics in meat.

People are more stressed out because their cortisol is unable to work in their bodies due to the high insulin. Chronically high insulin is the issue for us and there is no evidence that the additives in the meat supply raise insulin.

The truth is, everyone doesn't eat that much meat, at least in America. When I go to the store, people always assume we're having a cookout at our house because we buy so much meat. If you look around, you just don't see that much in people's baskets.

Loops Wrote:
Also, I have been eating a VERY high fat diet for the past 3 years. I really hate to be misinterpreted as the next person! I have no fear of fat - I have been low-very low carb and eating around 75-80% of my food as fat for the whole of this time. I LOVE fatty foods. I have NO FEAR of them.

And so I'm off to eat chicken with butter.

Loops

Loops, I'm not here to split hairs either. I don't think I came across clear enough. I don't really care much about gluconeogenesis or ketosis or any of that. To me, they are all irrelevent. I have no axe to grind or weight to lose for that matter. Therefore, being "right" is not necessary for me.

I'm sure you and Kristelle may be right about Suzanne's diet. However, just because a diet appears high in protein, that doesn't mean it is. Stefansson noted many times that a diet appeared to be lean but in reality it wasn't. It may not be as high in fat as another, but that's not really the point. It all comes down to the individual's energy levels. If I ate the same amount of at as some people, I would be nauseous. By the same token, someone eating my idea of high fat would be lethargic. It always goes back to the individual.

The point is that we can eat meat to satiety and drink water and be on the healthiest diet. It's true that if I add more fat I am sated sooner and have more energy. I've always said that. Perhaps I didn't eat as much fat before as I do now, but I've always been very active and I certainly was not doing all that on glucose.

All these theories are just that. The point is that people who eat high fat diets are healthy and if we want to be likewise, that's the thing to do. How exactly it all works is quite irrelevent to me, today.

The best thing for any of US (I include myself in this) to do is get off these computers and go eat some fat and have a terrific weekend! 😊

Regards,

Charles

RE: Zero Carb / Meat and Water - nyteez - 08-15-2008 08:14 AM

Well, I am not down 1/2lb this morning, I am down 1 whole lb! This is so amazing to me!

Quote:
1) Can you do zero carb like the Bear where he eats eggs and cheese and some cream but no veggies? Anyone here doing that?

Yes, lynn you can do zero carb with eggs & cheese. I did it for a while with no results though. Since I have cut out the eggs & cheese and upped my fat intake I have lost 7 lbs in 2 weeks.

Quote:
2) Where is the evidence that we don't need veggies? Studies etc? My dad died of a brain tumour and my mother has cancer also. So I have eaten a LOT of non starchy vegetables for years along with my low carb diet to ward off cancer. What about the phytochemicals that can only be found in veggies?

The studies about what requirements our bodies need is somewhere in this thread or the bears thread. I am sorry I don't have a link to it. There are no special nutrients found in vegetables! That is a myth! The nutrients in vegetables are difficult for our bodies to assimilate. And in reality our bodies LOSE nutrients in trying to access these nutrients in vegetables. All the nutrients our bodies need are in meat and fat.

Quote:

3) Is zero carb something you have to do for the whole rest of your life if you do it? Does anyone here ever have a higher carb meal for a special occasion such as Christmas? From what I am reading one should either zero carb or eat a high fat, adequate protein diet with carbs around 60 so one is not in ketosis. Am I understanding this correctly? Also does a zero carb diet not heal the body somewhat so that one's pancreas produces less insulin? Therefore after a time could one progress back to low carb?

No, you don't have to do it for the rest of your life, but I feel so good I plan to do it for the rest of my life. I ate salads one weekend when we were out of town. I felt awful, gassy & bloated all weekend, not worth it. I would rather go hungry than eat another carb. Zero carb just seems to work better with high fat. High fat and 60 carbs is bad, zero carbs and high fat is good. Don't know about healing. I guess you could go back to low carb, but why, when zero carb makes you feel so great.

Quote:

4) I have PCOS and went off my metformin recently and gained 8lbs in six weeks. I even gained weight on my thighs which was extremely odd since I am an apple and when I gain weight it goes to my belly and breasts. I never had lower body weight even at my heaviest. Is there anyone here who zero carbs and is coming off their metformin?

I am sorry, I don't know anything about this.

Quote:

5) Any former vegetarins here? A lot of you seem to really enjoy meat. I eat meat because it's healthy and because my body craves it if I don't get it. However I can't honestly say I enjoy meat. Not like I enjoy dairy or veggies.

I was a vegetarian for 2 years, but never ate much meat for most of my life. I gained 20 pounds and felt like crap when I was a vegetarian.

Quote:

6) What is the rationale behind zero carb? I thought the body produced little insulin when eating veggies. On an all meat diet one still produces insulin also so is there a big difference in amounts produced on zero carb as opposed to low carb induction? Does the body run on fat or ketones on low carb ketogenic? Does the body run on fat only on zero carb?

The rationale is that is how our bodies are supposed to eat. Our bodies don't need carbs. The few carbs our bodies do need can be manufactured from protein. The body runs on fat all the time. When you eat
carbs, the body has to convert that carb to fat, then store it as fat in order for it to be used. When you eat fat, it just gets burned up or eliminated.

Charles or Kristi can better answer the insulin issue.

---

**RE: Zero Carb / Meat and Water - LindaSue - 08-15-2008 08:31 AM**

lynnhopes, I'm probably not the best person to reply to your questions because I don't eat strict zero carb. I just noticed that no one has replied to your questions yet.

There are some days when I do eat no carbs and some days when I eat a few veggies or things like cream, flax and nut flour. I do find that I feel the best when I don't eat any carbs or foods containing fiber but, on my budget, it's just not practical to go carb-less 100%. I almost never eat more than about 10 carbs per day. When I do eat veggies, I go very easy on them or risk severe constipation that can take several days to go away once I stop eating them. It frustrates me sometimes that my body can't handle even the tiniest bit of fiber without plugging up because I do enjoy veggies once in a while.

I've got about 8 pounds to lose but eating this way doesn't seem to allow me to lose anything much. At least I'm maintaining and not gaining. I eat a fair amount of protein and a LOT of fat every day and I'm still trying to work out the best things to eat to keep from being hungry most of the time. So far I've figured out that a half pound hamburger patty topped with a slice of cheese will keep me full for about 6 hours. I usually have one every morning for breakfast around 8:00 and don't need to eat again until about 2:00 in the afternoon. I love the freedom of not having to think about food during the morning and part of the afternoon. I'm going to try an experiment in the next few days to see if I can get by on two meals like that per day. I figure that if I can go six hours between breakfast and lunch, I should be able to go from 2:00 in the afternoon until 8:00 at night if I eat another half pound hamburger for lunch. If I need it, I will eat an ounce of cheese before bed so that I won't go to sleep hungry. It would be great if I only needed to think about food twice a day instead of every couple hours or so.

For two big cheeseburgers and an ounce of cheese in the evening, my numbers would be about like this:

- 1409 Calories
- 105g Fat
- 106g Protein
- 4g Carbohydrate

By the way, I use the highest fat ground beef that I can buy and I don't drain off the fat when I cook my burgers. I pour any fat from the skillet over the patties. When I heat up my burger in the morning, there is usually a pool of fat on my plate and I swish each bite of meat in the fat to use it all up.

So, basically, while I believe that zero carb is probably about the healthiest way to eat for some people, it may not be the most practical or even necessary for everyone. I lost my weight (50 pounds) eating between 20-30 carbs per day of veggies and other low carb foods so I'm not convinced yet that zero carb is the ONLY way to lose weight and be healthy.

---

**RE: Zero Carb / Meat and Water - lynnhopes - 08-15-2008 08:38 AM**

Thanks Linda and Nyteez!!

I am just gonna go back to Barry Grove's 60 carbs, high fat and strict protein intake. It worked very well for me before so I should give it another go.
lynnhopes Wrote:
1) Can you do zero carb like the Bear where he eats eggs and cheese and some cream but no veggies? Anyone here doing that?

We're kind of unstructured over here. There is no plan per se, but true zero carb is just that, meat and water. Eggs, cheese and creams have carbs despite their labeling and serving size. Eggs are strange in that they reportedly don't have carbs but several of us have reported weight loss as soon as we stopped eating them, so I have my suspicious about dairy in general. Butter is probably just fine, but I have nothing to put it on so I don't eat it.

lynnhopes Wrote:
2) Where is the evidence that we don't need veggies? Studies etc? My dad died of a brain tumour and my mother has cancer also. So I have eaten a LOT of non starchy vegetables for years along with my low carb diet to ward off cancer. What about the phytochemicals that can only be found in veggies?

The better question is where is the evidence that we DO need veggies, studies, etc. Nurses and Nurses II showed absolutely no benefit to increased fruits and vegetables so I persist, where is the evidence we do need them?

People who do not eat veggies do not get brain tumors and cancer. What other study do you need? The need for phytochemicals is overstated. They are necessary when you eat carbohydrates which require these nutrients to process them. When you cut them out, you no longer require these so-called nutrients.

It is true that the refined and easily digestible carbohydrate foods are more to blame for metabolic syndrome than 5% vegetables but there is no evidence that a so-called "balanced diet" is healthy. We do have whole populations that eat a high-fat diet and they are completely healthy. That means that they are consuming what is by definition, a healthy diet.

lynnhopes Wrote:
3) Is zero carb something you have to do for the whole rest of your life if you do it?

By your question, it seems you are implying that zero-carb is a weight-loss diet and I think all of us would strongly object to that description as to how we eat. For many people, their hyperinsulinemia is such that to enjoy optimum health, there is no alternative. For others, it may not be harmful to eat some 5% vegetables, but there is no reason to consume "monkey food" especially if you don't enjoy it.

Cynthia Wrote:
Does anyone here ever have a higher carb meal for a special occasion such as Christmas?

This is part and parcel of the problem. Why is food such an integral part of these "special occasions?" These psychological connections are directly related to diet and the narcotic nature of sugar is directly to blame. When we go to movies, sporting events, birthdays, holidays, promotions, afterwork socials, or just because someone decided to bless the office with a pan of cupcakes, there is always an excuse to eat unhealthy food. Drug users report the same connections to their activities. They need their drugs to "wake up" in the morning.

I am glad to report that I can attend "special occasions" without regard to what food will be served. It is purely irrelevant to me. I can freely enjoy the company, the conversation, the experience of being in the place, and I have possibilities to explore with all the free time. I feel no awkwardness at not eating
unhealthy food as a lemming just following the crowd. I have no problem asking the restaurant for exactly what I want to eat since I'm paying for it. I will exercise that option in about 30 minutes when I will order pork ribs without sauce or seasoning.

Lynn hopes wrote:
From what I am reading one should either zero carb or eat a high fat, adequate protein diet with carbs around 60 so one is not in ketosis. Am I understanding this correctly?

Even Atkins doesn't say that. Atkins says that a person should eat a moderate fat and protein diet (nowadays lean protein) with carbs at a level that allows for weight loss or weight maintenance and this varies for every person. Many people consider what you described to be a "low-carb" diet, although I think that is highly subjective. I certainly could not enjoy 60 grams of carbs and lose weight.

Lynn hopes wrote:
Also does a zero carb diet not heal the body somewhat so that one's pancreas produces less insulin? Therefore after a time could one progress back to low carb?

I don't believe so. I think that once insulin resistance rears its ugly head, it's over. At that point, hyperinsulinemia can only be controlled, not healed in the sense that it can now efficiently remove glucose. I'm not so sure it's "broken" as it is that the adaptation for glucose was weak to begin with so the incorrect diet just overtaxed the adaptation.

Stefansson and Dr. Eades write of decreased sugar tolerance after being on a zero-carb diet for a while since the body stops its production of the enzymes necessary to process carbohydrates. Over a short period of time, the body cranks up that process and it gets better. However, we certainly can not go back to the pies and cakes of our youth without ultimately making a return trip to a forum like this or a book looking to start induction again to lose the pounds gained. This provides ample proof to me that "this dog will never hunt again."

Lynn hopes wrote:
4) So I am terrified of going off [metformin] again and gaining loads of weight. Is there anyone here who zero carbs and is coming off their metformin?

Can't answer this one, but the idea of needing medicine for the rest of my life pales in comparison to the idea of eating zero carbs for the rest of my life. Let's see, real food or medicine? I'll leave that for you to decide.

Lynn hopes wrote:
5) Any former vegetarins here? A lot of you seem to really enjoy meat. I eat meat because it's healthy and because my body craves it if I don't get it. However I can't honestly say I enjoy meat. Not like I enjoy dairy or veggies.

That's a matter of conditioning. People enjoy what they are conditioned to eat. Stefansson made this observation in the 1920s and many have made similar observations. LeMagnen's "the physiology of taste" presented in GCBC, is a must-read for anyone wishing to learn why we prefer what we prefer.

It's very hard to reverse one's conditioning and try new things or develop a "taste" for what they formerly found repulsive. However, one of the main things we learned from Stefansson's expeditions was that people of both sexes, all creeds and nationalities, could learn to develop a taste for something especially when nothing else was available. The food is only "monotonous and boring" if you are not hungry.
For us on zero-carb, we have to accept that there is no other metabolic fuel out there that fills our gas tanks and causes our engines to run nearly as efficient as high-fat protein. We're BMW's that need premium fuel. Regular unleaded is going to make us knock!

Lynnhopes Wrote:
6) What is the rationale behind zero carb? /quote]

Peter Cleave answered this better than I've ever seen. He said:

[quote=Peter Cleave]"Evolution should be our best guide for what constitutes a healthy diet. It takes time for a population or a species to adapt to any new factor in its environment; the longer we've been eating a particular food as a species, and the closer that food is to its natural state, the less harm it is likely to do."

Gary Taubes went further and stated: "The fat content of the diets to which we presumably evolved, however, will always remain questionable. However, there is no such ambiguity on the subject of carbohydrates. The most dramatic alterations in human diets in the past two million years, unequivocally are (1) the transformation from carbohydrate-poor to carbohydrate-rich diets that came with the invention of agriculture -- the addition of grains and easily digestible starches to the diets of hunter-gatherers; (2) the increasing refinement of those carbohydrates over the past few hundred years; and (3) the dramatic increases in fructose consumption that came as the per-capita consumption of sugars increased from less than ten to twenty pounds a year in the mid-eighteenth century to the nearly 150 pounds it is today.

Why would a diet that excludes these foods specifically be expected to do anything other than return us to "biological normality"?

It is not the case that carbohydrates are required in a healthy human diet. Without them, our brain and central nervous system will run on ketone bodies, converted from dietary fat and from the fatty acids released by fatty acids released by adipose tissue; on glycerol, released from triglycerides, and on glucose converted from the protein in the diet. Since a carbohydrate-free diet will have considerable fat and protein, there will be no shortage of fuel for the brain. Indeed, this is likely to be the fuel mixture that our brains seem to run more efficiently on.

The 2002 Institute of Medicine Report acknowledges that the brain will be fine without carbohydrates because it runs perfectly well on ketone bodies, glycerol and protein-derived glucose.

That's all I needed, how about you?

Regards,

Charles

Charles

I had only just joined the old board when it went down so I never got to see your progression to zero carb. Did you find it hard to cope with social occasions and forgo drug like food on special occasions at first?

Were you always a big meat eater? Also you write that you have increased your fat intake lately. How have you done this? Added coconut oil or butter?

Thanks for everything you do!

RE: Zero Carb / Meat and Water - Charles - 08-15-2008 09:26 AM

lynnhopes Wrote:

No, I never had any trouble with this. I've never felt compelled to eat by others. There have been some really sweet older ladies who would give me a hard time for not trying their pie or whatever, but I just stuck to my guns and stayed as polite as possible. I don't make any crusades about it, by saying it's unhealthy or anything like that. I just politely refuse and engage in conversation while others indulge. That always seems to work.

lynnhopes Wrote:
Were you always a big meat eater?

I wish! I ate a lot of meat growing up, probably every day. But when I got married, I married a starch lover and changed my diet to match. I gained 65 pounds in 15 years.

lynnhopes Wrote:

If I cook some bacon in a pan, I will collect the liquid fat in a dish and dip the bacon in the fat while eating it. I do this with whatever I'm eating, whether it's chicken, beef or pork. I get full faster and I have tremendous energy since doing this. Not to mention, I'm at my lowest weight.

lynnhopes Wrote:

RE: Zero Carb / Meat and Water - Gr82bthin - 08-15-2008 09:40 AM

lynnhopes, I came off Metformin while on Atkins about a year ago. I was consuming 15-20 carbs daily. I also came off several other medications for high cholesterol, depression, and diabetes, all under the supervision of my doctor. I had no trouble with weight gain as long as I stayed around 15 carbs a day. I am trying the zero carb now and am doing well and feel better than ever. Good Luck!

Not in Chicago. Chicago is one of the centers of the Optimal Diet started by a Polish doctor in Poland. The immigrants from Poland took the diet with them to Chicago. There is a place in Jefferson Park where lard is king. The Optimal Diet limits the carbs and the protein and the rest is all lard or fat.

Mac
We were in chicago last weekend for the Scorpions concert at the charter one pavillio. What an awesome show they put on and yes they rocked us like a hurricane. Charter one pavillion faces west and as the sun sets the entire skyline of chicago can be seen, it was the best concert venue that i could ever imagine. Soldier field to the left and the sears tower to the right, wow what a visual. about half way through some low clouds rolled in and were lit up by the city lights to produce a pink sky.

Every time we are in chicago we go to Giordano's for the best pizza that there is. Sorry to post this in the zero carbs section but we only go to chiicago about every other year.

Well if you ever want a deep dish Chicago pizza recipe I have one. Giordanos is good but I came to prefer Eduardos's deep dish when I lived in Chicago. Theirs is the one I have the recipe for. Of course you would need a real deep dish pizza pan to make it. I used to make deep dish pizza when I was eating carbs but only once a year. Nancys is good, Uno & Duos pizza is good. Ginos East is good if you like your crust with a bit of corn meal in it.

RE: Zero Carb / Meat and Water - travis t - 08-15-2008 01:26 PM

Mac
i love Chicago and I am thinking of coming back up next August for the Accenture triathlon that they have downtown, I love that race and the atmosphere around it. Since I'm trying to go zero on my carbs I might just wait for Giordanos or maybe Pizzeria Uno as a post race treat. We shall see.

RE: Zero Carb / Meat and Water - feckless - 08-15-2008 02:10 PM

yeah! 😁

lynn, i was going to say don't worry about 'special occasion' eating right now. thinking about it now is just a way of suffering from deprivation before it even gets here and talking yourself out of trying zero carb. i understand where you are coming from because i like to cook and love cooking shows and think of food as an artform and sometimes on occasions when great dishes are made, you can't imagine not tasting these creations.

but things will change for you, your mindset will change. so don't worry about it now. say you go zero carb and you are feeling healthy and happy. and thanksgiving rolls around, well, you might decide on that day you must taste mom's special recipe and all that. so maybe you go for it, or maybe you feel so good by that time that it's not even tempting. either way, you will see how you feel. maybe it won't be a big deal, or maybe you will feel awful or gain weight and it won't have been worth it. then the next time you may make a different decision.

even charles had to 'experience' consequences several times before he got to his place of not ever being tempted. my point is, don't torture yourself over some thought about deprivation in the future. it will work itself out.

nyteez Wrote: Hi Everybody! I think the magic key is FAT! So many people are fat phobic and just don't get this. I was doing zero carb for 4 months and didn't lose anything until I started eating way more fat than I would ever allow myself, and cut out eggs. I don't know what it is with the fat, you just have to try it and see for yourself. It is like jet fuel! I haven't had this much energy since my 20's.
Isn't it great Charles? Have you noticed a difference in your running since adding fat? I felt like I could run for days this morning.

Measuring makes me crazy. With my ground beef & sausage breakfast I add about 1 T of butter and 1 T of tallow or lard. So, there is about 1/3 cup of juices & fat that I eat in a bowl with the meat. Meat is about 1 cup or so. I don't eat anything until about 7 pm now. My dinner isn't as fatty because I am afraid I won't sleep LOL!

Even if Carbs mixed with fat would produce the same results as meat & fat, I wouldn't do it. Carbs are just bad and there is scientific proof of that. The body does not need to ingest carbs and the little carbs we do need for certain cells our bodies can manufacture from protein.

I ask a butcher for pig fat and beef fat. You guys must have places around that cut their own meat. They throw most of the fat away, so they just give it to me. I cut it up into stew size chunks and put it in the crock pot for about 2 days. Then pour it into mason jars. It's really easy. If you don't have a crock pot you can do it in the oven. Put the fat chunks in an oven proof pot and set the oven to 250. It takes all day.

Cute dog Charles! I also feed my dogs raw meat, eggs & bones every day. Everybody comments on how white their teeth are.

I'm on my way to finding my abs!

You are so right about the fat!!! Congrats on your success. I hope to find my abs soon, too!

RE: Zero Carb / Meat and Water - waywardsister - 08-15-2008 03:48 PM

So far so good, I think. Sleeping well, and feeling refreshed on less sleep. Energy and mood is good. Skin is good. A bit up in weight today, but TOM is arriving in a day or so.

I notice that I don't miss veggies at all. What I do keep eating are condiments! I will mix stuff like ketchup, hamburger relish etc with mayo, but I wonder if that will keep me from adapting? I'm not tracking my intake so no clue where my carbs are from this stuff, but I suspect they may be higher than I think. I've never checked my blood sugar, etc, so no clue if I have any insulin issues.

Today for some reason (could be TOM), I feel like something is missing. I think it's fat. I want something creamy and fatty. Not sweet, necessarily, but creamy and fatty! Not a big craving or anything, just the sense that something is...well, missing. Man, I really want to make pemmican.

But...I have NO desire to eat chips. They're my weakness around TOM, and I couldn't care less about them.

RE: Zero Carb / Meat and Water - poo123 - 08-15-2008 05:22 PM

lynhopes, I also have PCOS. I was on metformin 8 years ago before I did IVF for my twins. When I got off the drug I gained 55 lbs in 4 months. I tried several times with IF, then finally had my twins. Then I did Atkins lost weight, put it on and the pattern went on and on. I was having really bad hot flashes and mood swings, then I finally decided to do zero carbs, I started on June 28th. I no longer have hot flashes, some moods (don't all women) and all other pcos symptoms are GONE... I will never eat another carb to
feel as bad as I did before. This way of life is what I plan to stick with, Thanksgiving, Christmas, Birthdays- Its does not matter, I feel wonderful and don't want it to change. Maybe you should give it a shot for a month and see if you feel better... alison

RE: Zero Carb / Meat and Water - Living_healthy - 08-15-2008 06:36 PM

I hit perimenopause in January. For a few months there, I was throwing the covers off and on all night....miserable. Never had any night sweats....a blessing. I started taking Black Cohosh, but dropped it like a hot potato, when I found out about the bad effects of soy. It didn't help much anyway. Ever since I went vlcd and now complete zc, I never experience hot flashes. I feel great!

Charles,
Love your quote "We're BMWs that need premium fuel. Regular unleaded is going to make us knock."

It says it all! Thanks, Trita

RE: Zero Carb / Meat and Water - cbnebraska - 08-16-2008 05:51 AM

I want to go back a bit to this piece, which I have been pondering a bit.

Charles Wrote:
It is not the case that carbohydrates are required in a healthy human diet. Without them, our brain and central nervous system will run on ketone bodies, converted from dietary fat and from the fatty acids released by fatty acids released by adipose tissue; on glycerol, released from triglycerides, and on glucose converted from the protein in the diet. Since a carbohyrate-free diet will have considerable fat and protein, there will be no shortage of fuel for the brain. Indeed, this is likely to be the fuel mixture that our brains seem to run more effeciently on.

The 2002 Institute of Medicine Report acknowleges that the brain will be fine without carbohydrates because it runs perfectly well on ketone bodies, glycerol and protein-derived glucose.

Is there any information concerning the longer term effects of this conversion to ketone bodies on the body? It seems like the body must work harder to use ketones for fuel rather than carbs. I would think it takes more energy to do so, burning more calories in the process, but are we putting excessive "wear and tear" on anything by relying only on lipolysis and "protein derived glucose"? (Please tell me this is the right term for converting fat to energy? I get all the terms used confused. I need to create a glossary page for myself until it's flowing more readily!!)

And, please clarify one thing for me. When/how does the body switch between burning dietary fat and stored fat? I've read that fasting and working past hunger for 48 hours will jump start the burning of stored fat versus dietary fat. I know this can't be true, but if someone could please clarify for me, I'd appreciate it. I'm sure it's some seamless process, but I'd like reminded on it.

Thanks again to all you experts for answering the same questions repeatedly. Someday maybe I'll get it all lined up straight in my head and the questions will cease. The nature of a forum like this, where there are various topics going on and jumping around, creates a little discontinuity in and of itself. As I read things, questions and reflections pop into my head and before I can really ponder or read back through to
find my answers, that topic is done and a new one is going strong!! It's actually overwhelming. I'm sure it's an age thing or a linear thinking thing as well, but my mind is constantly running with all the information and reflection. I tend to be that way about anything I'm interested in, at least when it's a new interest, so please have patience!

Have a wonderful day!

Quote cbnebraska:
When/how does the body switch between burning dietary fat and stored fat?

Cynthia, I believe Charles said we use the fat that we ingest during our waking hours and from the body while we sleep, (during our fasting time).

RE: Zero Carb / Meat and Water - MirMir - 08-16-2008 07:15 AM

I started reading this thread two days ago and am only on page 77.

What great info here. I'm excited about working on lowering my carbs way down from approximately 50-65 a day to maybe nothing.

Last night I ate 1/2 of a ribeye (just that because I couldn't eat the rest of it, too full) and am having the rest right now for breakfast. No other carbs, and no eggs this morning. I do love them but sometimes after I have them I just want to take a nap.

Of course I did have red wine with dinner so I'm thinking I'll have to stop that as well.

Charles thanks for all the great info you and the other seasoned posters give. It's great.

RE: Zero Carb / Meat and Water - daveo - 08-16-2008 08:12 AM

I'm not sure that the occasional red wine needs to be given up. If I remember correctly, The Bear has been zero carbing for 49 years, and he said he only gave up red wine in 1990 when he started lifting weights. So I assume from what he said, that you can have a healthy 0 carb lifestyle and still enjoy some
occasional wine.

Me, I've given it up for now, only because when I've been drinking, I tend to make poor food choices 😞

We never burn dietary fat. All dietary fat is put into storage then used later. You eat fat, it gets digested, put into storage, then used as needed. If you are insulin resistant, the "used as needed part" is broken because the insulin resistant storage cells won't give up their fuel to be used by the muscles. That's my simplistic understanding of it.

---

RE: Zero Carb / Meat and Water - Dwayne - 08-16-2008 08:33 AM

I have a question about insulin responses from smell. I have to endure some heavy carb meal smells from my wife and son. I notice I get hungry for no reason whenever I smell their meals. Is that normal? Is it from smelling the foods and my body getting ready to ingest them. Does anyone else have this problem? Would a nose clip help? Once I become keto adapted will this go away?

---

RE: Zero Carb / Meat and Water - Kristi31 - 08-16-2008 08:44 AM

Here is what the Bear said in regards to alcohol:
"Alcohol is a social drug. It is a simple, easy to make and cheap, it is a body and brain damaging toxin-the metabolic waste of the fermenting organism. It is actually a carbohydrate, assigned a value of 7 cal.gm, nearly twice that of glucose, and is fattening. Furthermore, detoxifying it seriously interferes with the liver's normal processes. I gave it away after noting its effect on my weight training, which lasted for three days after drinking a single glass. I never drank much, maybe a single 4-6 oz glass with dinner, twice or three times a week. On testing- by reducing the amount taken to <2 oz, I still found the effect, so I no longer drink any alcohol."

---

RE: Zero Carb / Meat and Water - Kristi31 - 08-16-2008 08:47 AM

I think the desire to eat carbs upon smelling will always remain to a certain extent. Unless you just ate. Simply accept it, be strong and keep eating meat and fat. 😞

---

RE: Zero Carb / Meat and Water - Kristi31 - 08-16-2008 09:01 AM

The brain actually runs better on ketones and once keto-adapted, energy is through the roof; radical damage is reduced, hunger normalizes, excess body fat melts away and all sort of other wonderful health benefits are achieved. Carbs and insulin increase "wear and tear", not ketones or the fact that protein and fat are converted to glucose (called gluconeogenesis). I am personally convinced our bodies have
evolved to depend on ketones, fatty acids and very little glucose.

The body does not differentiate between fat that comes from the diet or from inside the body. When the body burns its own fat for energy and needs no more energy than that, you will not want to eat fat. If overweight, you will use up the excess fat at first for energy, eventually depending fully on dietary fat because the body will no longer want to sacrifice anymore fat.

Dietary fat will not get stored, only carbs will lead to fat storage. On a zero-carb diet, you cannot be overweight or gain weight, no matter how many calories you eat. The excess eaten will simply be excreted, burnt off. That's all. If you eat when hungry, then there will be no excess.

**RE: Zero Carb / Meat and Water - lynnhope - 08-16-2008 09:28 AM**

Charles Wrote:
The better question is where is the evidence that we DO need veggies, studies, etc. Nurses and Nurses II showed absolutely no benefit to increased fruits and vegetables so I persist, where is the evidence we do need them?

People who do not eat veggies do not get brain tumors and cancer. What other study do you need? The need for phytochemicals is overstated. They are necessary when you eat carbohydrates which require these nutrients to process them. When you cut them out, you no longer require these so-called nutrients.

It is true that the refined and easily digestible carbohydrate foods are more to blame for metabolic syndrome than 5% vegetables. We do have whole populations that eat a high-fat diet and they are completely healthy. For others, it may not be harmful to eat some 5% vegetables, but there is no reason to consume "monkey food" especially if you don't enjoy it.

Which people? Which tribes do not eat veggies? I do enjoy veggies but if it neccessary to give them up for my health then I might just have to.

Charles Wrote:
I don't believe so. I think that once insulin resistance rears its ugly head, it's over. At that point, hyperinsulinemia can only be controlled, not healed in the sense that it can now efficiently remove glucose. I'm not so sure it's "broken" as it is that the adaptation for glucose was weak to begin with so the incorrect diet just overtaxed the adaptation.

Over a short period of time, the body cranks up that process and it gets better. However, we certainly can not go back to the pies and cakes of our youth.

I wouldn't be looking to go back to that. However I am wondering about going back to low carb after a time of zero carb. Is this possible?

RE: Zero Carb / Meat and Water - Kristi31 - 08-16-2008 09:35 AM

Personally, I think it's best to stick with zero-carb. Going back to low-carb will most probably make you feel yucky and want to go back to ZC anyways.

We don't have a digestive system suited to veggies and they have to be cooked to be better digested so that should tell you something. We definitly don't have a cecum or four stomachs, nor the teeth of ruminants and when we chew our foods, we don't go from right to left and left to right...we go up and down. Plants contain toxins to defend themselves from predators as well as antinutrients. Our bodies have not evolved to deal with those and besides the plants today aren't what they were in the wild...far from! Plants in the wild, eaten raw or even cooked taste bitter...there is a reason for that. Kids hate veggies...there is a reason for that. We usually like plants with "dressing". In the wild, there is no such thing. Think about it and make your own conclusions.

RE: Zero Carb / Meat and Water - lynnhopas - 08-16-2008 09:38 AM

Why are we omnivores instead of carnivores if we are not meant to eat vegetables?

I am also wondering what do you mean when you say we should either be fat adapted or just outside ketosis? What level of carbs is just outside ketosis?

Have you been a zero carber long?

RE: Zero Carb / Meat and Water - Charles - 08-16-2008 10:03 AM

Cynthia, someone has probably already tackled this since I'm catching up, but I still like to comment because as you said, some people just don't want to dig through this enormous thread to find the information they are looking for.

You're assuming that carbohydrates are easy on the body and that weight is lost by "excessive burning of calories." This simply not the case. Our bodys always burn fatty acids. They do not burn ketones for fuel
Cynthia Wrote:
And, please clarify one thing for me. When/how does the body switch between burning dietary fat and stored fat? I've read that fasting and working past hunger for 48 hours will jump start the burning of stored fat versus dietary fat. I know this can't be true, but if someone could please clarify for me, I'd appreciate it.

There is no "switch" because the body does not know or care which one gets burned first. Actually, the way it works is that when food gets broken down in the stomach, it goes immediately to your fat tissue and there it stays until it is added to the long term fuel supply which is in your circulation. Scientists refer to it as the "stream of nutrients" that goes throughout the body. Once the fatty acids from the fat tissue are added to the circulation, the body has no way to know the origin. The fat tissue actually plays a very active role in our body fuel supply and it serves as our primary fuel depot. The gut is the short-term fuel supply.

The fatty acids just get mixed in with all other fatty acids. That's why this concept of the daily calorie need or the basal metabolic rate are such foolish notions. They were posited in the late 1800s before people actually discovered how our bodies actually work. Nobel Prize winner Hans Krebs and Sir Phillip Randle let us know what really happens.

Regards,
Charles

Cynthia, I believe Charles said we use the fat that we ingest during our waking hours and from the body while we sleep, (during our fasting time).

That's correct!

MirMir Wrote:
I started reading this thread two days ago and am only on page 77.

What great info here. I'm excited about working on lowering my carbs way down from approximately 50-65 a day to maybe nothing.

Welcome to our forum and thanks for the kind words!

Regards,
Charles
We never burn dietary fat. All dietary fat is put into storage then used later. You eat fat, it gets digested, put into storage, then used as needed. If you are insulin resistant, the "used as needed part" is broken because the insulin resistant storage cells won't give up their fuel to be used by the muscles. That's my simplistic understanding of it.

Very close, Deanna. The insulin resistance part only comes in with regard to carbohydrates. Carbs are broken down to glucose and insulin has to take that glucose and move it to your muscles to get burned.

It does this by clearing the bloodstream of all nutrients to give the muscles unrestricted access to the glucose. Once the muscles process the glucose, fatty acids return from fat storage and then they supply the energy we use. If you understand this then you understand that fatty acids predominate and they supply the majority of our fuel even on a high carb diet!

The problem comes when the muscle cells become insulin resistant and they will not accept glucose from insulin. Therefore, the pancreas increases production of insulin to get the glucose out of the circulation and balance blood sugar. The high insulin is what causes problems to many of our body's systems and causes it to break down.

Fatty acid mobilization is what usually happens, not the exception. Carbohydrates and alcohol are the exceptions. Too many people just don't seem to understand this. When you go to zero-carb, you are not just "going to fat burning" you are merely increasing the time that fat burning happens by taking away the "glucose sideshow" so to speak.

If you understand that, then you realize that insulin resistance does not have to be fixed (and I don't believe it does get fixed) on a zero-carb diet. Those cells don't have to worry about receiving glucose from insulin because we don't supply it.

Insulin resistance only applies to some cells, not all of them. Everyone has mostly functioning cells that accept glucose but there are enough of them that will not and that's why lowering your glucose intake makes you more healthy.

Carbohydrates are still evolutionary in the sense that our body still views them as foreign. We convert them to fat and attempt to handle them as fat. Because this is so inefficient for most of us, we experience many problems.

This is why we're sure that our bodies do not need carbohydrates in any form or fashion. There is far less work for our bodies to do without having to deal with this "phantom menace!"

Regards,

Charles

lynnhopes Wrote:
[quote=Charles]The better question is where is the evidence that Which people? Which tribes do not eat veggies? I do enjoy veggies but if it neccessary to give them up for my health then I might just have to.
The Native American of the Great Plain did not, the Inuit, the Samburu, the Masai, the Chewya of Kenya, Muhima of Uganda, Watsui of Ruwanda, and the Neurs of the Western Nile regions. There were many other groups who ate small amounts of vegetables but Dr. Price noted in his travels that:

Quote: 
all healthy African groups had good sources of animal fat, and that the healthiest groups consumed less, not more, of plant foods

Lynnhopes Wrote:
I wouldn't be looking to go back to that. However I am wondering about going back to low carb after a time of zero carb. Is this possible?

What do you mean by "possible"? Anything is possible it's just a matter of what you want to do and what you're body will put up with. These are questions that will only be answered by you once you embark on the journey. Stefansson ate low carb after zero-carb but constantly seemed to remark how much better he felt on meat-only. His wife even tried to force the issue a few times from what I understand.

If you're interested, read his book and make your own conclusions based on what you read. None of the sources I rely on (even Taubes) recommend a zero-carb diet. However, he agrees that all his research seems to point to the conclusion. If you honestly read the entire book, when you turn the last page on 449, you go away thinking, why not zero-carb? To me, it runs like a shiny thread throughout so many studies and accounts that you come away with that as a conclusion although it is not stated.

It's just like reading about Syndrome X. The originator of the term does not believe sugar causes Syndrome X but when you couple his work with that of diabetes research and cholesterol and heart disease work, you see that they are intimately related and the same thing causes the whole litany of disease, refined and easily digestible carbohydrates.

Charles

RE: Zero Carb / Meat and Water - Charles - 08-16-2008 10:37 AM

lynnhopes Wrote:
Why are we omnivores instead of carnivores if we are not meant to eat vegetables?

Because once we started eating vegetables our health deteriorated. Many anthropologists believe that agriculture was the worse mistake mankind has ever made. Everyone who eats in this "omnivore style" has bad health as a result. Perhaps, if they continued solely on "monkey food" man might be okay, but vegetables seem to function as a gateway drug to more and more refined carbohydrates.

Lynnhopes Wrote:
I am also wondering what do you mean when you say we should either be fat adapted or just outside ketosis? What level of carbs is just outside ketosis?

That varies by the person. Some enter ketosis at 60 grams and some at 20 or lower. Many people seem
to spend time right at their threshold without enduring the transition process and getting ketoadapted where our tissues and cells that use ketones, use them exclusively instead of using glucose.

By the way, for those who were interested, I did check for ketone production this morning and it was negative. My strips are good because my wife's test was purple (she also has the breath). I weigh 154.2 (down .2), have great energy and I eat a diet very high in fat. I dunk each piece of meat in fat before eating it. After running tomorrow, I'll likely be 152 but it probably won't hold.

However, I will say that yesterday, I had unseasoned ribs for lunch and I did not have a dish of fat on the side. This caused me to eat more than I normally would and was sapped for energy in the afternoon until dinner. The last two meals have been with my beloved dish and I feel wonderful.

Regards,
Charles

RE: Zero Carb / Meat and Water - poo123 - 08-16-2008 10:45 AM
lynnhopes, when I stopped metformin I was just trying low calorie, low fat and that sure didn't work. I only started doing atkins after I had my twins. When I did do atkins I followed the book to the letter. My symptoms were at bay after I had my kids for about a year. Then after that the symptoms came back full force and then I had a partial hysto- so now I really had bad symptoms and the atkins didn't help so then when I went to zero carb the symptoms are gone. Like I said I will not go back... hope this helps....alison

RE: Zero Carb / Meat and Water - Kristi31 - 08-16-2008 12:36 PM
Contrary to what is noted in Stefansson's book, I don't think humans would thrive on "monkey food" (veggies, fruits, roots) exclusively. We just don't have the equipment (teeth, digestive) to do well on such a diet and get all the protein and energy rich food that we need (especially our brains).
Interestingly, animal fat (vs vegetable) appears to be better for humans and a few of us are noticing this.

We are omnivores, in that we can, should the need arise, survive (not THRIVE) on "monkey food" but to live long-term that way will bring about complications and shorten our lifespan. Omnivory allowed us to survive in times of shortages. Nothing more. But we did better on meat, our "real" food.

RE: Zero Carb / Meat and Water - Kristi31 - 08-16-2008 12:37 PM

I don't think muscles ever burn glucose for energy BUT glucose does get converted to glycogen which then increases glycogen reserves in the muscle, making the muscle look bigger than it really does (glycogen=water retention).

I also think fat freely circulates in the body and does not get stored ever. Should bodyfat be too low, I think more glucose is produced by the body and then stored as fat.

RE: Zero Carb / Meat and Water - deedum - 08-16-2008 12:45 PM

So, its NOT our storage cells that become insulin resistant but some of our muscle cells. It would be good if our fat cells were insulin resistant then they wouldn't take the fatty acids that insulin was trying to give them, right? I need to study a flow chart that shows these processes. I know I've seen one somewhere...

Charles, you know Dr. B. Groves (you mentioned him in one message), well that about natural (raw) meat and fat is more important than you seam to believe (at this point of yours and others meat and fat diet):

http://www.second-opinions.co.uk/temperature-of-oils.html

Weston A. Price:
https://www.westonaprice.org/knowyourfats/skinny.html

The Focus is on Nutrition:
http://www.texasgrassfedbeef.com/focusing_on_nutrition.htm

I believe that health is not just any meat and fat - just like the oil you put in a motor; bad oil = the motor will run but how and how long? Heat will also create toxic waste and inhibit digestion.

Nicola

RE: Zero Carb / Meat and Water - jeepifer - 08-16-2008 01:46 PM
I wish my fat was insulin resistant. But noooo, which is how I got fat in the first place. That, and feeding my body too much junk to burn out those insulin receptors. *sigh*

Skinnier people's bodies simply are more efficient and don't store the fatty acids. But they still might be burning out -- as Charles said, only the lucky ones get fat. Then we know there's a problem!

**RE: Zero Carb / Meat and Water** - caroline - 08-16-2008 02:06 PM

Nicola,

Is your point that meat should be eaten raw? That the fats should be eaten raw? I read all the passages you mentioned, but I'm interested in understanding what you were talking about...

**RE: Zero Carb / Meat and Water** - caroline - 08-16-2008 02:18 PM

Nicola,

According to Weston Price's info, coconut oil is 92% saturated. So why would one (other than for taste) eat meat fat instead of coconut oil. Isn't the high saturation what we are looking for? If all of you who are eating meat fat, tallow, etc. can get something fattier, such as coconut oil, wouldn't that be even better for health, energy, longevity?

**RE: Zero Carb / Meat and Water** - FormerDonutJunkie - 08-16-2008 03:33 PM

caroline Wrote:

Now there's an interesting angle on saturated fat consumption! According to Dr. Bruce Fife, coconut oil has less calories per gram than other saturated fats, 6.8 vs 9. In addition, he says the MCT's of coconut oil are metabolized differently than other saturated fats, being transformed immediately by the liver into energy to be used and not stored. Just wondering and curious about the real differences.

**RE: Zero Carb / Meat and Water** - caroline - 08-16-2008 04:39 PM

Hey FormerDonutJunkie (love the name)--your information about the liver transforming it to energy makes me think even further that this is a superior fat. I was surprised at the difference in percent of saturation---if you want to see it, look on the site Nicola posted.

Also, I wonder if the heating of these fats (which she sort of mentioned but didn't clarify and I didn't see anything in the Weston Price info) makes them not so good for you. The advantage to the coconut oil (if you get yours cold pressed) is that it has not been heated. Seems that this would be superior to fat that could change in possibly non-optimal ways when heated.
Is this the same for meat? Is meat better raw? (I am not talking about preference here--I mean, that's why people are doing zero carb, right? Because they believe it is most healthy--so perhaps raw meat is more healthy b/c the enzymes remain intact. I eat it raw every day and haven't had any problem. I cook it as well, but for my quick meals, I just eat it raw.

I think all of these thoughts are interesting since we are looking for optimum health.

I do believe it is healthier because of the enzymes. I've been reading about raw paleo for some time.

I actually prefer my beef raw. I do sear the outside of the steak, but it is raw inside. I know it is supposed to be dangerous, but I even eat ground beef raw - sometimes I brown the outside of the pattie, but again the inside is still oozing blood. 😏 Mostly I just eat hunks of it raw. I get it freshly ground at a farm store (usually have to wait for it to be ground while I am there). I only just started back eating beef after 16 years of only eating seafood/eggs....but back when I did eat beef, I always liked to nibble on raw ground beef if I was making a recipe with it (and that was grocery store beef - I wouldn't do that today though!). Yep, like mine still mooing. 😃

RE: Zero Carb / Meat and Water - caroline - 08-16-2008 05:37 PM

Twilight--When I say I eat it raw, I mean RAW. If I do cook it, it is only to brown outside, rest is totally raw. I have mine ground fresh also. If you are used to tasting it, you can taste in two seconds if the meat is funky. I eat my ground beef, just taking it out of the paper and put it in my mouth. Presto.

I guess my thought is that if people are looking for OPTIMUM health, why destroy enzymes by cooking. There are lots of scare tactics about raw, but I have found info that says the problem is not the little guys in the meat, but our overwrought systems. That the "bugs" can, in fact, be healthful. Hey, if people don't think eating all meat all the time is odd, what's so odd about raw.

What's your take on the coconut oil, Twilight?
Some interesting thoughts on coconut oil: http://raypeat.com/articles/articles/coconut-oil.shtml

On raw meat: I agree, it's almost certainly better for us, but I also know, me and raw, aren't going to happen 😐

RE: Zero Carb / Meat and Water - caroline - 08-16-2008 06:23 PM

Again, if coconut oil is more saturated than the fats in tallow, wouldn't that be the optimal fat?

RE: Zero Carb / Meat and Water - twilight - 08-16-2008 06:26 PM

caroline Wrote:

What's your take on the coconut oil, Twilight?

That's what I do also. 😊Mmmmm

I've got Nutiva coconut oil and I like it right out of the container (solid). My ground beef isn't very fatty, so I either have some coconut oil or get some beef fat out of the freezer and cut up some chunks.

RE: Zero Carb / Meat and Water - FormerDonutJunkie - 08-16-2008 07:03 PM

Daryl....Ray Peat also makes a good case about how vegetables came to be staples in the diet world. He states they, like other foods found in many cultures, were 'famine foods' and eventually gained widespread acceptance as healthy and necessary. He states a very interesting case entitled, "Vegetables -- Who Defines Food?" In the end he says "Animal proteins, and fruits, because they contain the lowest levels of toxins, should form the basis of the diet." He further states that many fruits are not even that safe. Interesting read!

RE: Zero Carb / Meat and Water - Daryl - 08-16-2008 08:13 PM

caroline Wrote:

Yes, but it does not happen like this. We all have fat stores, or what are called "adipose tissue cites." We need them for storage. We are hyperphagic creatures in that we store a lot of the fat we use during the day and we live off of this at night. We don't live off the meal we just ate. The primary energy depot is our adipose tissue. Fat does, however, freely circulate but it gets slowed down by about .001 percent when it enters and exit adipose tissue cites due to triglycerides.

This was discovered in the 1960s when they used the "fat-tagging" system to follow fatty acids throughout the body. Moreover, the adipose tissue sites have blood vessels and nerves running throughout which means it is connected to the central nervous system. The fat tissue is an integral part of the long-term fuel supply. We can't exist without it.

I know I've seen one somewhere...

Yes and no. It would not be good if our fat tissue would not accept fatty acids because that's our long term fuel supply. The only reason fatty acids get trapped in fat tissue is because of the size of triglycerides, which are one glucose molecule attached to three fatty acid molecules. They have to be assembled, disassembled and re-assembled (esterified) as they pass through the fat tissue in the stream. This process slows down the flow of fatty acids and causes them to back up in fat tissue. This is how
you get fat.

The key is to slow triglyceride production by eliminating glucose from the diet. With no glucose, our bodies can't make excessive triglycerides.

On the other hand, our body does need to store some fat for its needs. Therefore, it can synthesize glucose in order to make the minimal amount of triglycerides necessary to store a little fat. This is normal and healthy. The bad part is too many triglycerides.

Our fat tissue becomes too sensitive to insulin in that it stores fatty acids at an abnormal rate. This means that even the slightest amount of insulin will stimulate storage whereas that amount of insulin might not have prompted fat storage in the past. This is the reason for the stall, uncontrolled insulin and too much sensitivity in fat tissue. It seems the longer one has been obese, the more sensitive the fat tissue is to insulin and therefore more prone to storage. Don't get sensitivity mixed up with resistance. These are two very different concepts. Muscle cells are resistant, fat cells are sensitive. Increasing sensitivity with drugs (such as metformin) improves symptoms but it does so by furthering the fattening process.

If you notice, on a low-carb diet, triglycerides are the first to fall and high triglycerides along with low HDL are the only reliable markers for heart disease. Everything else, ldl, stress, etc, is mere speculation.

Nicola Wrote:
Charles, you know Dr. B. Groves (you mentioned him in one message), well that about natural (raw) meat and fat is more important than you seem to believe (at this point of yours and others meat and fat diet):

They can make all the claims they want. No one argues that grass-fed beef is not more nutritious then grain-finished beef. However, you cannot show that grain-finished beef is not nutritious. Those sources do not stand for that proposition.

I am healthy today by every objective standard. I do not believe that my health will one day suffer because I don't eat grass-fed beef nor raw food.

You are more than entitled to your opinion as is anyone else who believes this way. Most cultures ate cooked food and were very healthy as a result. The Inuit rarely ate anything raw so this argument does not hold up. Some cultures didn't even eat beef at all yet still had optimum health. There are many ways to get it done but a food analysis doesn't tell the whole story.

The articles from the Price website are dealing with animals and animal studies. The cats didn't fare so well on cooked food. I am not an animal and I do well with cooked food. I do give my dog raw ground beef and he's doing well with that.

Having said all that, I do believe that you should not over cook your food. I tend to go from medium to medium-well and Stefansson and Anderson did they same thing. Stefansson liked his medium-well and Anderson liked his medium.
It should also be noted that fresh meat, both cooked and raw, cured scurvy which is a deficiency disease. Obviously, there must be something in meat that contains the nutrients needed and it does not seem to matter whether the meat is cooked or raw. Raw may have more, but cooked clearly has enough.

poo123 Wrote:
Well I am down 2 lbs this week. I really am happy. things are good....alison

Congratulations, Alison! I figured that change to the coconut drink caused problems for you since I've been following your progress. Keep it clean and you'll be fine. Don't be too quick to jump on these prescriptions that everyone has.

Every culture did not eat coconuts. Those that did, such as the Tocalauans, were very healthy with it. They ate coconuts and fish and did wonderfully. Others never ate fish at all and also had great health.

I agree there are some goups who do well with raw meat, but it's difficult to say that you would fare better than those who eat theirs cooked. It's not automatic that one nutrient is "better" than another. There is simply no evidence that so-called "more nutritious" food is better in the long run because as I've posted before, one cannot merely analyze the foods to determine what the body does with that food.

The Inuit did not consume enough calcium, yet they did not have bone deterioration or bad teeth -- nor any deficiencies for that matter!

Even though some did not eat fish and coconuts, they were healthy with good teeth. Others ate meat and bones and were also very healthy. Find a combination you like, that your body does well with, eat it, and live.

Regards,

Charles

RE: Zero Carb / Meat and Water - daveo - 08-17-2008 08:30 AM

Couple observations...

1. I was feeling pretty keto-adapted yesterday. I wanted to see how I would handle and occasional glass of wine, so I had one before dinner last night. Not good. I slept about 9 hours last night and work up hungry this morning, which is rare for me.

2. I went hiking this morning for the 1st time in a few years. The trail has a fairly steep switchback at the beginning of it, and I am at the heaviest I have ever been when I have gone hiking, so I was dreading that 1st part. Turns out, I didn't get winded at all and it was pretty easy! I thought that was pretty interesting. Looking forward to doing some longer hikes soon!
RE: Zero Carb / Meat and Water - Dwayne - 08-17-2008 10:18 AM

Glad to report that eliminating the cheese and the diet drinks has started me back up losing. Back to my low after I first started. Feeling really good. I had to go through some nice induction flu again. I am between 5 and 10 carbs most day and if I stall it will go lower. So far it is working great. =) Adding fat has been challenging, but it is moving along.

RE: Zero Carb / Meat and Water - suzanneyea - 08-17-2008 11:05 AM

I eat my meat raw in the middle, but I have always preferred it that way, even as a child. Just a personal preference on taste.

Suz, thank goodness for you that you figured out how to optimize your health without ever having to gain weight. Too many times my skinny friends seem to fall back on "if it ain't broke, don't fix it". The problem is, they don't have any idea that they are breaking some things down, they just can't see them. They don't connect their allergies, sleeping problems, low energy, early osteoporosis, frequent colds, etc... to carbs in the diet. Most people can't - and who's to blame them - not everyone can think outside the box. They just don't understand the science or see the connection. I fear what ailments they'll add to that list as we age because we are only 30-40ish right now - it's only downhill from here. The one thing I fear is that my husband and I, who eat very low carb and high fat, will be the ones to end up with some
disease or disorder that is traditionally credited to saturated fat. Then, all the people I explained to and defended to will be able to say "I told you so... see what you get." In my heart I know that people take leaps of faith everyday, in the areas they so choose. However, I think of my choice to eat outside the normally excepted parameters as an educated and enlightened leap, but still a leap. Come what may, I guess. My goal is to live a quality life in good health, doing what I so choose, until I die. What else is there? We all have a 100% death expectancy!

Is your point that meat should be eaten raw? That the fats should be eaten raw? I read all the passages you mentioned, but I'm interested in understanding what you were talking about...

I know Dr. Groves very well; he helped me over a year with answers. I have got to know Lex well too; he explained in great detail how and why he is eating raw paleo (private mails). Geoff on the rawpaleo forum has a lot of information about raw vs. cooked.

I started out with cooked meat and fat ("Schaubkost; Die kohlenhydrat- und säurearme Ernährung", Dr. Wolfgang Lutz - personal Kontakt, Optimal Diet...), but cooked meat did not digest well and cooked fat mad me feel off!!!

As you can read; natural meat and fat would be ideal and yes, raw would be naturaly healthy.

I don't say "should" - in the words of "good/bad or black/white"; humans like to think that way and that is not good.

Nicola

RE: Zero Carb / Meat and Water - Ell.eee - 08-17-2008 04:50 PM

Hi everyone. Two weeks of meat and water absolutely no cheats and I'm now up 7 lbs - 3 since zero carb. OK I was underweight but I can't keep gaining a pound every 3 days. I know I have early diabetes and hyperinsulism/insulin resistance and I'm menopausal, but surely I should see some results. My energy is usually good and other than after meals I'm not hungry, but I'm tired of shaking, sweating, and feeling faint after eating. Any ideas anyone? Maybe zero/vlc is just not going to be the answer for me or maybe I just haven't found the right foods for my body yet. I try for 75% fat and eat beef, pork, chicken with skin, and some lamb. Please give me your ideas. I'm feeling defeated and really want to avoid medications if at all possible.

Well if you were underweight, and your body is trying to return to its ideal weight, then gaining is just what you should be doing. Why not wait to see if you keep gaining after you reach your ideal weight?

As far as the shaking, sweating, and feeling faint, it may just be 2 weeks isn't enough.

You are so right about the fat!!! Congrats on your success. I hope to find my abs soon, too!

Thanks FGOA!

Quote:
I'm not sure that the occasional red wine needs to be given up. If I remember correctly, The Bear has been zero carbing for 49 years, and he said he only gave up red wine in 1990 when he started lifting weights. So I assume from what he said, that you can have a healthy 0 carb lifestyle and still enjoy some occasional wine.

I also like my red wine. I have cut it out, then added it back in. There was no difference for me, so I do still enjoy my red wine. But, if I stall again, the wine has to go.

Quote:
I wouldn't be looking to go back to that. However I am wondering about going back to low carb after a time of zero carb. Is this possible?

Lynn, when you get down to zero carb and work out all the foods that don't work for you, you kinda reach a stage of "nirvana". It is hard to describe, you just have to experience it yourself. I feel so good, it is like a natural high. I don't even think about food, I have a ton of energy and I have no desire to eat anything except fat & meat. I LOVE pizza! But I know if I had a slice (or 4) I would feel like crap for a
few days. It is so not worth it. When you get to this stage it is easy to say no to all those foods because they are no longer "tempting".

It is like Charles said...we are BMW's and only the best fuel will do! 😁

Quote:
However, I will say that yesterday, I had unseasoned ribs for lunch and I did not have a dish of fat on the side. This caused me to eat more than I normally would and was sapped for energy in the afternoon until dinner. The last two meals have been with my beloved dish and I feel wonderful.

Funny you should mention this Charles. I am going out of town Labor Day weekend. I am OK with what to order for dinner (a steak), but I am having trouble w/ breakfast since I usually have my bowl of meat swimming in fat. I am wondering what would happen if I ordered 2 hamburger patties w/ a side of bacon grease! LOL! I can just imagine the look of total disgust on the waitpersons face. I might have to settle for scraping the unwanted butter off of everybodys toast. LOL!

RE: Zero Carb / Meat and Water - Kristi31 - 08-17-2008 07:12 PM

Ell.eee,

I kind of had that reaction after a meal if I ate too much fat...try eating lean protein at one meal and see what happens or just fat...compare...food for thought.

On a personal note...
Been eating barely any fat these last couple of days...I just don't crave it. And not much protein either. Feel great, lots of energy and barely hungry. I think the excess fat in my body is being used up and that's probably why. I so overdid it with fat these last few weeks and probably months, my body has much to use for fuel! I ate about 50 grams of protein today, barely any fat, like a little piece of bone marrow. Right now, I'm just going with hunger and I'm really really not hungry for either protein or fat.

---

RE: Zero Carb / Meat and Water - nyteez - 08-18-2008 06:55 AM

Kristi - I haven't been hungry either. I am wondering if it is because my body is burning stored fat. I have 40lbs of stored fat! That can go a long way! LOL I am still eating lots of fat, but my evening meal is getting smaller & smaller and is not as fatty as my morning meal.

I am down another pound! I still have tons of energy and feel great!
RE: Zero Carb / Meat and Water - jeepifer - 08-18-2008 06:59 AM

Down 4 of the 12 lbs I put back on. I'll take it! LOL

I made my pork steak this morning and had a couple of bites but didn't feel like eating. Go figure. I'm starting to get a little hungry now, though, so maybe time to reheat the meatballs.

RE: Zero Carb / Meat and Water - Charles - 08-18-2008 08:47 AM

cbnebraska Wrote:
Please tell me, what is early diabetes?

That's a term for most of us who have insulin resistance. This shows up long before the disease! As I wrote to you elsewhere, the diseases of civilization are all progressive. The damage starts at the cellular level and then spreads out over decades until it manifests itself in some way. The lucky ones get fat, 1 in 5, the unlucky ones get cancer 1 in 2 (men, at least) and so on.

RE: Zero Carb / Meat and Water - Charles - 08-18-2008 08:54 AM

Ell.eee Wrote:

I hate to break it to you but I think what is happening with you is exactly what is supposed to happen. It's not healthy to be underweight and even if it was, it's simply not up to you. Weight is regulated by your body. All you can do is eat healthy and let your body do what is best. If you eat carbohydrates, you'll only make the symptoms worse.

There are not medications that will help you treat the cause of what ails you. Those medications are only geared to the symptoms much like your mind. I encourage you to really think beyond the symptoms you can see and look inward and gauge how your body is responding. That can make all the difference.

All of the things you named -- diabetes, hyperinsulinemia, and insulin resistance are all symptoms of metabolic syndrome. As you know, they are not the only symptoms. You can't let weight determine what works or doesn't work. You can live a long and happy life with extra weight but you cannot live a long life with any of the diseases you named.

Best regards,

Charles

RE: Zero Carb / Meat and Water - HaloStatue - 08-18-2008 09:01 AM

Charles (and everyone else)...
You guys are a fount of info on this. I've loved reading this thread.

I got started on the carniverous WOE back in December, before Christmas. I've had no bread, veggies, pasta, nuttin' of any vegetable or bread type at all. I've only had heavy cream or unsalted butter in the dairy group. The only carbs I know I've taken in come in the eggs I eat. I can proudly say I haven't cheated a day. The only vegetable anything I eat would be in ground spices I use in cooking. I have drunk coffee and diet sodas. Even so, there were very few times when I checked the KetoStix and found "Trace" or less indicated. Usually, there was a higher reading. I still haven't figured this out.

I'm a 5'10" 52 year old, and when I started I weighed 235. Today I weigh 215. In February I weighed 215. In March I weighed 215. In April I weighed 215. And I've stayed like that until now. A very stubborn, frustrating stall. Periodically, my weight would jump 5 to 10 pounds in a matter of days, which I could only attribute to water gain due to something I was doing in my diet.

My goal is to get to 195. That was my goal in December and that's my goal now. I'd intended to be done by May. I've changed that.

So I got tired of all of this and around mid-June I decided to break the stall and begin to ramp up my exercise intensity and cut portion sizes in order to break the stall. I lift weights (very heavy, very intense) every other day and do sprints/intervals on the other days. I jump rope for 30 minutes nearly every day and hit the heavy bag for 25 minutes every other day.

This nutrition/effort began to yield small losses, but I was really feeling run-down. I was listless and achy, with annoying, base-of-the-skull headaches. I began to figure that maybe I wasn't eating enough. I started looking around the web and came onto this thread last week.

After reading about half of the thread, I decided my problem still might be the diet I was eating. Soooo....starting last Thursday I dropped all cheese, eggs, coffee and diet sodas, Crystal Light-type drinks...anything except meat, unsalted butter and water. And I've started eating more; to satiety.

Owwww....

I have had a caffeine withdrawal headache every day since I started. It's been smaller each day, so I guess I'm getting through it. That makes me feel like I'm doing something right. Friday, the KetoStix went deep purple instantly and amazed me. I've been zero carb (I thought) since December and dropping some "okay", no-carb foods makes a huge change on my stix! That makes me feel like I'm doing something right, too.

But the weight still isn't moving. It just sits there. So my questions...

1. What ideas do you have about the stall? I'm going to stick with this, but I'd like to make any adjustments necessary to get the weight sliding.
2. Why would the KetoStix show a dramatic increase in ketones by simply dropping the cheese, eggs, coffee and diet sodas?
3. Can one be so resistant that portion size/calorie deficits might be the only way to get the fat off?
4. Am I the only one out there that this is happening to?! I mean I know I'm special, but I'm not that special! : )

I don't mind doing whatever it takes, nutrition or exercise, to get to my goal. 20 pounds isn't that much for me. I've lost that much since I started. But this stall is getting a bit old.
Thanks for any advice, help or comments.

Charlie

I am down another pound! I still have tons of energy and feel great!

I'm like you ladies! I am hungry, but my meals are much smaller than they used to be. I can't believe I can't eat a full rack of ribs anymore. That's kind of depressing. I am more than satisfied with a half-rack. My breakfast is down to a patty which is probably about 1/4 pound or slightly more and 3 or 4 strips of bacon. I even dip the bacon in the fat!

Suffice it to say, I'm down to 153.2 (which is 11.8 below goal) this morning. I don't really have much desire to lose weight, but it's intriguing nonetheless. I was 146 when I joined the Navy Reserve in 1986 and I was 154 when I got married 17 years ago. I'm just wondering where this is all going to lead, or as Morpheus said in the Matrix, "how deep does the wormhole go?"

Regards,
Charles

HaloStatue,
Welcome to LLVLC forum. I am about your age and about the same height and have been stalled at my current weight for going on close to 9 months now. I lost 70 pounds from my high and have been plateaued at my current weight (more or less) ever since. Since you started exercising, have you been losing any inches but not weight? Someone on this forum recently gave up butter and salt and started losing. Ghee (clarified butter) may be a good substitute for the butter as dairy can stall some people. You might consider coconut oil or fat back instead of butter. I can attest to water weight gain if I consume too much cream in coffee. I don't have any real answers for you but you might want to up your fat intake. Others have reported that increasing the fat percentage in their diet has broken their stalls. You didn't report it, but be suspicious of sausage and processed meats as they can contain hidden carbs and
are usually high in salt. Charles reports he eats less and is more satisfied if he doesn't add salt to his meat.

RE: Zero Carb / Meat and Water - Charles - 08-18-2008 09:25 AM

HaloStatue Wrote:
But the weight still isn't moving. It just sits there. So my questions...

Hello Charlie and welcome to our forum.

Charlie Wrote:
1. What ideas do you have about the stall? I'm going to stick with this, but I'd like to make any adjustments necessary to get the weight sliding.

It's hard to say since you just started zero-carb. If you don't lose even on zero-carb, this informs the rest of us that you won't lose more by adding more carbs either. Any of us are only going to lose what our hormones allow. I'm not sure you're there yet, but we'll see.

Charlie Wrote:
2. Why would the KetoStix show a dramatic increase in ketones by simply dropping the cheese, eggs, coffee and diet sodas?

Because those foods all have carbs in them. Their "0" carb status is only due to the serving size. If you eat more than a serving, then there are carbohydrates present. Moreover, dairy has that effect on many of us here. I eat no dairy because it makes me gain weight and have cravings.

Diet sodas and artificial sweeteners cause us to secrete insulin in anticipation of the sweetness. It makes no difference that there are no carbohydrates present in these substances. Insulin is the problem, not the number of carbohydrates.

Charlie Wrote:
3. Can one be so resistant that portion size/calorie deficits might be the only way to get the fat off?

No because semi-starvation will not reduce your fat stores. It will reduce you in equal measure until you look like Ghandi, but this isn't what you want to accomplish. You want to be strong, lean and muscular as your body changes, not weak, chunky and non-defined.

Charlie Wrote:
4. Am I the only one out there that this is happening to?! I mean I know I'm special, but I'm not that special! : )

No, our forum is littered with this issue. Just as there are many who are going through this, there are many opinions as to how to change things. You just got mine.

Charlie Wrote:
I don't mind doing whatever it takes, nutrition or exercise, to get to my goal. 20 pounds isn't that much for me. I've lost that much since I started. But this stall is getting a bit old.

Exercise really doesn't help in terms of weight loss as you've discovered. You should exercise only
because you enjoy it, not because you think it will make you lose weight faster. Weight is like body
temperature, blood pressure, pulse rate, cholesterol levels, etc. It is regulated by your body and your
body fights to keep you at equilibrium as it should. If you want to reduce your fat stores, you have to
provide better metabolic fuel which you have just begun to do. Let's see what happens!

Regards and again, welcome to our forum!

Charles

RE: Zero Carb / Meat and Water - MirMir - 08-18-2008 09:46 AM

Good morning all!!

Oh, had to bark at my brother, he threw out my bacon fat again!!!

We have had this discussion before: bacon fat does not spoil, when you do the refrigerator run (throwing
out the old) do not throw out the bacon fat.

Now I have to start over again which I will but this time I'm using a big marker and putting the words:
DO NOT THROW OUT UNDER PENALTY OF .... on the container.

I'll let him fill out the rest.

RE: Zero Carb / Meat and Water - Linda - 08-18-2008 09:54 AM

Happy Monday, everyone!

I just thought I'd post here and let you all know I've joined the ZC movement. 😃I've been ZC'ing since
Thursday and doing well so far. I've given up coffee and heavy cream, but do occasionally have butter.
I'm currently rendering some beef fat to also up my fat content. I like to add this to chuck roast when I
reheat it. Yum! I try to use minimal processed meats such as uncured bacon, nitrate/MSG free hot dogs
or sausage, etc. I drink water.

I do have a question. Prior to going ZC, I had been doing VLC....less than 10 carb per day. I'm using
ketostix to see when my body finally starts getting into heavy ketosis. I would then expect to have the
ketones quit showing once my body adapts. However, I'm only showing trace or small amounts of
ketones. How long would it take to show that I'm in ketosis?

Thanks,

RE: Zero Carb / Meat and Water - MAC - 08-18-2008 10:00 AM

Thanks,

Appears from what you have written that you are already keto adapted and out of ketosis when you were VLC. You don't have to be zero carb to be keto adapted. You want to be keto adapted. Ketosis means you are throwing off unused ketones. Keto adapted means your body is using ketones instead of glucose.

I'm wondering, once again, about coffee. Is it the caffeine in the coffee that causes insulin to rise? If so why, if not, would decaf coffee be acceptable?

Also, I am finding that liquid bacon fat, at least that which comes off of low sodium bacon, doesn't really taste all that great to me. I love the fat that's deposited around the outside edges of my steaks though. Especially when it's crunchy on the outside! So, what is this stuff called and how can I go about getting some extra? My favorite steaks are chuck eye and rib eye. I suppose prime rib has some fat, but that is just too expensive to buy for home. Is there something fattier out there? We do get the 80/20 hamburger, but I would say much of it burns off on the grill and can't be recovered from the drip tray - ick. Oh, and we buy expensive brisket once in a while too. We are looking to buy a smoker so we can smoke some ribs, but once again there's the dripping issue. We grill because we cook a large, large mound of meat every 2 weeks, divide it into 2 groups, freeze one and put one in the fridge. Works great since we both work and our 2 kids have busy schedules as well. However, I think I'd like to prepare some extra beef fat to have along with my other meat. Any ideas on how to best do this?

I have one other little situation. I am a teacher and I have to eat at 11:20 every day, or I don't get to eat at all. I have only been eating zc a few days, so this is the first time this happened to me. I had hamburger with bacon for breakfast at 7am and had to throw some of it away because I got full very quickly. I didn't think about food even once all morning and next thing I know it's 11:20 and time to eat --- and I'm not even remotely hungry. Ugh. I forced myself to eat my steak, but now I feel icky. Should I eat a little less than sated at breakfast knowing I'll have to eat at 11:20 or should I eat breakfast to satiety and force myself to eat a smaller lunch? I have to make it through the afternoon and to at least 5:00, so I can't just skip lunch. I fear that if I eat a small lunch I'll be too hungry in the mid afternoon and carbs will start to look like food to me. I'm finally to the point where I look at it all and simply don't see it as food. I kind of think of it as art. Hmmm, that looks interesting, and I move on. I just can't believe that I filled up so quickly at breakfast and was so full still 4 hours later. Amazing.

Thanks for your ideas

Lynn, when you get down to zero carb and work out all the foods that don't work for you, you kinda reach a stage of "nirvana". It is hard to describe, you just have to experience it yourself. I feel so good, it is like a natural high. I don't even think about food, I have a ton of energy and I have no desire to eat.

It is like Charles said...we are BMW's and only the best fuel will do!

Again, I am not talking about eating pizza. I haven't eaten high carb in years. I am talking about adding back some veggies after a while, similar to Atkins.

At the moment I am a work in progress. I am trying different types of meat so that I will have a repertoire of meat to choose from if I do go zero carb as right now I only eat chicken, turkey and beef. The old tastebuds are still not well adapted to meat yet 😊

---

**RE: Zero Carb / Meat and Water - suzanneveya - 08-18-2008 10:22 AM**

Why not the fatback that Charles and I have been cooking with? It cost less than a dollar for a good sized piece of fat and you only need a bit to cook with, it makes everything taste yummy and juicier. It is in the pork section, btw. Can't hurt to try...

I often find that I have to eat when not hungry. Like this weekend, I wasn't hungry but I was going into the wedding reception and wasn't going to be able to eat for the next 5 or 6 hours, so I ate. Maybe just try eating, but not as much. I do the same thing before a movie, if the movie starts at 12:30 I am never hungry before, but I always eat something so I do not exit the movie starving.

Also, have you thought of cooking everything in the broiler? Not in a broiler pan, but a regular pan so it can cook in its own juice and fat? I never grill anymore.

I tend to eat a smaller breakfast, have a large lunch, and that holds me through to dinner. I don't have a strict lunchtime, but there are usually a lot of meetings in the early afternoon, so I try to plan to eat earlier if possible.

You should be able to go to the butcher and ask them to give you some beef fat trimmings or suet. Then you can render it. I do it by putting in a heavy pan over fairly low heat until it is all melted, skimming off the remaining chunks, and then pouring through a cheese cloth to get the smaller particles.

If you can't find it locally, I know you can order it online from places like Slanker's Meats and US Wellness Meats. Added bonus is that those are grass-fed, which many people believe may have a slight health advantage. They are a little more expensive, but they will last a long time 😊

You know, I guess you're right. I have just started the zero carb. I thought I was doing it, but wasn't. When I started the path (Bear's path) last December, I guess what I did was find every exception rather than the strictest of all interpretations. Now that I'm straight meat and water, we'll see what happens.

As to the exercise thing...it's not as much for the fat loss as for the fun, leanness and conditioning. But from what I understand, even though it doesn't do as much for the fat loss, it helps keep it under control once it's lost.

Thanks for the reply, Charles!

---

RE: Zero Carb / Meat and Water - HaloStatue - 08-18-2008 10:42 AM

Thanks for the thoughts and the reply, Mac...

I've already cut all sausage/processed meats (which sucks! I love Brats and the like on the grill!) and cut the coffee, so there's no creamer there.
I try to increase my fat intake all the time, thus the unsalted butter. I've heard the coconut oil mentioned, but never looked into it 'cause I didn't think this would give me this much trouble. Now I guess I'd better!

I'm going to order some coconut oil from Puritan's Pride. Where do I get the fatback and how do I use it? And would the bacon drippings (from bacon for the rest of my family) I've been saving contain too much salt, nitrates, etc. to use in increasing my fat?

Thanks again!

Charlie

Charles Wrote:
Nicola Wrote:
Charles, you know Dr. B. Groves (you mentioned him in one message), well that about natural (raw) meat and fat is more important than you seem to believe (at this point of yours and others meat and fat diet):

They can make all the claims they want. No one argues that grass-fed beef is not more nutritious then grain-finished beef. However, you cannot show that grain-finished beef is not nutritious. Those sources do not stand for that proposition.

I am healthy today by every objective standard. I do not believe that my health will one day suffer because I don't eat grass-fed beef nor raw food.

You are more than entitled to your opinion as is anyone else who believes this way. Most cultures ate cooked food and were very healthy as a result. The Inuit rarely ate anything raw so this argument does not hold up. Some cultures didn't even eat beef at all yet still had optimum health. There are many ways to get it done but a food analysis doesn't tell the whole story.

The articles from the Price website are dealing with animals and animal studies. The cats didn't fare so well on cooked food. I am not an animal and I do well with cooked food. I do give my dog raw ground beef and he's doing well with that.

Having said all that, I do believe that you should not over cook your food. I tend to go from medium to medium-well and Stefansson and Anderson did they same thing. Stefansson liked his medium-well and Anderson liked his medium.

It should also be noted that fresh meat, both cooked and raw, cured scurvy which is a deficiency disease. Obviously, there must be something in meat that contains the nutrients needed and it does not seem to matter whether the meat is cooked or raw. Raw may have more, but cooked clearly has enough.

Regards,

Charles

Just a few thoughts, one from the yahoo AV-Skeptics group and a nother from the rawpaleo yahoo
i'm not limiting to 15k. i specifically said that i would trust what man ate *prior* to agriculture (which i peg at approximately 15K years ago). i think we're in complete agreement here! i definitely agree with the large ruminants being the food of choice and likelihood for the bulk of man's evolution.

*->grass-fed vs. grain-fed debate*

i guess i approach this one from that standpoint that for most of man's evolution he did not have access to grain fed ruminants. since the pastured ruminant is more close to what we evolved on i tend to assume it to be more in line with our needs. having said that, i am a firm believer in nose-to-tail eating. i also put a lot of stock in irregularity of activity and food. there was feasting when the game was fat and lean times when it wasn't. there was an ebb and flow that the body is probably well adapted to dealing with (and perhaps thrives on?). certainly if we look at the bulk of the other bazillion species on this planet they have it reasonably well figured out. perhaps not always having optimal chow actually promotes better overall health long term?

also, i guess i tend to disagree with the concept of the grain based feedlot and propping up the animals with meds 'n such so that they survive long enough to be slaughtered. when we eat from the feedlot we are basically eating very ill animals which may or may not bode well for us.

The argument that the Eskimos rarely ate their meat raw is so absurd, it's ridiculous. I mean, one of their most favourite foods was frozen, uncooked fish - that is basic knowledge. And I already pointed out, in a previous post, how Stefansson ate raw marrow during that (1-year!) Bellevue study. Then one has to take into account that the Eskimos were eating wild-meats with much higher nutrient-levels than supermarket meats.

Charles: "I am not an animal and I do well with cooked
What exactly do you think you are, if not an animal?"

Nicola

RE: Zero Carb / Meat and Water - Ell.eee - 08-18-2008 10:56 AM

Thanks for the support everybody. Sorry I can't quote well yet to reply.
cbnebraska - early diabetes, AKA prediabetes is my Doc's term to indicate that I am a candidate for metformin which I'm avoiding so far. My fasting bg is up to 110-120 and I'm having symptoms that he thinks are reactive hypoglycemia, but I think are hyperinsulinism. Luckily he has a bit more flexibility than some Docs and is letting me try my way first and respecting my choices - he just thinks I'm wrong and putting myself in jeopardy.

I think you all are right about the weight gain being my body finding its level, but it's tough to read how everybody is losing, finding their abs, and celebrating weight lose even when they are already thin,
while I am growing out of my pants! I think my ideal weight is 115 so I'll give this a few more weeks and see if the weight gain slows.

I think I may be overdoing the fat as someone posted. Sometimes I feel a little nauseous after meals (as well as shaky, sweaty, and light headed!). Maybe I should consider going to 1 meal a day and see if that cuts the symptoms.

Anyway I'm committed to sticking with meat and water for now - as Charles said there really is no better alternative - I know any carbs make everything worse - and maybe my body will begin to regulate itself. I'm prepared to do this for life if necessary.

---

**RE: Zero Carb / Meat and Water - madonnawhore** - 08-18-2008 11:30 AM

Charles,

I've read through quite a bit on here. How do you feel about "processed" meats? For example: beef jerky, bratwurst, lunch meat, etc.

I can eat steaks, hamburger meat, and chicken breasts just as much as anyone else, but sometimes I want things that do not take as much time to cook or handle. What is your opinion on that for someone who is attempting no carb?

---

Maybe from a butcher you can get the fat back. Charles said he can find it at Walmart. I had no luck finding it at my supermarket this weekend. Nearest thing was Salt Pork or basically what is cuts of pork belly or uncut bacon chunks.

You would render the fat back and dip your meat in it. You can use bacon drippings. Lots of folks here are using bacon drippings. Nitrates are a non issue according to Dr. Eades. I personally don't worry about salt in food as zero carb is so diuretic. It is the carbs that cause the water retention and not the salt.
cbnebraska Wrote:
I'm wondering, once again, about coffee. Is it the caffeine in the coffee that causes insulin to rise? If so why, if not, would decaf coffee be acceptable?

I'm not sure what the mechanism for coffee is. I suspect there is more than one in coffee. The thing is, if it is good for you, then you should be able to take or leave it. If you "must have it" then that sounds more like an addiction and that's what we're trying to overcome. There should be no food or drink that is a "must have."

Cynthia Wrote:
Also, I am finding that liquid bacon fat, at least that which comes off of low sodium bacon, doesn't really taste all that great to me.

Then you shouldn't eat it. Although, taste is all a matter of conditioning. There are some things that are repulsive today that one can grow to prefer if they give it sufficient time. There is no reason to feel miserable though unless you have low energy levels in which case you'll need to increase the fat.

Cynthia Wrote:
So, what is this stuff called and how can I go about getting some extra?

I use fat back which is salt-cured pork and I get it at Wal-Mart although I would think most stores would possibly carry it. Lard would be very similar to it as well, I would think. The thing is, I don't know that it "tastes" any better than bacon fat. It doesn't have much of a taste but it makes the meat "greasier" and increases the fat quite a bit. Many find it difficult to eat straight fat on the edge of a steak but they can take it in liquid form. I go for both because I dip my fatty protein in fat.

Cynthia Wrote:
However, I think I'd like to prepare some extra beef fat to have along with my other meat. Any ideas on how to best do this?

I don't care for grilled meat much just because of that issue. I prefer putting meat in the broiler, convection roasting over, or the skillet on the stovetop so that I can get the fat and drippings. At the very worse, you can melt the fat in a saucepan and just dip your leaner meats in it to increase their fat or compensate for that which was lost in the cooking process. Try not to overcook the meat as well.

Cynthia Wrote:
I have one other little situation. [...]Should I eat a little less than sated at breakfast knowing I'll have to eat at 11:20 or should I eat breakfast to satiety and force myself to eat a smaller lunch?

Eating is a matter of conditioning as well so I would either eat a small breakfast or eat a big one and just try to make it until 5:00. There's no reason you couldn't, honestly. It might be hard the first time or two, but after that I'm pretty sure your body will adjust to it if that's the way it is. Take some food with you the first couple of times and if you're dying at 3:00, take out a piece of meat and just take a bite.

When you are on zero-carb, you'll find that when you get hungry, you can eat a piece of meat or you can ignore the hunger and after a few minutes, you'll find that you're fine. You'll get hungry at your normal times but nothing says you absolutely have to eat at those times. People with more severe hyperinsulinemia will find this more difficult to do and I don't necessarily recommend it in those cases,
but on the other hand, we all must do what we must do.

Regards,

Charles

Your source needs to read Stefansson's book. You can download it here and provide him a copy of it. I have posted it many times and don't feel the need to do so again. He clearly writes that they rarely ate their food raw and again, every eskimo did not eat fish. Some ate caribou, some ate seal and walrus and none of them tended to eat the same thing year after year.

Please don't trouble me with this. I do not wish to argue with the raw paleo forum. I'm glad they've found what works for them and I respect that. Now, please respect my choices as well.

I think it is the oils in the coffee. Not the caffeine. So decaf would have the same problem.

lynnhopes Wrote:
Again, I am not talking about eating pizza. I haven't eaten high carb in years. I am talking about adding back some veggies after a while, similar to Atkins.

Pizza or spinach, a carb is a carb the body doesn't know the difference. You CAN add some back, but you might gain weight and you will definitely get gassy & bloated. I used to think I would add back veggies too, but now I have no interest in adding back any carbs.

daveo Wrote:
If you can't find it locally, I know you can order it online from places like Slanker's Meats and US Wellness Meats. Added bonus is that those are grass-fed, which many people believe may have a slight health advantage. They are a little more expensive, but they will last a long time
Before you buy grass fed fat be sure to try some first. It does not taste the same as what you are used to. It tastes really bad to me.

Some people can handle processed meats some can't. I can eat them in moderation with no problems. I usually look for the higher quality ones and check the carb content. I try to find ones with 1 or 2 carbs at the most. Caspers Hot dogs are really good, I like to snack on those if I am hungry and want something quick.

I don't think you are eating enough because you are afraid of gaining weight. Your body has likely gone into starvation mode and is storing fat to keep you from yourself. You have to eat. Please don't go down to one meal a day.

You should not force yourself to eat more fat. If you are getting nauseous, eat more lean. It's okay, really. The only time you should increase fat is in response to low energy levels, not just to do it. Fatty protein is generally enough unless you have low energy.

How tall are you again?

Generally, I would say to avoid them, especially those containing nitrites and nitrates, but I know many people who ate mostly processed meats and they lost tremendous amounts of weight so it's hard to say that they affect everyone the same way. Nitrites give me headaches but they don't bother my wife. If that's the case and your only sticking point, then why not? If you are not losing or you run into trouble, then you know what to eliminate.

I don't like it as much as grain fed either.. to me it's more the smell than the taste..

Charles Wrote:
It's hard to say since you just started zero-carb. If you don't lose even on zero-carb, this informs the rest of us that you won't lose more by adding more carbs either. Any of us are only going to lose what our hormones allow. I'm not sure you're there yet, but we'll see.

So, Charles...it's obvious that in the major things we're all pretty much the same. But we need to "tinker with the knobs" a bit to get this WOE dialed in for our individual metabolisms and goals.

Do you (or does anyone) have any ideas or theories about how long to stick to a particular course without any measurable changes before deciding that more tinkering might be required?

I hope that question's clear...

Thanks again,

Charlie

Hey Charles, Thanks again for your advice. You really are a wonderful moderator and I especially like that you are willing to continue to tweak your own diet (ie no more salt, increasing fats). You are open minded and learning like the rest of us!

I think your right one meal a day would probably not satisfy me. I just thought it might pull back the insulin release to once a day. I'm not worried that I'm not eating enough. I'm always over 2000 cals when I put my menus in fitday and I'm gaining weight. I do know about starvation mode and even experienced it a little when I tried a low fat low carb diet for a few months, thank goodness I've learned fats are good. I usually feel energetic enough. I run 4 miles 3 days a week and I sleep well. I'm 5'4". My only real problem is feeling lousy for an hour or so after I eat and blood sugar levels that my Doc says are too high. (I have high cholesterol as well - hence the attempt at a low fat diet, but I've taken myself
off statins and from what I've read I'm not concerned.)

I guess I'm just impatient to see my metabolism improve. Thanks again to all and I promise I'm done whining. From here on in if I don't have something positive to say I'll lurk.

Thanks Charles! You are a great teacher😊

Quote:
I don't like it as much as grain fed either.. to me it's more the smell than the taste..

I have a funny story about grass fed beef. A few years ago a rancher traded my husband a cow to fix his old ranch truck. My DH does body work. We split the cow with DH's partner. I noticed the beef was a little different, darker and the fat was more yellow. And it tasted different, slightly gamey. I could mask this taste with marinades & sauces with the steaks & roasts, but not with the ground beef. The ground beef with the higher fat content was just bad, and that smell! I tried everything...mixing it with pork, store bought beef, making sausage, even making salami, NOTHING would cut through that taste (and smell). We fed 50lbs of that ground beef to our dogs! My DH's partner thought the meat was bad and threw it all out! 300+lbs! We all live in cowboy country and eat lots of things off peoples farms & ranches, but nothing ever tasted so "off" as this beef. We later found out this was Grass Fed beef! I thought; you have got to be kidding me! People are paying 15.00 a pound for this crap? I went out and bought a Grass fed top sirloin just to make sure, cost me 14.00 for a small top sirloin! Yep, same taste and smell!

The ranchers are laughing their butts off about this Grass-Fed craze. It is easier and cheaper to let their cattle just graze until market. It is more work and money to finish off w/ grain to "sweeten" the meat & fat. Save your money and buy Prime Rib or ribeyes, it is cheaper and tastes a whole lot better!

---

RE: Zero Carb / Meat and Water - MAC - 08-18-2008 03:25 PM

I'm of two minds on grass fed beef. Twenty some years ago I worked in Argentina for some time and ate a lot of beef. Their beef is supposed to be grass fed. Tasted fine to me back then. Couple of months ago I bought some frozen rib eye that was grass fed from Australia. It didn't taste bad but it didn't wow me either and I decided that I wouldn't be buying any more grass fed beef. Didn't seem worth the cost given it didn't taste that great.

---

RE: Zero Carb / Meat and Water - caroline - 08-18-2008 03:48 PM

Great story, Dana! I have also noticed when we got grass fed that it was beaucoup bucks for one thing, and tasted innocuous--not bad, but not anything. No flavor.
I get hormone free meat dirt cheap from butcher, and they grind it totally fresh with lots of extra fat. I wouldn't bother with organic--it doesn't taste as good and would be insane with the volume of meat we eat.

RE: Zero Carb / Meat and Water - cbnebraska - 08-18-2008 03:51 PM

Ell.eee Wrote:

If there is anything you will learn about Charles, it is that he is very patient and will repeat himself ad nauseam for any of us who are still learning. He is absolutely awesome! He truly wants to help us take back our health and reach our personal goals, whatever they are. It is very evident in his responses and willingness to share - over and over again. Honestly, everyone here is that way. All very knowledgeable, all finding our way. It seems like it should be so easy - eat meat and drink water. BUT, it isn't as easy as it sounds. You're not whining, you're emoting to a group of people who share a common interest and actually do enjoy the analyzations, evaluations and explanations. That is why I have become so comfortable here. I still feel like an oddball in "real life" and certainly can't explore the nuances of this WOE with anyone else. Eyes glass over, heads start to shake and confusion sets in, but somehow very few of them ever REALLY want to know anything. We all do, so bring it on!

I'm still a newbie, so I do more asking than answering, but someday, maybe I can give advice or contribute something that helps someone. For now, I just keep asking and trying to read outside materials. If you really want to learn more, you should check out Charles' reading list on page 20 of his zero carb running forum. It's a great place to start. I'm working my way through it.

RE: Zero Carb / Meat and Water - Charles - 08-18-2008 04:23 PM

HaloStatue Wrote:

That's right. We all ate differently over the years and we've damaged our insulin receptors and made our fat tissue sensitive at different rates and levels. Some of us have been obese our entire lives so our fat tissue is exquisitely sensitive whereas others just gains weight in adulthood and they are able to dial it back more quickly.

Charlie Wrote:
Do you (or does anyone) have any ideas or theories about how long to stick to a particular course without any measurable changes before deciding that more tinkering might be required?

Stefannson gave a time of 6 months to see whether a person could adapt to an all-meat regimen. If you last that long without cheating then you will likely never go back to carbohydrates for any significant period of time. It may sound tough right now, but when you see how much better you'll feel at that point, you'll see how astute he was!

Regards,
Ell.eee Wrote:
Hey Charles, Thanks again for your advice. You really are a wonderful moderator and I especially like that you are willing to continue to tweak your own diet (ie no more salt, increasing fats). You are open minded and learning like the rest of us!

I just hope people know that I am a real person with real feelings and struggles like everyone else. Sure, I don't have weight to lose or an axe to grind, but I really want people to get it and change their lives. I realize everyone won't but if I can be instrumental for a few, that would more than allow me to pay back the debt I owe to these great scientists and researchers who have long figured this thing out!

Ell.eee Wrote:
I think your right one meal a day would probably not satisfy me. I just thought it might pull back the insulin release to once a day.

The reason is that when you go hungry, insulin actually can stay in circulation longer that's why I advise people to eat when hungry and I mean as soon as hunger hits so you can get the digestive process out of the way and get back to mobilizing those fatty acids. At 5'4", that's only a BMI of about 20. I think you could go all the way to 140 to 145 before you would even be considered overweight.

When your body gets to the weight it wants you to be at, I would think that some good weight training would sculpt a really fine body that anyone would be proud of, even if you weighed 130. I don't want to scare you but you've got to let your body take charge.

Ell.eee Wrote:
I guess I'm just impatient to see my metabolism improve. Thanks again to all and I promise I'm done whining. From here on in if I don't have something positive to say I'll lurk.

Please, don't just lurk. You can whine to many any time. I promise not to complain! I can certainly understand the impatience but I think it's best to keep that menu short and keep things moving even though things stay the same. One day your body will change without you doing anything once it's finished doing what it's doing on the inside. It takes some mass to make the muscle you want so if you're gaining muscle, that's a very good thing. Many people claim to be gaining muscle when they're really getting fatter. I really don't belive that's the case for you.

Best regards,

Charles

RE: Zero Carb / Meat and Water - Charles - 08-18-2008 04:41 PM

I just wanted to share with you all that I took your advice at Harris Teeter grocery. I was buying some 80/20 patties for my children and saw the butchers cutting meat. I asked them what they did with the fat. He said they put it in bags and someone comes and picks it up. He showed me a ribeye and they must cut two inches off the edge of each one. 😊
Well, tomorrow afternoon, I'll be picking up my big bag of beef fat! I'm so excited!

I'm off to the gym, I'll check back tomorrow!

Best regards to all,

Charles

**RE: Zero Carb / Meat and Water - suzanneyea - 08-18-2008 04:52 PM**

My butcher will leave the fat on the steaks, actually I always buy the steaks wrapped in fat. I still like how the pork fat melts with the heat.

**RE: Zero Carb / Meat and Water - cbnebraska - 08-18-2008 04:54 PM**

Wow, that's awesome. I'll have to check with our local Baker's and see if I can arrange something like that for myself. I am one of those weirdos who does like to bite into warm fat on the edge of my meat, not just dip in the liquid. I will broil it up so it has a crunchy top and dig in. I hope the grocery store will help me out!

Oh, another question I came up with. Eating chicken skin. Fat, right? Okay to do? I love it when it's crunchy. My favorites are chicken thighs fried in their own grease to the point of crunchy. Delicious! What is the highest temp we should use? I remember something about high heat being bad. Why? Fire is pretty dang hot and I'm guessing they cooked it up over some hot fires years and years ago!!

Lastly, I bought the salt pork since Wal-Mart didn't have any fat back. Someone, please remind me how to "render" this. I am not the cook in my family and my husband has certainly never done this. Lay it out on the broiler pan and set the oven to broil? Wait until it all liquifies and then pour it off? Someone said something about cheesecloth, but is it really necessary to strain the fat? If so, why?

Thanks!

**RE: Zero Carb / Meat and Water - Charles - 08-18-2008 05:08 PM**

cbnebraska Wrote:

Animal fats are very stable even at high temperatures. Vegetable oils can become rancid quickly with too much heat so they advise you not to heat them too much. That's not the case with beef tallow, pork fat, chicken fat, etc.
Cynthia Wrote:

I just put it in a saucepan and let it liquify then I pour it in a dish. I dip each bit in it and go to town! With chicken fat, I bake it in the oven and collect some of the fat underneat the meat and I use that to dip with.

I do the same with beef fat. If the steak could have two or three inches of fat on it, I wouldn't need to use the liquid fat but they always trim it off so that's what I'm forced to do!

Okay, now I'm really going!

Charles

RE: Zero Carb / Meat and Water - twilight - 08-18-2008 05:26 PM

ebnebraska Wrote:

I guess I am a wierdo too. 😊I think the fat is the best part. When I was a kid I always thought the best part of the porkchop was the fat on the edge (and the little bit of marrow in the edge of the bone).

mmmmmm 😋

I have beef fat that the butcher gave me last week. I have it in the freezer and slice off some to add to the pan when I lightly brown my ground beef patties. Nothing like having the best part of the steak with your hamburger! I also eat some of the fat raw while I am cutting it up. Now, that probably really sounds wierd. 😋

I did render some of the fat for cooking leaner meat, but prefer to eat the fat just slightly fried.

RE: Zero Carb / Meat and Water - twilight - 08-18-2008 05:32 PM

That's great! I was very happy when the butcher gave me the bags of fat last week. I think they thought it was wierd when I told them I didn't want it for bird food. I told them I wanted it to cook with - they would really have thought I was bonkers if I told them that I love the taste of fat and fry it up with my burgers. 😋

RE: Zero Carb / Meat and Water - feckless - 08-18-2008 05:37 PM

Charles Wrote:
Diet sodas and artificial sweeteners cause us to secrete insulin in anticipation of the sweetness. It makes no difference that there are no carbohydrates present in these substances. Insulin is the problem, not the number of carbohydrates.

Is there some way to can tell if a food is triggering insulin. Is there a feeling or symptom associated with it. For instance, if I have a cup of black tea with a tiny speck of stevia, even though there is virtually no carb there, I will have a strong craving to eat afterwards that will last quite a long time. But I test blood sugar readings and they do not drop, so I'm not sure if the cravings = insulin release.

I'm just trying to figure out the best way to learn how foods affect me.

Do you (or does anyone) have any ideas or theories about how long to stick to a particular course without any measurable changes before deciding that more tinkering might be required?

If you mean how long to wait to see if minor adjustments (like omitting eggs) will have any affect, I would say at the most 2 weeks. I personally wait 1 week, if there is no change, then I figure I am ok with that food. I recently omitted eggs and lost 6 lbs in one week. I noticed a difference in 3 days. BUT, I have been doing zero carb for 5 months. I think if you go from 20+ carbs down to zero, you may have to give your body more time to adjust, like a month or so.

RE: Zero Carb / Meat and Water - waywardsister - 08-18-2008 06:24 PM

Question - so does gaining weight automatically mean you have insulin resistance? Does the degree of weight gained have any correlation with the degree of insulin resistance you have? Is there such thing as being a little insulin resistant?

RE: Zero Carb / Meat and Water - jeepifer - 08-18-2008 06:35 PM

Next time I see the butcher for chuck eyes, I'll ask about the leftover fat!

I am SO exhausted. Could barely crawl into the house after my workout. And I stopped before I overdid it! Someday when I'm at goal and running and strength training, I want you to remind me of this day and how far I've come, ok?

Dana...that's exactly what I meant. I've been doing "zero" (even though now it seems that it's not really zero!) since December and am only now omitting eggs, coffee and anything with artificial sweeteners. If something doesn't "give" in my current permutation, I was wondering when to start fine tuning again. What I don't want to be doing is changing so quickly or so often that my body doesn't have time to demonstrate the results and then getting myself totally confused.

Thanks gobs.

Charlie

jeepifer Wrote:

I think they were a little bewildered when I asked. 😐 So I asked if anyone else asks for it, and they said no...only for making bird suet. 😁 But they didn't mind giving a couple bags to the wacky old lady and said I could get more when I wanted it. 😊

Don't forget guys, weight loss or gain is not the only measure of success and failure when trying a new food or eliminating one. I dropped eggs a few weeks ago and had no change to my weight (I am maintaining, BTW), but I like the change. I now eat a big ground beef breakfast and I am fuller longer. So, try to look for other positive changes when you drop a food, not only weight loss.

It's just hard to imagine having ground beef for breakfast! How come you guys don't eat a hefty portion of sausage and bacon? Mmmm!!!!
nyteez Wrote:
The ranchers are laughing their butts off about this Grass-Fed craze. It is easier and cheaper to let their cattle just graze until market. It is more work and money to finish off w/ grain to "sweeten" the meat & fat. Save your money and buy Prime Rib or ribeyes, it is cheaper and tastes a whole lot better!

I live in Switzerland and am trying to understand what others learn about life in different parts of the world.

I don't understand; do normal ranchers let their cattle just graze - don't they finish off w/ grain (do the ranchers not feed them to get fat before they get to be a few years old?). So what if they are not grain fed, then why is the meat and fat different to "pastered"?

Nicola

I really try to avoid sausage and bacon. They have nitrates, salt, and the sausage usually has fillers, including sugar. It makes me bloated and the salt cause leg cramps at night. I ate at a restaurant last Thursday and Saturday and Sunday night I had leg and foot cramps from the salt. My body is just starting to recover from the meal.

We are going out to breakfast this morning, but I am not taking the risk and eating before we go. Even though I just order a steak, I cannot handle the salt in restaurant food. This is ironic cause about 3 weeks ago I used enormous amounts of salt on my food and even dipped my steak in a salt pile on my plate.

RE: Zero Carb / Meat and Water - lynnhopes - 08-19-2008 05:15 AM

Nicola

I was wondering that too. Here in Ireland cows sit around in the fields all day and obviously eat grass. What happens in America??? Do they not lie around in fields?

---

RE: Zero Carb / Meat and Water - jeepifer - 08-19-2008 07:28 AM

The cows that are raised for meat are usually in crowded pens that are too muddy from their excretions to ever hold grass. They're fed grain that is loaded with antibiotics because living in such close conditions breeds sickness. Some of the conditions are truly terrible, some are okay. It depends on the area of the country, the availability of land and pasture, and a lot of other factors.

Where I lived, the cows did have plenty of pasture space, and were brought in and fed grain right before being shipped out to fatten them up and "soften" the muscles because they weren't walking around.

---

RE: Zero Carb / Meat and Water - lynnhopes - 08-19-2008 07:41 AM

Wow. If I lived in America I would always buy grass fed then.
I eat meat because my body needs it. However if I could thrive on vegetarianism like some of my friends then I would DEFINITELY be vegetarian. No wonder there is a huge animal activist movement in the states if that's how animals are treated. I believe it's okay to eat meat but I want to have the animal live a good life before he dies.

**RE: Zero Carb / Meat and Water - jeepifer - 08-19-2008 07:45 AM**

It's tough. The commercialization of beef production (well, any animal meats really) means the companies try to keep costs down and profits up at the expense of the animals.

But, saying that, I don't have the budget to buy the grass fed meats most of the time. They're easily twice as expensive and with a family of four, it's just not feasible. I do the best I can.

**RE: Zero Carb / Meat and Water - lynn hopes - 08-19-2008 07:51 AM**

Yes we all do the best we can. It's not easy. We make the best choices we can with what we have. It's the companies fault; not the consumers.

Regina Wilshire wrote a great article related to this [http://www.weightoftheevidence.com/](http://www.weightoftheevidence.com/)

**RE: Zero Carb / Meat and Water - LindaSue - 08-19-2008 08:27 AM**

I had some luck today finding pork fat at the small grocery store where I go to buy most of my meat. What I bought is called "pork trimming". It's comes in a regular flat meat package with slabs of fat, scraps of meat and a few odd bones thrown in. It was only .69 pound so I bought a small package to try. It's simmering on the stove right now. I see that it takes quite some time for the fat to render out. At first it didn't seem like much would come out but now the pieces have shrunk down to little slivers. My husband and I have been nibbling on the meaty bits as they got browned. Very tasty. This fat isn't cured or smoked and that store never "enhances" their meat so this stuff has no additives which is great.

**RE: Zero Carb / Meat and Water - nyteez - 08-19-2008 08:46 AM**

I live in Northern California, we have "Happy Cows" LOL! I don't know the specific details, but basically they are pastured most of their life. It is very expensive to raise cows on grain. I don't know anybody who raise cattle on grain. You have to have a facility big enough, you have all the labor and cost of feeding the cattle daily and the expense of antibiotics. When the pastured (grass fed) cattle are ready for market, they are sold. The people who buy them, grain feed for a certain amount of time. This is where you see lots of cows crowded in a small area, w/ no grass, but with big tubs of grain around. These cows are being grain fed to fatten them up and make them taste better. Cows are grain fed for one reason and one reason only, it is for TASTE. They don't get any more money for fatter cattle, they are paid by the head, not by weight. And these days all the fat is cut off!

What the cattle are fed will change the taste of their meat. Some ranchers have a secret recipe for finishing off their beef that results in an exceptional tasting beef. For example; I live by Sierra Nevada Brewery. The Brewery has a nice restaurant. They get their beef from the CSUCHico farm, their beef is finished off with a mixture that contain the same Hops, they use to make their beer.

The ranchers are laughing all the way to the bank because they are getting more money if they sell
directly to the slaughter house their "grass fed beef", than if they sell to a commercial company who
grain finishes the beef. This whole "grass-fed" craze is a joke!

Grain is bad for cattle, just like it is bad for us and causes the animals to be more susceptible to sickness,
so antibiotics are used to keep the cattle healthy. The US has very strict rules about antibiotics and
hormones used in our beef. All antibiotics and hormones are pulled well before slaughter so that no
residue is present at slaughter. Cattle are tested all the time. Sick cattle are money down the drain,
nobody wants their stock to get sick. Sick cattle cannot be sold or slaughtered for human consumption. So
the idea, that sick cattle are being slaughtered and sold in our stores is ridiculous.

RE: Zero Carb / Meat and Water - Charles - 08-19-2008 08:54 AM

feckless Wrote:
Is there some way to can tell if a food is triggering insulin. Is there a feeling or symptom associated with
it.

As one of our favorite sayings go, "It's not, you are what you eat; rather, it's what your body does with
what you eat."

In your case, the craving that comes as a result of the tea should let you know something is not right
with it. Also, unless I've already gone 7 hours between meals, I can't look at prime rib and get hungry. It
looks rather repulsive until I get hungry. If you have just eaten and you see a food and you get a craving
to eat it, this is a good marker.

Insulin is not that mysterious. It's a part of our physiology. All of these things are connected via our
central nervous sytem. When you have an insulin secretion, your entire bloodstream empties of all
nutrients which directly induces hunger. The fact that you feel hunger is a sign that you have secreted
insulin.

Your five senses are all connected via your central nervous system so when you experience food with
one of these senses, your nervous system conveys the signal to the pancreas to secrete insulin because a
meal might be coming. Your body will never be unprepared.

Our problem is that our bodies are overprepared, if you will. They know our history so they have to
make sure they don't get caught unawares.

feckless Wrote:
Charles Wrote:
Diet sodas and artificial sweeteners cause us to secrete insulin in anticipation of the sweetness. It makes
no difference that there are no carbohydrates present in these substances. Insulin is the problem, not the
number of carbohydrates.

Is there some way to can tell if a food is triggering insulin. Is there a feeling or symptom associated with
it. For instance, if I have a cup of black tea with a tiny speck of stevia, even though there is virtually no carb there, I will have a strong craving to eat afterwards that will last quite a long time. But I test blood sugar readings and they do not drop, so I'm not sure if the cravings = insulin release.

I'm just trying to figure out the best way to learn how foods affect me.

Sorry Feckless, I know its been awhile since you posted this.

I also feel hungry after tea or coffee and I interpret that as insulin release. But I don't test my blood sugar so I'm not sure that's what actually happens. I have been assuming I am hyperinsulenic because of this feeling. My hunger feels like hypoglycemia. It doesn't happen as often as it used to and I can go longer between meals now that I'm zero-carb. Another clue of hyperinsulenia is that I am holding on to some abdominal fat.

It bothers me to hear that you feel this hunger after tea but your blood sugar is ok because that probably means my blood sugar isn't low even though it FEELS like it is.

Here is what I think it means, and someone correct me if I'm wrong: Feckless and I are hyperinsulenic but our blood sugar doesn't lower because we are also insulin resistant so all that insulin we are releasing doesn't lower our blood sugar and we feel hungry because our insulin resistant muscle cells can't receive that blood sugar (after its been converted to usable fuel of course) for fuel so those cells scream "hunger".

This is how I work stuff out in my head. I not only have to read it but I also have to write it out to fully understand. If I could see a cute little diagram or flow chart that would be helpful too.

A better test if one doesn't have type II diabetes would be insulin levels not blood sugar levels, right?

LeMagnen wrote, "it's not a paradox to say that animals and humans that become obese gain weight because they are no longer able to lose weight."

Insulin resistance starts long before you gain weight or show any other symptom of metabolic syndrome. The chronically-high insulin levels over time promote more and more fat storage as the fat tissue gets increasingly sensitive to insulin so that the smallest amounts of insulin promote fat storage even though our cells need the energy contained within it.

When people stop working out and have trouble repeating their workouts or reclaiming their youthful shape, this is a good example of a "little insulin resistance." For instance, when I was young, if I got out of shape, I could just start running regularly and I was right back to where I was the year before. As you get older, it gets harder to do this and you have to work out more and more. This is all due to insulin resistance. It is progressive and it only gets worse.
The correct diet does not require one to exercise to be lean. I workout far less than I did the past two years but I am much leaner.

The longer one has been obese, the harder it is to overcome it.

I don't know about you all, but I just love Dana! Great information. The next time I get an e-mail from someone inquiring about why I don't eat grass-fed beef, can I please forward it to you to answer for me?

We have a local barbecue place here called the Q-Shack and they only use local grass-fed beef. There is simply no comparison between them and the cheaper grain-finished ribs I buy at Wal-Mart. The cheaper ones taste so much better. I understand this much better now due to your explanation.

Hey, if people have developed a way to provide beef more inexpensive to a greater number of people, they should be commended not scorned. I feel for the poor animals as well but they just don't compare to people. I would gladly trade healthy people for animals who have to endure a little unpleasant fattening prior to their slaughter. There's no debate.

Save the animal? I say, save the people!

Very, very close to perfect, Deanna!

You feel hungry because the insulin secreted was excessive. All of your cells are not resistant, but a significant number of them in your muscles are resistant. The high insulin keeps your muscles primed to burn glucose but there is none coming in your diet. Your liver and your muscles have glycogen but they are not giving them up. Your cells scream "glucose" because insulin has primed them to be this way.

If you add glucose, you will feel better but you will re-enter the vicious cycle and set yourselves back to where you were and quite probably make your resistance a little worse.

In short, you control the "hypoglycemic feeling" by furthering the fattening process; i.e., feeding the addiction. You have to break the cycle by not providing more glucose until your pancreas gets the message loud and clear that none is coming and there is no reason to hypersecrete, which is the opposite of how you got there to begin with.

Regards,

Charles
tissue or other tissues? And they need to get broken down by LPL again to get into tissues, so if insulin is low, how does LPL get stimulated, if any? When fatty acids move out of fat tissue, do they go directly to other tissues as fatty acids or first reassembled into triglycerides and if that's the case, how do they get reassembled?

Basically, I'm trying to figure out, once and for all, how fat whether dietary or bodily, is stored, used up, deassembled, reassembled, distributed in the body in people who are not consuming any carbs?

Charles?? Anyone?!

Thanks.

**RE: Zero Carb / Meat and Water - Charles - 08-19-2008 01:56 PM**

Kristi31 Wrote:
On zero-carb, how is fat metabolized, used and stored?

This is a good question and I keep meaning to do a series of posts that I will pin somewhere that describes the different cycles in metabolism such as Krebs and Randle.

On a zero-carb diet, when we eat meat, the majority of this is fat so it is broken down in the gut and immediately transported to our adipose tissue. This stored fat will provide about 75 percent of all energy we expend over the course of a day. Oleic acid is the monounsaturated fat in meats and it is a triglyceride. Triglycerides are three fatty acids and one glucose molecule. On a zero-carb diet, the only ones come from the diet.

This triglyceride goes to the liver and undergoes de novo lipogenesis (the new creation of fat in Latin). This process can also happen on a limited basis in adipose tissue itself. Lipogenesis is always regulated by the state of nutrition. It happens only minimally on a zero-carb diet.

The triglyceride is broken down and added to the circulation. The glycerol molecule gets re-esterified when it enters and exits fat tissue into a triglyceride.

With that background, your questions:

Kristelle Wrote:
From what I understand, triglycerides (dietary fat) are eaten and then broken down to fatty acids in the digestive tract thanks to bile and pancreatic enzymes. These fatty acids end up in the liver and then what? Do some just go directly in the blood and fuel certain tissues that need immediate energy?

The majority of the dietary fats are broken down and go to fat tissue before being used as fuel. Only the few triglycerides found in the meat will go to the liver and this is a small amount. The liver sends them to the circulation where hopefully some tissue or muscle will take them up for fuel. If not, they return to the fat tissue and ultimately back to the liver where they are repackaged, sent out on lipoproteins and shipped back again to the fat tissue.

This storage happens in widely scattered adipose tissue sites with the stream of nutrients flowing in widely fluctuating amounts, first in one direction and then the other in a finely adjusted minute by minute response to the fuel requirements of energy metabolism of the whole organism..

On a zero-carb diet, fewer fatty acids are bound up into triglycerides and more of them remain free to
escape our fat tissue to escape into the circulation. As a result, we have a high concentration of free fatty acids in our circulation and very little in our fat tissue. We should keep it this way!

Kristelle Wrote:
Do some get reassembled into triglycerides and how so? Then these triglycerides go where? Only adipose tissue or other tissues?

Triglycerides are always being broken down and reassembled as they move through fat tissue. The same fatty acids don't get reused to reassemble the triglyceride. It's whatever three happen to float by. As long as there are glycerol molecules present in the circulation, triglycerides will be bound. However, this happens very little on a pure zero-carb diet. They generally are only found in the circulation, the fat tissue or the liver. This lasts until some tissue, organ or muscle takes them up for fuel.

Kristelle Wrote:
And they need to get broken down by LPL again to get into tissues, so if insulin is low, how does LPL get stimulated, if any?

By the muscles and their need for fuel in the form of glycogen. If the muscles request fuel, then LPL activity increases there and decreases in fat tissue. When the activity of the muscle is finished, then the LPL activity slows and the LPL activity in fat tissue increases to replace the lost fatty acids. The glycogen contained in the muscle is spared because low insulin primes the muscles to only burn fatty acids thus "sparing" the glucose found there.

Kristelle Wrote:
When fatty acids move out of fat tissue, do they go directly to other tissues as fatty acids or first reassembled into triglycerides and if that's the case, how do they get reassembled?

Yes, they go through the circulation as free fatty acids and basically all nutrients in the stream, fatty acids, amino acids, glycerol molecules, etc, are offered to every tissue, organ and muscle. Some of the free fatty acids get grabbed if there is glycerol molecules available because they have to be esterified in order to enter and exit adipose tissue due to their size. Once they are inside, they are broken down again. When they exit, they are broken down again. The triglyceride binding is only needed to get the glycerol through the adipose tissue. When glycerol is in the circulation, it can ride on lipoproteins.

Kristelle Wrote:
Basically, I'm trying to figure out, once and for all, how fat whether dietary or bodily, is stored, used up, deassembled, reassembled, distributed in the body in people who are not consuming any carbs?

This is basically the mechanism. If you add carbohydrates then you get the glycerol phosphate molecule which will link fatty acids together and is an essential component of fat metabolism regulation. Keep insulin down and there is no fat storage except for the minimal amount that comes about through diet. Of course, if a women were to get pregnant, then her sex hormones would act on the system to urge insulin to store fat. However, no other hormone can fascilitate fat storage except insulin. All other hormones work to mobilize fatty acids.

The ability to store fats is important because as I've noted before, we are hyperphagic so we tend to store a large percentage of fatty acids during the day and we live on these fatty acids at night. Therefore, in the morning, you should weigh the least and during the late evening, you should weigh the most. If you weigh yourself at 3:00 a.m., you will likely weigh a couple pounds less by 7:00 a.m.

That doesn't mean that we expend all our fatty acids during the course of a day. Even a person with very
little body fat always has enough fat to walk from Miami to Brooklyn. Hunger comes as a result of the stream showing signs of faltering. Therefore, the appetite is stimulated via the central nervous system to prompt us to search for food. The gut only plays a role in digestion. It's not the case that we are hungry due to our "empty stomach."

Regards,

Charles

You know Con, I was just thinking about this very thing today. I'm serious, I had these same thoughts. I personally believe (and this may depress some of you) that this is a sign that we have arrived to biological zero when we view food in this way.

I look at food merely as fuel and I think it's a good thing. I don't particularly view it as "yummy" or memorable unless I was seriously hungry at the time I ate it. When I dip my meat in fat, it's not so much that I enjoy the taste of the fat, but I like the effect on my body when I eat this way. I'm not saying it's nasty, but I'm saying that each meal is not really memorable where I would describe it in glowing terms. Food has just become fuel and no more pleasurable than brushing my teeth.

When I am hungry, I eat the food and it's very good. When I'm full, it's detestable. It literally turns my stomach to think of eating because I'm perfectly satisfied.

I've described us as BMW's and if you think like that, a car does not really care about the texture or the "taste" of fuel, it just needs high-quality fuel, (preferably detergent added) to run perfectly. That's the way I view my food.

So now, the question is, what do I do with all the mental and physical energy I used to put into food? You have to use your new imagination! You should have more energy, a clearer complexion, stronger hair, six-pack abs, more stamina, etc. This should make you more active, more interesting, more dynamic, etc.

Need I say more?

Regards,

Charles

Con Wrote:
This is so interesting because I have just given up everything-I mean there is nothing left to give up eating!!
No more salt and no butter or any spices. Five lbs came off within 3 days so there was a big change in my body. But there was also a distinct change in the appeal of food to me-that is there's not much appeal left! I don't look forward to eating and when I do eat there is no pleasure connected with it like there used to be. None of my senses shouts with joy when I think about eating or when I eat. It felt very sad-- like the end of something great. Can I continue with this? Have I FINALLY given up the totality of my drug/my addictions?

Yep. Happened to me as well. Food does not taste the same nor have the same appeal. But I don't think that is a bad thing necessarily. Food is just fuel these days. Nothing more. Nothing less.

RE: Zero Carb / Meat and Water - jeepifer - 08-19-2008 02:38 PM
I had to laugh at my Pavlovian response to some microwave popcorn this afternoon. You know how in an office environment the smell travels? My mouth literally started watering. And I don't even like the stuff! 😜

RE: Zero Carb / Meat and Water - suzanneyea - 08-19-2008 04:39 PM

I still enjoy eating and love food, but the big difference is I do not eat for emotional reasons anymore.

RE: Zero Carb / Meat and Water - Kristi31 - 08-19-2008 04:41 PM

I finally got some beef fat, about 3 kilos, from a butcher. I'm good for at least a week. I just don't "dig" bone marrow. Fat hunger has returned! I'm gonna try some lamb from New Zealand with that...fat first and then the lamb.

They had all kinds of other stuff too, like pork stomach, veal lungs, lamb from New Zealand, a variety of organ meats from all kinds of animals, pure duck fat. You name it, they had it. And if they happened to not have it, then just ask for it and you'll get it. They also had regular ground beef, 30% fat and other fatty meats like shortribs. While I was there, they were actually butchering a pork, from neck to feet...it was huge! I'm in love with the place! And one the guys working there...well, he was pretty cute too! 😊

RE: Zero Carb / Meat and Water - nyteez - 08-19-2008 04:44 PM

Quote:

I like to put it this way....I used to live to eat, now I eat to live. To me it is so liberating!

RE: Zero Carb / Meat and Water - nyteez - 08-19-2008 05:51 PM

I found a great page on the biblelife site on beef. It pretty much backs up what I said about grass fed vs grain.

http://www.biblelife.org/beef.htm

RE: Zero Carb / Meat and Water - suzanneyea - 08-19-2008 06:16 PM

Am I the only one who has no clue what my dinner ate for dinner? I buy based on price, what my cow had for his last supper really never crossed my mind.

RE: Zero Carb / Meat and Water - cbnebraska - 08-20-2008 03:52 AM

No, you're not the only one. I don't either and honestly, I can only get on so many bandwagons. I can't be running around trying to find special stuff. I'm going to have to hope that taking out carbs is good enough. It's certainly better than leaving the carbs in and eating "organic". I have a friend who is obsessed with the label of "organic". I just haven't gone there. Now, it really only matters with what I
feed my kids anyways, and I'm trying to turn them into mostly meat eaters, so I've got enough on my proverbial plate right now!!! Maybe that's a task for me once I get this all under control...

RE: Zero Carb / Meat and Water - poo123 - 08-20-2008 05:39 AM

WooHoo, down 3 pounds this week!!!! And when I buy my meat, its on sale and its the ones with the most fat. I really don't care, grass, grain, organic, or what ever. It tastes great and does the job...alison

so funny... no, you're not alone there. I always get the cheapest. I don't think it matters much in the long run what the animals were fed before we eat them.

RE: Zero Carb / Meat and Water - MirMir - 08-20-2008 06:16 AM

Wow am I feeling better already!

I'm working on going zc, meat and water. So yesterday I did have two eggs because I had nothing else in fridge. But last night for dinner I have a wonderful pork steak, lots of fat. Since my brother threw out my bacon fat I had to cook it in olive oil but I added some water at the last minute and made a wonderful topping which I poured over my meat.

I've always loved meat but grew up with the eat your veggies mantra. I'm also not as hungry.

RE: Zero Carb / Meat and Water - daveo - 08-20-2008 07:34 AM

Just wanted to check in and say things are going great! Feeling keto-adapted, losing weight, life is good 😊

I told me dad what I was doing and he basically thought I was killing myself, and made me promise to go get checked out by a doctor in 90 days to make sure my liver and kidneys haven't exploded. So, I'll go do that and let you all know the results 😊

RE: Zero Carb / Meat and Water - KimPossible - 08-20-2008 08:01 AM

me checking in too...have lost back down to about 3 lbs above vacation weight...and that came off fairly quickly. I've been hovering around the 164 mark for abotu 4 days...I started orienation this week and the schedule I'm on is a drastic change. Anyone have ANY ideas for a quick bite without straying from ZC? I cooked up a whole bunch of beef patties to have on hand but left home this a.m. w/out grabbing a couple. I have one here in the fridge at work, but I'm already hungry...I just grabbed a SB protein bar. Surely there's something better out there?

Also...got home around 9:45 last night, got the kids in bed (yes, it's been late nights for all of us) and
was hungry, not having eaten since about noon...(not famished--that was the first I felt hungry or even thought about eating) so I had two hamburger patties (w/condiments...haven't given those up yet). Was skeptical as to whether I should or not....the whole "don't eat after 7" or right before bed thing. I went to bed about midnight finally and woke up a half pound lighter.

So does eat when you are hungry apply to night as well? I would love to catch up but it will be impossible now that school has started...I hope everyone is doing well!

lynhopes Wrote:
I was wondering that too. Here in Ireland cows sit around in the fields all day and obviously eat grass. What happens in America?? Do they not lie around in fields?

I can't speak for the States, but in Canada (at least in Ontario) you see cows (and sheep, etc) out grazing if you're out of the major metropolitan areas. This has been a tough issue for me bc I care very much about animal welfare (hey, I'm an animal too IMO), and much of the info I end up hearing has a U.S. slant. I'm sure we have feedlots here as well, but we also have a lot of farmers and it's easy to buy directly from them. I don't mind grain-finishing, I do think it tastes much better (though I've had some nice grass-fed, it's way to spendy-trendy and not worth paying extra for). It does bug me though that grains aren't a good food for the cows...I know what grains do to me. But like someone else mentioned, we do what we can.

So my 'do what I can' is buying from farmers as much as possible, and supplementing with grocery-store meat. I am lucky in that I have a weekly farmers market a block from my apartment, stocked with plenty of meats. I get bison, beef (they even have hearts), sometimes chickens, eggs and sheep cheese/dairy (if I want it). There's another one 10 minutes away that has all sorts of meats, including game meats like elk and wild boar. The people selling the meat raise the meat, or work very closely with those that do (many farms form co-ops of sorts and get their wares to market through a single source, usually a larger farm)

There's a store I haven't been to yet, but have checked out and communicated with online, that sells Mennonite wares - meats, produce, preserves, etc. If you're not familiar with Mennonites, basically they're 'old fashioned' ppl, using horse-drawn wagons, traditional methods of cooking, rearing animals, farming etc. It's pretty funny, actually, bc you can place an order online and then pick it up on their delivery days - from people who generally don't use much modern technology. Love it. Anyway, your post just got me thinking about this stuff. I think buying locally is more important than organic, or grass-fed, or what-have-you. I like buying my nourishment from the people who cared for it, and who depend on it for their livelihood.

Charles Wrote:
Insulin resistance starts long before you gain weight or show any other symptom of metabolic syndrome. The chronically-high insulin levels over time promote more and more fat storage as the fat tissue gets increasingly sensitive to insulin so that the smallest amounts of insulin promote fat storage even though our cells need the energy contained within it.

So insulin resistance then is a prerequisite for weight gain? I'm just wondering about my own status, really, as I've never checked my blood sugar or anything. I assume that bc of my high carb intake, I was developing resistance. I gained about 30lbs over my 'ideal' weight, no clue if I'd have kept gaining or not. I suppose it doesn't matter, as one can have MS without gaining an ounce. Whether I'd gained more or not, I imagine I'd have eventually developed full-blown MS had I kept eating the same way (plus other problems resulting from gluten, etc).
I was listening to a recorded conversation between Mercola and Bruce Lipton (a cell biologist busy busting the whole genetic determinism thing, very cool guy), and Lipton brought up caloric restriction/longevity studies as a way of demonstrating that genes don't determine lifespan, etc. Mercola corrected him by pointing out that the mechanism behind the increased longevity was low levels of insulin (ie: proper, natural levels), not low levels of food. That's really the trick, isn't it? All this talk all over the place about superfoods, vitamins, exercise, etc etc ad infinitum, and really it comes down to keeping insulin in check. Do that, and you're pretty much there. Don't do that, and it doesn't matter what else you do bc it won't compensate.

con Wrote:
None of my senses shouts with joy when I think about eating or when I eat. It felt very sad-- like the end of something great. Can I continue with this? Have I FINALLY given up the totality of my drug/my addictions?

You know Con, I was just thinking about this very thing today. I'm serious, I had these same thoughts. I personally believe (and this may depress some of you) that this is a sign that we have arrived to biological zero when we view food in this way.

Funny, I was thinking about this too! I felt really sad when I had to give up gluten grains. Seriously sad. Like, for several days. My sister had the same reaction. Really, it was like withdrawal. I got over it. But these past few days I've found myself getting a little grouchy about eating. Bleh, boring, ugh. No joy in it. This really clued me in - food is NOT entertainment. It's not something we use to occupy our time. It's nourishment. And I realized that still, I have a tendency to look to food to amuse me, or as a companion to another amusement (like a movie, reading a book, etc)

I spent this weekend alone - everyone had gone away and I couldn't go along. Fine by me - books to read, movies to catch up on, writing to do. But I found myself battling against a binge. I wanted to plop down in front of a movie or two and munch out. I even got online and started ordering a gluten-free pizza - but the page wouldn't load! I tried several times, and took it as a sign (gift?) that hey, I was living out an old, unhealthy pattern and to quit it. Still, this mental thing was there, so I ate a bunch of cow's cheese. And got stomach pains for three days 😞But I felt this "there...I had a little binge. Now I'm happy" feeling, and it really gave me pause. What's that about? Why after all I've learned and experienced do I still get this urge to use food to entertain me? It doesn't happen often, but since going VLC I think I'm having some sort of...withdrawal?

I like thinking of food as nourishment. But I also recognize the need to feel enjoyment - I just think for a lot of us, our enjoyment scale is off-balance due to years of misuse. We're re-learning, like Stefansson did, how to enjoy our food. I'm really looking forward to this, to creating new connections in my brain as to what constitutes a 'treat' food. I had a 9oz bison t-bone yesterday, smothered in butter with a bit of sea salt and HP - OMG, now that was a treat. I am diving into a few cookbooks (the meat sections!) and learning about different cuts and how best to prepare them, how to make rich butter sauces or egg/oil-based sauces, how to use spices and herbs in different ways (I am ok with herbs/spices). I am going to expand my meat selection to include more fish, just for interest (I have a great Jamie Oliver book that is very detailed about fish and how to cook whole ones). I think, if you want to reclaim some joy, getting creative and playing within the realm of VLC/zero carb can help. There is hedonistic, sensual joy in a pancetta-wrapped chicken breast, a smoked brisket, a beautiful cut of beef pan-grilled and doused in herb butter, tender fatty lamb scented with cumin or rosemary.

Wow, I'm long-winded today. Sorry.
I actually came here to mention something about the whole raw meat thing. I ground up a cow heart for my kitties yesterday, and had this strong urge to eat some. I had an ice cube-sized serving, raw and cold, and wow - it was really, really good. Next time I'll buy two, and use half of one in a tartare. Seriously, it was delicious, and the texture was gorgeous (the colour is fantastic too). Kristelle, ever get any heart? (actually, first time I ever had beef tartare was in Quebec City, and I've been meaning to give it a go at home ever since.)

---

RE: Zero Carb / Meat and Water - abnormalslc - 08-20-2008 09:56 AM

Wayward....

Beef heart is very good.

We used to have fresh hearts and livers, back in the day....

Boil the heart and slice it....mmmmm too good for the kitties.

pan fry the liver with some onions.....yummy to the max! (I only like the hours fresh liver....not the store bought stuff.)

---

---

RE: Zero Carb / Meat and Water - Kristi31 - 08-20-2008 10:17 AM

Yes, I've eaten raw heart on many occasions and from many different animals like bison, lamb, goat, beef. Isn't particularly good but not bad either. The texture is good, yes! Oh...but I remember this one time, when I ate slightly cooked lamb heart and that was delicious!

My favorite organ meats are liver and kidneys. I like tongue too. Brain tasted bland to me and thymus is ok.

So, this morning, I started eating some of that beef fat I got and it didn't taste that good. So I slightly cooked a few bits and OMG! it was out of this world. I even seared the outside of my lamb and that was amazing too. So, I think I might cook my fat and meat just a little to give it added taste. And besides, I think our Paleolithic ancestors probably ate at least some of their meat and fat pretty warm because they would have probably eaten some meat from the animal immediately after it was killed.

This exact issue is the problem my husband is having with my new attempt at near-zero-carbing. Although I am ready to move on from food being a diversion, he is not. He is the cook in the family and has always enjoyed preparing great food for me. I will say we have both been low carbing together since the start of 2007 (although I have eaten LC for close to 9 years with a few relapses along the way) so the food he fixes for us has never really been outside a LC realm. Now that I'm stepping away from dairy, vegetables, artificial sweeteners and LC substitute foods, he is not really too happy about it. His main issue is that I'm not "overweight" so why am I doing this? It's true, I'm not overweight, and neither is he, but I would like to be the thinnest I can be while still being healthy AND, more than anything, I want the obsession with food to be gone. I wasn't able to shake it when I was LC, and now I feel I'm finally getting somewhere. I want to put the energy into other things. Herein lies the problem -- what? Actually, it's not so much me personally because I have TONS of hobbies and pleasures, the issue is really what we can do together. He is more of a homebody who doesn't really have any hobbies other than cooking, his daily workouts and spending time with me and the kids - at home. He really enjoys the bottle of wine we used to share a couple times a week and really resents me not wanting to enjoy a few glasses with him. He does enjoy watching TV, which I absolutely do not, so we come up short on quality together time - at home. I would gladly grab the kids and get out and about more together, but he's a homebody. This has ALWAYS been a struggle for us, but it's just that me taking food & wine out of the picture is complicating things even further. Please know that we are happily married and he is wonderful in the way that he cooks exactly the way I ask him to and supports me almost fully, it's just those last few carbs he resents me giving up.

Okay, I was long winded too, but I'd love to know if any of you have spouses that come into the VLC/ZC picture and if you have any similar experiences to mine?

---

RE: Zero Carb / Meat and Water - suzannevea - 08-20-2008 12:23 PM

Have you been reading my journal? I am struggling with my zero arb diet and my husband too.

Kristi31 Wrote:

I finally got some beef fat, about 3 kilos, from a butcher. I'm good for at least a week.

I can't identify with all that, Kristelle, but I did get my beef fat from the Harris Teeter Grocery Store butcher. He gave me 5 pounds of beef fat for free:

The Wal-Mart stuff was $3. The Harris Teeter beef fat was free. I'll be visiting that store more often. However, they are expensive on many things and their meat is excessively lean. Now, I know why! It never occurred to me that even at the grocery store they trim these meats before putting them out.

I know, Dana is probably cracking up at my naivety with meats, but I'm telling you, I just never paid attention to how the meat got into the plastic with the price on it! I'm willing to bet that if I ask them at Wal-Mart, Costco or any other store with a "meat department" they must trim their steaks and stuff as well. They all must have fat that is just going to the garbage, or to "cosmetics" as the guy at Harris
Teeter told me.

KimPossible Wrote:
So does eat when you are hungry apply to night as well? I would love to catch up but it will be impossible now that school has started...I hope everyone is doing well!

I don't think it applies as much at night because we live on the fat we've stored throughout the day. The evening hunger will vanish usually before you go to sleep. I try to eat the lightest meal at night. If I eat too much at dinner, I'm usually up a pound in the morning. However, if I do it right the next night, I'll be down 2 the next day. This kind of thing shouldn't worry anyone, it's just a normal fluctuation that happens. This is similar to what I mean by "overfeeding." Overfeeding is not really that harmful because any weight you gain by eating too much meat will generally vanish once you return to eating to appetite.
As far as "eat when you're hungry" goes, I am not of the opinion that one should eat just anything when they are hungry. I know, I told you to eat when you're hungry, but there is nothing wrong with going on a fast for a few hours until you get the correct food. Besides, this is what you do at night anyway. I will typically wait until I get the right food rather than just relying on something to "hold me over."

Don't get me wrong, I'm not urging you to make yourself ill, but I find personally that my hunger pang only lasts for a few minutes and I can ignore it if I choose to. This might sound like an intermittent fast and in some ways, I suppose it is. I'm just arguing that we should be able to go long periods of time without eating if we choose to and there is nothing unhealthy about it.

That doesn't mean you should make this a regular part of your regimen because of the need to condition your pancreas. On the other hand, you have to live in the real world and if proper food is not available, you might just consider going without until you find it. If you choose to do this every now and a long then, you have my blessing! 😊

Regards,

Charles

RE: Zero Carb / Meat and Water - Kristi31 - 08-20-2008 02:08 PM

I got my beef fat at 3.99/kilo but good enough.

Interestingly, I was watching "The Human Animal-The Hunting Ape today ([http://tinyurl.com/557m4b](http://tinyurl.com/557m4b)) and Desmond Morris, the host, said that humans cooked their meat such that it was similar to fresh meat they would have eaten after a kill. That's why rare meat (as opposed to well-done or RAW) tastes the best or why slightly cooked fat tastes so absolutely fantastic! I came up with that same explanation earlier today to only have a zoologist later confirm it. Cool!

I came up with that idea because for one, I didn't really enjoy eating the fat raw and the meat raw was ok but definitely better cooked. I wondered about that...why is it that cooked fat and meat, up to a certain extent, taste better than raw? Then, I remembered watching on TV either surgical interventions on humans or animal kills where the fat looked most like it would if slightly cooked and the meat kind of tender and red or bloody, similar or almost to rare meat. Bingo! I reckoned we probably ate at least some of our meat back in the Paleolithic times when it was fresh right after a kill, like lions and other carnivores would. That meat is obviously warm due to the animal's body temperature. So there you go...Glad I got that figured out! 😊

Now, I don't feel guilty eating my meat a little cooked and the major bonus is that it tastes FINE! Especially the fat...I did have fat hunger all along just not for RAW fat. Dilemma solved.

waywardsister Wrote:
So insulin resistance then is a prerequisite for weight gain?

Not necessarily. I was just writing about how we get fat during that particular quote you used. Insulin resistance just leads to higher levels of insulin initially. We don't usually know about it until we put on some pounds, if we're lucky. If we're not so lucky, the celluar damage gets bad enough to allow free radicals to accelerate the progression of other diseases of civilization and we don't get fat. If we exercise
like fiends for years and years, we can forestall the obesity while working on the other diseases of civilization which happens with world-class athletes like Alberto Salazar, one of America's greatest marathon runners, who has heart disease yet is skinny.

waywardsister Wrote:

RE: Zero Carb / Meat and Water - Kristi31 - 08-20-2008 02:31 PM

Further to my earlier post, it just dawned on me that, during Paleolithic times, seafood would have been eaten at a colder temperature (coming from the ocean or even lakes and rivers) than meat and that's why raw fish tastes good as opposed to fatty meats. Everything is making so much sense now!

Charles, looking good...as always! 😊

RE: Zero Carb / Meat and Water - con - 08-20-2008 02:47 PM

HMMM...I'll take the guy in the mirror
I used to cook great dishes and would get offended if people wouldn't try them(could care less about their health issues) and looking back what I really wanted was emotional feedback --like compliments etc.
It's easy to forget how emotionally conditioned we are to the rituals surrounding food. We are seeing these great results in our bodies but the spouses are making it all mean whatever they want to believe e.g. you don't love me any more or we don't share the same values/interests any more.

I think if I were at a good weight and healthy, I'd probably compromise a little maybe give him 5 carbs a day or so. Or we could negotiate for a sip of wine?
hee hee😊
Con, I agree with you. I am a chef (not working right now because of the kids), and I loved to cook. Now I used to cook for the joy other people eating it would give me, I loved the smiles and oohhs and ahhhs, this is great...on and on. Now I hate cooking, I want to get rid of most of my stuff because its getting dusty and its in my way. My husband eats very little and the kids don't care about food one way or the other, so I will be figuring what to get rid of really soon. I can use all the extra counter space for crafting....alison

It's funny, but I can come at this from your hubby's side. I used to be more of a homebody, while my fella was an out and about kinda guy. He hated food (really! no joy in it at all), I loved food. He hated wine, I loved wine. It drove me nuts! I think it was Con who said that these things can be interpreted as a "you don't share my values" thing, and I agree, bc that's what bothered me. It was my own issue. Took awhile for me to get to the point where I valued the time we spent together more so than the details of what we did during that time. But yeah, he probably feels threatened somewhat - she's changing! Why? That kind of thing.

Now I go out a lot more than he does, and have to drag him places...funny how things change 😊 But we're verrrrrrrry different, like you and your fella (and hey, that's what makes things fun sometimes), so we have to find ways to share stuff together. Maybe if you watched some TV with him (I know, I know...my guy watches the military channel, and I now know more than I ever wanted to about light machine guns) and poured him a glass of wine, while you sipped on a sparkling water and gave him a cuddle, he'd feel a bit better? Maybe I'll visit your journal rather than blathering on in this thread, since I am very long winded today!

Charles Wrote:
I don't have a good answer for this one, however, my thing is, do you want the kitchen or do you want this...

Count me in for "this" 😁Dayyy-um!

Congrats to everyone who's feeling good and keeping on! And Kristelle, that's pretty cool about the whole meat/fish thing. Never thought of it that way.

RE: Zero Carb / Meat and Water - suzanneyea - 08-21-2008 02:23 AM

My friend is up here visiting, she is from NY state and I live in Quebec, Canada. We were talking about beef prices cause she commented I was serving very good cuts of meat at meals. Now, I buy my steaks at the local grocery store each morning and I buy the ones marked at half price, so I was kinda surprised. For a large rib eye I pay about $4, for two large rounds steaks, maybe $2 each...

Then I noticed the price on Charles' fatback, $3! I paid about 50 cents for that amount of fatback. What are you beef prices like in your area?

---

RE: Zero Carb / Meat and Water - Nicola - 08-21-2008 02:31 AM

nyteez Wrote:
I live in Northern California, we have "Happy Cows" LOL! I don't know the specific details, but basically they are pastured most of their life. It is very expensive to raise cows on grain. I don't know anybody who raise cattle on grain. You have to have a facility big enough, you have all the labor and cost of feeding the cattle daily and the expense of antibiotics. When the pastured (grass fed) cattle are ready for market they are sold. The people who buy them, grain feed for a certain amount of time. This is where you see lots of cows crowded in a small area, w/ no grass, but with big tubs of grain around. These cows are being grain fed to fatten them up and make them taste better. Cows are grain fed for one reason and one reason only, it is for TASTE. They don't get any more money for fatter cattle, they are paid by the head, not by weight. And these days all the fat is cut off!

What the cattle are fed will change the taste of their meat. Some ranchers have a secret recipe for finishing off their beef that results in an exceptional tasting beef. For example; I live by Sierra Nevada Brewery. The Brewery has a nice restaurant. They get their beef from the CSUCHico farm, their beef is finished off with a mixture that contain the same Hops, they use to make their beer.

The ranchers are laughing all the way to the bank because they are getting more money if they sell directly to the slaughter house their "grass fed beef", than if they sell to a commercial company who grain finishes the beef. This whole "grass-fed" craze is a joke!

Grain is bad for cattle, just like it is bad for us and causes the animals to be more susceptible to sickness, so antibiotics are used to keep the cattle healthy. The US has very strick rules about antibiotics and hormones used in our beef. All antibiotics and hormones are pulled well before slaughter so that no residue is present at slaughter. Cattle are tested all the time. Sick cattle are money down the drain, nobody wants their stock to get sick. Sick cattle cannot be sold or slaughtered for human consumption. So the idea, that sick cattle are being slaughtered and sold in our stores is ridiculous.

Slanker's Grass-Fed Meat:

Nicola, here's my answer:

---
If one subscribes to the idea that all foods are good for you and that chronic disease (bodies failing) is a natural thing, then you should continue doing what you are doing and what everyone else is doing. But, if you are interested in taking care of your body so that it won't fail, then maybe you should pay a little attention to modern peer-reviewed science. On our web site are links to real scientific reports by Artemis Simopoulos. She is world renown today like Einstein was in his time except her field of focus is nutrition. You can thank her for all the talk about Omega-3 fatty acids that started back in the 1980s. Yes, she's the one. The only reason Omega-3 fatty acids are something folks talk about these days is that Artemis discovered that certain fats are essential for all animal health and the American food system was deficient in one very important essential fat. The reason that occurs is because man invented grain farming and grain is deficient in the Omega 3 fatty acid. So, the more grain-based our food system has become, the more body failures there are in the general population. Every chronic disease you can name is a body failure and every one of them can be traced to eating grain. Even obesity and early maturity in children comes from eating grain.

Now lots of folks doubt that, but millions of animals every year are fattened on grain and are made to mature earlier by being fed grain. But nobody takes all the millions of experiments on animals of all types and relates it to people. (Like for instance, why are veterinarians so busy treating pets with the same diseases that people get?) Not being able to relate these facts together is pretty dumb, huh?

Grass-fed meats taste they way they do because they are loaded with Omega-3 fatty acids like all animal bodies are supposed to be. Also, they are loaded with vitamin E, vitamin A, Beta Carotene, CLA, and the list of nutrients go on and on. All these very important nutrients have flavors. Grain fed meats are low in these very important nutrients and therefore the meats are flavorless. You can say, correctly, that all grain-fed meats are anemic.

Now you can sneer at grass-fed meats all you want, but when I look at Joe Six-pack, I usually see a pretty sick, overweight fellow. But people take on their growing loads of chronic diseases as signs of maturity. In other words they are proud of their sicknesses! And in time if you eat grain, grain-based foods, and grain-fed livestock you will be just like the Joe Six-packs. But I have a different goal. I am focused on quality of life and my body is important since it's what carries me around.

Our web site is loaded with information. Go to the Omega-3 Essay section. [http://slankersgrassfedmeats.com/focusing_on_nutrition.htm](http://slankersgrassfedmeats.com/focusing_on_nutrition.htm) Go to Science Links. [http://slankersgrassfedmeats.com/science_underscores_grassfed_meats.htm](http://slankersgrassfedmeats.com/science_underscores_grassfed_meats.htm) Check out the reports by Artemis Simopoulos. And keep in mind that America's grain-based food system is feeding 300,000,000 people three meals a day. So it's not a machine that can be turned around in even a few decades. If the USDA told the truth about grain, there would be panic in the streets because there wouldn't be any food to eat in the stores. So the time for the whole truth is decades away yet. But individuals can make a difference. And until the masses are involved the grass-fed industry will be tiny and it won't have the advantages of mass production. So the real food it produces will cost more. Maybe to you, money is more important. So be it. But before you shoot your mouth off much more about grass-fed meats and expose your tremendous ignorance, why don't you look over the fence (read the scientific literature) and then maybe you'll understand why some of us are focused on changing our taste buds to accept our new foods.

There is too much more to tell you, but your reading assignments are already probably beyond what you're willing to do. Plus over the years I've found that trying to educate folks with their heads firmly planted in the sand is futile to say it mildly.

According to Dr. Eades, the amount of Omega-3s in grass fed meat is not that high versus grain fed. In addition, the ratio of Omega 6 to Omega 3 may not be as important as the blood level of Omega-3. See Dr. Davis' blog to confirm. It takes more than one scientist's work to confirm an hypothesis. The Japanese have high blood levels of Omega-3 because they eat fish. Not because they eat beef. Are there any randomized controlled studies to back up these facts? The other thing to consider is that even though someone is eating grain fed beef, which is worse, humans eating grain fed meat or eating the grains directly? As much as I would like to buy Slankers arguments, he is a purveyor of goods. He makes his living off of selling grass fed products. That makes any proof given by him suspect. I didn't say wrong, I said suspect.

Also on his science site, he has a reference to Cordain. From what I have found out recently, I don't believe much Cordain has to say anymore. At one time he claimed Paleolithic man was a vegetarian. Now he has changed his tune.

RE: Zero Carb / Meat and Water - abnormalslc - 08-21-2008 12:03 PM

I finally reached 80 pounds lost!
I have been attempting ZC/VLC for just over 4 weeks and FINALLY reached the elusive 80!
I have not been completely faithful every single day, but I am working on it. I sometimes have reverted back to simply living low carb, but always return to VLC. I also drink diet soda....even with aspartame...I am still a work in progress...

Charles....you do not realize what an inspiration you truly are. Sometimes when I look in the mirror it seems that I can actually see where my 6-pack is going to be! ....it must be my imagination....😊

***edited to add..when doing meat only....I also eat pork rinds....various flavors..I am not quite ready to give that up yet...

What's wrong with pork rinds? They're a meat product. Just avoid the flavored ones with sugar added.

RE: Zero Carb / Meat and Water - aldiemincey - 08-22-2008 03:23 AM

I've been following along for over a month now and feel compelled to introduce myself and express my
gratitude to Charles et al for the selfless share of knowledge and relentless support.

For the past 4 years, I've intermittently suffered from chronic fatigue. I think that I have done much
damage to my digestive and "blood sugar management" systems through my idealist, albeit naive, forays
into raw vegan and macrobiotic diets.

I have been 0-carbin' (80-90% fat + 10-20% protein, sans dairy or eggs) for the past 4 weeks. I think that
I've developed hyperinsulinemia, as I still suffer with persistent global muscle fatigue, brain fog and
minor headaches. At the onset of 0-carb, I had hoped that a bit of low-intensity rebounder exercise
would help. Whoa, was I off the mark; 30-mins worth left me bed-ridden for the following 2 days with
extremities that felt like lead weights. I haven't repeated that mistake since.

Some days are better than others, and often, appreciable relief is experienced for up to an hour after
eating. I trust that my condition will steadily improve with continued commitment to 0-carb. Unlike with
my past and varied vegan attempts, I am rarely hungry. As the fatigue and mental haziness are constants, I assume that I need to eat when the fatigue and muscle soreness worsen and the haziness progresses to a slight headache. I never have cravings, and like many of you, have experienced satiety like never before. For the first 2 1/2 weeks, I ate about 3/4 lbs of 73/27 hamburger, in addition to some overt fat (e.g., beef tallow, pork fat back, bacon) 3-4x/day. Hoping to help tame the insulin, I have been eating smaller and more frequent meals, while maintaining same total volume/day. Interestingly, I feel best in the morning before breakfast and feel the worst about 60-90mins after each meal. I must report that I have been sleeping through the night for the past 4 days and no longer waking up in the middle of the night.

Not incidentally, I picked up ~10 lbs of beef fat trimmings from my butcher this morning. See, I've been reading, absorbing and practicing.

There's my frustrating but seemingly not uncommon story. Having introduced myself, I won't feel like a voyeur 😊I look forward to sharing this journey with you. Much warmth. -Aldie

Welcome, nice to meet you! My comments would be that 80-90% fat seems high to me. I shoot for more like 35-40%. If you're eating 73/27 beef, once it cooks, you're looking at 40% fat or less. I think the goal here is to replicate the ratio of meat to fat that would be found on an animal. Animals are not 80-90% fat, so I'm thinking that's too much. My understanding is that protein is muscle food - if you are feeling weak, I'd up the percentage of protein. It does sound like you're making progress, for sure, but I'm sure you're frustrated with the time it is taking. If you've been all over the map with your eating and are going "cold turkey" on all your previous foods, your body will take longer to adapt than those of us who are simply moving to zero carb from low or very low carb. Have you given up something else, like caffeine, that could contribute to the headaches? Congratulations on the sleeping well too. That is just so VERY important!

RE: Zero Carb / Meat and Water - MirMir - 08-22-2008 06:30 AM

Hi Charles,
Thank you so much for your insights about all the meat and water way of eating.

I have a question for you.
As you know I just started the mostly zero carb way of eating. I still have coffee in the morning.

But, today is Friday and I am a Catholic which means no meat today. I'll have fish for dinner tonight and probably tuna fish for lunch but, breakfast will be eggs. Do you know what others do in this situation?

I have had eggs a couple of times this week and it doesn't seem to affect my fat loss.
Actually in just the few days I have been eating just meat, I can feel the fat leaving. Yay!
It's the belly fat I am interested in losing and so am hoping that over time that will lessen significantly.
This WOE is just awesome. My shoulders are getting cut and right now I am doing no exercise. (I'm 62)
Thanks, Charles.

MirMir

RE: Zero Carb / Meat and Water - suzanneyea - 08-22-2008 06:44 AM
Welcome Aldie,
It took my body a long time to adjust to low carb, then zero carb. The first month was really rough, I was ill, dizzy, tired, a total mess. I just kept at it and now I feel amazing. It just takes some of us and our bodies longer to adjust.

Hi Aldie!
Most of us here do eat 80% or more of fat so do not change that. Fat is the key for no cravings and keeps you full. It does take a while for you to body to adjust. Just stick with it.

I guess I stand corrected. I personally don't need to eat that much fat to feel full and not have cravings. Maybe I need a higher percentage of protein because I am quite muscular and athletic? I know that my muscles feel weaker and my brain gets foggy if I don't. Which systems of the body are fed mostly by protein? Muscles and organs? I have always thought of it as protein is muscle and organ food, fat and carb are energy. I'm sure that's too simplistic, so maybe one of you can clear me up on that.

Also, I believe I made a discovery last night. I had eaten my fatty meat dinner, felt full and needed to run to the store. I popped a piece of sugar free gum (Extra) into my mouth rather than running up to brush my teeth. Even though I had just eaten, about 20 minutes into my shopping trip (not to the grocery store) I start thinking about food. What the heck? When I got home there was no way I could go without eating, so I ate some breakfast sausage to hold me over til morning. Then, this morning, I was up about .5 lbs on my weight. So, my question is, does anyone see the same reaction and is there something I can freshen my breath with besides brushing that won't do this?

Thanks!

aldiemincey Wrote:

No, same here, looking for "the light". I just thought he was nasty about it. I was actually hoping to start a dialogue with him about the issue, bc I blog about it as well, but I've since changed my mind about that! It's one thing to respond with a sound argument and research, etc to what you perceive as a misconception, but it's a whole other to respond with "You're an idiot who won't get it anyway."

cbnebraska Wrote:

I've had some weird reactions to sf gum too, I think be of the maltitol (sp). I use a mouthwash from the HFS near me that has no sugar or weird stuff added. Peppermint tea works well too, or water with mint added.

You guys have got me hooked on burger patties! I made up a bunch and froze them. So handy. I'm going to do up pork patties as well, and am thinking of lamb patties or meatballs. Oh, I love lamb! So fatty.

My skin looks great, and my dry lips are healing up (as long as I don't pick at them). Weight is holding pretty steady at 114, with some TOM fluctuation. And my nails are growing too quickly to keep up. I'm going to look like Dracula soon.

**RE: Zero Carb / Meat and Water** - nyteez - 08-22-2008 08:10 AM

Nicola,

I am not sure why you keep trying to convince us grass fed beef is better. I think we all agree Grass fed beef does have a few (not much) more nutrients than grain fed, but that does not mean grain fed beef is bad. There are no scientific studies finding grain fed beef is bad for us. If you want to eat it go ahead! I don’t. And I am not paying 18.00/lb for meat that tastes terrible! I can buy lobster for that. We eat about 4 lbs of beef a day, that would mean almost 100.00 per day! I wouldn’t buy it if it was 2.00/lb! I don’t like it. All I know is I eat grain fed beef and I feel better than I have in 20 years!

I know what I know about beef because for the past 20 years my friends and neighbors raise cattle. Even the ranchers I know who raise both grain & grass fed don’t eat the grass fed!

This grass fed argument you keep presenting is no different than the “we need vegetables & fiber argument”. It’s just laughable.

You know, we're still flushing that out and I don't mind keeping you posted.

I wrote about this on the old forum before the hack and it turned into quite a firestorm. Being the fire starter that I am, I have no problem igniting the flame again.

Statistics show quite clearly that people who have experienced these extreme makeovers (specifically, the show) have not remained married to their spouses more than a year afterwards. When I read that, it really got me to thinking.

Now, I don't want to get into a religious debate about the sanctity of marriage and people's view on divorce, but it is certainly worth considering that when you really make a "lifestyle change" the effect on those around us is very profound.
You will have new interests and more free time than you had before. You will be more active and just want to do things because you have "energy to burn." I have also heard the "we don't have much in common anymore" talk and I have to decide in my mind how much work I want to invest there. After 17 years, do I have to say "I love you" and reassure you every minute?

Some make this journey together and that's commendable. Others are making it alone and they have people around them who will not change and they have trouble accepting your lifestyle change. They long for the days of yore when you sat around on the couch with no energy.

On the one hand, those around us have to change to accept the new person we've become. On the other hand we have to decide how much energy we want to expend to reassure others and help their insecurities. At the end of the day, there may be no alternative. We're healthy and active, or we're dying and dependent.

Thoughts?

Charles

MirMir Wrote:
But, today is Friday and I am a Catholic which means no meat today. I'll have fish for dinner tonight and probably tuna fish for lunch but, breakfast will be eggs. Do you know what others do in this situation?

I'm very sorry, MirMir, but I can't help you with that one. I don't see what would be wrong with some fatty fish. Much of my religion revolves around carbohydrates and needless to say, I have serious problems with the way its practiced and I skip many a ritual because of that fact. (Yet, another thing my wife finds objectionable.)

I don't dislike fish, I just never sit around and say, boy, I sure would like some fish....However, if I were going to have fish, I would start with mackerel, salmon steak, smoked salmon, smoked fish, trout, catfish, bluefish, and halibut. These have more fat per 6 ounces than other cuts of fish. The other
varieties are fine but they are very lean and I would be forced to drown them in butter. Dairy is suspect to me so that wouldn't be appealing, but I suppose I could bear it for a day or two if necessary.

Regards,

Charles

RE: Zero Carb / Meat and Water - Charles - 08-22-2008 08:57 AM

ebnebraska Wrote:
I guess I stand corrected. I personally don't need to eat that much fat to feel full and not have cravings.

Don't sweat this. You are more than likely eating more fat than you think you are. It's really hard to get these ratios correct and I don't use them personally. The key is that if you average 1/2 pound of fat to 2 pounds of lean, that is actually 80% fat even though it doesn't appear to be.

That looks good in a journal, but in the real world, you should eat fat to the edge of nausea. Once you get there, eat more lean until you're full. If you're low on energy, eat more fat. If you are nauseous, eat more lean. Always eat to appetite and don't eat when you're not hungry. This is an optimal 80% fat diet.

Cynthia Wrote:
Also, I believe I made a discovery last night. I had eaten my fatty meat dinner, felt full and needed to run to the store. I popped a piece of sugar free gum (Extra) into my mouth rather than running up to brush my teeth. Even though I had just eaten, about 20 minutes into my shopping trip (not to the grocery store) I start thinking about food. What the heck?

You've just proved my point from the thread on artificial sweeteners. The sweetener is irrelevant. The issue is that you associate sweetness with gum and therefore you secrete insulin which prompted the hunger. If I were you, I might carry a small bottle of Scope!

Charles

RE: Zero Carb / Meat and Water - montmorency - 08-22-2008 09:39 AM

Hi folks. Just saying hello as I've been out of the country (GB), and away from regular computer access for a while. Was actually in Germany on a language course (and a bit of holiday). Great country, but it's hard to get it totally low-carb, especially when the food is partially provided as part of a course! They really like their "Kartoffeln" (potatoes) and "nudeln" (pasta) there don't they! Occasionally, I managed to get the spuds (potatoes) swapped out for some green salad, and occasionally managed to get my wurst without broetchen (roll), but you have to fight it a bit.

Did manage to keep off beer (and never wanted any...I tasted some that a pal had bought me and couldn't finish it). This is partly because I've been learning to love red wine (which I always hated). I probably drank a little too much of the latter for my own good, but it appears at least I didn't put on any weight, and I may have lost a little (only a pound or two).
Fortunately, the hotel where I was staying for the course provided an excellent buffet breakfast, where you could eat all the bacon and sausages you wanted (as well as eggs, boiled and scrambled, although I only had moderate quantities of boiled eggs), butter, and cold meats of all types, oh and roll-mop herrings. I was literally piling my plate, because I knew that at lunch & dinner-time, choice would be more limited, and there was no way I'd be able to get enough fat or protein.

Curiously, it seems the Germans, at least here (Thuringen), almost never seem to drink tap-water, although I am sure it is at least as safe as in the UK. We lunched and dined in a university mensa (cafeteria), and I was surprised that there was no plain water freely available. The "meal ticket" allowed one drink from the various taps, which only included carbonated water (as well as sugary drinks of various sorts). Of course, you could pay extra and buy expensive mineral water, but why do that?

(I carried bottles that I'd refilled from the tap in the hotel room...).

I come back home, and the papers are all over the Olympics, with stories suggesting we should all be inspired by them to get off the couch, stop being so lazy and so greedy, and start losing weight...

.....er, in trying to counter this, where exactly does one begin ...? :-)

With kind regards,
Mike

RE: Zero Carb / Meat and Water - LindaSue  08-22-2008 09:54 AM

Mike, a German friend of mine says that Germans don't believe that it's healthful to drink anything with a meal, especially anything cold. They believe that it prevents proper digestion, or so I was told.

Thoughts?

Those are all scary thoughts. I know from experience that it is very difficult to manage some else's happiness. People who are dependent on others for theirs will always be disappointed. I have said this over and over to my spouse, I want you to be happy, but I want you to take control of that happiness and not lay it in my lap. I love you more than anything, but at the end of the day, it's up to you to decide what brings you joy. I want you to have something other than me that does so... hobbies, friends, challenges, etc... He gets it, it just isn't as easy for him to do as it is for me. Fortunately ours are just little episodes and we have way more good times than bad, so our marriage isn't in jeopardy. If it were the reverse, I'm not sure how long I'd last in the battle for independence....
I do have a great book recommendation though if anyone is interested. It actually is a little converse to what I just said, but it is an excellent read that I felt revolutionized my marriage quite a few years back. It gave me patience with my husband's needs and helped me to look at my own on equal ground. It's called "the Five Languages of Love" by Chapman.

That is a very powerful sentence that you wrote, Wow! I can imagine many situations where the person transforms into something totally different than the man or woman that someone married. In some cases, someone may be used to you being dependant upon them. What happens when you withdraw that dependence and start to show self-confidence and greater self-esteem?

I was young and healthy when I got married and gained 65 pounds over 15 years. During that time, I became more of a home body and quite inactive. From my perspective, I merely regained what I lost.

Because she is unable to experience the same change for herself, do I have to forever manage her happiness?

Some people were overweight and fairly inactive when they got married. For them, to lose weight and improve their health must be an entirely new reality to deal with. They now have confidence and a new outlook on life. Any efforts to channel that would be seen as "holding them back" or stifling their growth. Many people get married in a dependant state but what happens when they finally become independent? Can the relationship survive such a thing?

Many have never run a 5k or felt confident enough to go to a beach or other social setting where people weren't constantly scrutinizing them and examining and what they ate. Now, they get to be "normal" and no longer want any scrutiny, thus it is hard to manage something like a zero-carb lifestyle in public. Who wants more attention, right?

So, there needs to be a new "normal." A world where we set the tone instead of following the status quo.

Regards,

Charles

RE: Zero Carb / Meat and Water - cbnebraska - 08-22-2008 02:19 PM

Charles Wrote:

Some people really struggle with change. I know many who will fight it to the bitter end. Those of us here are very homogeneous in the fact that we are all looking for change, looking for something better, stepping outside the box, embracing "different". Not everyone strives for that, it just simply doesn't occur to them to seek out information or new experiences. They generally wait to change until forced to
do so by something they simply cannot fight. Something like a near death experience or a health situation. Others of us cannot wait to find the next thing to embrace or learn or challenge. Nature? Nurture? A little of both? Who knows, but I do see so often that opposites attract in marriages and homogeneity attracts with friends. Doesn't that seem odd? People coupled up for life that are very similar really lack balance. What would two quiet people say to each other? Two spenders would go broke. When it comes to friends, we want someone that is as much like us as possible. I'm not saying this is ALWAYS true, but more times than not....

Charles Wrote:

Charles

(Unfortunately, I love attention. In fact, that's something I always have to work on - not making myself the chatty one that rambles on.) Some people simply never will want attention, no matter how thin or healthy, they won't want to run a 5K or do anything athletic, so to assume that every overweight person is an athlete or star waiting to bust out is misguided, but the problem is that being overweight sucks up so much energy that the person can't even know why they'd want to be thinner. To do what? Why? I'm fine just the way I am, doing just what I do. It's a catch 22, I can't know why I'd want to be thin because I don't know what it feels like.

I don't see these things in my spouse, because he's not overweight and he's athletic, but I do see them in my parents, especially my mother, who is my main motivation to stay as thin as possible myself. I'm built more like my Dad, but you never know...............

Okay, it's quitting time and I've stayed late to write this. I've got to stop and pick up some meat to cook tonight. The butcher was setting aside 5 lbs. of beef fat for me. Yum!!

RE: Zero Carb / Meat and Water - Nicola - 08-22-2008 02:27 PM

nyteez Wrote:
Nicola,

I am not sure why you keep trying to convince us grass fed beef is better. I think we all agree Grass fed beef does have a few (not much) more nutrients than grain fed, but that does not mean grain feed beef is bad. There are no scientific studies finding grain fed beef is bad for us. If you want to eat it go ahead! I don't. And I am not paying 18.00/lb for meat that tastes terrible! I can buy lobster for that. We eat about 4 lbs of beef a day, that would mean almost 100.00 per day! I wouldn’t buy it if it was 2.00/lb! I don’t like it. All I know is I eat grain fed beef and I feel better than I have in 20 years!

I know what I know about beef because for the past 20 years my friends and neighbors raise cattle. Even the ranchers I know who raise both grain & grass fed don’t eat the grass fed!

This grass fed argument you keep presenting is no different than the “we need vegetables & fiber argument”. It’s just laughable.
Just one last message from Mr. Slanker (just if any body does care...) and then I will shut up. Let me just say - I am not doing this to satisfy my self, I am just trying to share what worrys me and have the feeling, that I am not alone:

Most professional medical people know nothing about nutrition. So say the MDs I've talked with over the years. That's because they're taught nothing about nutrition except what the USDA puts out in its Food Pyramid.

There are more meat studies than you can shake a stick at that show how animal bodies adapt the fat profiles of the foods they eat. Eat grain and you gain that fat profile. That's an absolute indisputable fact. An improper fat profile whether gained directly from eating grain or from eating grain-fed livestock leads the way to body failure. I don't know who Dr. Eades is, but he definitely hasn't read any published meat studies. ALL meat scientists report the nutrient differences in their studies that compare grain-fed with grass-fed meats and they've been doing so for many years. They just don't knock the grain-fed meats as nutritional disasters because the universities are supported by the grain-fed meat business. But they report the basic facts correctly.

People like Mac are casting about with two many meaningless inputs in their minds. It's all real simple and if a fellow reads reports and understands the differences between studies based on the limb of a tree versus a forest, then they can see the truth. But if a fellow has a million tree limb studies in mind, he can't see the forest.

Grain as a food is a concoction of man. Fields of grain are not only seasonal, but don't occur unless man intervenes in the natural way. So it is impossible for grain to be a food staple for any animal life. All animal life is supposed to follow the green leaf. That's the way it has been since the first one celled green plant came into being. And that's the way it will be for all the rest of time.

Unless a fellow can recognize that basic point, they are lost.

Everyone in the ranching business knows for a fact that unless he takes harvested grain to his livestock, no matter how he tries, other than hauling it to them, the livestock won't have any grain to eat in a natural setting. And that is true even if the rancher plants winter rye or winter wheat pastures. That's a fact. So, until the folks in the cities pull their heads out of the sand, they can't possible understand why the science behind grass-fed is so fundamental and sound. Even Lorain Cordain at one time didn't understand it just like all of us. But he has a much better handle on it today and so do I. It was learning about livestock nutrition that put me in this business and then later I learned that it applied to people as well. Then I changed the way I eat and my health improved dramatically. Prior to that I followed the USDA suggestions and was going down hill year after year.

Ted Slanker
Again, thanks for sharing Mr. Slanker's opinion.

Regards,

Charles

RE: Zero Carb / Meat and Water - nyteez - 08-22-2008 03:48 PM

I think we all completely agree with Ted here. He is stating nothing that we don't already know. Most of the people in this thread including myself only eat meat. We have spent countless hours reading hundreds of studies regarding meat because everybody tells us we are going to get sick eating this way. We don't eat grain or vegetables and have found great health, boundless energy & weight loss. The Bear, who only eats meat, has been eating grain finished beef for almost 50 years! He is in great health.

We all agree 100% grass fed beef is more nutritious than grain finished. But the difference is not all that much. We all know grass is the cows natural food. We all know grain is not good for cows, just like grain is not good for us.

But, the bottom line is there are no studies stating grain fed beef is unhealthy to eat. Grain fed beef is still more nutritious than vegetables and grain. It is not grain fed beef that is making the world sick, it is the high carb diet recommended by USDA.

RE: Zero Carb / Meat and Water - daveo - 08-22-2008 03:50 PM

I agree with Mr. Slanker that grass fed is probably better. However, everything I have read leads me to believe that controlling insulin is the most important issue, and a 0 carb diet allows that. Switching to much more expensive and worse tasting grass fed beef may indeed be healthier, but it is probably only a LITTLE healthier, and it is MUCH more effort in cost, difficulty to attain, and difficulty to enjoy.

This weekend I'm smoking a big old Brisket for a BBQ. It was 12 lbs and cost me $21 at Wal-Mart. Gonna get a ton of leftovers, and it is fatty and going to taste great. If I could even GET a nice, fatty, grass-fed brisket.. which I doubt... It would have cost me about $70 and arrived frozen. It's just not worth it to me. The 80/20 principal (google Pareto's Law) applies here. Most of the benefit comes from eliminating carbs. Doing grass fed, organic, raw, etc all seem to be a huge pain while adding little extra benefit.

RE: Zero Carb / Meat and Water - daveo - 08-22-2008 04:02 PM

Hey Charles!

I ate lunch at Golden Corral yesterday 😊

They had some pork steaks there that were AWESOME.. I was a little afraid of them because they had a sticky sauce on them, so I assumed it was loaded with sugar, but according to the web site the pork steaks have no carbs.

Great meal, and the cool thing is my wife, who wouldn't go near a buffet before, came along and
actually enjoyed it. She is avoiding grains and doing a low-carb (for her) diet, so she was a big fan of the salad bar and the Bourbon Chicken 😊

My thoughts exactly!

RE: Zero Carb / Meat and Water - montmorency - 08-22-2008 04:59 PM

Some random thoughts here, as I've been out of the loop for a couple of weeks or so:-

Just before I went away, some of us (including me 😊) were worried that we might not live to be 100 if we went all-meat. Well, I see that people are less worried about this now, so I think I'll stop worrying. Anyway, as they used to say in the old action movies, just before the big attack "Hell, do you wanna live forever?!". (No, I just want to live healthily; thank you).

Looking back at an early post in this thread, someone had suggested that with muscular insulin resistance, there was actually insulin in the muscle cells. Is that really so? - just a small technical point I think - doesn't really change anything. I find the whole concept of IR pretty tricky though, and I think that is one small fault of GCBC, that it doesn't quite explain it clearly to the lay person (I was certainly confused, even after many readings on that topic). I think I get it better now, having read some great postings here on this thread - thanks folks.

Clothes sizes...don't worry, I'm not going to talk about my underwear, but clearly it's been an issue for some of us. Let's be honest, it's not all this health stuff that really bothers us - it's being able to wear the clothes we _want_ to wear, rather than the clothes that we can get to fit us - that counts! I think that when you are the right weight for your body size, your clothes - whatever they are - just fit and hang better than when you are overweight. I haven't been able to get clothes to fit me since back when I was about a 32 inch waist (and it was even better when I was 30 inches), and that was a long time ago. OK, I can get clothes to _fit_ me, but they look, and feel horrible. However, since going - almost- ZC, I have really begun to feel thin again! This is obviously something of an illusion, since I know I have at least 20 lbs to lose, and probably more like 28, but it's beginning to feel right! And I know (in all seriousness) that it's about much more than weight loss, but this is (we hope) an external sign that something is going right inside.

Time to stop rambling... :-)

Kind Regards,
Mike

LindaSue,

I'm sure that's probably a part of it, but to the extent that they do drink water, they seem to have bought into the whole bottled water marketing ploy, hook line and sinker (just as people here in the UK are finally beginning to question it a bit, probably because we're all going broke and can't afford it any more :-)).

Regards,
Mike

RE: Zero Carb / Meat and Water - Kristi31 - 08-22-2008 07:45 PM

So, I'm doing amazing since switching to slightly cooked meat and fat. Plus, enjoying it so much more. I had some lamb in the morning with a little beef fat and tonight ate out, had some delicious "blue" rib steak. I have soooooo much energy. Spent most of the day outside in the sun and did not get sunburned...whereas 1 yr ago, I definitly would. Zero-carb is just amazing...WHEN you cook your meat a little, at least for me!

RE: Zero Carb / Meat and Water - poo123 - 08-22-2008 08:04 PM

Well tonight was a test for me. For the first time since I started this way of life we bought pizza for the kids. This was a test because I always said if I was on a desert island the only food I would want would be pizza. Well I smelled it, and it didn't do anything to or for me. I had no desire to eat it, or anything. I was so happy and proud of myself for coming such a long way. Right now just thinking about other food does not even excite me and it really did before. I am a changed woman.....I am losing about 1/2 to 1 lb a day, so I am very glad I am on this journey.....glad there are so many along for the ride, we can all appreciate the scenery and not worry about the snack stops.......alison

RE: Zero Carb / Meat and Water - C-Dunc - 08-22-2008 08:20 PM

After 2 weeks on this meat and water way of eating, I am down about 8 pounds from 145. So, 137. I don't care about that though. What I do care about is that I am feeling much better and energy is getting progressively better. But this has not been consistent. For some parts of some days it was a grind--kind of like screeching breaks, in order to go in a completely different metabolic direction.

A question about meat: There are no Super Walmarts in Vermont and so there is no ground beef (although there are frozen pre-paddied hamburgers) or fresh cut steaks. So I have to shop elsewhere for steak. What is the fattiest cut of steak? I have tried T-bone, Porterhouse, Sirloin, and Ribeye. I'm not sure if any of these meats are the fattiest cuts available.

Thanks,

C-Dunc

If all are trimmed the same way then ribeye is the fattiest. Unless you get prime rib which is fattier still.

Slanker. The definition of a true MEATHEAD!! This guy has to be the stupidest businessman that exists. Insult potential customers. Wow. That makes a lot of sense.

RE: Zero Carb / Meat and Water - **caroline** - 08-22-2008 10:17 PM

I guess all of Slanker's omega fatty acids that he's supposedly getting in greater quantity from his grass-fed meat aren't doing his thought process too much good after all--otherwise he would know to live by the old saying that "you catch more flies with honey,"--not INSULTS.

All that venom directed toward innocent bystanders makes me think he's not getting enough fat--hence the nerve endings aren't coated (which is what fat does) hence: ANGRY meathead.

I do remember that my German friends only drank bottled water and I've noticed how common it is in England too. If you want still water in a restaurant it will most likely come in a bottle and you have to pay for it. Do people over there think that there is something harmful about tap water? I never drink water from the tap here in Houston, Texas but that's because it tastes really bad. I use a Brita filter pitcher to get nice-tasting drinking water. When I visit my friend in London, I always drink the tap water at her house because it actually tastes good.

Super Wal-Mart isn't the only place that sells fresh meat. I assume that you have grocery stores where you live. They would sell ground beef and steaks too. I find it hard to believe that the stores don't sell ground beef. I've never seen a store that didn't sell it. If you buy the cheapest hamburger they sell, it will have more fat in it. The more expensive the ground beef, the less fat in it. Most stores sell at least four grades of ground beef. Around here they call them ground beef (or sometimes just hamburger), ground chuck, ground sirloin and ground round. At Kroger I've even seen something called ground beef trimmings which they told me is made up of all the scraps of meat that have been trimmed off the roasts and steaks. It's usually very high in fat and is the cheapest of all.

I agree that ribeye steaks are probably the fattiest because they have fat marbled throughout the meat and not just around the edges like a T-bone. I think that sirloin steaks are pretty lean. If you don't want to spend a lot of money, chuck steaks can be pretty fatty but they can also be kind of tough unless you cook them very rare.

Most of the benefit comes from eliminating carbs. Doing grass fed, organic, raw, etc all seem to be a huge pain while adding little extra benefit. for me, if i had to find, pay for and eat grass fed meat, the stress of that would probably discount any extra benefit the meat might have.

RE: Zero Carb / Meat and Water - MirMir - 08-23-2008 07:37 AM

Woohoo!

I fit into some pants yesterday that I haven't been able to wear for months.

And I feel great too!

Was going to have bacon and eggs for breakfast but ended up just eating 3 pieces of bacon and a bite of eggs. I cooked them in the bacon fat but ended up giving them to the dog.

RE: Zero Carb / Meat and Water - montmorency - 08-23-2008 08:06 AM

Lindasue,

Right on cue, an interesting and thought-provoking piece on bottled vs. tap water has appeared in the weekend Guardian:

http://www.guardian.co.uk/lifeandstyle/2008/aug/23/bottled.water.tap

I think at first, she was inclined to be somewhat anti the bottled water producers, but looking deeper, it doesn't seem quite so clear cut.

Speaking personally, I find the tap-water in our area (Oxfordshire) ok, but I know some people who won't drink their own local water, at least without filtering it, or letting it stand to let some of the Chlorine "pass out" of it (can't think of the technical term!).

In the last few months, I've seen several articles appear questioning both the need for us to drink as much water as "experts" had hitherto suggested, and also questioning whether bottled mineral water was in any way superior to what came out of the tap.

Moving away from bottled water, but still with water, there was an article recently, again in the Guardian, suggesting that meat required more than twice the amount of water to produce the same food value as the equivalent of vegetarian produce (can't remember how this was measured). Anyway, the basic message was that eating meat was "bad" from a water consumption point of view. However, this was somewhat contradicted by a further point that much of the UK's veg now comes from Spain, which is a very water-threatened country, so eating veg in the UK undermines water supplies in Spain...
Regards,
Mike

Well, I'm just an old East Tennessee Redneck but the best I can tell from looking, grain is basically the seed of grass. So how is eating the seed or the blade a whole world of difference? And yeah, I may be over simplifying it just a wee bit, but that's how us old country boys tend to look at things. Maybe somebody else has a different take on it but it seems to me like this is a 'hair splitting' debate over which part of the grass our cows have for dinner.

Even growing up here in the foothills of the Smoky Mountains we had cows out to pasture but we always put them in the barn and fed them corn or grain of some kind for several weeks before turning them into steak and hamburger. I personally prefer the grain fed beef.

Now I'm not a nutritionist or a scientist....but I did stay at a Holiday Inn Express last night! 😊😊😊

It is funny you brought that up, I was afraid too. LOL! Oat grass, wheat grass, rye grass, all grass produce grain as seed. So cows do naturally eat some grain and always have.
I also wonder about labeling. Are there rules about grass fed labeling? All cows are grass fed for most of their life. So technically they are grass fed beef. It is how they are finished that counts. I wonder about this because anybody who claims they really like the taste of grass fed beef either eats a lot of wild game meats (and has acquired a taste for gamey meat) or didn't eat 100% grass fed beef. Is feeding the high grain grasses cheating? (as opposed to low grain alfalfa, clover or hay) I don't think there are any regulations on any of this yet.

Talk about splitting hairs! LOL

I'm confused now. Maybe it's my silly brain but I thought the American cows were kept indoors in feedlots? Or is that only some and the majority lay out to pasture? How would one know whether they lay around in the fields or were kept in feedlots?

---

**RE: Zero Carb / Meat and Water - cbnebraska - 08-23-2008 11:37 AM**

I live in Nebraska and I can say that here, they all graze in the fields. The grass is free and the amount of land you own determines how many head of cattle you can raise. It's too expensive to feed them grain their whole lives. It's just the finishing that's done with grain. I don't know any of the nitty gritty details as I am not actually from this state and live in Omaha, but I do know this much. I am also wondering - where exactly do they feed them grain their whole lives? Somewhere that doesn't have much land? And also, since the grass is free and the grain isn't, why does grass fed cost so much more? Seems like a paradox to me.... I guess that's why Dana says the ranchers that sell "grass fed beef" are making a killing selling meat most of us don't even like? Kind of a racket, eh?

---

**RE: Zero Carb / Meat and Water - nyteez - 08-23-2008 11:39 AM**

I don't believe any cows are raised in feedlots. Commercial feedlots are definately not indoors, they are outside. They are only at the feedlot for 30 days to 4 months.

---

**RE: Zero Carb / Meat and Water - lynnhopes - 08-23-2008 12:00 PM**

So before that they eat grass then and spend the majority of their lives in fields?

---

**RE: Zero Carb / Meat and Water - LindaSue - 08-23-2008 12:04 PM**

I don't see the big difference between cows eating grass or grains either. They're both foods with carbs.

Did anyone else notice the "cow" ad that was here? The ads seem to somehow pick up on the topic of the discussion.

montmorency Wrote:
Looking back at an early post in this thread, someone had suggested that with muscular insulin resistance, there was actually insulin in the muscle cells. Is that really so? - just a small technical point I think - doesn't really change anything.

Yes. You have to understand that insulin circulates in the bloodstream and that the stream carries all fatty acids, nutrients, hormones, etc within it and the stream offers them to every tissue and organ in the body. Each tissue or organ takes what it needs as the stream circulates by. If you were to watch fatty
acids in a radioimmunoassay, you would see that the stream constantly changes directions responding to energy requests throughout the body.

Ethan Sims was able to measure the insulin sensitivity in the muscle as well as in the fat tissue. He took biopsies of the muscle to make the calculations. These tests were highly complicated and have not been duplicated since. He found that sensitivity in fat tissue does not affect sensitivity in muscle tissue. Carbs may help lower the insulin response in the bloodstream by furthering the fattening process but they have no effect on the muscle tissue. That is why diabetics do not improve on the ADA diet.

Mike Wrote:
Clothes sizes...

I'm with you, Mike. I keep having the same issues. Since I "upped" my fat about a month ago, I have just continued to lose weight. Today, I tipped the scale at 152. That's my lowest since 1995 and I haven't gone running since Wednesday and I last lifted on Thursday.

I finally got my pants situation together but now my shirts are getting too big. I was just happy in a 15 1/2 x 34 which is a medium but now I'm fitting the small, which is 14 1/2 x 34. I'm kind of in-between and it sucks because I have a lot of these medium shirts which I work in. This stuff gets expensive because I refuse to walk around in "too big" clothes. As I get leaner and more muscular, I still get smaller even though I look bigger with more definition.

See, women aren't the only ones with these issues!!!

Charles

RE: Zero Carb / Meat and Water - con - 08-23-2008 03:23 PM

ONE MAN'S OPINION ATER EATING AND STUDYING ZC FOR 50 YEARS:

"Grain fed and grass fed beef are nutritionally EQUIVALENT. They differ only in aesthetics like texture, fat colour, toughness and flavour. . What the animal eats is not going to matter so far as nutritive value is concerned, so long as the animal
was healthy. A plant may indeed be dependent on its nutrition, but the animals we use for food have the
ability to manufacture in their bodies or with the aid of commensal organisms living in their intestines,
many if not all of the nutritive substances they require which may fall missing in their diet. Food
animals are herbivores, they live on feed which has the lowest level and format of organic-nutrient value
on the planet- they are highly evolved, complex organisms which are specialised in converting low value
feed into high value meat. Any proposal that the nutrient quality of meat is different due to what the
animal is fed is only propaganda serving a special interest, like the organic farming mob. There is no
nutritional difference between 'organic' meat and any other kind- except of course, the cost per unit to
the buyer.

Sheep bison and cattle are grass eaters. Deer and goats however are browsers, and will eat almost any
plant except grass. The problem with grain as food for the grass-feeding ruminants, is that the natural
bacteria in each of the various 'stomachs' are not very good at digesting it. Feedlot cattle are fed a
bacterial mix which replaces the normal flora with ones which can digest grain. I do not think this is a
particularly good idea, but it in no way damages or lessens the nutritional value of the resulting meat. "
THE BEAR

RE: Zero Carb / Meat and Water - Charles - 08-23-2008 03:30 PM

Leave it to the Bear to clean it all up for us...😊

RE: Zero Carb / Meat and Water - montmorency - 08-23-2008 03:56 PM

Thanks for the replies Charlies.

Insulin: thanks for clearing that up. It was quite a while before it "clicked" with me that there were two
quite distinct sorts of insulin resistance that come into play in metabolic disorder (i.e. muscle and fat
cells).

Shirts, etc: yes, a problem, but a muscular man in a slightly too loose shirt is far more dignified (IMHO)
than a still slightly portly gent "poured" into slightly too-tight-fitting clothes! :-)

I won't enter the grass / grain debate, but what does interest me is what was the nature of the animals
that eventually became our domestic beef and dairy cattle. I wonder how far back in the evolutionary
process man was able to get pretty regular supplies of this sort of animal for food.

Regards,
Mike

RE: Zero Carb / Meat and Water - rozi - 08-23-2008 04:31 PM

I don't think that wheat rye etc are the problem with feeding beef. The real problem seems (from what
I've read) to come with soybeans and corn, which are not natural to beef, and that they do not have the
proper enzymes to digest, it seems as though soy is no better for cows than for us!
i'm wondering about the rise in body temp that accompanies ZC. mine has gone up from usually under 98 to hovering around 99. is it because metabolism is increased or does fat burn hotter? sometimes i really 'feel' like i'm throwing off a ton of heat. it's new for me being a former 'always cold' type. is this why they say carnivores don't live as long?

also, should thyroid meds be adjusted downward -i'm confused because i had read that thyroid might actually be supressed without carbs but body temp is one indicator of thyroid levels.

I wonder about that too, feckless. You see people talk about how caloric reduction extends life, and one of the things they bring up is that it's because of a slowing of the metabolism. Things don't burn out as rapidly....

I really cranked up the fat in my diet last weekend, and not only had a noticeable rise in energy, but couldn't seem to cool off that night.

Mike Wrote:

Perhaps, but a muscular man does not look very muscular in a too-loose shirt. People feel free to say, "you've lost too much weight" and other things. When you get the slimmer fitting shirt, it highlights your physique and complements your hard work in the gym.

Regards,
Charles

I find the opposite. I tend to run cold more often since ZC. I could never get warm enough. However, I have noticed this a lot less since I increased my fat consumption. The stuff I've read on the increased life span with calorie-restriction is more in rats and studies haven't been able to definitively show the same in humans.

also, should thyroid meds be adjusted downward -i'm confused because i had read that thyroid might actually be supressed without carbs but body temp is one indicator of thyroid levels.
Search thyroid on this site. WendyOh is the resident expert and has posted some wonderful information on this subject.

Charles

RE: Zero Carb / Meat and Water - feckless - 08-23-2008 10:31 PM

Charles Wrote:
I could never get warm enough. However, I have noticed this a lot less since I increased my fat consumption.

it is definitely a function of fat consumption for me. while i was eating steak and eggs, i didn't notice it at all. when i switched to 22% fat burger dipped in beef fat drippings and w/bacon...i would get HOT after a meal and throw off a lot of heat for a number of hours. that's why i started actually taking my temp just to see if there was really something physiological going on and sure enough, i was up 1 - 2 degrees from where i normally fell.

also, and this is kind of delicate...but um...i become really interested in procreating during this time.... (that's as demure as i could phrase it!)

RE: Zero Carb / Meat and Water - suzanneyea - 08-24-2008 02:24 AM

I am usually pretty hot, especially in the evening, but I love it. I spent 30 years freezing! I was diagnosed with hypothyroid and went on synthroid, a very low dose. I stopped taking the medication a while ago, on my own, no doctor would ever tell me to stop. I felt the hypos symptoms for a a week or two then they disappeared. My last blood work showed perfect thyroid level. I never told my doctor I stopped the medication. Now, I have since for a doctor more in line with my way of life, but I do not trust or listen to most doctors. I do not believe medication is usually the right answer.

RE: Zero Carb / Meat and Water - cbnebraska - 08-24-2008 03:04 AM

Charles Wrote:
I find the opposite. I tend to run cold more often since ZC. I could never get warm enough. However, I have noticed this a lot less since I increased my fat consumption.

I would have to say I am having the same experience as Charles. I've only been zc (Can I still call myself that with my daily coffee and couple of glasses of red wine per week?) for not even 2 weeks now. I moved to ZC from VLC, so not a huge jump, mind you. I was always the "hot one" meaning my skinny no muscle friends would be shivering and I'd be in a tank shirt. I always assumed it was the higher metabolism (energy need) that comes along with being more muscular. I read that heat is a by-product of the body creating energy, thus I guessed I was literally heated by my burning fuel? However, with zc I am down only 7ish lbs but yet I am shivering in air conditioning that used to be comfortable.

I have to comment just once again on how absolutely thrilled I am by this WOE! Although my main goal was to stop being driven by insatiable hunger (even on less than 25-30 gr. carbs with moderate fat!!), the added bonus of losing weight just has me on a high. I am not at all drawn to the kitchen, my
thoughts are on things other than food and I am starting to see the beginnings of muscle definition in my legs, which has always eluded me, even though I lift and am generally a muscular build. One of these days I want to be able to post before and after pictures that aren't inappropriate, but I want to wait until there's a more visible difference!

So, I guess what I'm saying is, thanks all for being here and sharing so much of your knowledge and making it such a comfortable transition. I feel educated and assured that I'm not doing something unhealthy as many would have me believe. My DH is adjusting and he is starting to throw himself into making various types of meat for us and tried really hard not to be too appalled when I brought home the 5 lbs. of beef fat the butcher gave me. He's actually assessing his choices and his LC eating is moving towards VLC. Which, brings me to my next question.....

I know that a high fat intake is safe and necessary for ZC eaters. However, what about for LC eaters like DH and moderate carb eaters like my children? I remember somewhere in this forum a while back someone said something to the effect that eating carbs and high fat could be a deadly combination. Should I be careful and feed the kids lower fat meats and not encourage my LC DH to indulge in the same level of fat intake as myself? Of course, my ongoing goal is to get the kids to LC, but I'm still struggling with that. Life gets in the way for this one - school lunches, friends' houses, cereal, sports team treats, grandparents, parties, etc....

RE: Zero Carb / Meat and Water - suzanneyea - 08-24-2008 03:21 AM

I still do high fat meats for dh and Andrew, even though they both eat carbs. You still need a high fat diet. I have been really reducing portion sizes of the carbs and no one has complained. I have removed vegetables completely since no one was eating them anyway. I found that if I made too many changes, Andrew seemed to want more carbs. So, I bought whole wheat tortillas again. But, for dinner last night I made meat loaf and mashed potatoes. I served huge portions of of the meat loaf and just a scoop of potato, no leftovers either for a second helping. The meat loaf was high fat beef cooked with a ton of bacon. Just keep slowly moving the meals towards high fat, low carb.

RE: Zero Carb / Meat and Water - montmorency - 08-24-2008 03:58 AM

I agree with Susanne about medications. Almost by definition they will have side-effects, and I feel that all too often, even the intended main effects are not fully understood. How could they be? We are such complicated organisms. Tinker with one part, and some other part or parts runs slightly differently, and has knock-on effects. It's like an amateur fiddling with a car-engine. Back when they were simpler, any handy person could probably get a car going again, but now they are more complicated with computer-controlled ignitions, etc. You fiddle with them at your peril!

So much more so with the human body. This is one reason why I've always worried about supplements (let alone actual medicines/drugs). Unless you have an up-to-date biochemical analysis of the body to hand, how on earth can you really know what is in short supply and what isn't? And who is to say what the ideal composition is in the first place?

Far better to eat what we hope are the most natural foods that we seem to have evolved with, and let nature/God/evolution/whatever do the micro-managing for us.

On another topic: ketosis: I have a proposition for discussion (so feel free to shoot it down - I won't be offended): that the term "ketosis" is not particularly helpful in the context of people knowingly,
willingly, and thoughtfully eating low-carbohydrate, very-low-carbohydrate, or zero-carbohydrate diets.

Why? - well, as far as I know, the suffix -osis is always used in medicine to indicate some form of sickness or illness - it is not a normal condition. We also know that opponents of LC always cite the ketosis as a reason not to LC, because they regard it as an unnatural state to be in, probably because they are confusing it with the much higher levels of ketosis or keto-acidosis associated with full-blown untreated diabetes.

We here know that the production of ketone bodies is a very normal by-product of the combustion of free fatty acids, and that once we become fully adapted, we should also be able to use those ketone bodies for fuel, and little, if any ketone bodies would be detectable in our urine. The body does not like to waste potential fuel, and so to that extent, the loss of ketones in the urine is not really a desirable thing, but on the other hand, it is not an illness either.

I think what I'm saying here is that although we know what _we_ mean by ketosis, by using the term, we are perhaps giving some ammunition to unthinking opponents of LC/VLC/ZC.

Thoughts?

Regards,
Mike

From what I understand, it can be a problem if a person takes in carbs over a certain amount (but what is that level?), AND eats a high amount of fat. The body prefers to use carbs for fuel, so if enough of them are in the diet for that purpose, not all of the fat taken in will be wisely used.

I think high fat coupled with high carb intake is exactly the thing that caused me to rise to my all time high weight of 288. Eating donuts, cakes, pies, pastries, cornbread, biscuits, etc along with the high fat content of many other foods. My body had no way of burning that fat intake because it was doing
everything possible to try to rid itself of the carbs. So it had no choice but to store it.

When I went LC and kept my carb intake at 20g/day or below I got my body into ketosis and in turn, burning the fat I was eating. For me 20g/day seems to be the sweet spot for effective weight loss. Others may be able to go higher. I've read of a few who can do as much as 50g/day and still lose some weight. To each his own.

In conclusion, I believe the carb level must be kept relatively close to Atkins Induction levels in order to burn fat. For some that could be even lower, VLC or ZC. And of course, it means processed carbs are totally out!

**RE: Zero Carb / Meat and Water - Daryl - 08-24-2008 05:13 AM**

And, keep in mind that excess carbs (alone, not to mention combined with high fat intake) can do damage, even in the absence of being obese.

We do the best we can, sometimes, and that's all we can do. I think Charles is doing terrific with his kids, finding a balance between "laying down the law", and realizing that ultimately, all we can totally control are ourselves.

Not sure if any of that made much sense, by the way..... 😞

Some folks certainly grab on to the term ketosis, and misunderstand and misuse it. Heck, I've seen some proponents of LC misuse it..... but I don't see this as near the impediment as fear of fat is. If we can get over that hump, then the going will be much easier.

**RE: Zero Carb / Meat and Water - cbnebraska - 08-24-2008 06:37 AM**

Thanks Daryl. I appreciate your reassurance.

FDJ, I fully understand the benefits of eliminating carbs, but unfortunately my choices are my choices and I cannot force them on the unwilling. I am trying to do what I can to keep my loved ones in the best of health despite their non ZC status. My hubby is definitely LC if not VLC, so maybe what's being said is that a higher intake for him is just fine and can be regulated by hunger. BUT, my main concern is for my 7 & 10 year old children. I feed them low carb vegetables like cucumbers and peppers and green beans and small tomatoes, and berries when they aren't ridiculously expensive. I also use low carb tortillas with them as well as cheese and nuts, but the high carb items still get into their diets by means I simply cannot control. I would LOVE to keep them in a bubble and force feed them meat only, but it ain't happening. I remember that growing up, much of what my parents forced on me was exactly that against which I rebelled. I try to set a good example, teach them why we do what we do, explain the short comings of the traditional food pyramid and stock the house with acceptable choices, but I can't force it down them.

So, hence my question is still - since I can't remove the carbs to a truly low carb level, should I feed
them only low fat protein? I'm leaning towards yes, but then I also feel like I'm facilitating hunger, which leads to yet more battles over what I allow them to eat when they are, yet again, "hungry". I send them away to find something to do, only to have them back in an hour with "I'm hungry". I am coming to believe that they truly are hungry and I am not feeding them on a cellular level - but yet they won't let me. I give them low carb choices and say "or nothing" and they choose the "nothing". One thinks that they'd eventually get so hungry they'd give in, but generally they don't.

This is the last I will visit the issue. I'm grateful for the advice you all contribute and understand that the children issue is not a concern for most of you here.

RE: Zero Carb / Meat and Water - Daryl - 08-24-2008 06:57 AM

It sounds like you're doing a good job with them, and I mean that. Think how much better off they are than folks eating twinkies 24/7! Keep up the good work 😊

RE: Zero Carb / Meat and Water - Vesna - 08-24-2008 07:20 AM

cbnebraska Wrote:

I would lean towards no, for exactly the reasons you describe. I would check out SuzanneYea's approach.

RE: Zero Carb / Meat and Water - cbnebraska - 08-24-2008 07:34 AM

I missed Suzanne's post when reading through somehow. I think I was typing at the time and didn't scroll up far enough. Good advice, I think I will definitely start heaping on the meat even more and not worry about the fat content for now. We'll see what that does for the hunger. What happens in other places will have to be out of my control.

Thanks for changing my mind.

Do many of you use a toaster oven? Can you make small portions of meat in it without making a mess?

RE: Zero Carb / Meat and Water - suzanneyea - 08-24-2008 07:49 AM

I use my toaster oven all the time, on broil.

RE: Zero Carb / Meat and Water - nyteez - 08-24-2008 08:09 AM

Quote:

I use my toaster oven to cook everything! LOL I have a 8x8 square cake pan that fits perfectly in my
toaster oven. Great for meatloaf, chicken thighs or breasts. I always cook fish in a tinfoil pouch in the toaster oven. I have also broiled steaks, but fatty steaks can smoke unless you broil on low.

Quote:
So, hence my question is still - since I can't remove the carbs to a truly low carb level, should I feed them only low fat protein? I'm leaning towards yes, but then I also feel like I'm facilitating hunger, which leads to yet more battles over what I allow them to eat when they are, yet again, "hungry". I send them away to find something to do, only to have them back in an hour with "I'm hungry". I am coming to believe that they truly are hungry and I am not feeding them on a cellular level - but yet they won't let me. I give them low carb choices and say "or nothing" and they choose the "nothing". One thinks that they'd eventually get so hungry they'd give in, but generally they don't.

I wouldn't worry about the fat content for them. I think what ever you are eating is ok for them, but I wouldn't let them dip their meat into butter & fat like I do LOL! Plus, if they fill up on fat they won't be hungry for carbs.

I think what I'm saying here is that although we know what _we_ mean by ketosis, by using the term, we are perhaps giving some ammunition to unthinking opponents of LC/VLC/ZC.

I am with you Mike, everytime my mother (a vegetarian) brings up ketosis I just want to scream. She dosen't really understand ketosis and uses it against this way of eating. Now, her new thing is acidosis! She just loves to argue about anything. (isn't that a side effect of too many carbs?! LOL)

RE: Zero Carb / Meat and Water - Mel - 08-24-2008 09:03 AM

I have got my 9 and 11 year old girls dipping their meat in fat and saying "yum". They still eat fruit and some carbs in the form of salads and rice based pasta. They are so much more satisfied and there is a lot less "I'm hungry" peeping going on. "Having children is like being pecked to death by ducks", don't know where I heard that but I always thought it was funny.
I agree that the biggest challenge is the food that they get outside the home by other mothers and in group settings. I just try to plan ahead and have them as full as reasonable with the best foods: I think their growing brains and bodies really need saturated fat and fatty meat.
Melinda

RE: Zero Carb / Meat and Water - Charles - 08-24-2008 09:51 AM

I've been doing the cooking for the past week as my wife is in California. Needless to say, it's been a zero-carb week for all of us. It wasn't really hard to do because I tend to prepare the meats different than my wife. She loves to grill and cook meat a little too much for my taste so I end up fending more for myself. But this week, I made the meats in the convection oven, the skillet, etc. I was able to serve them more of the fats so the same meals that my wife makes were much more filling because I prepared them.

For instance, if we make 80/20 hamburgers, my daughter can usually eat 4 of 5 grilled burgers. However, she was only able to eat 2 of mine and she was full. I bought a $6 beef roast at Wal-Mart and just looking at it, you wouldn't think it would be enough. I cooked it in the convection oven using the
probe and I served it medium well and poured fat all over it. This easily fed all four of us and everyone was stuffed.

The children don't dip in fat like I do, but the meat is so fatty when you take care to preserve the drippings and fat that it is automatically more filling.

It's funny, the anti-meat people always argue that if everyone ate meat, there would not be enough for everyone. Well, the way they eat lean meat, that might be true. However, if you leave the fats, it doesn't take much to satiate us.

I think I'm going to have to do more of the dinner cooking!

Regards,

Charles

So there should be NO cheese...even no carb cheese?

Welcome to the forum and this thread. If you are a strict zero carber then yes NO cheese. Most cheese has at least 1 carb per oz. Never heard of no carb cheese. Could be one just not aware of any. Cheese causes stalls for some people.

---

RE: Zero Carb / Meat and Water - nyteez - 08-24-2008 05:05 PM

You can try cheese, but as most of us have found out, it stalls us.

It's a pity though. I used to assume that cheese was a perfect food: high fat, relatively low in carb (very low, really), lots of calcium; tastes great! Used to eat it by the
bucket-load, practically. I'm sure it's what was slowing my weight loss though. One of the things, anyway. I've cut it out now, and I think that's helped a lot. I now believe it's wrong for us because it's not really a natural food, although we tend to think it is (or I always used to). Just a very traditional processed one. Same could apply to butter though, which would be a blow, but I haven't given that up yet...

RE: Zero Carb / Meat and Water - con - 08-24-2008 07:32 PM

Unfortunately I have had to give up butter and salt. It was very sad to give up, but I think maybe it doesn't have to be forever. (?) Most people wouldn't deprive themselves of everything but unspiced meat but if it works, hey...I say give it a try if you're plateauing.

---

RE: Zero Carb / Meat and Water - caroline - 08-24-2008 09:56 PM

I'm not understanding why lots of people are giving up butter. I haven't noticed any problems whatsoever with butter. Now cheese, eggs, are a different story. But butter--works great. As much as coconut oil.

---

RE: Zero Carb / Meat and Water - Mel - 08-24-2008 10:22 PM

I agree that butter should be OK. But some people stall with it and maybe it's the milk solids in it. You can get the milk solids out of it by turning it into ghee. Just melt it and pour off the clear stuff to keep and cook with or cook it a little longer to get a deeper color and flavor and then pour it off. Some people can eat the tiny extra carbs in the milk solids, some can't. I think there must be something else to it than just carbs though, just too few.

There are two reasons to eat zero carbs and sometimes they don't overlap. One is to eat for optimum health and the other is to try to reach an ideal weight. I think butter is good for the body so we go ahead and eat plenty of it but it might stop weight loss and that is the rub. I don't get it.

---

RE: Zero Carb / Meat and Water - suzanneyea - 08-25-2008 02:14 AM

I have nothing against butter, but I like the taste of cooking with animal fat better, like the fatback or bacon.

I had to give it up, turns out I'm allergic to dairy. Nose runs like a train, then I get congested, my throat constricts. 😢
caroline Wrote:

I haven't really tested it since I haven't stalled, but I just decided not to use it because I try not to use salt due to cramps and overeating. If you use the unsalted butter, it doesn't taste much different than the animal fat the butcher gave me - for free. If you stall or aren't happy with your rate of loss, you could try taking it out of your diet and using purely animal fat.

RE: Zero Carb / Meat and Water - Charles - 08-25-2008 08:39 AM

I agree on the butter situation. I have my suspicious about dairy but nothing scientific. I just didn't have anything to put butter on so it wasn't so much that I took it out, I just couldn't see the use for it. I would much rather soak the meats in their natural fats thus my use of chicken fat, pork fat, and beef fat. I don't really "cook in" anything but the natural fats of the meats so coconut oil doesn't make much sense to me. However, if ate vegetables, I suppose I would cook them in coconut oil, but...

Cynthia, I use a toaster oven at work and it's wonderful because I pre-cook my meats at home to medium rare, and then I finish them right before lunch. It renders the fat perfectly in about the time it takes to finish the meat. The carboholics all come by and enjoy the smell emanating from my office!

That's what happens at work. They see my ribeye and drool. LOL

RE: Zero Carb / Meat and Water - cbnebraska - 08-25-2008 09:28 AM

I just get weird looks, but, we'll see how weird the looks are once this weight keeps falling. I still can't believe I'm actually losing.

I am going to buy a toaster oven. I plan to use it to broil small strips of fat in and when winter comes and grilling season is over, I will cook my meat in there as needed. I know that grilling is a fat drainer, but my husband does the cooking and that's just the way it is. I've asked a lot of him, I can't also take away his grill!! I just decided getting the free fat and adding that in will be the way it goes for me. He actually
said he wants to taste it once I broil it up. Planning to do that tonight. With burgers, he has moved to the high fat beef and cooks the meat less to retain more of the fat. We are ALL loving the taste of that yummy meat.

So, this is what I'm doing. Tell me what you think. I brown up low sodium bacon on the stove and then add in high fat hamburger. Once cooked, I scoop out all the meat and store it in a tupperware container in the fridge. I pour all the fat into a jar and store it in the fridge separately. Any time I re-heat meat, I first add about 2 Tbsp. of the cold fat on top of the meat. I sop up all the fat with the meat as I'm eating it. I tried not separating the fat out and just pouring it all into the container, but the fat went to the bottom and solidified there so the top portion had no extra fat. I found that by adding it as I eat, I can better control how much is in each portion. I just mix all the fat in the same jar and keep scooping out of it. It's delicious!!

Now, I'm sure someone will want to warn me about microwaves, but that's just one of those things I'm taking my chances on - just like cell phones. I like my life the way it is and I don't have the time - or desire - to cook our meat fresh everyday. (Plus, I'm not the cook and DH gets home later than the kids need to eat - so re-heating is what works.) I will say, adding the fat is just a delicious way to keep the meat from becoming too dry when reheated. The kids are loving it too.

With the beef fat, I plan to broil it on the broiler pan, eat the crispy fat and keep the liquid fat the drains through the slots to put in a second jar in the fridge. We will just be swimming in fat around here! The fat won't go bad if it's refrigerated, will it?

cbnebraska Wrote:

So, this is what I'm doing. Tell me what you think. I brown up low sodium bacon on the stove and then add in high fat hamburger.

I think you're doing outstanding. Good for you and your family. Don't ever feel you have to justify the choices you make. We're with you! As far as the wierd looks, oh, you may still get them but they won't be able to argue with your success. I had a discussion with someone recently who suggested that in the long term, I would not be healthy for my efforts since I cut out whole food groups.

I responded, "so, let me see. You are unhealthy today yet you do not eliminate any of the food groups. I am healthier than you today and I eliminate all but one food group. Despite all this, you will somehow be healthier than me in the long run. Is that right?" Head turns sideways, and conversation ends.

I will say that last week, I didn't have bacon for breakfast which was not really intentional. I just had some extra pork steaks and not so much time since it was just me and the children. Well, today, I've hit 151.0. I checked my notes and on this date last year, I was 161. It's not so much the scale number, as I got slimmer over the week. I have this size 14 1/2 shirt on today that I could wear last year, but I couldn't button the collar. Today, I could.

The bacon was the saltiest thing I had remaining in my repertoire and I didn't seem to miss it. So for now, it's gone again. (NOTE: Don't feel like any of you have to remove bacon because I did, I'm just telling you just in case you're plaetaued and you're looking for solutions.) And to think, I don't have any weight-loss aspirations!

There is just something about salt that adversely affects the appetite, I guess.
Cynthia Wrote:

No, that fat will last a long time.

RE: Zero Carb / Meat and Water - abnormalslc - 08-25-2008 09:46 AM

Over the weekend I achieved another pound to reach 208....82 pounds lost!

For "fun" I tried on a pair of size 34 jeans that I have had lying around for "motivation"...and THEY FIT! My wife said they did not look too tight...of course they are tighter than my current size 36....but I could move around in them, and kneel down and such without bursting any seams!
My wife does not like the specific cut of these cheap Costco jeans, so they will probably be labeled as "work around the house" jeans...and I am not quite ready to "commit" to size 34...not that I fear gaining, but I am pretty comfortable in size 36....after another 10 pounds or so gone, maybe size 36 will seem too big, and I will be ready to move down...

This ZC/VLC seems to work for me.

I currently work 4 10-hour shifts and do find myself hungry some days....but my work schedule limits some of the things I can do. I am not "dying" to eat...and it is nice to actually be hungry once in a while. Some days all I eat is eggs, meat, and diet soda....occasionally I will have cheese...but not regularly, and I eat the 0 carb cheddar or swiss when I do. My snack of choice is pork rinds...to help stave off hunger during the long 10-hour shift...

...some have said that sweeteners, even if artificial, trigger a desire for more sweets for them, but I do not have that reaction...at least not any more.

The longer I follow ZC\VLC way of eating, I find it is easier. I can sure tell when I have eaten leaner meats....but sometimes that is all we happen to have come eating time.

What has worked best for me and this 10-hour shift is the following:
This is my ideal menu, and I do not eat this menu every day, but as I progress, I think it will become my basic menu.

**Breakfast:**
2-3 fatty hamburger patties with little or no spices/flavorings (frozen, or fresh...no preference for me.)
I prepare these fresh in the morning, or the previous night and reheat them to simplify the morning routine. I eat these around 6-6:15AM and am not hungry until 11:30 or Noon.
Or...sometimes just a bunch of bacon...I love the stuff.

**Lunch:**
2-3 fatty hamburger patties...same as breakfast...prepared with the breakfast patties and reheated at work. I sometimes add some butter to add some more fat, and I enjoy the flavor.
I am not usually hungry again until dinnertime, 6-6:30PM.

**Dinner:**
What ever meat my wife has prepared or some leftover meats from previous meals. Most days it is a simple meal, as my wife works outside the home, and I just "punt" with whatever I find in the fridge. Food is just not a big deal to me any more.
For drinks, I drink water, or diet soda...depending on what strikes my fancy at the time. I drink some diet soda with Splenda, and some with aspartame. I still try and limit aspartame, but have not given it up completely yet.

I have 28 more pounds to go to reach this new goal. I have weighed 180 in my early 20s, but do not remember much about it...it was short-lived...so...we shall see.

I tend to only lurk when the discussion turns to grass-fed/grain fed...I really don't care one way or the other. I tend to shop by price and ease of availability.

God Bless

Ab

RE: Zero Carb / Meat and Water - poo123 - 08-25-2008 10:02 AM

Well I was all excited on Sat. I went shopping and found some sausages made with pork, spices thats it, no fillers, no sugar it was great. I cooked them and had them for dinner and breakfast the next day. Well maybe they thought sugar was a "spice" because that is the only thing I have eaten that was different from the steaks I eat and I am up 3 lbs. I threw out the trash so I can't go to the website because I don't remember the name. I will be making my own from now. I feel fine, I am not sick, or anything just up 3 lbs. I know its got to be the food because I don't have a TOM anymore, so I was really mad but I am over it, just have to make my own from now on. Oh well my husband really like them, he can have them again...alison

RE: Zero Carb / Meat and Water - bbcakesii - 08-25-2008 10:10 AM

I've been reading the latest posts in here and can someone please give me a short version of why you are eating so much fat. I'm pro low carb and my using that WOL, I'm just wondering why there is a lot of talk about saving the fat, etc. Thanks.

RE: Zero Carb / Meat and Water - suzanneyea - 08-25-2008 10:14 AM

LOL
Charles may have a technical answer for this, I can tell you my personal answer. I find that I have more energy and feel better on high fat. I can also go long periods of time without eating and that is very convenient. For those trying to lose weight it seems to facilitate this process as well.

RE: Zero Carb / Meat and Water - cbnebraska - 08-25-2008 10:20 AM

Congrats to you both! That's just wonderful. It's so empowering, isn't it? If you can do this, what's next?
Woo-hoo!

RE: Zero Carb / Meat and Water - FatGirlOnAtkins - 08-25-2008 10:27 AM

Ok, please don't attack me... I'm just musing out loud. I have been faithfully following a vlc-zero carb lifestyle for more than a month. Before that it was 20-30 carbs a day for months. I was losing weight, had good energy levels, wonderful mental clarity and even moods. But this week, I was hit harder with illness than I have been in YEARS. It started with just a tiny cut on my hand that turned into a huge infected sore... then a couple of days later it was strep throat, then my eyes, nose and about everything else was infected, too, along with body aches, fever and horrible headache. I felt like someone hit me with a train! Every year when school starts I get a cold, but it's usually a couple of days and I'm better... this was a whole week. I have never had so many things wrong with me at the same time that took so long to get over.

So I'm left wondering if I am not getting enough vitamins or something. I mean, I feel like my immune system should have been stronger than ever, and apparently it just shut down on me. What's going on? I really have never been so sick... there's no way to make it sound as awful as it was. I am wavering on the no-carbs thing now.. I just need reassurance, I guess. And it didn't help that my husband kept on in his know-it-all way "It's the way you're eating, you know." Is he right? I really thought I was doing everything right. I know that I'm still going to get sick sometimes, but this was beyond sick.

RE: Zero Carb / Meat and Water - bbcakesii - 08-25-2008 10:36 AM

Suzanne...you are right about the more energy and longer periods of not eating, as I experience that from eating high fat; however, the eating fat and "dipping" meat in fat conversation made me think about clogged arteries.

Because history tell us that populations that did not consume carbohydrates ate high-fat diets. A high-protein or high-carbohydrate diet can kill you. However, a high-fat diet is healthy for a lifetime.

A suggested reading is the PDF I've attached to this post. It's been posted before but it's hard to find.

Clogged arteries, oh dear! That would be a problem. The diet police make it sound that dietary fat goes straight from your stomach to your arteries and just clogs them up. Have we no concept of human physiology and what happens to the food we eat in our bodies?

Suffice it to say that carbohydrates clog arteries, not fat. Populations that don't eat carbohydrates don't have heart disease or atherosclerosis so clearly fat must not be the villain we think it is. However, populations such as ours that eat 70% carbohydrates, boast a rate of 50% chance of heart disease and cancer.

Something else must be going on....

I can't remember where I read it, but when you go zero carb your body begins to detox as it gets rid of candida, bacteria used to break down carbs and whatever else. Sometimes this detox can make you get sick as these toxins are being flushed out. Maybe somebody else knows more about this. Kind of like Induction Flu.

Is it that bad here?

Quote:
Every year when school starts I get a cold, but it's usually a couple of days and I'm better... this was a whole week. I have never had so many things wrong with me at the same time that took so long to get over.

Well, you said it yourself, you get sick every year around this time and this year is no different except you seem to have gotten a little worse.

The thing is, the center of your immune system is located in your digestive tract so that would need to heal completely before you experience the improved immune system. You said that you eat VLC so even the small amount of carbs that you do eat have the potential to affect your immune system, especially since it was already compromised before.

If you took supplements in the past, it's hard to tell whether you over supplemented in certain nutrients and it's possible your body lowered your levels of other minerals and nutrients to compensate for what you were doing.

I can't say what it is that has you so sick but I can say from personal experience that I very rarely get sick. It's not natural to get sick every year from whatever bug goes around yet people do despite eating tons of fruits and vegetables.

Either way, I don't think you have been doing zero-carb long enough to attribute these things to it. Cutting carbs at any level usually improves people's response to illness, but it's hard to say how soon that happens. I suspect that your immune system is just going to take longer to get going than others.

It's always worse when there is someone close by telling you "I told you so." so I can certainly understand your wavering. All I can say, is hang in there and do what you think is best.

Regards,

Charles

RE: Zero Carb / Meat and Water - nyteez - 08-25-2008 11:14 AM

Candida feeds off sugars & carbs, w/ zero carb there is no food for Candida, so it dies off. Some people get pretty sick just from the Candida die off.

That's the question of the day. How did you cut your finger? I didn't even think of that...
Hi there--

I got worried about the cholesterol issue about a year ago when my husband went for his first ever complete physical with blood work and lipids profile at age 39. His total cholesterol was 239. His breakdown numbers were actually decent, as in his HDL was high and triglycerides were low, but I still wanted to find out more about the numbers and what they mean. Since I was eating low carb at the time and he was what I'd call "moderate carb", I searched amazon for "low carb diets and cholesterol". I ended up with 2 books. The Great Cholesterol Con by Kendrick and Good Calories, Bad Calories by Taubes. Fabulous reads that were absolutely life altering. Needless to say, my husband is off carbs, on fat and working on managing stress. I don't care so much about the cholesterol number, but I do care about him living to grow old with me😊

GCC more or less points the heart/arterial disease finger at stress hormones that are ever present in the bodies of many people in today's society. It didn't use to be this way. The stress hormones were needed in fight or flight situations only, which is what they were meant for. Having them ever present in your system shuts down other systems, which causes disease. He also talks about carbs in the diet a few times.

GCBC is a heavy duty dose of science that is a must read for anyone who really wants to understand why so many of the truths we think we know about fat and carbs and diet in general are actually myths and why carbs are killers. Charles did a great chapter by chapter breakdown of this book here on this website. Check the home page for discussions.

I hope you'll look into these books to get the whole picture.

Congrats, Dave!

I have a question about water for everyone. I'm drinking to thirst only, but rarely am I thirsty-so I finally force myself to drink 2-- 8 oz. cups of water because otherwise, if I drink less my eyes get dry and hurt in the middle of the night.

So the question is how much water are you all drinking on an average day?

I'd estimate something like a half gallon a day on a normal day, more when I go hiking.

RE: Zero Carb / Meat and Water - feckless - 08-25-2008 12:48 PM

Charles, do you ever worry about the higher PUFA content of chicken? A lot of science suggests PUFA has unhealthy effects on the body.

con, i am drinking MUCH less water. sometimes the whole day goes by and i realize i never drank any water. if i try to force water, my stomach hurts. i wasn't worried about it, but last night i did wake up with dry eyes/mouth, so i'm wondering if there is a minimum amount.

RE: Zero Carb / Meat and Water - cbnebraska - 08-25-2008 12:54 PM

I'm not much of a water drinker either. I don't get thirsty often at all. I'm guessing maybe 10 oz. each day. I do, however, drink about 3 cups of coffee a day. I've never had the dry anything issue.

RE: Zero Carb / Meat and Water - Living_healthy - 08-25-2008 01:04 PM

I sip on water throughout the day and brush often because of the thick mouth phlegm due to ketosis. I'm hoping that problem will be a thing of the past once I'm ketoadaptive.

RE: Zero Carb / Meat and Water - suzanneyea - 08-25-2008 01:17 PM

The more I have been watching this tv show about the hunting tribe in Africa, the more comfortable I become with the high fat, all meat diet. I do not believe heart disease is a big problem among this tribe and they eat all the fat on the animal.

RE: Zero Carb / Meat and Water - Mel - 08-25-2008 01:19 PM

I have learned to only sip water when I'm thirsty, not gulp it. By reducing the amount of water I drink, I think my skipped heart beat problem has greatly decreased. Maybe by over drinking water I was diluting my electrolytes. The eight glasses a day thing is bogus:
http://junkfoodscience.blogspot.com/2008/07/wellness-water-8x8-myth.html

I'm eating when hungry and I'm learning to stop when satisfied. I've been getting a strong thirst signal as I get to the end of any fat/meat meal. I take that as a signal that I'm food full. I stop eating and just sip a little water. Does anyone else experience that thirst signal during eating or have an idea what might
cause it? I'm saying my thirst is well satisfied before the meal starts and I no longer add salt to my meats.
Melinda

Nope. I don't even know what PUFA is, but if it was going to affect me, it should have done so by now because I eat a good deal of chicken! 😊

Regards,
Charles

RE: Zero Carb / Meat and Water - Charles - 08-25-2008 01:44 PM

I just drink to thirst. I do indeed know when I've had too much though because I tend to have a cramp or two and get a little nausea. Even when I drink a glass of water, it has to be a small glass. Just like my dog, I'm in the bathroom within 30 minutes afterwards most of the time.

RE: Zero Carb / Meat and Water - montmorency - 08-25-2008 03:01 PM

Ab, your comment about jeans size made me want to check the size of the trousers I'm wearing (which keep almost falling off me!), so I took em off (sorry if this is TMI :-) ) and discovered they were 38 inches around the waist. Definitely too big for me now, at around 182 lbs; they have probably stretched bit though. I have a pair of 34" which were too tight for comfort last time I tried them, but I've lost a bit since then, so may be...

cnebraska: I hope you won't mind if, for the sake of accuracy, I correct the title of Gary Taubes masterpiece to be "Good Calories, Bad Calories" (if only because that's a mistake I've made myself on more than one occasion). Actually, here in England it came out as "The Diet Delusion". Glad you cited Malcolm Kendrick's book as well; such a great read!

Today, I found a printed copy of the article cited below, by Nigel Slater from 2003, and fortunately, it's still available online:

http://www.guardian.co.uk/lifeandstyle/2003/feb/09/foodanddrink1

Now, when I read this, I'd never heard of low-carb (or never taken it seriously) and was trying to come to terms with my increasing weight problem, and trying various things. At the time I was into my "healthy diet" period - lots and lots of fruit and veg, bread, rice, pasta, salads. Minimal meat and animal fats. For some reason, I never questioned why this "healthy diet" wasn't helping me to lose weight. I now know why, of course, but it took me at least 4 more years to find out.
Reading Slater's article now, I just think what a complacent twerp he actually comes over as. So good for him, he was always skinny, and he was actually the correct weight, but his problem was he had tummy fat.

His bottom line was basically just that he ate less and walked more.

Hm...don't know how old he was/is, but I'd love to know how he has got on over the last 4-5 years, and if that "recipe" has worked for him still.

Although people here probably cook less than ever before, we watch more and more TV chefs all the time, and do you know what? All they seem to show us is carbs, carbs carbs, and do you know another thing? They are mostly overweight! OK, there are exceptions, but they are mostly young. I'd love to see them in middle-age.

Regards,
Mike

**RE: Zero Carb / Meat and Water - FormerDonutJunkie - 08-25-2008 04:45 PM**

My water intake is no where near the eight 8 oz glasses that some 'diets' recommend. I'm sloshing if I drink anywhere near that much. I'm not a ZC yet, so I do drink two 8-10 oz cups of coffee every morning. Then I'll drink a couple bottle of water during the day as needed.

When I started LC a little over a year ago, I tried the water 'force feeding' thing and it was annoying to say the least. I think the best policy is to drink to satiety and that's it. Let your body be your guide just like with the protein/fat.

The whole 'drink water so you'll feel full' and not eat as much just ain't good science. There's a difference between feeling bloated with water and feeling full from a good 73/27 burger! And guess which one lasts longer?

http://raypeat.com/articles/nutrition/oils-in-context.shtml

Barry Groves (http://www.second-opinions.co.uk) is also very scathing about polyunsaturated fats.

Water: I too seem to have cut back a bit on water, although I increase it a bit if I think constipation may be becoming an issue; otherwise I just drink according to my taste. I used to believe that thing about drinking water first, if you thought you were hungry, and I notice that Nigel Slater comes out with this one in that article I posted a link to. Some low-carbers seem to believe that unless you drink gallons of water, that whole "ketosis" thing isn't going to work properly. I'm not sure of the science behind that one, but I suspect it isn't the case. They say that you can get dehydrated ages before you feel thirsty. Well, possibly so, but I am sure that we were built to withstand a little water shortage. It will kill us eventually, but not (usually!) before we'd have time to do something about it.

Regards,
Mike

RE: Zero Carb / Meat and Water - cbnebraska - 08-25-2008 06:06 PM

So, now someone will have to tell me, why is the fat of a chicken different than the fat of any other animal? I also wanted to ask about something that may or may not be related. I've heard about the "bad" fatty acids, something with a 6 versus the "good" ones with a 3? Anyone care to elaborate for me? I have read things in various sources over the years and my sense of "good" and "bad" has become very scrambled with my new take on ZC!!

Thanks!

RE: Zero Carb / Meat and Water - Daryl - 08-25-2008 06:17 PM

The "6 and 3" refers to omega fatty acids. It makes up at least part of the "grass fed vs grain fed" argument.

You tend to see omega 3 called "good fats", while the omega 6 get more of the evil eye 😞, as we supposedly get too much of them, causing the ratio between the two fats to get out of whack.

Quote:
Lack of omega-6 fatty acids, however, is extremely rare in diets of those living in certain Western countries, particularly the United States, as well as Israel. In fact, North American and Israeli diets tend to have too much omega-6, particularly in relation to omega-3 fatty acids. This imbalance contributes to long-term diseases such as heart disease, cancer, asthma, arthritis, and depression. A healthy diet should consist of roughly one omega-3 fatty acids to four omega-6 fatty acids. A typical American diet, however, tends to contain 11 to 30 times more omega-6 than omega-3 fatty acids.
Salmon is a good source of omega 3s, as is fish oil.

See this link about lard which explains the different fatty acid types. There are three types SFAs (saturated fatty acids), MUFAs (monounsaturated fatty acids), and PUFAs (polyunsaturated fatty acids). The types vary in the number of double bonds. http://www.proteinpower.com/drmd_blog/ They can then be further broken down into omega-3s and omega-6s.

Well, my HDL is 115 and my triglycerides are 39, so IF those are actually any sign of a healthy heart (which I'm not so sure about anymore), I think I'm good. However, I had been taking the Omega 3 when the test was run, so maybe I'll just stick with it. I've got a ton of them anyways, may as well use them up!

Thanks for the links.

RE: Zero Carb / Meat and Water - nyteez - 08-25-2008 07:14 PM

All these tests were done assuming the typical high carb american diet. Since we don't eat carbs I don't believe these balance of fats have anything to do with us. I also don't believe for one second that an imbalance of omega 3's and 6's cause diseases. It is not the fats! It's the carbs & insulin.

RE: Zero Carb / Meat and Water - FormerDonutJunkie - 08-26-2008 01:49 AM

I believe Dana is right again! I'm beginning to question this whole supplement theory. I've spent lots of money in the past on some really expensive Multi-Vit-Mins, Omegas, etc and don't really know what they did for sure except turn my urine bright yellow. Sorry if that's TMI.

If Steffanson and crew, and the Eskimos lived a healthy life without them on a pure meat diet then I think we can pretty much relegate their usefulness to improving the bottom line of the supplement companies.

When I told my wife I wasn't taking the vitamins anymore, she said she was very concerned that I needed them more than ever now that I'm eating a 90-95% meat diet. We shall see. I'm not buying any more until I see if there is any difference. Actually, I think that money just might be better spent on prime rib!

Like you Dana, I think the whole supplement thing might have been to help correct the ills of over consuming sugar and other carb-laden foods. Just my two cent worth, for what it's worth!
RE: Zero Carb / Meat and Water - suzanneyea - 08-26-2008 02:43 AM

I used a lot of vitamins when I first started Atkins, but gradually weened off of them with no ill effects. I still take vitamin C, no idea why.

RE: Zero Carb / Meat and Water - cbnebraska - 08-26-2008 02:43 AM

I guess my thoughts on the fish oil was just that since I don't eat much fish, and it has been recommended that we eat a varied diet of meat sources, maybe just the fatty acid from fish might be a good thing to ingest. I think of Omega 3 as eating fish. I completely agree that a full meat diet facilitates the body in making whatever it needs to be healthy - except vitamin D - so I suppose any type of supplement is superfluous. However...... I bought the dang things, so I may just finish them off.

Thanks for your thoughts.

Good morning!

Here's an interesting article stating that "Cutting down on omega-6 is better than increasing omega-3"
http://www.second-opinions.co.uk/omega-6-lungs.html

RE: Zero Carb / Meat and Water - MAC - 08-26-2008 03:48 AM

Here is a Q&A from Dr. Eades blog on the levels of Omega 6 versus Omega 3 in grass fed versus grain fed beef:

"Dr. Eades,
I’m salivating over that picture of the ribeye steak you’ve included in this post, and it’s reminded me of a question I’ve been longing to ask you for a while now, despite the fact that it may be slightly off-topic here.
Between your well-written and thoroughly researched articles regarding saturated fat, I’m convinced they’re not the monsters the media have made them out to be; I’ve read many of Mary Enig’s articles as well, and her words have also put me at ease that I’m not slowly killing myself whilst ingesting these delicious, fatty steaks (which allow me to control my weight beautifully–I’ve been low-carbing since you and the wife published ‘Protein Power’)

Finally, my question (speaking of the ribeye picture above)–do you subscribe to the notion that grass-fed
beef is much healthier to consume? Every internet store selling it claims their steaks are much higher in the omega 3’s (some claim their beef has just as much if not more than fish!) thus are less inflammatory and less ‘contaminated’ with hormones, antibiotics, etc.

I know organic or ‘natural’ may tend to be better, but does the food the animal eats actually make the beef on my plate much less dangerous than say, a store-bought steak, which, according to many of these purveyors of grass-fed, contains too many omega 6’s?

I’m not a lover of fish, and I easily get ‘chickened-out’, so I’d love to hear your opinion about the so-called ‘health benefits’ of grass-fed beef. Yes, it’s alot more expensive, but if you think it’s healthier to consume on a more regular basis, I’m willing to spend the money.

Thanks for your help, Dr. Eades!

The ratios of omega-3 to omega-6 are different in grass-fed and grain-fed beef, with there being higher levels of the omega-3s in the grass-fed. But the amounts of both are pretty small, so I wouldn’t get all that worked up over it. I like the idea of grass fed because of the lesser amounts of pesticides, hormones, antibiotics, etc., but I like the tastes of grain-fed better. I eat about equal amounts of each.

If you’re looking strictly at the best steak to get for health reasons, I would go for grass-fed. If you’re looking for both taste and health, go for organic, natural beef, which, as I understand it, are grass-fed up until the final few months, then grain-fed until slaughter.

RE: Zero Carb / Meat and Water - MAC - 08-26-2008 03:54 AM

See this post from Dr. Davis' blog that it may be the level of Omega 3 that is important and NOT the ratio of Omega 6 to Omega 3.

"The fact that neither omega-6 nor arachidonic acid content differed counters the argument that Simopoulos has made that the omega-6 to omega-3 ratio (intake, not blood levels) is what counts. It also argues against the EPA to AA ratio (and similar manipulations) that some have argued is important. In this study, only the omega-3 level itself made a difference; no ratio was necessary to distinguish sudden death victims vs controls."

RE: Zero Carb / Meat and Water - Richard - 08-26-2008 05:32 AM

I'm the new guy on the block and I have a few question.

First a little history....I have done Atkins, P. Power or Carb Addicts off and on for the past 10 years (more off than on I am afraid) Due to some recent health issue I have come to the conclusion that this time the low carb choice is it for LIFE!

The Zero Carb interest me because cravings were always a problem on the other programs. From the 25 of 234 pages I have read in the long run cravings seem to be lower on the ZC path.

Now for the questions:
1. Are the carb cravings really lower?
2. What about artificial sweeteners, aspartame, stevia etc... (in diet drinks mostly)?
3. I did love to do some flavored whip cream (whip cream, DaVanci flavor and sweetner) but carb counts on packages vary...should I 'give this up' or just as a special treat (I REALLY LOVE THIS!!!)
4. How long should I expect the 'issues' with transitions(I have been on ZC for 4 days and seem to be having some 'internal' issues)?

Thanks to everyone for the information

---

**RE: Zero Carb / Meat and Water** - LindaSue - 08-26-2008 05:47 AM

I tend to not be concerned about what percentages of this or that are in my food. We humans have survived for quite a few years without having a clue what nutrients were in our foods and in what percentages. If I have enough time on my hands to analyze every bite of food that I put into my mouth, I need to find more useful ways to spend my time.

Welcome to the forum, Richard.

---

**RE: Zero Carb / Meat and Water** - suzanneyea - 08-26-2008 06:28 AM

I rarely have any carb cravings, every so often when I am cutting a cheese pizza for my son, it looks yummy. But, I used to be a big binge eater and that is no longer an issue.
2. I have one coffee in the morning with one equal, no other aritificial sweeteners and definately no diet soda. I used to drink a ton of soda.
3. Sweet flavors give me carb cravings, so I avoid them. Cream cheese too.
4. It took my system several months to adjust, I had lots of issues in that area too.

---

**RE: Zero Carb / Meat and Water** - caroline - 08-26-2008 06:39 AM

Suzanne,

Do you find the coffee works okay for you? I just love coffee but gave it up b/c I figured I was better off (due to it making you produce adrenalin, tweaking with hormones, etc.).

---

**RE: Zero Carb / Meat and Water** - caroline - 08-26-2008 06:52 AM

Richard,

I also was a binger and never binge anymore. I was a sugar addict and don't care for sweet anymore. This diet (way of life, rather) works!
RE: Zero Carb / Meat and Water - MAC - 08-26-2008 07:01 AM

Richard wrote:

Now for the questions:

1. Are the carb cravings really lower?

*Carb cravings are caused by too high a level of insulin. A low carb diet should lower your insulin levels over time and prevent cravings.*

2. What about artificial sweeteners, aspartame, stevita etc... (in diet drinks mostly)?

*Same issue as 1. Your body responds to artificial sweeteners as it does with any food by secreting insulin.*

3. I did love to do some flavored whip cream (whip cream, DaVanci flavor and sweetner) but carb counts on packages vary...should I 'give this up' or just as a special treat (I REALLY LOVE THIS!!!)

*See response to #2. I say special treat.*

4. How long should I expect the 'issues' with transitions(I have been on ZC for 4 days and seem to be having some 'internal' issues)?

*Varies by individual.*

Welcome, Richard! I too suffered cravings and hunger, even on low carb (20-30 per day) and even when not overweight. The cravings for sweet then salt then sweet then salt were debilitating, and frustrated me to no end. I was always thinking about my next meal, even though I was eating low carb and not overweight! I cannot tell you how liberating this zero carb diet has been for me. The most important part is the FAT. You MUST eat high fat meat. Lean meat will not conquer hunger and cravings on a cellular level - plus the fatty meat is DELICIOUS. I too loved sweets and couldn't imagine giving them up and felt the low carb ones were my "treats" for choosing low carb foods. I truly wanted to be free of the control food had over my life though and began reading this forum about a month ago (maybe? I'm a bit memory challenged when it comes to the passing of time!) I went ZC 2 weeks ago after first paring out
cheeses, artificial sweeteners, "low carb" food derivatives (Atkins bars type stuff) and nuts almost the
day I found this discussion area. Each time I cut something out, I felt better and better. I can't believe
how just 2 weeks has set me free from food cravings and constant thoughts of food. The added bonus is
- I've lost weight that I wasn't really trying to lose. It's amazing how I settled for good enough when I
could have felt this great and looked even more lean with a simple diet tweek.

Stomach issue - yep. It will settle down, but it's so great to know things are moving so well and that the
fiber issue truly is a myth, isn't it? We don't need it and most of our bodies don't like it. If you want
something to be free flowing, grease 'er up, don't throw a bunch of little expanding sponges in it. Ha ha.

It can be so hard to do this because our society revolves around food and we have ourselves accustomed
to this being a normal leisure time activity. Believe me, I enjoy my meat when I eat it, but I look at
sweets and everything else more like art at this point - "oh, now isn't that pretty?". I'm truly don't see it
as food and I'm truly not hungry, so it doesn't make my mouth water and thus, no craving or desire to
"indulge" or treat myself. Artificial sweeteners are DEFINITELY insulin inducing, even without carbs.
It's Pavlovian. You see something sweet, you know what it will taste like, your insulin goes up (in
defense if you ask me!) so it can tackle the sugar when it comes in. Doesn't really matter that the sugar
never shows up, just your insulin being up prohibits fat burning, which means your body has no fuel,
which means it sends hunger signals. This may be simplistic, but it made it easy for me to give up the
sweeteners and "lose my sweet tooth". This amazingly all happened for me in just a few weeks! Guess
I've finally found a biological fit for me!!

Once again though -- FAT is very important or you won't squash hunger.

Long and windy because I'm still on a high myself about it all! Go for it!

RE: Zero Carb / Meat and Water - nyteez - 08-26-2008 07:40 AM

Hi Richard & welcome! Zero carb is not easy to just jump into, but once you get there you will love it. It
took most of us a few months or years to decide to go zero carb. Don't be afraid to give in to "safe
cheats" like whipped cream and artificial sweetners. Eventually you won't want those anymore either. I
am not a big coffee drinker but occationally I will drink it and I put heavy whipping cream in it. It is like
dessert!

As soon as I got over my fear of fat, and started eating lots of it I no longer had digestive problems. The
fat is what really curbs the hunger & cravings too.

All these tests were done assuming the typical high carb american diet. Since we don't eat carbs I don't
believe these balance of fats have anything to do with us. I also don't believe for one second that an
imbalance of omega 3's and 6's cause dicesases. It is not the fats! It's the carbs & insulin.

That's absolutely correct. Americans have high Omega 6 due to the oils in so much of the refined and
easily digestible carbohydates they consume. When you eliminate the carbs, your Omega 6 and 3 will
balance just fine without the need for disgusting fish capsules.

As I've posted many times, many cultures never ate fish so to say that everyone needs to have fish or
fish capsules is quite naive and once again putting an association forth without cause. The cause is clear.
Remove the carbs and you'll find that there is nothing more to concern yourselves with.

Regards,

Charles

Good point. Association is NOT cause. Which is the downfall of epidemiological studies. Care to enumerate which natives those were?

Trying to refute the following association from Dr. Davis' blog:

"This conversation is still evolving. But we can learn some important lessons from three populations of the world that are vigorous consumers of fish:

--The Inuits (aka Eskimos) of Greenland and northern Canada
--The Japanese
--The Bantus of Tanzania who live along Nyasa Lake

All three indigenous populations have several-fold greater intakes of fish and omega-3 fatty acids, have higher blood levels of omega-3 fatty acids, and have enjoyed reduced cardiovascular events, reduced atherosclerotic plaque, or improvement in various surrogates of cardiovascular risk (e.g., Lp(a))."

RE: Zero Carb / Meat and Water - Richard - 08-26-2008 08:36 AM

Thanks again for all the reply's and information...now to sit back and let the knowledge here soak in.

RE: Zero Carb / Meat and Water - suzanneeya - 08-26-2008 09:07 AM

I do have on ecup of coffee in the morning with an equal and heavy cream, but Caroline, if you already gave it up, why go back? I have given it up before, but cannot seem to do it for any long period of time. I used to drink 5 or 6 cups a day, plus tea! So, one cup is major for me.

RE: Zero Carb / Meat and Water - waywardsister - 08-26-2008 09:16 AM

Back after a weekend away - I chose to eat some carbs over the weekend (gluten free hot dog buns, some potato chips) and am taking the resulting water weight in stride. Back to my regularly scheduled WOE today. One thing I noticed was that my pollen allergies, which are non-existent when I am not carby, reared their head last night. Just slightly, but zero to slightly is enough of a difference for me.

suzanneeya Wrote:
The more I have been watching this TV show about the hunting tribe in Africa, the more comfortable I become with the high fat, all meat diet. I do not believe heart disease is a big problem among this tribe and they eat all the fat on the animal.

ooooh, what show?

Re: omega 6 vs 3 thing, I really think the problem is too much omega 6 in the SAD rather than not enough omega 3. I take fish oil only bc I still use some PUFA stuff, like commercial mayo (with canola oil). If I was only using animal fats, I wouldn't bother.

I tend to not be concerned about what percentages of this or that are in my food. We humans have survived for quite a few years without having a clue what nutrients were in our foods and in what percentages. If I have enough time on my hands to analyze every bite of food that I put into my mouth, I need to find more useful ways to spend my time.

I just added that to my Low-Carb Quotes!

RE: Zero Carb / Meat and Water - travis t - 08-26-2008 09:26 AM

This talk about O'6 and O'3 makes me think back a couple of months ago when i first did a drastic cut in carbs. The skin on my feet has always been smooth and soft even in the heel area but when i dropped most of my carbohydrates my heels got dry and developed cracks in them.
My theory is that when i dropped my carb levels it caused a drop in insulin which caused a rise in hormone sensitive lipase which allowed fats of all kinds to release into general circulation from adipose tissue.
This dump (transient rise) of fats into the blood included omega-6 fats that have now been metabolised. Kinda a herxheimer like reaction for omega-6's.
Now no cracks and smooth again.

Well, I believe Kendrick would point out in "The Great Cholesterol Con" that these populations don't suffer from the same level of stress as many others. Cortisol and adrenaline come into play here. I wish I could be more specific, but I read the book quite a while ago.

Cholesterol levels and blood lipids are simply indicators of what is going on in the body. I look at them like a fever -- it's there because the body is working to fix something, but just by reducing the fever (with outside interference) you don't fix the real problem - whatever it is. And, some people's temperature runs higher than others, even when they're healthy, and it's nothing to be concerned with.

MAC Wrote:
epidemiological studies. Care to enumerate which natives those were?

I've posted Dr. Price's list of meat-eaters many times. You can also add in the Native American of the Great Plain who ate Buffalo and very little vegetation. He was extremely healthy before the white man came with refined carbs.

Dr. Davis Wrote:
--The Inuits (aka Eskimos) of Greenland and northern Canada
--The Japanese
--The Bantus of Tanzania who live along Nyasa Lake

He's using the same flawed methodology as Keys did. Calling the Inuit prodigious eaters of fish shows that he didn't read Stefansson very closely. There were some who ate prodigious amounts of fish but there were other groups of Inuit who did not eat any fish. Those who did, may not have had it all the time. They might have had it one year and then went a few years without. The McKenzie Inuit ate mostly caribou and during off-years, they may have some seal and walrus but some of them never ate fish.

The point was that they all had the same extraordinary health.

The Japenese can't come into play in any argument because the typical Japenese of the 1950s and prior barely ate a subsistance level of food. Their diet was automatically low carb, low-calories, etc. The also did not eat any refineded and easily digestible carbohydrates.

One cannot attribute these associations to cause because there are other factors. The biggest of which, all three did not eat carbs (or at least not that many) and I believe this is the biggest factor.

I rarely eat fish and do not take supplements yet I am positive that my Omege 6 and 3 is in balance.

These folks keep trying their best to say that there is a certain amount of nutrients that we all need to ingest over our lifetime for optimum health. But the problem with this argument is that some cultures do not eat the minimum daily allowance yet show no deficiencies. Obviously, there is something else going on and it doesn't involve fish capsules.

According to Malcolm Kendrick ("The Great Cholesterol Con"), while the Japanese didn't use to get heart attacks, they did use to get strokes. However, there is a complication here, in that, apparently, due to cultural issues, heart attack deaths were sometimes reported as strokes, which were at some level, socially more acceptable.

Perhaps the lesson to learn here is that we can't learn all that big a lesson from epidemiological evidence. The numbers can be misleading, incomplete, etc, etc. It was Ancel Keys who got us into this mess in the first place, by reliance on the wrong sets of figures. So we have to be wary of population studies, yes, even ones which appear to support our own pet theories.

Charles Wrote:
Congratulations, Alison! I figured that change to the coconut drink caused problems for you since I've been following your progress. Keep it clean and you'll be fine. Don't be too quick to jump on these prescriptions that everyone has.
Well, this has been a fun week and a half! I've been totally ZC (beef, chicken, pork and water...nuttin' else). I am totally gung-ho and have been absolutely strict. I'm down about 6 pounds since a week ago. I'm excited and I'm learning a lot.

But, WOW! I've been feeling really sluggish and lethargic...no energy. Some headaches (probably caffeine withdrawal). So after reading some of the posts on here, I bought some coconut oil and started eating it right out of the jar to up my fats.

Now, I've read this whole thread this far, but no one has mentioned one of the risks of eating the coconut oil straight out of the jar. I thought if I told my story, maybe it would prevent it in someone else's life:

This morning early, I took a tablespoon of coconut oil out of the jar and ate it off the spoon before I started in on my ribeye. Did I say I ate a tablespoon of coconut oil? I meant to eat a tablespoon of coconut oil. What I actually ate was a tablespoon of salve I'd made of petroleum jelly, tea tree oil and oregano oil to help with dry, scaly feet. I mean, they were right there next to each other. And yep, I swallowed it.

Gack.

Took me a moment or two, and then I realized that although the consistency was similar, the pleasant, slightly coconut-y taste I'd come to expect had been replaced with something different...something stronger. Something MUCH stronger!

I wish I had a video of my face as the realization set in. I am very proud of myself, though! Everything I used to get that taste out of my mouth was zero carb! I never went off plan!

No one's actually prescribed this yet, but I'll let everyone know if it helps.

But someone coulda said something.

I haven't bought too much coconut oil, as the good stuff is quite expensive, but when I did have some in, I found I was using it quite a bit as a skin moisturiser. Would probably make quite a good foot salve :-)

re: Zero Carb / Meat and Water - feckless - 08-26-2008 11:15 AM

got the following stats from the gym:

i'm 5'6 1/2" and 42...
weight: 125
bodfy fat %: 23
Muscle %: 35
metabolic rate: 1300
water %: 56

i'm wondering how to 'use' these numbers. first of all, does this give any real indication of how fit i am? my body fat % is average, but what is best for optimum health? i feel i'm lacking muscle, but again, i don't know what is a good % to aim for?

and how many calories should i eat above my metabolic rate (if i am still trying to lose fat), should i aim for a bit under metabolic rate + exercise expenditure, or should i not worry about it. so far, i haven't been worried about it, but in over a month's time have not lost any weight. appreciate any input.

I am 5'5 1/2" and 40 and I would love to be 125 lbs. - however, I am not overweight and neither are you. Why do you think you need to lose more weight? If you're only eating meat and you are eating to hunger, maybe you are where you should be?

I remember one time Charles said something about only being able to lose as much weight as our hormones allow. Not sure what that means, but I guess I'd love to know more. I know that we women in our early 40's are starting to deal with higher and lower levels of various hormones, so I wonder if there's a connection...

I wouldn't go that far, Mike, because there is nothing wrong with the observations in most cases. The question is which hypotheses explain ALL the observations and Keys' didn't because he didn't include all the data. If you take sugar consumption and apply it to the 22 countries that were available at the time of the 7 countries' study, you'll find that it does indeed account for the diseases of civilization and reliably predicts them. That's why Peter Cleave's saccharhine disease hypothesis and George Campbell's research was so astute.

The Japanese ate low-carb because they could barely get enough to eat. It's not surprising that they had a prevalence of stroke and dental caries despite their low incidence of heart disease. Even heart disease is difficult to track because the technology did not exist to accurately diagnose it until fairly recently in history. However, we know that colonial physician's form Hrdlicka onward were very consistent in describing those populations that they lived among.

This is the part that our "experts" don't want to acknowledge. The colonial physicians did not just speculate from the background as Keys did, looking at numbers. These doctors actually lived among these populations and treated them and they reported that there was none of the diseases of civilization. When disease appeared, it was clear as to cause. Those who got disease ate the Trader's foods. Those who remained on their native diets did not get sick. Stefansson took advantage of the same opportunity. He did not just write books, he actually wintered over in the Arctic and he was only one of many who were able to return with an entire crew free from scurvy.

These types of things are far more important to me than some USDA facts and figures which were compiled pretty late and were very unreliable as everyone will agree with.

Regards,

Charles
RE: Zero Carb / Meat and Water - suzannevea - 08-26-2008 12:08 PM

Feckless,
Why do you want to lose more weight? It seems like 125 is a perfect weight for your height. I am 5'5 and loved how my body looked at 125.

RE: Zero Carb / Meat and Water - Charles - 08-26-2008 12:22 PM

feckless Wrote:

There is no way to aim at all. Your body regulates all these numbers. All you can do is eat fat and protein to appetite and let your body take care of the rest. You appear to be at a good weight for your height and if you're not losing, it's probably because your body likes you where you are. If you want to be more muscular then you can lift weights but there are no real "optimal" numbers. If you're eating properly, you can't influence too many of these numbers.

What I mean about hormones is that they determine whether you mobilize fat or not and insulin determines whether you mobilize or store fat. Insulin can override any other hormone and store fatty acids when the other hormones wants to mobilize. Cortisol and adrenaline do very similar things. The both aim to mobilize fatty acids. Only insulin can fascilitate fat storage. Apologies to Dr. Kendrick, but people with high insulin tend to have high cortisol because more cortisol is needed to perform its function because insulin is overriding it. That's why the high-carb crowd is so uptight and stressed out. High cortisol is only associated with excess weight, not the cause.

Studies on low-carb diets consistently show a greater sense of well-being as one of the markers. It should come as no surprise that Eskimos are considered the "happiest people on earth." Looking at their surroundings would provide no reason for all that optimism. However, when you consider what they eat (if they're not already Westernized) then it's not hard to see why. I'm probably next in line because I'm pretty happy!

feckless Wrote:

You haven't been reading many of my writings if you're asking about metabolic rate because that is absolutely useless. You cannot exercise yourself thinner, Feckless, regardless of what they're telling you at the gym. When you stop exercising, LPL activity stops in your muscles and increases in your fat tissue to reclaim any lost fatty acids. That's physiology and the reason exercise doesn't work for weight loss.

Thin people do tend to be more active than obese people but it's not because exercise got or keeps them thin. Thin people exercise because they're thin, not to be thin. The converse is also true. Obese people do not exercise because they are fat. They did not become obese by not exercising or eating too much. It's important to get the causality correct before you determine the treatment.

Yes and no. It's not that they have to "reduce their calories" to lose, it's just that they have to really pay attention to how hungry they are. This may have the same effect as cutting their calories, but it's really different because the calories vary each day. I definitely 100% eat less calories at 150 today than I did last year at 161. However, I did not just decide to start eating 2,000 calories per day. My hunger decreased as I got smaller so I just fill it. Some days I eat more than other days but it's all predicated on my hunger.

If you stick to a set number, then some days you will overeat and some days you will undereat and both frustrate your body's ability to regulate your weight.

feckless Wrote:
i realize i am considered slim at 125 pounds, however, i have very visible spongy fat on my belly/thighs/butt. not

I believe you. I think that a whole-body routine of weights will tighten you up. You may be fat from years of low-fat dieting. If that's the case, you need to add lean mass. That means plenty of protein to build muscle. Never be afraid of protein or you won't build muscle. Only your body knows how much protein you need so you can't be afraid of following your hunger.

feckless Wrote:
but it sounds like what you all are saying is that all i can do is keep doing the right things and hope eventually my body will cooperate. and if it doesn't.....wah!

That, and weight train. But remember, when you increase energy expenditure, you will get hungrier and you must eat. You don't get hungry very often now because you don't do anything. Once you get on a whole-body weight routine, perhaps three days a week at the most, then you'll get hungry and you will need to eat. Get the book, Slow Burn, read it, and get to the gym and get busy!

I see this all the time now in the media (partly because of the Olympics...it's topical, and obesity is always topical). e.g. Jackie Ashley, in the UK newspaper the Guardian ...ok, just found the quote:

"Looking round at all the lean kids in coloured shirts, even I can see that Manchester United or Liverpool will do more to stop British boys being too fat than any government programme".

I emailed her to ask whether she seriously thought that those kids were lean because they played soccer, or did they play soccer because they were lean. No answer so far! - I wonder if she will even understand
the question though - I made sure to mention Gary's book to her. So far I've not managed to get a mention of it in any published letter to that newspaper. Not what they want to hear, I fear.

For YOU, yes, you could probably push it a little. When someone has many pounds to lose (like over 30), then I don't recommend exercise because they could do more harm than good due to the impact on the joints and the reduced muscle.

If all you can do is go around your house, then force yourself to do some walking first. Don't go off into some gym workout if you haven't been doing anything at all. You have to work up to it. Try taking a 5 minute brisk walk every day for 5 days and then next week, we'll see where we are!

Charles,

I have to chime in here to say that I have WAY more than 30 lbs to lose, but ever since I keto-adapted I've been going hiking every morning. I need something to do with the energy, and it really feels good to get out there and do it. I'm not doing super steep terrain yet, but I'm doing some fairly difficult stuff. I assume I am also getting some cardiovascular benefits, as my resting heart rate has dropped quite a bit since I started hiking.

On the other hand, you mention reduced muscle as a reason not to exercise. I would have to guess that due to being pretty overweight, my legs are probably pretty strong from having to carry me around all day 😁

nyteez Wrote:
Feckless, I was really tired too! I was eating 6 eggs a day. I kept cutting them back until I just had one egg a day on my ground beef for breakfast. I was so tired! I finally got rid of the one egg and my energy soared and I started losing again. I don't know what it is w/ eggs but that one egg made me tired all day. I noticed the difference in 3 days.

Now that's interesting! Who'd a thunk it? 😁

nyteez Wrote:
Are you eating eggs?

hey thanks for the encouragement nyteez! i do eat an occasional egg, i feel i've given up so much (and i don't want to get into such feelings of deprivation all at once that i give up) so I'm kinda needing that egg right now, but if nothing changes soon, i guess the egg has to go. i have not been able to exercise pretty much at all since i started ZC over a month ago. i have no energy, zero, i go from bed to couch to bed everyday. (good thing i work at home!) i try to have faith and keep waiting for the day that people describe when i wake up and feel like a new me! but it's hard.

Interesting that you mention deprivation. True story: In times past, I have done Atkins type diets. I've lost weight, but I invariably craved the stuff I couldn't have. One day I would have "just a taste", and the next thing I knew I was on a carb bender and regaining all my weight. Before I found this thread, I had read The Bear's thread, and tried 0 carb, but like The Bear, I ate Cheese, Cream, Butter, and Eggs. In
fact, I ate way too much of them. They seemed so much more desirable than beef and pork. I ate my meat and way too much dairy, my cravings didn't go away completely, and I came off the tracks again.

When I found this thread and read about eating just meat and water, my first thought was that I would be deprived. I mean, even the all animal food diet I had tried felt limited, and there I was eating cheese, cream, butter and eggs. However, I took the leap of faith and went for it.. and I find myself totally amazed at the results. I see now that the dairy caused cravings, and I feel much less deprived (in fact, not deprived at all) than I did with all that dairy in my diet. I have no desire to eat anything else. If you told me a few weeks ago that I would feel this way, I would have laughed at you.

Try it for yourself, if you feel deprived, you can always add the eggs back in, but I think you will find what I did.

This egg subject just keeps popping up. I have two eggs every morning but after seeing this message dozens of times I may just have to cut them out for a week or two and see how things shake out. It's not as bad as giving up coffee! Is it?

Ron, I hope you'll keep us updated on your results if you do try this.

I haven't given up eggs entirely because I sometimes need them to fill in between my meat meals to save money. I probably eat them about twice a week at the most but I haven't noticed any change in my weight when I don't eat them. I've also lost weight sometimes when I have eaten them. I don't like eggs all that much so it wouldn't be a hardship for me to quit eating them if I could afford to not ever eat them.

It's the same for me with cheese, which can also be a troublesome food for some people, but I usually eat some every day as filler between my meat meals. I just have to have something cheap on hand to eat when I'm hungry and can't afford to eat even more meat. I don't ever crave cheese but I'm not sure if I could do without it for reasons of convenience and economy.

This is my same exact scenario! I don't miss the eggs or dairy.

I raise chickens who lay 10-14 eggs a day! I hated giving up eggs, free food LOL! Good thing the dogs like eggs.

I was dead tired when I started Atkins, like could barely move. I also got hit with a wave of fatigue when I dropped my eggs, but I just worked out through it. I still have days when I get tired. Then again, if I didn't bound out of bed at 4:30 am, that might help too.

LindaSue,
I'm just wondering what the price comparison between meat, cheese and eggs is where you live. Where I live in N Calif. I buy meat under $2.00/lb.-often it's $1.49/lb. whereas cheese is $3-4/lb. and eggs are $2.00/dozen(don't know the weight). Just wondering if it's possible to figure out the price advantage per lb. of each food?

**RE: Zero Carb / Meat and Water - suzannevea - 08-26-2008 04:36 PM**

My friend from NY could not believe how cheap the meat is in Quebec compared to the US.

**RE: Zero Carb / Meat and Water - cbnebraska - 08-26-2008 04:42 PM**

It sounds like a lot of you had the fatigue issue. I haven't felt it yet, but maybe my time is coming.... I am, however, dealing with a grumbly, rumbly, gassy stomach right now. It's been roughly 9-10 days since I've eaten meat only and this just started yesterday. I read in the book that Charles recommended, called Fat of the Land, that the men who joined Stefansson on his Arctic, meat only voyages, had the same issue and that it cleared up in decent time. My only problem is it makes me want to drink tons of water for some reason. This, in turn, disturbed my sleep last night - which is not normal for me. I don't sleep long, but I sleep hard, so I am not happy with that...

I'm counting on the fact that everyone says this will clear up....

**RE: Zero Carb / Meat and Water - feckless - 08-26-2008 06:25 PM**

i want to thank all you guys so much -your willingness to share your experiences is so important to me. i'm relieved to hear some of you relate to my feelings of deprivation. i figured, because i have an addictive brain, that it would be impossible for me to get to a point where food is just nutrition, but to hear that you all suffered feelings of deprivation at one point or another, and worked through them is really inspiring. i realize i have done a lot of damage in my youth, and sometimes i get down about that
and think it's futile. that makes it hard to stay with doing the right thing. but everyday i come here and find there are people willing to answer my questions and give me support. THANKS!

THANKS!

feckless...Here's an excerpt from an extremely long winded post I wrote on my old blog concerning 'The Deprivation Mindset'. I plan to revise and update it and add it to my new WordPress blog eventually. Hope this helps.

I Am Sooooo Done With The Deprivation Mindset!

The first few days and weeks of a diet, even the first few months for some of us, are filled with excitement, motivation and optimism. But as we lose a few pounds and become happier and healthier, there is sometimes a tendency for our excitement, motivation and optimism to fade. It's at this point that we are in danger of sabotaging ourselves by losing our focus, blurring our boundaries and getting sloppy with our newly learned, healthy way of eating. This mindset, left unchecked, can lead us right back down the road to our old destructive eating habits.

One of the underlying causes of this derailing behavior is the old, "I deserve it...it's not fair...everybody else is eating it...I earned it...I feel so deprived" mentality. This childish way of thinking, called the Deprivation Mindset, could just as easily and accurately be called the Failure Mindset, according to Dr. Stephen Gullo, author of The Thin Commandments Diet. It is by our very own deceptive thoughts that we conceive such damaging notions, and by our very own self-deprecating words that we perpetuate and reinforce those thoughts until they give birth to compulsive, emotional, mindless over-eating! It is a childish way of thinking that says "any and all boundaries and guidelines are bad and unnecessary!" At times I've heard that child within me screaming and throwing a 'fit', demanding that I have anything and everything I want to eat...regardless of the consequences! If you've ever struggled with weight control, then you've probably experienced the same 'fits' from the 'child within you' as well.

Don't feel bad, because the fact is, dieting has always been associated with deprivation. It's kind of like a 'virus' that infects you the minute you start dieting [I actually hate the term 'diet', because it implies a temporary way of eating, instead of a healthy, nutritional lifestyle of weight control]. And that 'temporary way of losing a few pounds' is exactly what makes you feel deprived. While you are stuck with eating some tiny, despicable looking, detestable tasting 'food-like-substance', all your friends are eating as many of those luscious, delicious, tempting, sinful tasting treats they care to stuff their face with. And that my friend is the 'Deprivation Mindset' in a nutshell...or shall we say, 'The Failure Mindset'?

"We all have power over the feeling of deprivation -- the ability to control it, decrease it, even extinguish it -- because the source of it begins and ends within you." ~Dr. Stephen Gullo
Discovering this hidden way of destructive thinking, and knowing that I have the power to destroy it before it destroys me, has been one of the most empowering strategies I have learned about successful weight control. I can truthfully say, that "a light really came on", when I read about this concept in Dr. Stephen Gullo's excellent weight control book, entitled The Thin Commandments Diet. This is the Eighth Thin Commandment: **Stop Feeling Deprived!**

**RE: Zero Carb / Meat and Water - suzanneyea - 08-27-2008 02:21 AM**

You cannot have done more damage to your body and mind than I have. Around 8th grade I discovered I could vomit after meals, I perfected this binge and purge addiction over the years. There were periods when I would white knuckle it and be able to stop doing it, but it was always there. It was so horrible, I spend days planning my binges, what I would eat, and how and where I would get rid of it. I also would hit the gym for 3 hour workouts. My knees and ankles were in so much pain, but I just kept working out. When I did eat anything it would be zero fat or a lean cuisine. I remember many times being so upset with myself and not understanding why I couldn't stop this behavior, I was desperate. I just wanted to live my life. The amount of damage I have done to my body is extensive. Atkins wasn't an overnight cure for my addiction to food and binging, I still had urges in the beginings. It has been a long time now, so I almost forget that I still had urges in the begining. Also, I took my a while to realize that certain foods triggered my urges. Foods that many Atkins people can eat, like cream cheese. That triggers me. I still have days when I overeat or eat when I am not hungry. But, no urge to eat 5 boxes of cereal and a stack of pancakes anymore. Atkins was a very rough adjustment for my body and I went through a lot of weird physical things as I detoxed, but look at me now. A lot of people focus on my body and weight and don't get me wrong. I love love love my body (never thought I would say that!) but, the greatest gift from this way of life had been the freedom from addiction to food. The ability to both enjoy my food and also to see food as fuel for my body. The point to my long winded post, is that our minds and bodies have an amazing ability to recover, but it takes time. I have been on this way of life for over 5 years now, although the change to meat only has been recent. For all the people upset that there is no change, you need to give your body time, listen to your body. 10 days is not a long time, think in terms of a lifetime, not weeks.

**RE: Zero Carb / Meat and Water - montmorency - 08-27-2008 02:36 AM**

daveo Wrote:
I have to chime in here to say that I have WAY more than 30 lbs to lose, but ever since I keto-adapted I've been going hiking every morning. I need something to do with the energy, and it really feels good to get out there and do it. I'm not doing super steep terrain yet, but I'm doing some fairly difficult stuff. I assume I am also getting some cardiovascular benefits, as my resting heart rate has dropped quite a bit since I started hiking.

I think the psychological benefit of getting out in the fresh air and having a change of air & scenery, especially if you can find some really nice places to walk, is at least as important as the physical benefits.

Regards,
Mike

Thank you for sharing your personal challenges in order to help others overcome theirs. So many of us know first hand about food addictions, not just cravings, addictions! And to hear stories like these about how they can be overcome is wonderful.

What a powerful statement about the greatest gift of this way of eating being the freedom from those addictions and the ability to see food as fuel instead of another 'fix', another 'food high'.

And thanks for encouraging us to give our bodies time to respond to the new way of eating. For many of us it took years and years to get into the sad shape we're in, so it may take years to turn things around and our bodies recover.

People like you and posts like these are what makes this forum so valuable to all of us who are to one degree or another recovering food addicts. It's here that we can find the support, encouragement and hope for a better day!

LindaSue Wrote:
I'm also trying not to eat cheese but for some reason it sounded like something that would make me feel better when I had that terrible reflux. I was going to eat a whole ounce of cheese but could only manage half an ounce. I have no trouble eating a lot of cheese when it's melted in a casserole or on a pizza but it's hard for me to choke it down "raw". I kind of nibble at a chunk just to make it easier to get down and a tiny piece fills me up very quickly.

Just wondering if you've ever tried fried cheese? It is quite tasty and is great for a "crispy" snack. I usually mix several types of cheese - cheddar, monterey Jack, Mozzarella. I think I got this idea from an "epileptic ketosis diet".
feckless Wrote:

Here is a trick I learned some years ago....take a picture of something you are feeling deprived over. The picture should be in full color and looking so good you will start to salivate over it (I'm doing that just thinking about it now!). Go to a B&W copier and copy it. Now look at the picture whenever you can. Replace the shining color image of this item in your head with a B&W flat picture. Associate this image with the old one. You can even turn the picture upside down or move it far away but focus on it and change you association to the item. Then start trying to do this so you can look at the food and think of it as a flat, dull and unappetizing. At some point you can do this with anything. At this point you will not feel any deprivation, just 'blankness'. If you can change one of you senses associated with the item you desire your brain will modify the association and your desire. The same goes for smell, texture and sound (yep sound of food...POPCORN is now replaced in my head with microwave pork rines sizzling and popping when they come out)

You dull the internal image of the thing giving you a problem and shine the image of the thing or action you want.

Think of a thick plump handmade burger with a little spice (I love sage burgers) mixed in. Grilling outside with the cool fall air and with the heat of the grill and the popping of the grease as it drips down on the fire and the smell of the smoke of the burger as it is ready for you to pull off the grill. Cut into it and it will slightly resist the fork and fresh cooked meat slightly steaming ....Well you get the ideas as I wipe down my keyboard!

I have found that all those grilling magazines have great pictures which keep me motivated.

The reason we do things or desire things is the mental association of pleasure with them is so strong. To one person its cleaning house, to the other it's shining the house!

NOTE:This can also explain the negative actions people tend to do such as the binge and purge. Both actions have become a positive linked in the brain even though they know it is a negative action on a conscious level.

Just a little mental gymnastics will help you through the tough points, hope it helps.

I haven't tried to figure that out. I mostly eat ground beef and rarely pay more than .99 pound for it marked down. But, you have to consider that you lose 25% of the weight of meat with cooking. With cheese and eggs, you get 100% of what you start out with. Maybe I'll sit down one day and work out the cost for each cheeseburger, ounce of cheese and egg. The last time I looked at eggs, they were just under $2.00 for 18 and I've been buying cheese on sale for $1.67 for 8 ounces. I stock up when I can get good prices like that.

I had a very nice splurge yesterday. I found a package of three big ribeye steaks marked down to $2.59 pound because it was going to expire. The whole package only cost me $6.00 and change. I cooked them up yesterday afternoon and we'll get several meals out of them. My husband and I each had half of one for our lunch and I had small pieces off another one a couple times last night. There is still one whole steak and a small part of another one left for today.

I assume you're talking about cheese crisps. If so, I've had them many times and they're really good. However, I find that an ounce chunk of cheese is more satisfying when I'm feeling hungry. I'm not sure why that is. I enjoy the crisps when I want something snacky and crunchy but "raw" cheese works better when I need to satisfy hunger.

RE: Zero Carb / Meat and Water - FormerDonutJunkie - 08-27-2008 07:05 AM

Linda, I am constantly looking for Chuck Eye Steaks since they are marbled like a ribeye but at about half the cost normally. They are hard to find because there just aren't that many of them in a cow. However, the butcher at Ingle's where we like to buy meat told me watch for Chuck Roasts to be on sale, because then is when they have quite a few Chuck Eyes.
Chuck eye is our absolute favorite as well! I buy them all out when I find them.

FormerDonutJunkie Wrote:
Linda, I am constantly looking for Chuck Eye Steaks since they are marbled like a ribeye but at about half the cost normally. They are hard to find because there just aren't that many of them in a cow. However, the butcher at Ingle's where we like to buy meat told me watch for Chuck Roasts to be on sale, because then is when they have quite a few Chuck Eyes.
That explains why I don't see them very often. I look for them every week but I rarely find them on sale or marked down when they do have them. They're charging about $3.99-4.99 pound for them lately and that's more than I can afford.

PRICES:

1 pound hamburger regular price $2.50lb
1 pound hamburger marked down 99¢lb
1 slice American cheese 16¢ ($3.79 for 16oz pkg)
1 egg .13 ($2.36 for 18)
1 tablespoon butter 8¢ ($2.69lb)
1 ounce cheddar cheese 31¢
1 ounce cheddar cheese on sale 21¢

MEALS:

8 ounce burger with one slice American cheese (marked down meat) - 66¢
8 ounce burger with one slice American cheese (regular price meat) - $1.41
8 ounce plain burger (marked down meat) - 50¢
8 ounce plain burger (regular price meat) - $1.26
4 ounce plain burger (marked down meat) - 25¢
4 ounce plain burger (regular price meat) - 63¢
2 eggs cooked with 1 tablespoon butter - 34¢
3 eggs cooked with 1 tablespoon butter - 47¢
1 ounce cheddar cheese (regular price) - 31¢
1 ounce cheddar cheese (sale price) - 21¢

As long as I can get my ground beef marked down, the burgers seem to be the best value for the money
because they are more filling and satisfying than either eggs or cheese. The cheese may be a better value than the eggs because an ounce of cheese fills me up better than a couple of eggs do. Either one makes a light meal for me. Eating a 4 ounce hamburger patty would be slightly more filling than either the eggs or the cheese and the cost is very similar. I don't usually bother to put American cheese on a half of a patty so I haven't included the cost for cheese on those.

Quite often my daily menu will be two half pound cheeseburgers and an ounce of cheese. That menu comes in under $2.00 per day which seems very affordable to me. If I eat one cheeseburger, a couple of eggs and two ounces of cheese for my daily menu, that's still well under $2.00 per day.

**RE: Zero Carb / Meat and Water** - cbnebraska - 08-27-2008 07:29 AM

Wow, LindaSue, that's some bargain planning. $2 a day? Plus, I can't believe you aren't hungry on that menu. Amazing. I'd be thinking about food ALL the time on that. Are the rest of you eating that light? I know we're supposed to eat to appetite and eat to be full for 5-6 hours, so that's what I'm doing, but it sure takes more than a half pound of hamburger each day... Yikes..

**RE: Zero Carb / Meat and Water** - nyteez - 08-27-2008 07:47 AM

I am eating about 1/3 lb ground beef w/ about 2 oz of breakfast sausage for breakfast (and added fat) Then I don't eat for 10 hours! And I will have a pork chop, ribeye, chix thigh, meatloaf or whatever for dinner. And that's it! I am just not hungry anymore.

hey thanks for the encouragement nyteez! i do eat an occasional egg, i feel i've given up so much (and i don't want to get into such feelings of deprivation all at once that i give up) so i'm kinda needing that egg right now, but if nothing changes soon, i guess the egg has to go. i have not been able to exercise pretty much at all since i started ZC over a month ago. i have no energy, zero, i go from bed to couch to bed everyday. (good thing i work at home!) i try to have faith and keep waiting for the day that people describe when i wake up and feel like a new me! but it's hard.

Poor Feckless! Don't worry, I was where you are now just a few weeks ago. Hang in there!

I was 6 months of very low carb and 5 weeks on ZC before I got my energy back and started loosing weight. I had below normal energy levels that whole time! I am your age too.

I also teach kickboxing and yoga 4 times a week and it was killing me. I gained weight last year eating a sloppy Zone Diet despite teaching so many classes. When I started VLC in January I had to drop the little bit of weight training I was doing because I was so fatigued.

I am only 5' and weight 130. My pants are a bit looser now but the scale has barely moved. But my energy is great now and I can teach all my classes and weight train a couple days a week AND walk my dogs everyday AND walk the dogs at my local animal shelter for 2 hours once a week!
Keep on doing what your doing, Feckless. Add fat to your meat (that helped me a lot with energy), pay attention to how you feel after things like coffee, eggs, sugar-free stuff, gum. When I have those things I feel a definite drop in blood sugar and get very hungry. So I've cut them out except for my morning coffee. I eat breakfast right after anyway.

Don't give up! Us 40-sumthin's gotta stick together and support each other!

Deanna

Keep on doing what your doing, Feckless. Add fat to your meat (that helped me a lot with energy), pay
attention to how you feel after things like coffee, eggs, sugar-free stuff, gum. When I have those things I
feel a definite drop in blood sugar and get very hungry. So I've cut them out except for my morning
coffee. I eat breakfast right after anyway.

Don't give up! Us 40-sumthin's gotta stick together and support each other!

Deanna

I did read that you are 41, right? I hope that was you...🤔

cell just checking in. Things are good, I am down 1 of the 3 lbs that damn sausage put on me. I am
eating like usual once in the morning (chuck steak) and once in the evening (chuck steak) so all in all I
know the weight will start to come off again just waiting for the old bod to get it together.....I am very
patient lately......alison

---

**RE: Zero Carb / Meat and Water - waywardsister - 08-27-2008 08:52 AM**

I'm on my way out so this is a bit of a drive-by post, but I've been wondering lately about why some
people feel better (or best) on VLC/zero carb while others feel crappy. The number of ppl here who've
had to drop eggs from their diet made me think that it could be food allergies/intolerances - those of us
who have them, for whatever reasons (leaky gut, etc) do better eating this way.

Eggs are one of the 'Sensitive Seven', the most commonly problematic foods, as are dairy (usually cow),
wheat, soy, corn, peanuts (though I would add most legumes to the list) and sugar. All have carbs, yes,
but others have proteins that many people are sensitive to...and I am really starting to wonder if for at
least some of us here, it's more than the carbs that are causing the trouble.

Then there are food chemical reactions, too numerous to list, that give ppl problems with vegetables and
fruits as well. So perhaps we're just a bunch of reactive people!

I'm sure there is something in that. We all know people who seem to be able to eat anything and everything and suffer no ill effects.

It could be that a low/very low carb diet is something that approximates to an ideal diet for a substantial number of people ... not necessarily everyone, because it eliminates most of the problem foods.

In a similar way to the way that a low-calories diet can approximate to an at least "ok" diet, because it reduces carbs as well, for those who find carbs problematic - and it seems clear that not everyone does find them problematic.

daveo Wrote:
I have to chime in here to say that I have WAY more than 30 lbs to lose, but ever since I keto-adapted I've been going hiking every morning.

Well, that's the thing. Generally, I say don't exercise until you feel like it. You obviously feel like doing what you do and I think that's a very good thing. I just hate the situation where they tell obese people to just get up and run a marathon and then all their troubles will vanish. I don't buy that garbage for a second.

When you begin to more efficiently burn fatty acids instead of storing them then I think that will motivate you to move more and exercise will take care of itself. I'm just against putting the cart before the horse, that's all. People move more and eat less because they efficiently mobilize their fat. Those who don't, move less and store more of what they eat (which is surprisingly not much more than the lean).

Regards,
Charles

I'm one of those substantial number of people for whom LC works as the ideal diet! And yes, elimination of problematic foods, aka carbs, is what works best for me. Moderation may work for some folks but not for me, as it sets in motion a perpetual craving machine inside me. Carbs are a cruel taskmaster so why not break totally free from them?

Amen!! This describes me exactly!!

I actually think there are fewer people for whom carbs actually "work", but many people are determined that a "balanced diet" is what's right. Since they have such strong held beliefs, I just don't bother to try to explain myself anymore. They see what I eat, they look at me, they see my physique, but yet they just know I'm killing myself from the inside somehow. There are few people who really truly want to know, most just want to say "I could never...". I've finally learned, after 9 years of low carbing and trying to convince everyone it's the right way, to say "I'm sure you're right. You should do what works for you." Never mind they're complaining because what they're doing obviously doesn't work for them. You would have thought I told them I eat and then throw up. Many people would rather hear me say - I just have great willpower and I can stand to be hungry for hours on end. It would make them feel better.

I totally agree as I'm not on a crusade to change everyone's way of eating either. Some give me 'the look' when they see what I eat, others speak a questioning remark and some could care less. Then there's the 'naysayers' who read you the riot act for 'eating all that meat'. Funny they never were concerned when I was woofing down a dozen donuts. Did they not see that as damaging? Anyhow, it's not worth the argument cause you ain't gonna change those folks anyhow. Best thing to do is just to go on enjoying your steak and grin from ear to ear. Besides when you just grin real big...people think your up to something! 😊

**RE: Zero Carb / Meat and Water - LindaSue - 08-27-2008 12:24 PM**

cbnebraska, if I don't eat two half-pounders per day, I usually have some other kind of meat such as chicken or pork. I do eat more than just 1/2 pound of meat per day. I probably could eat more than I'm eating but I know that my little body doesn't need that much food. I eat as much as I need to keep from being hungry but not much more than that.

waywardsister, I don't know if I have an egg allergy or not but they often make me feel a little nauseated after eating them. I never liked them as a kid for that reason and just learned to eat them this past year. It seems like around the time I finally started to halfway enjoy eating eggs, I read on here that they can stall weightloss.

Did you all watch Jimmy's YouTube from yesterday's FitCamp? I was happy to hear what Isabeau said about "calories in = calories out" and how over training wasn't a good thing.

**RE: Zero Carb / Meat and Water - MPT - 08-27-2008 01:02 PM**

Hello! I'd like to introduce myself as a new meat-and-water dieter. I'd never participated in any forum before and only wanted to lurk and learn from others' experiences (I read your entire thread over the span of several days!), but had to register to this one because I came across information in "Protein Power" that MIGHT shed light on why some of us, including me, are feeling so fatigued on this diet.

Previously I bought grass-fed meat, which was great when I was watching calories, but now I want fatty meat on my new diet! I recalled that the Eades wrote a recipe in "Protein Power" (which I read 5 years ago) for making lean cuts of meat juicy and succulent, and I wanted to try their method so I could make the grass-fed meat fattier while I use up my supply. In searching for that recipe, I came across the following passages that may interest my fellow fatiguers.

From Protein Power:

"Are You Sensitive to Arachidonic Acid?
The main symptoms associated with too much AA (or sensitivity to it) are:
- chronic fatigue
- poor or restless sleep
- difficulty awakening or grogginess upon awakening
- brittle hair
- thin, brittle nails
- constipation
- dry, flaking skin
- minor rashes

"Arachidonic Acid:
Nature Throws Us a Curve"

"Arachidonic acid is one of those curves nature loves to throw at us just to keep from being able to wrap everything up nicely and simply. Arachidonic acid (AA) is a fatty acid essential to life but also incredibly destructive in excessive amounts. Lab animals injected with large amounts of all other fatty acids go on about their business with no apparent ill effects -- those injected with arachidonic acid are dead within moments. AA is made in the eicosanoid synthesis pathway and is the immediate precursor of the bad eicosanoids. If you keep your insulin down and your glucagon up, you should make very little arachidonic acid, but -- and here's the curve -- arachidonic acid doesn't come from just the eicosanoid pathway; it also comes in directly via the diet. Unfortunately, the dietary variety can also transform into bad eicosanoids. So, you may be asking, I can do everything right, watch my carbohydrate intake, keep my insulin down, and still be sabotaged by dietary AA? Yes, but only if you're particularly sensitive to arachidonic acid and eat a large amount of it."

"AA is found in all meats, especially red meats and organ meats, and in egg yolks. It probably hasn't escaped your notice that these foods are the same ones that most people identify as being loaded with fat and cholesterol. Despite popular opinion, though, it's not the saturated fat and cholesterol that cause most of the problems associated with these foods: it's their arachidonic acid content -- for those are are sensitive to it."

"The AA in meat is located both in the muscle tissue and in the fat. The quantities are higher in red meat because red meat has more fat, which, at least in today's domestic feedlot animals, contain high levels of AA. Animals have the same eicosanoid synthesis cascade that we do, and when they are grain-fed and fattened, the high-carbohydrate grain stimulates their insulin just as it does ours. Fats are stored in fatty tissue in the same ratio that they occur in the blood, so cattle -- and people -- having large quantities of circulating AA will store large quantities as well. The good news is that range-fed cattle and wild game have much less fat to begin with, and what fat they have contains little AA. You can add wild game to your diet by following in the footsteps of your ancestors and bagging it in the field or by purchasing it from one of the purveyors listed in the appendix. But the easiest first step in avoiding dietary AA is to avoid as much visible fat as possible on your meat, especially red meat."

"Does this mean you should avoid beef entirely if you're sensitive to arachidonic acid? Not at all. Here are a couple of techniques that will decrease the amount of AA you get in the beef you eat. First, after you trim as much of the visible fat as you can, grill your steaks. This method of cooking reduces the amount of AA in beef by about 35 percent. You can also follow our favorite way to marinate a steak that is not only healthful but actually makes the beef taste better -- we've provided that method in the box on page 352. Most alterations you make in the foods for health reasons really take a toll on taste, but not this technique for steak. The only drawback is that it takes a little advance preparation, so it doesn't work for spur-of-the-moment meals."

"No advance work is necessary to decrease your arachidonic acid consumption from egg yolks. Make omelets using one or two whole eggs and the remaining egg whites. Or use one egg and add ricotta or tofu to scramble it. Try to remove yolks from egg recipes as much as you can because the yolks are very high in arachidonic acid. If you must eat a lot of eggs and you're AA sensitive, add some fish oil to your
"What about sauteing and frying? You now know how the trans fatty acids in margarine prevent the building blocks from getting into the eicosanoid production pipeline, so we want you to avoid margarine. Many polyunsaturated fats undergo a trans alteration during the high temperatures required for panfrying, so your health will also be best served by avoiding those. We need heatable fat that also imparts great taste, and the substance that fits the bill is butter."

The parts about ecoisanoid went over my head, so I ignored those for now. I disagree with the authors about using tofu or any other soy products -- bad stuff, in my experience. But what they said about AA is intriguing, because I've been feeling fatigued and unusually staying up nights tossing and turning, so I'm willing to consider that I might be sensitive to AA. In the next 3 days I'll eat mostly fish or grass-fed meat to see if my symptoms will have improved.

At least I hope the above information might be of use to some of you fellow sufferers.

Regards,
MPT
discard the marinade, rub the beef with some pepper or other spices to your taste, then grill it. You won't believe the taste. The wine acts as a solvent to leach out a fair amount of the saturated fat in the steak, which is replaced in part by the monounsaturated fat in the olive oil or other oil you use. These oils permeate the steak, giving it a juicy, succulent taste that you have to experience to believe -- and make it more healthful to boot. You can use this technique with roasts as well. You won't get quite the same arachidonic acid decrease you will with the steak because you will be roasting the meat instead of grilling. Roasts taste even better if you make cuts all over the meat and insert slivers of garlic."

I'll experiment with coconut oil and lard from pastured pork to see which works better. I'm betting that coconut oil would taste great with pork!

Regards,
MPT

That would be great if all carbs provided was weight gain in some people. However, we know that carbs provide all the other diseases of civilization often without the weight gain symptom. It's difficult to tell what effect carbs have on an individual and weight is the most unreliable one. Remember, 1 in 5 get fat but 1 in 2 get cancer!

MPT Wrote:
"Trim all the visible fat from the steak, then place it in a large resealable plastic bag along with a mixture of 1 cup of red wine and 1 cup of olive oil or light sesame oil (or any other oil you like as long as it contains no ALA). MPT

Welcome to the forum, MPT! If you've read this post over a few days then you must know that this is the very LAST thing that any of us would do. Trim the visible fat from a steak? Are you kidding, we go to elaborate lengths to add fat to steaks. In fact, many of us have raided our local butchers and they've been more than happy to give us whole bags of fat for free that they have criminally trimmed from their steaks.

As MAC said, we've already visited the AA train and it has left the station.

Despite that, we do want to welcome you to the forum and hopefully you'll continue to post your experiences with eating and enjoying a high-fat diet.

See, and I wonder if the weight stalling is an egg intolerance or an extreme sensitivity to carbs - personally, I'd suspect an egg intolerance first. Lots of ppl have trouble with the proteins in the white, some have problems with the yolk as well. And if a reaction is slight - say some bloating or minor nausea - it's often hard to even notice until other reactive foods have been removed from the diet. With eggs, intolerance makes sense (to me) from an evolutionary standpoint, as they'd not likely have been a huge part of our diets pre-agriculture...and even when they did become more common, hens were free range, running around eating bugs and stuff, and the eggs were eaten fresh from the coop - could make a difference?

Eating disorders (some of you mentioned struggling with them in the past) have also been linked to food intolerances.

Shed the water weight from my over-carb weekend...I swear all I did for the past two days was go to the bathroom!

criminally trimmed! Ain't that the truth! LOL!

RE: Zero Carb / Meat and Water - lynnhopes - 08-27-2008 05:19 PM

Does that mean you all actually eat the fat that goes around the edge of the steaks?
All,

I've read through this thread twice now and if nothing else, Charles' disposition alone should be more than ample evidence you are all on the right path. He is the real deal.

I've also studied every word BEAR has written as he has done it for 50 years.

I made the transition months ago and as I won't bore with the details, but it has been a major success, between Charles and BEAR all you need to know is here, period.

I never planned on posting, but with all PUFA, Arichidonic Acid talk lately, I feel obliged to urge you guys to read Ray Peat, in particular his article entitled Fat and Degeneration. He is borderline genius, and although not a "zero carb" guy, he puts to bed all the nonsense especially the recent I can't do his works justice so please study it for yourself, but in short grain fed will have a slightly higher omega 6 ratio than grass fed, but omega 3 is just as bad if not more volatile once inside the body. The saturated fat of beef/buffalo is such that you don't have to worry about the trace amounts of PUFA's due to the high saturated/monounsatuated fat content.

I took some of his advice and stopped all the salmon, sardines, fish oil and chicken fats (high percentage of PUFA) stuck with all beef/fat and years of inflammation on face/skin disappeared.....

SO much for beef fat causing the AA. It did just as Ray Peat claims, removes the poisonous AA replacing with anti-inflammatory Mead Acid.

I think this is why the BEAR talks about beef/fat and water as all that is really needed. Some chicken, pork now and then won't hurt, but the more PUFA's the more inflammation. Once these combine with sugar its a firestorm inside the body. Saturated red meat has the opposite effect. Amazing

Sorry for the length, but all the answers you guys are searching for are on his site I guarantee it.

PS- Interesting how the study a few posts ago claims the cows store the AA based on a grain diet, yet humans get AA from meat??????? Could it maybe have come from humans eating the same diet as the cows, genius?????

The problem these days is the idiotic low fat movement has the butchers trimming all the fat away on a lot of cuts. And the ranchers raise beef & pork to be leaner. Idiot low fat know nothings.

And here is the concise version of BEAR:
http://activenocarber.myfreeforum.org/Concise_Bear_about1646.html

RE: Zero Carb / Meat and Water - feckless - 08-27-2008 05:48 PM

Got lab results and i think it scores one for high fat...

Lipids:
LDL = 197
HDL = 79
TRG = 56

**LDL Particle Numbers nmol/L:**
LDL-P Number = 1129 *this was flagged as greater than optimal
small LLDDL-P = 0

**Metabolic Syndrome Markers:**
LDL Particle size 22.6 nm
Large HDL-P = 18.6 umol/L
Large VLDL-P = .3 nmol/L

while the lab report shows that most of the numbers fall in the 'low risk' range, i'm not really sure how to interpret the particle size and metabolic syndrome numbers, so if anybody has a clue, or knows a resource to help me interpret these, please chime in! i got my doc to agree to particle size tests to assess my risk as she was pushing statins based on cholesterol levels alone. i want to be able to tell her intelligently why i don't need statins when i go back in.

See this link: [http://heartscanblog.blogspot.com/](http://heartscanblog.blogspot.com/)

Your HDL and TG numbers are really good BTW. You also don't need statins period. They are only effective and minimally at that for men under 55 who have PROVEN heart disease. Let your doctor respond to that. They are all statin happy these days.

See this link as to why HDL and TG are better predictors for heart disease: [http://www.medscape.com/viewarticle/551425](http://www.medscape.com/viewarticle/551425)

Also see this link: [http://www.drsears.com/tabid/399/itemid/12514/LDLP-Tests.aspx](http://www.drsears.com/tabid/399/itemid/12514/LDLP-Tests.aspx)

"The TG/HDL is not only a good indication of the LDL particle size but also of the degree of insulin resistance."

Interesting. I have never heard of the TG/HDL ratio as a measure of the degree of insulin resistance.

---

RE: Zero Carb / Meat and Water - jeepifer - 08-27-2008 10:28 PM

Yes the tg/hdl ratio is a good IR marker, but once you start low carb it is erroneous b/c your tris drop but your IR isn't "instantly" better. 😐

---

RE: Zero Carb / Meat and Water - MAC - 08-28-2008 02:57 AM

jeepifer Wrote:

I wonder why he even says this then but then this is Mr. Zone, Dr. Sears, and he recommends a 40% carb diet. I fail to see the connection myself as to how this ratio is an IR marker.

---

RE: Zero Carb / Meat and Water - jeepifer - 08-28-2008 04:58 AM
I don't understand all the science behind it personally, but I got to sit in a presentation a month or so back where a doctor was discussing different factors of coronary artery disease, and a relation to diabetes, like waist circumference vs. BMI, etc. The upshot was they didn't have much difference. But the degree of insulin resistance did, and one of the ways they "test" for this is to look at the TG/HDL ratio. I'll look at work and see if I still have the pdf of the presentation -- it was very interesting. Unfortunately I didn't get a chance to ask the Doc about low TG levels with low carb.

RE: Zero Carb / Meat and Water - suzanneyea - 08-28-2008 05:00 AM

I am another who totally does not get the science part of all this, nor do I seem to have any interest in learning. I do know that I go to the doctor every year and he says my blood work is just about perfect and I have no health issues. Good enough for me.

Thanks Dana - interesting.

lynnopes Wrote:
Does that mean you all actually eat the fat that goes around the edge of the steaks?

Yep! Always. Not the tough, gristly stuff, if that's what you're thinking of? The white, soft fat that crisps up nice in the pan and holds all the flavour 😊

sean Wrote:
I can't do his works justice so please study it for yourself, but in short grain fed will have a slightly higher omega 6 ratio than grass fed, but omega 3 is just as bad if not more volatile once inside the body. The saturated fat of beef/buffalo is such that you don't have to worry about the trace amounts of PUFA's due to the high saturated/monounsaturated fat content.

Hi Sean! I'll have to take a look at Ray Peat's stuff. Always looking for more info. I go back and forth on the whole omega 6/3 thing. Currently taking fish oil supps, but honestly wonder if I really need them, especially now that I've found a source of beef fat to render! The farmers I buy beef from will bring me bags of trim - they usually feed it to their cats. I'll have to be nice and give mine a little of it too, I suppose. Spoiled pusses that they are.

I keep hearing about Ray Peat here and there - who is he, exactly? I've read a couple of articles of his, but know nothing about him. Is he a reliable source?

The Bear thread is REALLY something else. A worthwhile, if lengthy, read.

Not only do we eat that, but we may dip it in liquid fat (you get more fat via liquid than you do when it's solid), and even cook up some fat of our own to eat along with the steak!

Regards,

Charles

feckless Wrote:
**Lipids:**

- LDL = 197
- HDL = 79
- TRG = 56
LDL Particle Numbers nmol/L:
LDL-P Number = 1129 * this was flagged as greater than optimal
small LLDL-P = 0

Metabolic Syndrome Markers:
LDL Particle size 22.6 nm
Large HDL-P = 18.6 umol/L
Large VLDL-P = .3 nmol/L

Feckless, these are works of art! You should be very proud. That HDL is fantastic and the triglycerides are low. That means you're doing exactly what you're supposed to be doing. The LDL particles are big and fluffy, not the small and dense VLDL. This shows that high fat does not clog your arteries. When you eat carbohydrates, you have more VLDL (very low density lipoproteins) and these are the ones that put holes in your arterial walls. Fat comes to try to clean up the mess and gets blamed for "clogging" the arteries when it's just there to help. It's kind of like blaming the firemen for putting out the fire!

Rest assured, you don't need any cholesterol-lowering, statins, or anything of the kind. Your lipid profile is otherworldly and you have nothing to fear.

And no, I'm not a doctor, but you can read Taubes, Dr. Ravnskov, Dr. Kendrick and many others and they will tell you the same thing.

Regards,
Charles

Welcome, sean.
linnhopes Wrote:
Does that mean you all actually eat the fat that goes around the edge of the steaks?
Of course, assuming that they haven't trimmed it all off, which is very likely. When I was a kid, steaks always had a rim of fat around them and it was my favorite part. The fat is not the same thing at gristle, which I don't eat.

RE: Zero Carb / Meat and Water - Dwayne - 08-28-2008 07:27 AM
I love fat on ribeyes. My parents and now my wife have always wondered where all the fat goes on the steak when I am eating since they think it is inedible. However... Gristle is gross.

Wolfmama Wrote:
I am so Tired tonight, I know I work night shift but I feel like a tractor ran over me. I have been eating chicken breast meat didn't bring any extra fat to go with it, could that be why?

Absolutely!! I find I get the same way if my protein is too lean. An idea could be to keep a jar of
coconut oil at work. It's not an animal product, but the group has determined it to be a good substitute when left with no other option. I need to take my own advice because I just did the same thing yesterday. Not enough fat and no access to any here at work.

I want to add to the questioning here - but only to the ladies. (Guys, I'm sorry, but you can stop reading now if you're the embarrassed type.) The last 2 days I too have felt pretty lifeless - all after I just said I hadn't felt the low energy issues. I evaluated my fat intake and do believe I had shorted myself, but I also noted on my little calendar that it is my dreaded week before my TOM. Normally, I get a little "poor me" ishness and have very little patience, but hadn't really noticed low energy before. My question is - do you find that you need more fat to maintain energy during your hormonal span? Fortunately, it generally only seems to last about 3 days, then once things actually get rolling I'm less emotional. (Plus, I have that great week afterwards to look forward to when I'm at my thinnest and very full of energy.) I'm guessing we're all very individual, but am mostly wondering about the upping of fat during those hormonal days?

Thanks!
Cynthia

I honestly have never noticed a change in energy at certain times of the month. On the other hand, at my time of life, I never know when TOM is going to show up so I have really wouldn't know when those days might be if I were to get them and I couldn't be sure that they were anything to do with my TOM.

LindaSue Wrote:
waywardsister, I don't know if I have an egg allergy or not but they often make me feel a little nauseated after eating them. I never liked them as a kid for that reason and just learned to eat them this past year. It seems like around the time I finally started to halfway enjoy eating eggs, I read on here that they can stall weightloss.

See, and I wonder if the weight stalling is an egg intolerance or an extreme sensitivity to carbs - personally, I'd suspect an egg intolerance first. Lots of ppl have trouble with the proteins in the white, some have problems with the yolk as well. And if a reaction is slight - say some bloating or minor nausea - it's often hard to even notice until other reactive foods have been removed from the diet. With eggs, intolerance makes sense (to me) from an evolutionary standpoint, as they'd not likely have been a huge part of our diets pre-agriculture...and even when they did become more common, hens were free range, running around eating bugs and stuff, and the eggs were eaten fresh from the coop - could make a difference?

Eating disorders (some of you mentioned struggling with them in the past) have also been linked to food
intolerances.

Shed the water weight from my over-carb weekend...I swear all I did for the past two days was go to the bathroom!

For what it's worth, Doctor Richard Mackarness, one of the early post-war British writers in favour of low-carbs (in 1958), later went on to write about allergies, intolerances, etc. This year I found an old copy of his 1958 book, with a forward by a fairly mainstream head-honcho type medic, which said something like carbs added no nutritional value to the diet and were not necessary. As Gary Taubes writes in GCBC, at this time, these views were not even controversial. It was only later when the dogma against animal fats became widespread, that it was decided that low-carb could not square with this, and therefore had to be condemned. When I have more time, I'll quote that foreword verbatim; it's worth reading, as is the book. (Referenced in GCBC's biblio).

Wow, I eat neither. It never occured to me. Does this mean I am not getting much fat with my steak even if it is the fattiest kind like a rib eye?

---

**RE: Zero Carb / Meat and Water - caroline - 08-28-2008 08:19 AM**

I do what CBNebraska does when I am not going to be able to access fat. In fact I was just thinking about it since I will be out and about today. I have a small jar of coconut butter under my seat, where it won't get hot. (make SURE it is in something that doesn't leak or it will be a MESS.) And I just eat that when I need more energy and fat.

It really does work. Every morning before I eat breakfast, first thing (unless I put it off) I take a few spoonfuls of coconut oil. And it makes a complete difference when it comes to keeping me regular. I don't do coffee, so my "regularity" needs help from getting the extra fat.

Yes, that's probably true. You have to actually eat it or cut it off, saute it until it's liquid fat and then dip your meat into it. How are you getting your fat if you're not eating the fat off your meat? Muscle tissue is the lean portion of a steak and the white stuff is the fat. There is no fat IN the muscle tissue, only around it. If you're cutting it off, you aren't getting much fat at all. Are you a zero carber? Fat is energy, lean feeds your muscles and organs. You have to do both or you will not survive on this diet.

Charles Wrote:
The LDL particles are big and fluffy

Thanks all, did anyone watch NOVAscience last night. it was about longevity and calorie restriction, the main points that caught my eye were:

1. the age 100+ people they studied had one thing in common, plenty of large fluffy HDL/LDL.
2. there is a certain gene that when triggered extends life. it can be triggered by certain survival stresses. calorie restriction is one such stress, BUT the reason calorie restriction triggers this gene is because it causes low levels of insulin, so it is lowered insulin that really triggers this gene. so my conclusion is, we are doing it the easy way!

several researchers commented that insulin is the key to enhanced genetic expression. of course, they are figuring out how to manipulate this gene directly, which will be the end of the world as we know it.

Does melting the fat damage or destroy the fat soluble vitamins in the fat? I try to eat at least some of my meat or fat rare to make sure I am getting the vitamins, but maybe someone with more knowledge than me can shed some light on this.

RE: Zero Carb / Meat and Water - waywardsister - 08-28-2008 09:51 AM

LindaSue, I get steaks like that! Buy from farmers when you can, I'm telling you.

Lynn, leave the fat on your meat 😊 Nature puts fat and lean together for a reason. Or yeah, trim, render and dip. If you eat veg, use the rendered fat to wilt some greens or saute veg along with your meat.

Feckless, I didn't see NOVA but I recently heard the same thing -- CR works bc it lowers insulin levels. We are doing it the easy way, IMO!

Re TOM and tiredness, I find that some months I am a little more tired than usual. Not sure why. It's nothing that really drags me down, I'm just lazier than usual 😊

RE: Zero Carb / Meat and Water - Dwayne - 08-28-2008 11:06 AM
On the subject of gristle I found the following while reading the summarized bear forum posts on another board.

The Bear Wrote:
The gristle in meat is the most precious and nourishing protein of all. A hunter without tools, in a survival mode must make a very hard choice whether to use tendon or sinew from a kill as food- or to form the back of a bow and make a bowstring. I highly recommend that you always seek out and eat any and all of the 'chewy bits'.

I still hate it though!

That depends on the cut of meat. If you get your meat with a lot of marbling you'll get plenty of fat even
if there isn't any around the outside. If you look at that photo I posted, you'll see that there is plenty of
fat around the inside of the steak.

waywardsister Wrote:
LindaSue, I get steaks like that! Buy from farmers when you can, I'm telling you.
Sure, if I was rich. I've only got a $50 per week grocery budget and that includes everything, not just
food. I figure that I can't lose by buying the cheap marked down ground beef with tons of fat in it. I only
get to have steak when I find them marked down low enough.

I'm not sure how anyone could eat gristle without just swallowing it whole. I can't get my teeth through
it but I'll sometimes chew on a piece of gristly meat like chewing gum until I've gotten all the good
flavor out of it.

RE: Zero Carb / Meat and Water - suzannevea - 08-28-2008 01:55 PM

Quebec is all about meat, cheese, and red wine. Many restaurants do not have a vegetarian option. At
our wedding we invited two peopl e who were vegetarians and they were served a plate of rice, the chef
had no clue what to serve them, lol.

RE: Zero Carb / Meat and Water - nyteez - 08-28-2008 03:18 PM

I live in California. Tons of vegetarians here. Some of my family lives in Santa Monica. You can't walk
3 blocks without finding a vegetarian restaurant, they are everywhere down there! Practically every
restaurant here has a few vegetarian dishes.

You got that right! But I've found the trick to resisting is to eat a Monster Manly-Man 73/27 Burger drippin' with fat before you get exposed to that stuff. It don't look nearly as appetizing when you're full-o-fat!

RE: Zero Carb / Meat and Water - cbnebraska - 08-28-2008 05:30 PM

Fried food isn't my thing, but keep those big rich, chocolaty desserts away from me. Ugh - I just love 'em so much.

RE: Zero Carb / Meat and Water - suzanneyea - 08-29-2008 02:13 AM

I hate chocolate, never liked it. Even as a kid. But, I agree. Whenever I am going to things like a fair, I alwys eat a high fat meal ahead of time, plus I bring food with me. Every so often I get suddenly hungry and I do not need to find myself starving standing in a county fair! Always best to be prepared.

RE: Zero Carb / Meat and Water - Nicola - 08-29-2008 03:17 AM

Did you know:

beef
and fish (which are very low on carbs) can significantly increase insulin production. In many cases meat eaten alone can induce more insulin than high carb high fiber foods.

Here's a link to the insulin index of some common foods: http://www.mendosa.com/insulin_index.htm

and a nother question:

don't you find, that high fat gives you runny stools?

I also tryed this "salt & water flush"; it was/is one of the subjects on the Low-Carb Discussion forum:

http://tinyurl.com/5dxvef

Nicola

The insulin index tested **extremely** lean protein not fatty protein. In addition, protein *unlike carbohydrates also causes the release of its counter regulatory hormone glucagon*. There is another thread where all the counter arguments to the insulin index regarding protein were answered including a response from Gary Taubes. Protein does raise insulin but at a level much less than carbohydrates. Insulin not only controls blood sugar but has other roles with respect to fat and protein. Dr. Eades covered all of this in his book 'Protein Power'. The insulin index was a one time study and has never been updated and they did not test fatty protein nor a lot of other foods. Nor did they test foods in combination as far as I remember. I have tested my own blood glucose after an only fatty protein meal and see little to no rise in blood sugar. Blood sugar is not insulin but insulin is released in response to blood sugar and my BG post prandially does not see much of a rise at all. Consider the glycemic index of ice cream versus sugar. Ice cream has a lower glycemic index versus sugar alone. Why? The fat. So the fact that they only tested extremely lean protein does not tell us what the rise in insulin would be if they tested a fatty protein. Nor did they measure glucagon for the protein they did test.

Here is the former thread: http://www.livinlowcarbdiscussion.com/showthread.php?tid=706

P.S. Nicola, I had to fix your link. You had spaces that were preventing linking to Mendosa's site.

**RE: Zero Carb / Meat and Water - lynnhopes - 08-29-2008 05:22 AM**

Well NOW I know why I would often be hungry after steak. I wasn't eating the fatty part. Only the protein. Silly me. I think I'll have to avoid steak as I can't imagine ever eating the fat around the edge. I really wonder why nobody I know ever eats the fatty part here? I've started a mini poll among friends and family. Especially considering we never went as extreme on the fat thing as the U.S. seems to have done. We have some low fat products sure but hardly any non fat products. Odd...

**RE: Zero Carb / Meat and Water - Ell.eee - 08-29-2008 06:30 AM**

Some foods (such as meat, fish, and eggs) that contain no carbohydrate, just protein and fat (and essentially have a GI value of zero), still stimulate significant rises in blood insulin.

Quote from above cited study.

Maybe this is why I'm gaining weight and still having hyperinsulinism on zero carb? My pp blood
glucose is not too bad but I think insulin is still being overstimulated. Wish there was a simple insulin monitor. I have to work harder on getting the fats up!

I like to add butter. I remember when I was a kid my grandfather would load his up with butter....maybe he knew something!

RE: Zero Carb / Meat and Water - nyteez - 08-29-2008 09:05 AM

I WISH I got fat on fried foods, fried veggies, country fried steak, hushpuppies and all that fried southern food! I don't like sweets, but fried food is so good. I never allowed myself to eat it because it was fattening! LOL! I got fat eating huge amounts of vegetables, tofu, alfalfa sprouts, brown rice & sprouted wheat bread!

RE: Zero Carb / Meat and Water - lynn hopes - 08-29-2008 09:46 AM

Yeah I always add butter to it. However that's probably not enough. If anyone had any tips on how to get the skin on chicken thighs crispy please please share.

BTW I hope nobody minds me posting here since I am on induction and not zero carb. Thanks!

RE: Zero Carb / Meat and Water - Richard - 08-29-2008 09:53 AM

Here is another newbie question...
I followed the 'grazing' eating pattern (every 3 hours-read that book too!). I am thinking of changing to a 6 hour or longer (physically hunger and not psychological hungry).

Also, sorry of this has been covered before but I am still lacking pages 30 - 235 on my reading.

**RE: Zero Carb / Meat and Water - chris m. - 08-29-2008 11:18 AM**

Hi All:
Finally ! Ifinished every word on this thread and it took me WEEKS.
The most interesting reading I've come across after being on low carb for about 5 years. Suddenly many of the experiences I encountered thru that journey became crystal clear.
I hope to be able to add a little something as we go along but pls. all keep this thread going as it is: INFORMATIVE INSPIRING HELPFUL and above all it is RIGHT !!!!
It is one thing to read all the science behind it but it is far better to read each one's individual experiences. That's the "proof in the puddin"
I've been down from 220 to 160 twice and am now at 180. Each time succumbed to the low fat complex carb doggerel and no matter what could not control the weight gain. I now know why. By way of advise I would encourage all "newbies" to read the entire thread before jumping in much - many of your questions will be answered. Thx again to all you may have saved my life - litterally!!

Chris M.

RE: Zero Carb / Meat and Water - cbnebraska - 08-29-2008 11:32 AM

Welcome, Chris! Wow, that is some accomplishment - to read this entire thread. I did not do so myself and you're right, I should have, but I just couldn't... I guess that can be a new goal along with all the great books Charles has recommended.

Are you planning to make the ze jump?

---

RE: Zero Carb / Meat and Water - chris m. - 08-29-2008 12:03 PM

Already have and took me from 186 to 180 in two weeks!!
I work out at the YMCA - not a big bodybuilder as I prefer a lean cut look to big muscles. SO excited what is going on inside my body though!!
Nicola - what was your experience with the "salt and water" flush.
I feel like I know everyone on this thread - so many different personalities but you all - especially Charles get gold stars for PATIENCE. Isn't that what its all about - reaching out and touching peoples lives - especially when they are so discouraged that they are about to give up.

Chris

Welcome Chris,
Reading this forum and some other forums daily is like attending e.g. WW support groups, except that this forum is available to me 24 hrs. daily. It has made all the difference between me failing once more in the battle of the carbs and victory!!!
Thank you to all the moderators for the unselfish devotion to the "cause".

Nicola Wrote:
don't you find, that high fat gives you runny stools?

Nicola

I have this same question.

It also brought up another question for me - about the nutritional content of breast milk. You would "assume" that breast milk would be the perfect food so I looked up the nutritional content.

Calories, Fat & Carbohydrates in
Milk: Human Breast Milk, fluid
Average All Brands

Serving Size: x cup (8.7 oz) oz g

Nutrition Facts
Calories 172(Kilojoules 720)

% DV**
Total Fat 10.8 g 17%
Sat. Fat 4.9 g 25%
Cholesterol 34 mg 11%
Sodium 42 mg 2%
Total Carbs. 16.9 g 6%
Dietary Fiber 0 g 0%
Sugars 16.9 g
Protein 2.5 g
Calcium 78.7 mg
Potassium 125.5 mg
Note: A dash indicates no data is available.

It is actually not as high in fat and higher in carbs than I expected it to be.

this may not be the best place to post this, but it fit the other poster's questions about runny stools. T
tweety Wrote:
You would "assume" that breast milk would be the perfect food so I looked up the nutritional content.
The numbers are kind of interesting. The fat content is higher than for whole milk, but the protein is a lot lower.

1 cup whole milk: 150 Calories; 8g Fat (48.6% calories from fat); 8g Protein; 11g Carbohydrate
1 cup breast milk: 172 Calories; 11g Fat (55.4% calories from fat); 3g Protein; 17g Carbohydrate

RE: Zero Carb / Meat and Water - lynnhopey - 08-30-2008 05:16 AM

As Richard Feinman said in his podcast with Jimmy:
"Human breast milk is for growth, for fattening".

So it makes sense that it has more carbs.

RE: Zero Carb / Meat and Water - MAC - 08-30-2008 05:33 AM

I wonder what the composition would be if the women were all low carbers.

RE: Zero Carb / Meat and Water - suzanne - 08-30-2008 08:57 AM

Well, I nursed Andrew for a year and he was one fat baby! People kept asking what he was eating, but he had no solids for the first 6 months and was a fatty.

RE: Zero Carb / Meat and Water - FormerDonutJunkie - 08-30-2008 09:56 AM

I was such a fat baby that my mother put me on Slim-Fast instead of Similac! LOL! 😄

RE: Zero Carb / Meat and Water - tweety - 08-30-2008 01:18 PM

FormerDonutJunkie Wrote:

Oh, you guys are funny!! I guess the point about carbs adding fat and wanting babies to fatten is a good one. I also like the comment from MAC about how much the mother's diet effects her milk? I know it effects the taste to some extent, like eating spicy foods and the baby not liking the taste afterward, but what about the nutritional value? Thanks for exploring this idea with me.

Hi Chris,

Welcome, although I am also a relative newcomer here, although not to low-carbing. Just a caution from
a "professional sceptic." I don't know whether "RIGHT" is the most appropriate word. I prefer to
approach it that I am learning more every day, as are many of us.
We don't learn by looking for revealed truths to be swallowed whole; rather, we learn by keeping on
questioning. This is how scientific research works, after all. We've seen what happens when people
believe they are "right".

Kind regards,
Mike

lynnhopes Wrote:
Well NOW I know why I would often be hungry after steak. I wasn't eating the fatty part. Only the
protein.

Yesterday I finished the last of the steak that I cooked the other day. This particular piece didn't have
much fat on it and afterward I noticed that I didn't feel very satisfied from it and I even felt a little
nauseated. I think that we need a fair amount of fat with our protein in order to be able to process it
properly. Even though I reheated this steak with some pork fat spread over it, it still didn't have the same
effect as eating the solid fat that usually comes with the meat.

Subjectively for me, beef seems more satisfying than pork, and in particular, ground beef seems the
most satisfying, I've speculated elsewhere, and repeat it here as a suggestion, that maybe the fat in
ground beef is more digestible/available than fat in "solid" meat, and maybe some of the latter just
passes through without absorption.

Maybe ground versions of other meats would be similar, but (IME) these are less commonly on sale than
ground beef.

Regards,
Mike

Mike, I agree 100% with the extreme satiating factor of 73/27 ground beef. I'm not sure either about the chemistry and nutritional/digestion science behind it, but this stuff turns me into a person I've never known in my entire life. After one of my Manly-Man Monster Burgers, nothin' else looks good to me...not even a donut! That is a miracle in itself! And that's science enough for me.

I've not been able to find 73/27 around here. So far the "fattiest" I've found is 80/20 - that seems to be standard - at least for the major chains, Giant Eagle and Kroger. I even talked to the butcher about it and he said it is hard to maintain consistency lower than 80/20 so they don't do it.

We do have a store around here (more expensive) that is known for their meats - I may check to see if they do "special" orders for people.

Most 73/27 hamburger comes in 3 lb packaging and looks like a big old sausage. It is wrapped in an opaque plastic wrapper. It is not made by the butcher. The one I get is the 'Meadowland Farms' brand which is produced by Cargill and they are trying to make this a national brand. So check your meat section for this or something like this. You may also find 73/27 as frozen patties.

I find ribeye steaks and prime rib to be more satiating for me than 73/27 hamburger and better tasting IMHO. 73/27 may be more satiating for some as the fat calorie to protein calorie ratio is 3:1. Hard to get that ratio today in a lot of single cuts of meat.

Kroger has their own brand in rolls. It's the one that's cheaper than ground chuck and I think they just call it "ground beef" or "hamburger" on the label. I'm not sure of the exact percentages in it but it has more fat than 80/20, which is ground chuck. Kroger also sells fresh packages of what they call "ground beef trimmings" which the meat manager says is made from leftover scraps from trimming roasts and steaks and it's loaded with fat. They don't give it a percentage but she told me it's got the most fat of anything they sell and it's quite cheap.

Do you have a Smart & Final near you? They carry frozen 73/27 patties in ten pound boxes. (Look for the boxes with the blue labels.)

It's very convenient to drop a frozen patty right on a hot pan. By the time the inside is medium rare, the outside is nicely browned.

Welcome, BeeDub.

Thanks! This is a fantastic thread with wonderful contributors...and Charles is absolutely amazing.
I am not yet managing to do Meat+water correctly (I have a horrible Diet Coke addiction -- and agree that it is no "diet" food, as it spikes insulin & hunger monstrously), but I'm only half-kidding when I say these are my goals:

Short-term: eat like Charles
Medium-term: drink like Charles
Long-term: look like Charles 😁

RE: Zero Carb / Meat and Water - cbnebraska - 08-31-2008 05:25 PM

Just wondering what part of the cow makes hamburger?

I find the 73/27 at Wal-Mart and use it, but I also love steaks. We use chuck eye, which has good fat content, but even it would not satiate me without the extra trimmed fat I got for free from the butcher. He gave me 5 lbs, so I split it up and froze it in about 1 lb. divisions. I lay it on strips on the broiling pan and broil it on each side for 8 minutes with the rack set just below midpoint in the oven, doing a fresh 1 lb. batch about every 2 weeks. (It looks a lot like thick bacon, without the meat portion.) Then, after it's cooled, I pour all the liquid fat that's at the bottom of the broiler pan into old margarin tubs with "BEEF" written all around it. (I also have one for "PORK".) I know many people would not be able to do it, but I love the crunchy broiled fat (not gristle!), so I heat up a few strips with each of my meals and indulge. I think of them as juicier pork rinds! I also scoop out some of one of the fats and spread it on top of patties or chicken or whatever I'm eating. This way, every kind of meat satiates me. Maybe those of you who can't find the fattier ground beef could supplement this way?

RE: Zero Carb / Meat and Water - LindaSue - 09-01-2008 06:25 AM

BeeDub, you got some 'splainin to do. I just looked at your profile and under diet plan, you wrote:

"Meat, Water, Diet Coke, Pizza"

RE: Zero Carb / Meat and Water - chris m. - 09-01-2008 07:57 AM

Deborah - Where can I find the PDF on FOTL that Charles scanned in for us? I did a search and it took me back to this thread.
I'm not technically ZC because of coffee but pretty darn close. I read on the meat and water thread that someone said that 10 gms [20?] of carbs was metabolically 0 but I'm not sure about this.
I do know you can't argue with results!!
Good luck to all and keep posting as I pick up so may hints on what and how to cook. Which reminds me - here's a tip for you busy one's that need to cut corners for time and simplicity. Take a large roasting pan with at least 1/2 inch sides to it - spread your hamburger all along the bottom of it and "bake" til done as you like at about 250 degrees - let cool and then cut into squares - put these in a Wal Mart sack and take to work - keep in the fridge and warm up as needed with butter or CO or other drippings. This is very easy and simple. BTW I still use a light sprinkling of Tony Chachere's "spice n herbs" seasoning on the hamburger. Hope this is helpful !!!
Chris

RE: Zero Carb / Meat and Water - montmorency - 09-01-2008 09:25 AM
Hi Mike, I also have a copy of this. I enjoyed the introduction which was written by Stefansson's wife, Evelyn. This book is online at:
http://www.ourcivilisation.com/fat/index.htm

Thanks for that link! My copy doesn't have an intro by Stefansson's wife, but has the foreward and intro as per your online link, so I don't need to transcribe those. I will transcribe the author's own Acknowledgements though:

"I wish to thank the many people without whose help and encouragement I could not have written this book.

In chronological order they are: Mr Hugh McLeave, Science Correspondent of the News Chronicle, who suggested I should write it; Professor Sir Alan Kekwick, who first told me about William Banting and kindly allowed me to quote his experimental work at the Middlesex Hospital; Dr G.L.S. Pawan, who supplied most of the scientific references and explained a lot of the biochemistry to me; Dr Alfred W Pennington of the Medical Division of E.I. Du Pont de Nemours, who sent me reprints of many of his papers on obesity which have appeared in many scientific journals; Dr Vilhjamur Stefansson, whose book, The Fat of the Land has given me more information than any other, besides being a pleasure to read (extracts from The Fat of the Land, 1956, are included by kind permission of The MacMillan company of New York); Dr Franklin Bicknell, who collaborated with me ten years ago in making some teaching filmstrips on nutrition and who read and criticised the manuscript of this book in its various stages and kindly wrote the introduction; Sir Heneage Ogilvie, who wrote the foreword and lent the weight of his authority to the ideas expressed here; The Controller H.M. Stationery Office for permission to include the "Quick Reference to Low-Carbohydrate Foods" in Appendix B; to Oxford University Press to include two excerpts from Obesity by Dr Leonard Williams; Mr and Mrs Keith Mackenzie who drew the chapter headpieces, and Mr Leslie Dahl, who patiently sank his own style in order to follow mine in the drawing of the diagrams; Mrs Holden, my secretary, who typed and re-typed the manuscript; and finally my wife, Margaret, and my son Patrick, who cheerfully put up with a great deal of disruption of our home life while I was working on it.
R.M."

This is from the 1958 edition, which notes that it was reprinted 4 times, during the course of the same year (May, June, June and November). "Eat Fat and Grow Slim", Richard Mackarness M.B., B.S. (London, The Harvill Press).

Gary Taubes only makes indirect reference to this book in the text of GCBC/TDD, although it is listed in the bibliography. However, as Taubes points out, and as seems clear enough from the introduction and forward, these were not even particularly controversial views at this time. I don't think Mackarness expected it to arouse any controversy; it was his later book "Not All in the Mind" that ruffled a few feathers, if I remember correctly.

Barry Groves credits Mackarness with having alerted him to the virtues of the low-carb path in the early 60s. I had not realised until recently re-reading the Acknowledgement with fresh eyes, that Mackarness
himself had been inspired by Stefansson, but it all fits nicely together, and is hence, I hope you will agree, somewhat relevant to this ongoing thread.

Some people seem to think that low-carb begins and ends with Atkins, but actually, for all his good points, he was comparatively late to the party :-) 

Regards,
Mike

---

RE: Zero Carb / Meat and Water - twilight - 09-01-2008 03:41 PM

Hi Mike, looks like my copy is a little newer. It's a small hardback and says copyright 1958, 1959, but doesn't have any print dates in it. Doubleday & Company, Inc., Garden City, New York.

It has the same Acknowledgements page you transcribed, and below that there is another couple paragraphs starting out with "For the American edition I came to Canada and the United States in November 1958, returning home for Christmas. ...R.M. New York, 1958."

Then there is a Preface:

"One morning at breakfast, the autumn of 1955, my explorer-anthropologist husband, Vilhjalmur Stefansson, asked me if he might return to the Stone Age Eskimo sort of all-meat diet he had thrived on during the most active part of his arctic work. Two years before, he had suffered a mild cerebral thrombosis, from which he had practically recovered. But he had not yet succeeded in losing the ten pounds of overweight his doctor wanted him to be rid of. By will power and near starvation, he had now and then lost a few of them; but the pounds always came back when his will power broke down. Doubtless partly through these failures, Stef had grown a bit unhappy, at times grouchy."

"My first reaction to his Stone Age diet proposal was dismay. I have three jobs. ..." (She didn't want to prepare two menus.)

"But aloud I said: "Of course, dear." And we began to plan. To my astonished delight, contrary to all my previous thinking, the Stone Age diet not only proved effective in getting rid of Stef's overweight, but was also cheaper, and easier to prepare than our regular mixed diet had been. Far from requiring more time, it took less. Instead of adding housekeeping burdens, it relieved me of them. Almost imperceptibly Stef's diet became my diet. Time was saved in not shopping for, not preparing, not cooking, and not washing up after unrequired dishes, among them vegetables, salads, and desserts."

.....Evelyn Stefansson April 22, 1959"

There is another page and a half if you'd like me to continue transcribing it.

Jes' being honest...knew I'd be falling off the wagon last night.😊

Is anyone else eating hamburger from bowls for extra fat? - BeeDub - 09-01-2008 04:21 PM

This has been working for me: as the patty is cooking, I'll put my extra fat in the bottom of one of those semi-disposable Gladware bowls and nuke it for a few seconds so it's warm & smells good.

Then, once the patty's done, I drop it in the bowl and break it into tiny pieces with a fork. Then I eat it from the bottom of the bowl, stirring/tossing so the meat absorbs the most fat possible.

I've been adding a dash of soy sauce for taste, and will soon eliminate that completely.

BTW, the Gladware might be a good solution for those who are zero-carbing at work. (I would even bet that beef+fat mixes could be prepared in advance & frozen. By lunch they would be defrosted and ready for a quick nuking.)

Okie, dokie.😊

"Some of our friends say: "We would go on a meat diet, but we couldn't possibly afford it." That started me investigating the actual cost of the diet. Unlike salads and desserts, which often do not keep, meat is as good several days later as the day it was cooked. There is no waste. I found our food bills were lower than they had been. But I attribute this to our fondness forutton. Fortunately for us it is an unfashionable mat, which means it is cheap. We both like itk, and thanks to our deep freeze, we buy fat old sheep at anything from twenty-two to thirty-three cents a pound and proceed to live on the fat of the land. We also buy beef, and wonderful beef marrow. European cooks appreciate marrow, but most people in our country have never even tasted it, poor things.

When you eat as a primitive Eskimo does, you live on lean and fat meats. A typical Stefansson dinner is a rare or medium sirloin steak and coffee. The coffee is freshly ground. If there is enough
fat on the steak we take our coffee black, otherwise heavy cream is added. Sometimes we have a bottle of wine. We have no bread, no starchy vegetables, no desserts. Rather often we eat half a grapefruit. We eat eggs for breakfast, two for Stef, one for me, with lots of butter.

Startling improvements in health came to Stef after several weeks on the new diet. He began to lose his overweight almost at once, and lost steadily, eating as much as he pleased and feeling satisfied the while. He lost seventeen pounds; then his weight remained stationary although the amount he ate was the same. From being slightly irritable and depressed, he became once more his old ebullient, optimistic self. By eating mutton he became a lamb.

An unlooked-for and remarkable change was the disappearance of his arthritis, which had troubled him for years and which he thought of as a natural result of aging. One of his knees was so stiff he walked up and down stairs a step at a time, and he always sat on the aisle in a theater so he could extend his stiff leg comfortably. Several times a night he would be awakened by pain in his hip and shoulder when he lay too long on one side; then he had to turn over and lie on the other side. Without noticing the change at first, Stef was one day startled to find himself walking up and down stairs using both legs equally. He stopped in the middle of our stairs; then walked down again and up again. He could not remember which knee had been stiff!

**Conclusion:** The Stone Ate all-meat diet is wholesome. It is an eat-all-you-want reducing diet that permits you to forget you are dieting - no hunger pains remind you. It saves time and money. Best of all, it improves the temperament. It somehow makes one feel optimistic, mildly euphoric.

**Epilogue:** Stef used to love his role of being a thorn in the flesh of nutritionists. But in 1957 an article appeared in the august journal of the American Medical Association confirming what Stef had known for years from his anthropology and his own experience. The author of this book has also popularized Stef's diet in England, with the blessing of staid British medical folk.

Was it with the faintest trace of disappointment in his voice that Stef turned to me, after a strenuous nutrition discussion, and said: "I have always been right. But now I am becoming orthodox! I shall have to find myself a new heresy."

Evelyn Stefansson April 22, 1959"

I am slowly reading through the downloaded copy of FOTL that I printed off from Charles and I have been wondering the whole time how long this man lived and how his health was in old age. It appears he abandoned his all meat diet at some point, suffered some diseases of civilization, then ended up going back to meat only and was able to reverse them? Wow. That's so powerful for me because part of me has always wondered if I've come to this too late in life (I'm 40 - although I was roughly 31 when I went LC) and the damage cannot be undone. I have no healthy problems, but I know that we can't always see what's brewing inside! I also fear for my children as I'm doing the best I can in our society to steer them away from carbs, but just fear that pushing too hard will have the opposite effect! I will continue to do my best to limit their carbs, but will rest easy in the philosophy that being a good teacher and a good example will be a good foundation and eventually they may follow suit and live long, healthy lives.

Thanks again!!

RE: Zero Carb / Meat and Water - suzannyea - 09-02-2008 02:52 AM

I was really limiting Andrew's carbs and it did have the opposite effect. He started asking for things like toast! He has never eaten toast! I have chilled a bit and we seem to have found a better balance, plus he asks a lot of questions about food and health. He asked yesterday if bread was healthy. I told him no and explained a bit. Then he asked why I give him bread and pasta if they are not healthy. I explained that he will have to make these choices on his own, we all decide what food we eat or do not eat. I reminded him that mommy never eats those foods, just like I do not eat McDonalds or candy. Those are my choices. The best I can do seems to be talking about nutrition and leading by example. I also do not have a lot of junk-carb food in the house, no soda, cereal, candy, etc. But, I want him to feel in control of his own food ( of course if he wanted to only eat candy I would step in, lol). I have noticed that the lack of vegetables at meals has not been noticed by my son or dh, lol.

Same here! Many thanks Twilight. Fascinating to get an insight into the great man from a "domestic" perspective. Also, people have speculated about his health in later life; this seems to give a little more info about that, also.

[update] after reading the additional text. Thanks again! Fascinating. e.g. "By eating mutton he became a lamb." - love it! Also fascinating is that he'd begun to think he'd become the new orthodoxy, which chimes in well with what Taubes writes when describing this period. It was only later, thanks to the mistaken beliefs about cholesterol and fat, that these views started to take a beating.

On a more banal note, I've now found a source of ground lamb, a bit more expensive than the beef for the same fat content (~20%); I don't think it's as satisfying as the beef, and for now, I am mixing them.
I'm finding that while I can keep hunger at bay for 4-5-6 hours while eating mostly ground beef/lamb, when I do get hungry, I really DO get hungry, and I feel that only more fatty ground meat will satisfy me. (I hope it's not a craving...). Cheese for example, though I like it, would not do the same trick. (I'd consciously given up cheese anyway, though I am sometimes tempted). Last night at about 9pm, my late lunch had evidently worn off and I felt ravenous. However, I was too tired to cook, and it seemed too late anyway, so I didn't bother; had an early-ish night a bit later, and although I didn't sleep as well as I normally do, when I awoke I noticed I was not at all hungry. So presumably my insulin levels had returned to "normal" during the night, and I was living off my stored fat.

Regards,
Mike

RE: Zero Carb / Meat and Water - FormerDonutJunkie - 09-02-2008 05:34 AM

Mike, I also find the 73/27 keeps me satiated for 4 to 6 hours, but when it runs out...I'm on EMPTY! And just like you I often feel that another 73/27 is all that will really satisfy that hunger. I don't for one minute think it's a craving. I think it's my body truly experiencing hunger! I think with my previous carb addiction I never really experienced true hunger...it was head hunger, coupled with carb cravings.

This same scenario happened to me one night last week. It had apparently been longer than I thought since I ate and all of a sudden, about half way through our Wednesday night Bible Study I experienced that ravenous, gnawing hunger you just alluded to. Fortunately we have food afterward so I found some LC fare and all was well.

True Hunger. That's just my take on it, for what it's worth!

It appears he abandoned his all meat diet at some point, suffered some diseases of civilization, then ended up going back to meat only and was able to reverse them?

Good Morning!
According to his autobiography which was published shortly after his death, he lived from 1879-1962 (although the dust jacket states his year of birth as 1880). His last entry was written in March 1962 and his wife wrote the last chapter (prologue).

Chapter 47 of Discovery by Vilghalmur Stefansson:
"At the age of seventy-six, I entered the third Stone Age era of my life as far as diet was concerned. I am still in it as I approach my eighty-third year. Somewhere around my sixty-fifth birthday I began to notice a stiffening in my right knee. By the time I was seventy, the stiffness had begun to spread to other joints. Evidently the exclusively meat diet I had been on for twelve years between 1906 and 1918 and for a year around 1930 had not saved me from the deleterious effects of the carbohydrates I had eaten since 1931. I had been loudly proclaiming the bad effects of "sugar and spice and everything nice," but I had been somewhat lax in practice. I had been so
healthy from the time I recovered from typhoid in 1918 that I paid no attention to nutritional rules, including my own, until I had a warning paralytic stroke in 1952."

He went on:
"Ralph, more a neurologist than nutritionist, pooh-poohed my idea that I ought to cut out carbohydrates in order to lose weight, and directed me to count my calories, as well as my blessings, in that the stroke had not been more serious. I cut down on eating and felt headachy and out of sorts, but I did lose weight until I was below 180. Then my will power broke down, and I began a seesaw of gains and losses...."

"One day we were listening to radio bulletins from Denver about President Eisenhower's heart attack. We were especially interested in those which expressed the opinions of my friend Paul Dudley White, of the Harvard Medical School. Every now and then someone other than Dr. White would remark that the President was another victim of the deplorable modern habit of eating too much fat. Most to be avoided, the radio voices said, were animal fats, and especially the hard ones such as mutton. In spite of my sympathy for the President, I began to feel annoyed with this railing against fat mutton, my favorite of all domestic meats. Having lived my healthiest year on a diet that gave me 80 per cent of my calories from animal fats, I became the more restive the more the radio harped on this theme.

My annoyance finally spilled over, and as usual my wife suffered from the spilling. I reminded her that we had a freezer that was only half full, that she knew my favorite food was fat mutton, and that she had often said that in our market this was the cheapest meat. If she herself ate whatever she liked, would she mind if I lived for a few weeks as Charlie Andersen and I had in 1930, wholly on meat and chiefly on mutton? For one thing, I would then have no trouble, on this diet, losing the excess weight that continued to worry Dr. Hunter. I had not thus far succeeded in losing permanently more than five of my 182 pounds. With real or well-simulated cheer, Evelyn agreed.

I loved the fat mutton. As the English do, I like it boiled. We were alone on the farm just then and sometimes I did my own cooking. When I did, I cooked mutton the way I like it best. I boiled it the way the Eskimos boil caribou or moutain sheep, putting the cold fresh meat into cold water, bringing it to a slow boil, and then setting the pot aside to cool. Then as Charlie Andersen and I used to do during our Bellevue year, I would skim the fat off and drink the broth.

As I have mentioned several times I do not think it fattening to take in added calories if they consist of fat meat, provided that you do your best to avoid carbohydrates and too much lean meat. As far as I know, the slimming effect of eating fat meat was first explained by an accredited physician in print through a "Blue Book" the British Admiralty's account of the first wintering of Europeans on the north coast of Alaska. The author was naval surgeon John Simpson and the publication was an installment of the British government's account of the search for Sir John Franklin. That account I quote and paraphrase in my 1946 Not by Bread Alone. When I republished this slightly augmented, in 1956 as The Fat of the Land, I received a flattering letter from Dr. Richard Mackaress, a writer on nutrition for British publications who later wrote a book called Eat Fat and Grow Slim. When an American edition was published later, my wife wrote an introduction to it. The magazine Coronet liked this piece so well that they asked her for a slight rewriting, which would adapt it to their audience. ..."

RE: Zero Carb / Meat and Water - chris m. - 09-02-2008 05:43 AM

I never thought that i could get to where I was only concerned about eating 3 X day [6-12-6] but I certainly have. Those are about the times I get hungry from the last meal. This is so much simpler coming from a "grazing" background and I read some where on this thread that it is better for
mobilization of stored fat to only eat 2 to 3 times a day.
If any of you are familiar with Anthony Colpo - He once said he eats only twice a day [late a.m. and then p.m.] This allows him to fill up at both times and he is "shredded". With my schedule 3X a day works best for me.
Colpo has a website but is now more geared to bodybuilding even though he wrote an e-book which I bought [The Great Cholesterol Con] and another which I have not [The Fat Loss Bible].
Colpo is very confrontational [witness his ongoing battle with Dr. Eades] which I think has to so with the calories in calories out thing.
I know from my own experience that I can eat more meat and fat calories and lose weight than I ever could eating complex low fat carbs.
Chris m

RE: Zero Carb / Meat and Water - DavidBurchall - 09-02-2008 05:45 AM

Hi,

I just got started on low carb Saturday for the umpteeth time. I did really great on it about 7 years ago shrinking my waist from a 44 to a 36. This was all during the height of the lc craze. But I went back to my old ways and have struggled every since with my weight. Now I'm at a 42 waist and want to get back to 36 in the best way.

In my experience LC helps eliminate my acid reflux and reduces ADD symptoms. My blood pressure and cholestrol also was great. So all around, I know it's the best way for me to eat. The challenge has always been living out in the world doing LC.

At any rate, I'm on day 4 of LC and my ketone stripes are during colors. After reading this thread, I'm thinking that zero carbs may be the ticket for me. The funny thing is I just stayed up cooking half the night - cabbage and cauliflower paddies in addition to the meat that I cooked. I'm considering freezing the veggies and giving zero carb a try. I can always thaw the veggies and eat them later if I choose to.

Typically, I bottom out on low carb after a month. Seems I loose weight during the first week (most water I'm sure), then nothing even though the ketone stripes show I'm spilling!!! It could be a number of things: vegetable oils, the carbs, nuts, LC tortillas, artificial sweeteners, eggs, cream. Who knows?!? But all meat and water at least for a time will give me a chance to see if I can lose weight again.

Any advice for a fellow like me?

David

I agree with the description. Same thing happened with me of all places the check out at Walmart. A basket full of meat and not a bit I could eat!

I have begun to experience this in the last 2 weeks that I have switched to ZC although never this bad. My wife thought I was going to be sick because of the sharp pain and the sudden onset. After getting home about 15 minutes later I set on the precooked 27% burgers in the refrigerator and in about 5 minutes the pain stopped. I told her that next time If I have to go for the meat section and open a package of precooked meat I will. I'm not going through that again if I can help it.

Yes FDJ, I think so; in my case, my stomach is screaming out "feed me you ...!" :-) It's not like on other occasions when, say, I'll see an apple in the pantry and think "I quite fancy one of those..."; that's not hunger, and furthermore, it wouldn't be at all satisfying (although I always loved apples).

Twilight: Thanks again! for the additional Stefansson text! Sadly, the English no longer eat boiled mutton. We are lucky if we can find it at all.

Yeah what's up with that? Here in the states lamb is pricey compared to beef and not very common and never on sale. You can get it. We must be using all of it in gyros or something. I used to really like lamb chops but haven't had them in eons. Gyros are good but they are a beef and lamb combo.

Any advice for a fellow like me?

David

Welcome, David!! The best advice I know I can give is eat lots of fat. I mean, really eat a lot of fat. If you don't, you will be extremely tired, lethargic and even discouraged. I was taught by others here that 80% of calories should be from meat fat and I have to say that is 100% accurate. I was appalled at first because I was thinking it meant 80% of my plate should be fat, but it really is a percentage of calories. I have never actually calculated it out, but have learned to melt a bunch of extra fat with my meat and to dunk every bite into it. Not only is it delicious, but the ratio seems pretty accurate for me as I get full (actually often to the point of my stomach flipping and saying "no more"!) at about the same time I finish my meat. The key is to experiment with the ratio until you can go 5-6 hours without getting hungry - truly hungry. The sight of meat (for me it's actually ANY food) should almost make you physically ill during those 5-6 hours leading up to hunger. If your energy is low during that time, you didn't eat enough fat so up it at your next meal, if you're hungry before 5-6 hours, you didn't eat enough lean, so up that.

And, I put it to the test majorly this weekend. I went camping with friends and decided I would not make my eating pattern a topic of conversation. I just wasn't up to the discussion. I did take some other food, placed them on my plate, moved them around and threw them away discreetly. Everyone is used to me not eating bread, so that wasn't an issue. All went well except for my lack of fat!! I was so terribly tired the entire weekend that I almost didn't make it. The fat from the hamburger just dripped off into the fire, the hotdogs were too low fat and so salty to me (now that I've nearly cut all salt out), and the cold meat rollups I did were way too low in fat - even adding mayonnaise. I brought along coconut oil and there was butter, but I couldn't figure out how to add it to stuff without drawing attention to myself. The only meal I felt decent after was breakfast because we had eggs and sausage (again with the salt, but at least good and fatty!) to which I could discreetly add butter since it was out. I don't normally eat dairy or eggs, but conceded to it to get by. I was dragging so badly by the end of the day that I had to make efforts to move from one chair to another. Sad, but true.

Oh, and lastly, David. Be ready for things to get a bit "loose", shall we say? It passes (no pun intended), but it is disconcerting at the beginning.
Everyone else, please correct me if I'm wrong with anything, but this is what I would share as another relative new comer. I don't tend to be very technical or scientific, even though I understand how the process all works.

Have a great day!

daveo Wrote:
Does melting the fat damage or destroy the fat soluble vitamins in the fat? I try to eat at least some of my meat or fat rare to make sure I am getting the vitamins, but maybe someone with more knowledge than me can shed some light on this.

Dave, I'm catching up on my readinb but just in case no one answers this question, the answer is no. In fact, animal fats are very stable at high temperatures. The same cannot be said about vegetable oils, including the beloved olive oil. These become rancid at high temperatures but animal fats can take the heat!

Barry Groves credits Mackarness with having alerted him to the virtues of the low-carb path in the early 60s. I had not realised until recently re-reading the Acknowledgement with fresh eyes, that Mackarness himself had been inspired by Stefansson, but it all fits nicely together, and is hence, I hope you will agree, somewhat relevant to this ongoing thread.

Some people seem to think that low-carb begins and ends with Atkins, but actually, for all his good points, he was comparatively late to the party :-)

This is a HUGE point, Mike. Drs Alfred Pennington Blake Donaldson were also directly inspired by
Stefansson and they were the first ones to have their stuff written up in the *New England Journal of Medicine*. Ironically, the latest Israeli study that showed the pseudo Atkins as being superior to the low fat is also posted in that same journal yet doctors are wondering why we've never heard of such a study before. Those journals are so voluminous that no one is going to go back and read that stuff. Ergo they keep repeating similar studies every 50 years and each time they tout them as a "major breakthrough." Meanwhile, we all get sicker and sicker!

I want to lead a book discussion on *Fat of the Land*, the first low-carb book. However, I would need to know that many of your have or are reading that book. If you can let me know if you would be interested in such a discussion, I'll speak to Jimmy and we can make it happen. I think this would be as valuable as GCBC was.

Charles

Hello, David and welcome to our forum!

When you say, "low carb" what do you mean? Did you follow the Atkins diet?

All meat and water is good as long as it's fatty meats and it all goes according to your energy levels.

Give it a shot and let us know how it goes!

Regards,

Charles

I couldn't figure out how to add it to stuff without drawing attention to myself.

You might consider decanting coconut oil (I prefer the flavorless kind) into pocket-sized bottles like this:
Of these, the 4 oz (or the 2 oz.) would easily fit in a pocket for easy swigging in a private moment (washed down with a gulp of water.)

I keep a couple of these in my glovebox for hunger pangs/extra energy whenever need strikes. (Coconut oil is very stable at high temperatures, as it's more saturated than almost any vegetable fat. It literally would be a couple of years before it went rancid.)

CO oil is almost 100% medium chain triglycerides, so it can be absorbed directly by the small intestine, giving you a blast of quick energy. (It's why some recommend that you don't take it right before bed, as it might keep you up.) It also shuts down hunger pangs immediately.
BeeDub Wrote:

Funny that you mention that because I did take coconut oil with me, in a jar, and left it in the tent. Of course, it became liquid nearly instantaneously due to the heat. I knew it would happen, but hadn't planned ahead with the type of bottle you showed. Good idea. Funny thing is, I gave the same coconut oil advice to someone a while back for keeping at work, but personally I simply can't gag the stuff down. I know there was a thread about which are the best brands, the most tasty, etc... and someone even referred to it as "frosting". I see absolutely no similarities there. (Although I know the evils of artificial sweetener, I wonder if putting some equal in it and mixing it up would help?) I bought the Spectrum brand at our local No Frills - and I don't think that was one of the brands people recommended. I will have to mull that over a bit for my next "situation" and may have to throw out the one I have and try one of the tastier versions. I haven't needed it at home or work because I've got plenty of extra animal fat rendered, which I find delicious (but not drunk straight up!), but I will have to plan better next time. At one point, I took a spoon full of butter when no one was looking, but that didn't go well either. Ugh. (Now that I think about it, there was whole cream in the cooler that I brought for my coffee, I should probably have gotten that out. I definitely could have swallowed that with no problem.)

Oh well, live and learn. I will be better prepared next time.

And then we saw a couple of cowboys rounding up cows, possibly headed for the feedlot.
RE: Zero Carb / Meat and Water - nyteez - 09-02-2008 10:38 AM

Well, I did pretty well on our trip. I fit into the size 10 dress, as soon as I find a pic I will post it. Dinner was easy, I had prime rib both nights, it was delicious! There are no restaurants within 50 miles that serve prime around here, can you believe that! so I order it whenever I can. I found some hot dogs (capers) that have 1 carb, only a few ingredients and taste good cold. I brought 2 along w/ us in case I got hungry. I had one for breakfast one day and for lunch the same day. I should have brought more because yesterday morning I was hungry and the restaurant didn't have hamburger on the breakfast menu. I didn't trust the sausage, so I had a bacon & cheese omelet w/ 2 pats of butter on it. It sure was yummy! But, I was hungry and tired in 4 hours. It sure was nice to have my beef & fat bowl this morning! I missed it! 😊

Charles Wrote:
When you say, "low carb" what do you mean? Did you follow the Atkins diet?

Depends on what period of time we're talking. I started out with Atkins and ended up eat way more carbs that Atkins would allow (about 70-90 daily) and lost the weight the first time. Other times (false starts after going back to old habits) I did Atkins or tried doing what I did when I lost the most weight eating more carbs.

I have a question about water. How much is recommended on zero carb? I'm one who does not like water. So I've always found it a struggle to drink much. Today I'm swigging on a gallon of tea (a mix of green, black, and olong) I made instead of water.

There is no recommended daily allowance of water on zero-carb just as there is no recommended calorie amount. This all depends on your thirst. Most of us are finding that we can only take water in measured quantities over time.

You certainly don't want to be drinking a gallon of water per day because you can easily dilute your electrolytes and run into hyponatremia which could kill you.

Just drink when you're thirsty and don't drink when you're not.

Regards,

Charles

RE: Zero Carb / Meat and Water - Loops - 09-02-2008 11:21 AM

Hi all -

I have a question about meats. Here in Chile I'm finding it a bit too expensive to buy beef - including ground. Does anyone here surviving on meat only NOT eat tons of beef. Pork and chicken are quite cheap - would they be ok as a principal source of calories (fatty obviously)? I'm still on and off zero carb. I actually dropped a pound when I added in vegetables so not sure which way I'm going to go now and why that should be. I always eat plenty of fat - no lean meat for me!

Cheers

Loops

I want to lead a book discussion on *Fat of the Land*, the first low-carb book. However, I would need to know that many of your have or are reading that book. If you can let me know if you would be interested in such a discussion, I'll speak to Jimmy and we can make it happen. I think this would be as valuable as GCBC was.

Charles

Charles - I would be interested in this, as well. I've got it printed off, so now I can start reading it. 😊

**RE: Zero Carb / Meat and Water** - cbnebraska - 09-02-2008 11:41 AM

Fat of the Land..........

Count me in! I think I'll slow down on it right now and wait for the discussion to begin! I've learned a lot, but would definitely benefit from some other perspectives.

**RE: Zero Carb / Meat and Water** - nyteez - 09-02-2008 12:10 PM

Hi Loops!

I eat a lot of pork & chicken. I find the cheaper cuts are the fattiest. Chix thi's, pork shoulder steaks, or shoulder roast. Pork chops & Chix brsts, are too lean.

**RE: Zero Carb / Meat and Water** - Loops - 09-02-2008 12:35 PM

Ok thanks. I gave all my cheese and cream away today to a friend so pork and chicken it is. Ever seen that film Requiem for a Dream? The fridge turns into a monster for the woman trying to ignore her hunger. THAT is what it is like trying to give up cheese and cream for me!

I had a new burst of motivation this morning as my clothes don't fit me - and not in a good way! Yeah I don't cheat or anything - low-carb all the way but something just isn't working for me lol. Maybe I'm just destined to gain now whatever I do? I hope not, so here we go - another shot at meat/fat only!

It's a shame it takes this for you to give zero-carb a try. If you truly believe that what you're eating is the proper diet for yourself, then why don't you just continue to do it consistently?

I can never promise that zero-carb will provide weight loss for you or anyone else. I can only say that I believe zero-carb will offer the healthiest of all diets that you can consume. This is good from a health perspective regardless of whether you lose weight or not. When you eliminate the carbohydrates, you will have less ability to break carbs down as your body will stop making the enzymes necessary for them. You may argue that, yes, but after a short time, my body will begin to make the enzymes again, which is true. However, if you're not managing them very well right now, can we really say that your body will do any better if you reintroduce them again?

That's really the question that you have to consider before undertaking our routine. The most successful people have been those who have decided to do it merely for health and weight control has to be a secondary thing because you must realize that if you're eating the proper diet, then you have no control over your weight.

When you eat zero-carb, what you're saying is that you are trusting your body to regulate your weight. You are merely following your hunger and your thirst and eating accordingly. There is no counting or measuring to be done. Sure, I step on the scale, but I'm basically powerless over what the results show.

This morning I was 147 which is only 1 pound from when I joined the Navy in August 1986. Hopefully, some of that is water or something since I raced on Sunday but my weight usually rebounds by Tuesday morning after a race. My goal weight was 164. That's quite laughable now!

Just a note of caution for all newbies that despite Stefansson's success late in life with reducing his weight, unfortunately it doesn't happen that way for everyone. There are many things that are reversed some of which we can see and some of which we can not.

Regards,

Charles

Stefansson was not that much overweight, from the little I've read, but perhaps more importantly, our
world has changed quite a lot since his day. We've all become used to eating far more refined carbs in so
many more "sophisticated" ways, and we're probably metabolically a whole lot sicker than people
generally were then. The longer we've been overweight, the more damage to ourselves we have probably
done, so the chances of a complete "cure" are probably not that high. Nevertheless, it's still the best we
can probably do.

On downloadable "Fat of the Land" ... (or not); sorry, I think I was getting confused with "Adventures in
Diet" (which itself is a great read).

Well, I guess it depends on what we call "everything." With zero-carb, I think you can cure eczema, bulimia, acne, obesity, and not be deprived of anything. The "deprivation" feeling comes from the addiction to carbohydrates. Once it's gone, it's gone.

Listen, on the beach last weekend, there was Dairy Queen, cold popsicles after the race, bananas, watermelon, pretzels, chocolate chip cookies, etc -- basically all of the things you would think one "needs" on a hot, humid day at the beach. I craved none of these things. All I needed was my bottle of water which didn't even have to be cold.

It wasn't like I felt deprived and I had to avoid these foods, or talk myself out of having them. It was as if they didn't exist. Basically, there was no real food there. Now, the steak and ribs I had prior to visiting the beach, now that's another story...

RE: Zero Carb / Meat and Water - paleobabe - 09-03-2008 01:29 AM

As a long-time lurker I've been following this thread with great interest - after first wading my way through all the pages to get totally up to speed! Some fascinating information and opinions being posted here.
I am the mom of a very tall, extremely active toddler (2.5) who is still nursing multiple times a day. Some pages back folks started discussing the effect of low/zero carb on breast milk composition, but unfortunately the discussion seemed to run dry very quickly (forgive the pun). I for one, would be very curious about any potential hazards or advantages this way of eating might have hold for a nursing child.

I've been doing very well myself on mostly paleo/low carb since 2000, and currently stick to 5-10 carb grams a day or less. I do test my milk once or twice a day for ketones and up my lean protein slightly if any appear (rarely happens).

I have a background in nutritional science, but have not been able to find a great deal of info on this subject. I can say that my toddler, who eats much the same as me except for the addition of more berries, veggies and nuts, appears to be thriving, so I'm not overly concerned. Anyone else have any thoughts?

---

**RE: Zero Carb / Meat and Water** - suzanneyea - 09-03-2008 02:04 AM

HI!
I so wish I had started Andrew on a paleo type diet from birth. I remember him naturally avoiding bread and carb products, but like an idiot I kept giving them, now he craves them. I am doing my best to reduce them in his diet, but it is not easy. I post about this struggle a lot. I also followed lc when nursing, but only nursed for a year. What are your reasons for still nursing him at 2 1/2?

---

**RE: Zero Carb / Meat and Water** - Loops - 09-03-2008 06:51 AM

Hi Charles -

yes I had the same thing going on on the beach last year. In fact I was almost bullied into ice-cream - but I was simply amused by people's like for it and had no desire etc.. It's strange - I sometimes get cravings for a tomato but nothing else. Also lemon juice occasionally. Usually it is because I've eaten something salty. And obviously pork ribs - those cravings come a lot. But yes that is another thing I have accomplished - I don't have any desire for the usual junk sugar foods - but then I never ate them anyway (in the past 10 or so years anyway).

I was actually quite surprised with my vegetables experiment - I don't like them anymore (apart from the above exceptions). Sometimes they make me a bit bloated, sometimes not. It seems like such a hassle to make a salad now - pointless almost.

---

**RE: Zero Carb / Meat and Water** - montmorency - 09-03-2008 07:27 AM

Veggies: interesting ... I found an (old, presumably) posting by The Bear, here: [http://zerocarbpath.blogspot.com/](http://zerocarbpath.blogspot.com/) in which he comes out as very anti-veg; not just that they are unnecessary, but that they are poison, etc. He also makes the interesting comment at one point that Atkins put the veggies into his diet in order to make it socially acceptable. (I can relate to this since I get stick from the family if I am not eating, or not seen to be eating, vegetables...in fact this is the best argument I can think of for a low-carber to eat at least some veg ... for the sake of a quiet life! :-)) But I see Atkins fans telling others that they _must_ eat veg....hm.

I've seen a reference here (I think) to The Bear having had a heart-bypass. Is this correct, and if so, when
was it? Has he made any public statements about it?

Regards,
Mike

Nursing is much more healthy for babies than formula. But you might need to supplement with Vitamin D3 to make sure your child is getting enough himself. The reason is that Americans are typically chronically low in D, as we have been told to avoid the sun and use lotion...by sunscreen manufacturers. That's a problem because the key way we get Vitamin D, a crucial compound, is through sun on our skin. Unfortunately, what we're not told is that avoiding the sun causes many more health problems than it solves. "Vitamin" D (it's actually a crucial steroid, not a vitamin) is massively anti-carcinogenic, reduces cardiovascular disease, prevents rickets, protects against osteoporosis, prevents calcium from being deposited in your arteries -- the list is quite astounding.

What this has to do with breastfeeding is that since the compound is so crucial -- and Americans get so little -- breastmilk will be completely devoid of vitamin D is most mothers. That's because her body won't release any D to the baby until she has enough D to meet her own needs (and it's unlikely that she does.) So the baby never gets any (especially since most good moms are very careful to shield their infants from any sun.)

Recent NY Times article on vit. D & breastfeeding

None of this is caused by low-carb eating -- virtually no foods contain Vitamin D. Cod liver oil has it -- if you had several tablespoons a day, you'd be covered. Salmon meat has it -- you'd have to eat a couple of pounds a day. If you're under 40, you can get it through getting enough sun (we lose our ability to make D from sun by age 40.)

Most likely, though, you need to supplement with D3 -- far over the current RDA, which is disastrously low -- before there will be any D in your milk.

Here is an interesting excerpt from Dr. Davis' Heartscan Blog, that seems to indicate that breastfeeding mothers need 6400IU/day of D3 before their babies have correct levels:

Quote:
Bruce [Hollis] kept the audience enthralled with a review of all the disease states that indicate 25(OH)D levels need to be much higher than they are now, that is, the multiple biomarkers that suggest the lower limit of 25(OH)D levels should be above 40 ng/ml and closer to 50 ng/ml. Then Professor Hollis spoke
of his ongoing study in pregnant women and how he got approval to use 4,000 IU of vitamin D per day back in 2003, quite an accomplishment. He also reviewed another one of his research projects, one that answered an age old question, why is breast milk a poor source of vitamin D? How were prehistoric infants supposed to get their vitamin D, by lying out in the sun where saber tooth tigers would eat them? No, they were hidden in caves and had to have another source or the human race would have died out long ago because rickets destroys a woman's and infant's chance to live through childbirth due to rachitic deformations of the mother's pelvis. Carol Wagner and Bruce Hollis, together with their colleagues, answered that age old question -- human breast milk is a poor vitamin D source because virtually all modern mothers are vitamin D deficient. That is, when pregnant women keep their levels where we think prehistoric human levels were, about 50 ng/ml, breast milk becomes a rich source of vitamin D. First Carol and Bruce gave [supplements of] 2,000 IU per day, then 4,000 IU per day and finally 6400 IU of D3 per day to lactating women. Only at 6400 of D3/day did the women maintain both their own 25(OH)D levels and the levels of their breast feeding babies above 50 ng/ml. On 6400 IU/day, the vitamin D activity of the breast milk went from about 80 to 800 IU/L. Quite a discovery, and another reason for all of us to keep our levels above 50 ng/ml.

More on D from the Heartscan blog -- the entire thing is fascinating, but too long to post here.

More on the sunscreen manufacturers' sleight-of-hand from last month's Mother Jones: Sun Scam - Think Sunscreen Protects Against Cancer? Think again

How fascinating is that? I feel the same way! 😊 Actually, I've come to loathe any food that you have to sweeten or season in order to make palatable. I always find it amusing that people have such a hard time eating fatty, greasy foods (with tons of flavor) yet they have no problem eating a dry bagle, a salad, or a potato. All of these things require a great deal of seasoning in order to taste good. Oh sure, a fresh, hot bagel may work for some people, but most would at least need to slather some sort of spread or cream cheese on it.
I'll never forget the first time I ate brown rice or brown pasta. That stuff tasted like pure cardboard. Even that Food for Life bread was absolutely terrible but after a while, I learned to "like it". So it is with fat. If you just eat it, after a while you begin to prefer it and you don't get nausea as readily. Lean meat can be pretty gross. I have no problem tossing it to my dog.

This is exactly what I would expect to find. Dr. Price made similar observations about populations in the sub-Sahara:

Quote:
It is significant that the vegetarian groups practiced the feeding of special foods during gestation and lactation. Apparently carnivorous groups found no need to supplement the diet, as it was already rich in the factors needed for reproduction and optimum growth.

If the diet is the proper diet for you, then there is no question it is the proper diet for your offspring. If a person enjoys optimal health consuming a particular diet, then that diet is by definition, a healthy diet.

A simple examination of the food people eat does not tell us anything about any deficiency in the people consuming that food. As I've posted many times, the Inuit diet was notoriously low in calcium, such that deficiencies should have abounded. However, they all had straight, uncrowded teeth, regardless of whether they ate hard food, soft food, caribou, seal, walrus, or fish only, as certain Eskimos who only ate whale and seal blubber. Stefansson reported that they all had the same immaculate health.

Stefansson provided many skeletal remains to the Smithsonian which backed up his observations and none of those remains showed a calcium deficiency.

Those who eat carbohydrates of any kind, have to be concerned with supplementation. Why? Because these things cause our bodies to expend nutrients to process them. With meat, we have not need for this.

The whole notion of vitamins needs to truly be examined. Casimir Funk speculated back in 1912 that vitamins B1, B2, C and D were "essential" for human health. How did he come to this conclusion? He examined healthy people and found that they had these nutrients in high amounts whereas sick folks were low in them. Therefore, he postulated that the healthy people must eat more of these vitamins than other people.

This old 1912 thinking continues to overshadow any intelligent discussions on nutrition. The observation that Funk actually missed was that people who contracted scurvy, did so after eating refined and easily digestible carbohydrates which caused the body to expend those nutrients. Scurvy could be eliminated with fresh meat 100% of the time, as long as you didn't overcook it or boil it. The lime juice and fresh vegetable theory only worked part of the time. Many sailors died trusting this conventional wisdom fruits and vegetables which never seemed to get disproved.

Stefansson and few others were able to actually "winter-over" in the Arctic using meat and did not lose men to scurvy.

Just as we saw with Nurses I and II, there is NO benefit to fruits and vegetable consumption. If this is true for women during life, why would fruits and vegetables be expected to do anything positive for the unborn child? If women can eat meat only during their lives and be healthy, why would their children be expected to be deprived of some nutrient?

This makes no sense to me.

Regards,

Charles

If you're under 40, you can get it through getting enough sun (we lose our ability to make D from sun by age 40.)

WHAT?? I have never, ever heard this before. Please give a reference of some sort for this one........ I have been operating with the information that we should not need supplements of any kind, ever, if we eat a meat only diet. I have read over and over again that our body can and does make every vitamin and mineral we could ever need, except vitamin D, which we must get from the sun. 20 minutes per day, unprotected, more if we have darker skin that tans easily or are overweight.

Can someone expound for me?

RE: Zero Carb / Meat and Water - caroline - 09-03-2008 10:31 AM

cbnebraska Wrote:

You can find information of availability of vitamin d based on latitude of where you live--it's not as simple as sitting out on a sunny day. There is a lot of evidence that a majority of people have vitamin d deficiency--Weston Price always has interesting info. on vitamin d.

this is the one supplement that we are taking, but we are taking it in liquid form. It is the only one I take now.

In the winter it is very hard above 30 degrees latitude to get enough sun. 30 degrees latitude is south of San Diego on the west coast. Winter being October to April depending on where you live.

"The need for vitamin D increases after age 50. It is difficult to meet the vitamin D recommendations for people over 50 years of age without recommending unrealistic daily amounts of some foods."

This is about 50 years old but it was the easiest link I could find from a non blog source.
RE: Zero Carb / Meat and Water - Charles - 09-03-2008 11:36 AM

cbnebraska Wrote:

Anyone who reads my writing knows I don't buy any of this nonsense. I am 40 years old and I am not the slightest bit concerned about getting enough Vitamin D.

These supplements are all a very new thing. What isolated populations took vitamin D supplements? What horrible fate will befall us if we don't get enough of vitamin D?

Quote:
Vitamin D deficiency impairs normal bone metabolism, leading to rickets in children and osteomalacia (undermineralized bones) or osteoporosis (porous bones) in adults (IOM, 1997).

These are diseases of civilization! Once again for the thousandth time:

Stop eating foods that cause you to expend Vitamin D and you will have no Vitamin D deficiency. An all-meat diet has never been shown to create any vitamin deficiency of any kind. This is no different.

Regards,
Charles

It may not be what will befall us but what has already befallen some others.

You can read Dr. Davis blog if you care to. For those with high calcification already it has improved their odds of avoiding heart attacks. http://heartscanblog.blogspot.com/search/label/vitamin%20D

Indigenous populations did not spend all day inside nor did they use sunscreen. I think the jury is out on Vitamin D.

See this article about calcium levels and lethal prostate cancer and the low levels of D associated with it: http://www.msnbc.msn.com/id/26525645/

"People treated for high blood calcium usually have chronic kidney disease, which is associated with low vitamin D levels. Low vitamin D levels elevate parathyroid hormone levels, Schwartz said."
RE: Zero Carb / Meat and Water - chris m. - 09-03-2008 12:02 PM

Thanks Charles,
You are right - so here is the question - Anthony Colpo is adamant about calories in-calories out as the way to lose weight. Where do you come down on this? For whatever reason I find it impossible to control my weight when eating complex carb low fat and much easier when I am doing low carb. I have slowly come to realize [with the help of this thread actually] that once and for all low to 0 carb is the healthiest way to live your life. I've never counted calories much but just "feel" that I'm on higher calories with low carb and still can lose and maintain better. I've been from 220 to 160 twice and am now down to 180. With the help of this site expect to lose this last 20 fairly consistently. I'm 65 yrs. old so it is getting harder but will not let it get away again. Thanks for all you and the others on this site do !!!

BeeDub Wrote:
If you're under 40, you can get it through getting enough sun (we lose our ability to make D from sun by age 40.)

WHAT?? I have never, ever heard this before. Please give a reference of some sort for this one....... I have been operating with the information that we should not need supplements of any kind, ever, if we eat a meat only diet. I have read over and over again that our body can and does make every vitamin and mineral we could ever need, except vitamin D, which we must get from the sun. 20 minutes per day, unprotected, more if we have darker skin that tans easily or are overweight.

That's not what the science shows. Here's an excerpt from Dr. Davis' post on the subject (you can read the whole post [here](#).)

Quote:
As we age, we lose the capacity to activate vitamin D in the skin.

*Studies suggest that, between ages 20 and 70, there is a 75% reduction in the ability to activate vitamin D. The capacity of conversion from 25 (OH) vitamin D to 1,25 di(OH) vitamin D also diminishes. (Holick M. Sunlight and vitamin D for bone health and prevention of autoimmune diseases, cancers, and cardiovascular disease. PubMed link.)*

(Here's a chart from the above study that shows how Vitamin D production from sunlight craters as we age...it's the bottom graph.)

Davis continues:
This would explain why 70-year olds come to the office, just back from the Caribbean sporting dark brown tans, are still deficient, often severely, in blood levels of vitamin D (25(OH) vitamin D). A tan does not equal vitamin D.

*A practical way of looking at it is that anyone 40 years old or older has lost the majority of ability for vitamin D activation.*
This often makes me wonder if the loss of vitamin D activating potential is nature's way to get rid of us. After all, after 40, we've pretty much had our opportunity to recreate and make our contribution to the species (at least in a primitive world in which humans evolved): we've exhausted our reproductive usefulness to the species.

Is the programmed decline of vitamin D skin activation a way to ensure that we develop diseases of senescence (aging)? The list of potential consequences of vitamin D deficiency includes: osteoporosis, poor balance and coordination, falls and fractures; cancer of the breast, bladder, colon, prostate, and blood; reductions in HDL, increases in triglycerides; increased inflammation (C-reactive protein, CRP); declining memory and mentation; coronary heart disease.

Isn't that also pretty much a list that describes aging?

A fascinating argument in support of this idea came from a study from St Thomas' Hospital and the London School of Medicine: Higher serum vitamin D concentrations are associated with longer leukocyte telomere length in women

Telomeres are the "tails" of DNA that were formerly thought to be mistakes, just coding for nonsense. But more recent thinking has proposed that telomeres may provide a counting mechanism that shortens with aging and accelerates with stress and illness. This study suggests that both vitamin D and inflammation (CRP) impact telomere length: the lower the vitamin D, the shorter the telomere length, particularly when inflammation is greater.

Data supporting vitamin D's effects on preventing or treating cancer, osteoporosis, lipid abnormalities, inflammation, cardiovascular disease, etc., is developing rapidly.

Now the big question: If declining vitamin D is nature's way of ensuring our decline and death, does maintaining higher vitamin D also maintain youthfulness?

I don't have an answer, but it's a really intriguing idea.

RE: Zero Carb / Meat and Water - Charles - 09-03-2008 12:26 PM

chris m. Wrote:
You are right - so here is the question - Anthony Colpo is adamant about calories in-calories out as the way to lose weight. Where do you come down on this?

Okay, Chris, I'm not looking to get into it with Colpo or Eades because I don't buy the metabolic advantage nor do I buy the "calorie is a calorie" nonsense either because everyone knows our bodies do something far different with beef spare ribs than it does with corn flakes. I would have to eat 8 cups of corn flakes to equal the calories of 6 ounces of beef spare ribs. I would gain weight eating the corn flakes yet I would either lose or maintain my weight with the beef spare ribs.

When we say "calories don't count" we're not invalidating the first law of thermodynamics. We're saying that calories do count, just not in a way that's relevant. Counting calories is a mental exercise with little relevance to human physiology.

People do not become obese from eating too much and moving too little. Obesity happens when your body is unable to mobilize more fatty acids than it stores in your fat tissue. This condition happens when
the principle regulator of fat tissue, insulin, is chronically high in the bloodstream. This facilitates fat storage or "lipid trapping" which basically means that fatty acids remain trapped in fat tissue for longer periods than they should be. This has little to do with caloric intake and everything to do with the insulin response to the various foods we eat. Certain foods (such as corn flakes) raise insulin levels to create this lipid trapping environment and certain foods (beef spare ribs) don't.

The real regulator of "calories in/calories out" is hunger. Hunger is a request from your cells for fuel. This should serve as the primary guide for how much one eats, not 1800's basal metabolic rate, or other nonsense. When a person eats fat and protein to appetite, their body will regulate their hunger as it's supposed to which will correct the metabolic disorder and begin to repair symptoms caused by said disorder such as obesity, hypertension, diabetes, cancer, Alzheimer's, dementia, etc. Weight loss is the result in seventy-five percent of cases.

It's commonly observed that individuals on a very low or zero-carb diet will voluntarily lower their food intake because they are less hungry. This is very true and most of us here have experienced just that. On the outside, this may appear that we've "lowered our calories" which we did, but assigning that to "cause" would be misleading. We eat less because we are less hungry. We are not less hungry because we eat less.

By the same token, we tend to move more because we become leaner. We do not become leaner by moving more. It's important to understand which is cause and which is effect.

Regards,

Charles

[i]As we age, we lose the capacity to activate vitamin D in the skin.

The science may suggest that but it's far from conclusive when studying a sick population. These are mere associations. Dr. Davis is speculating based on the associations and he says as much here:

Dr. Davis Wrote:
This would explain why 70-year olds come to the office, just back from the Caribbean sporting dark brown tans, are still deficient, often severely, in blood levels of vitamin D (25(OH) vitamin D). A tan does not equal vitamin D.

A practical way of looking at it is that anyone 40 years old or older has lost the majority of ability for vitamin D activation.

This often makes me wonder if the loss of vitamin D activating potential is nature's way to get rid of us. After all, after 40, we've pretty much had our opportunity to recreate and make our contribution to the species (at least in a primitive world in which humans evolved): we've exhausted our reproductive usefulness to the species.

This says nothing of the diet that those 70-year olds consumed prior to visiting his office. 70 year-old
Masai men and women don't show these deficiencies at age 70. This people in the studies ate a poor diet which caused their bodies to lose vitamin D, it was not because they did not consume enough supplements. I don't disagree that they may lose their ability to absorb vitamin D as they age, however I dispute that adding a supplement will correct the damage they did. They would have to change their diet or the vitamin D will still not be absorbed.

Associations do not denote cause. As the conclusion of your post says:

Quote:
Now the big question: If declining vitamin D is nature's way of ensuring our decline and death, does maintaining higher vitamin D also maintain youthfulness?

I don't have an answer, but it's a really intriguing idea

Speculations! All of us know many people who, despite their advanced age, have very beautiful skin and bones. Of course, we also know many who do not. Just because one consumes the supplement that does not mean their bodies will absorb the additional vitamin D if it is determined to excrete it due to an improper diet.

African-Americans rarely suffer from vitamin D deficiencies but the point is, any vitamin deficiency is a disease of civilization. Because it is that, there is a cluster of associations that are not only common to vitamin D deficiency but all the other diseases of civilization. To assign cause to a single vitamin deficiency is foolish. Even Dr. Davis does not go this far. To him, it's an intriguing idea and I agree. However, I am not relying on some supplement concocted in a laboratory.

Regards,

Charles

RE: Zero Carb / Meat and Water - nyteez - 09-03-2008 12:48 PM

I totally agree w/ Charles on the Vitamin D thing. Again, take a look at the Eskimos, who eat only meat. They also spend 1/2 the year in the dark, yet they had perfect teeth & bones. When the sunny season comes they are all bundled up with barely their noses exposed to the sun. How did they get enough vitamin D?

One thing I really noticed this summer is my skin. I have always been a sun worshiper. In the last 5-6 years I have noticed the sun damage after only a few days in the sun. This year, since I have not had carbs since Feburary, my skinned tanned very nicely, no dark brown spots, no white spots, just clear tan skin, like when I was in my 20's.

Charles, me either!! Colpo can be very dogmatic with whoever disagrees with him !! What you said does make a lot more sense. I don't buy the metabolic advantage or calorie in calorie out. I do know that 1500 ccalories of oatmeal will cause me to gain weight while 2500 calories of meat and water and I can lose. This of course moves me more to 0 carbs [which is what this thread is all about]!!!
As Mac you and others say it is all about the insulin.
Thanks again,
chris m. [P.S. get on with that book !!!]

That's right, Cynthia. The Premium Grade fuel has vitamin D and all the essential nutrients in it at the proper levels we need for maximum absorption. It doesn't matter that meat has less vitamin C than an orange. The orange will make us need more vitamin C whereas the meat will ensure we absorb it and we'll have plenty.

Cynthia Wrote:

This is the part that really gets me. How did people survive for so many centuries without sunscreen? Why is it so prevalent nowadays? We need a new term! Along with the "diseases of civilization", Charles is now making a new term: (drum roll, please)

The new term is "Products of Civilization"!

These are products that solely exist to combat the ailments of civilization that are brought about by a poor diet. I argue that by consuming the proper diet, you can skip 'em!

1. Multivitamins and vitamin supplements
2. Fish oil
3. Blood pressure medication
4. Insulin injections
5. Sunscreen/Skin and hand lotions/UV Protection
6. Acne medicine
7. Lip balm and lip therapy
8. Athlete's Foot Fungal Medication
9. Deoderant
10. Metamucil/Fiber supplements
11. Mouthwash
12. Toothpaste and tooth brushes
13. Sleep aids
14. Pepto Bismol and related products
15. Energy Bars/Diet Bars
16. Protein Shakes
17. Eye glasses and contact lenses
18. Dog food
19. Shoes and orthotics
20. Tylenol and Aspirin

These are my top 20. Can you name some?

---

**RE: Zero Carb / Meat and Water - Charles - 09-03-2008 02:08 PM**

Okay, listen. Our Zero-Carb/Meat and Water thread is about to break 100,000 views in the coming days. This is about 80,000 more than the next closest thread on this entire forum. That means the interest is very high concerning this topic.

In recognition of that 100,000 mark, I want to get the *Not by Bread Alone* book discussion going very soon. To that end, I would like to know (and I'm sure Jimmy would like to as well), how many people are willing to participate in this discussion. Please [go to the poll](#) and vote today. The poll will go for 14 days and we'll see what type of response we get. I know that many of you have already indicated you are interested, but please vote at the poll anyway.

That will give me time to outline the book and determine how long it will take us to get through it and give us plenty of time to discuss and debate it.

Regards,

Charles

**RE: Zero Carb / Meat and Water - BeeDub - 09-03-2008 02:33 PM**

Charles Wrote:
[quote=BeeDub]
That's not what the science shows. Here's an excerpt from Dr. Davis' post on the subject (you can read the whole post [here](#)).

*As we age, we lose the capacity to activate vitamin D in the skin.*

*The science may suggest that but it's far from conclusive when studying a sick population. These are mere associations.*

How do you know? Did you pull Holick's paper, analyze his methodology and find it lacking? Dr. Davis seems to find it persuasive.

*Dr. Davis is speculating based on the associations and he says as much here:*

*Dr. Davis Wrote:*

*This would explain why 70-year olds come to the office, just back from the Caribbean sporting dark brown tans, are still deficient, often severely, in blood levels of vitamin D (25(OH) vitamin D). A tan does not equal vitamin D.*
A practical way of looking at it is that anyone 40 years old or older has lost the majority of ability for vitamin D activation.

**This often makes me wonder if the loss of vitamin D activating potential is nature's way to get rid of us.** After all, after 40, we've pretty much had our opportunity to recreate and make our contribution to the species (at least in a primitive world in which humans evolved): we've exhausted our reproductive usefulness to the species.

A weird grab, Charles -- clearly the underlined portion is what Davis is saying is speculative. He certainly doesn't doubt Holick's research...nor does he doubt the blood tests he's running on his patients.

**This says nothing of the diet that those 70-year olds consumed prior to visiting his office. 70 year-old Masai men and women don't show these deficiencies at age 70.**

More relevant would be the fact that when descendants of the Masai move to Boston, put on suits and use suntan lotion, their Vitamin D levels drop through the floor and they suffer disproportionately from coronary disease, stroke and diabetes.

**This people in the studies ate a poor diet which caused their bodies to lose vitamin D, it was not because they did not consume enough supplements.**

Now the above really is speculation...unless you can point me to the research that shows a particular diet causes D to be blocked or excreted even though the body needs it.

**I don't disagree that they may lose their ability to absorb vitamin D as they age, however I dispute that adding a supplement will correct the damage they did.**

Really? Eating Vitamin D3 supplements won't raise your blood D3 level? That's not what anyone else is finding. Evidence?

*They would have to change their diet or the vitamin D will still not be absorbed.*

Again, any evidence that a particular diet blocks absorption of ingested D3?

**Associations do not denote cause. As the conclusion of your post says:**

*Quote:*  
Now the big question: If declining vitamin D is nature's way of ensuring our decline and death, does maintaining higher vitamin D also maintain youthfulness?

*I don't have an answer, but it's a really intriguing idea*  
**Speculations!**

Well, yeah, he's musing at the **conclusion** of the article. But the implication that the entire **post** is speculative is false.

*All of us know many people who, despite their advanced age, have very beautiful skin and bones.*

We also see a lot of beautiful skin in PETA's ads for veganism. So?
African-Americans rarely suffer from vitamin D deficiencies

African-Americans suffer disproportionately from Vitamin D deficiency and the related diseases. There are HUNDREDS of articles in PubMed to this effect.

But the point is, any vitamin deficiency is a disease of civilization.

But what exactly does that mean? Civilization makes us eat grain? Or civilization makes us wear clothes and sunblock?

I am not relying on some supplement concocted in a laboratory.

Certainly your prerogative...but Drs. Eades, Davis & Cannell recommend D3 supplementation, and that's enough for me.

(Here's Eades on Vitamin D: It has been shown that vitamin D is protective against colon, breast and prostate cancers so going out in the sun and getting vitamin D helps you avoid a host of common cancers. But, supposedly (I don't believe it, but let's accept it for this argument's sake) sunlight causes melanoma. What no one ever tells you is that there is one melanoma for every 200 of these other cancers, so by avoiding the sun you increase your risk for common cancers to prevent an extremely uncommon one.)

RE: Zero Carb / Meat and Water - montmorency - 09-03-2008 02:57 PM

MAC: Many thanks for The Bear edited threads; fascinating stuff!

I guess the specific bit I was looking for was in here:

"Odd you can't find it, I seem to recall telling about the double off-pump bypass I had in 2000. The blockage was present from my teens, and caused classic angina when I began ballet training in my early 20's. I thought it was just my intercostal muscles hurting, due to the sudden experience of very heavy breathing. It passed, and did not return until much later after a period of low activity, followed by renewed strenuous exercise- it passed then too. The heart's coronaries lose the ability to form new arterial pathways (anastomosis) by the mid 20's.... in some people, earlier than that. My cardiologist remarked on the extent of my 'natural bypass' which he said confirmed that the blockage was very old indeed. The blockage, over 90% was in the (left) descending artery, the single, critical feeder for the ventricles, the most important muscle group in the heart. I had another, minor narrowing of ~60% in the right circumflex, not considered operable alone, but they still fixed it while attending to the other. The damage was there, as it is in everyone (shown by autopsies on kids- as young as 13), by the end of my teen years, and only became a real problem after I had put on about 35 pounds of muscle in a few years starting in '90. The added mass required more oxygen than my compromised heart could provide, even though it had grown 5% larger than average. I have had a slightly grey complexion all my adult life. It was gone forever when I came out of surgery. I healed up so fast I was able to do incline dumbbell presses three weeks post-op. The new arterial connections add extra blood supply to my heart, and the result is more endurance and strength than ever before in my entire life."

So, he is pretty much convinced that it was an old blockage, and not a result of his all-meat diet, later in life. In an earlier post, he is talking about how no diet can reverse arterial blockages (presumably in response to speculative posts by others, and perhaps in response to the potential question: "If your diet is
so good, why didn't it clear the blockage?". I suspect he's right anyway, although that scourge of low-carbers, and friend of vegans, Dr Joel Fuhrman, claims he's cured cardiac problems using his "phytonutrients" (supposedly nutrient-dense vegetables and fruit, and oh yes, a lab full of supplements).

Vitamin D: There is some interesting stuff about this on Barry Groves site: http://www.second-opinions.co.uk

Among many other other things are some pertinent comments about sunscreens, and I find this particularly interesting:

http://www.second-opinions.co.uk/full_spectrum_sunlight.html

Cnebraska: Love the idea of only running on Premium Grade Fuel! :-) Yes my exhaust runs much cleaner now! :-))

Regards,
Mike

---

RE: Zero Carb / Meat and Water - montmorency - 09-03-2008 03:06 PM

Love the list of "Products of Civilisation" Charles :-)

Another possible:

Anti-histamines (or any other anti-hay-fever/anti-allergy potions)

BTW a report in today's Guardian says that school-kids are OD-ing on "energy drinks", e.g. "Red Bull", especially around examination time! (revising late into the night...). Not sure if that's a product of civilisation, or simply one of marketing ... like "alcopops".

Regards,
Mike

BeeDub Wrote:
This says nothing of the diet that those 70-year olds consumed prior to visiting his office. 70 year-old Masai men and women don't show these deficiencies at age 70.

More relevant would be the fact that when descendants of the Masai move to Boston, put on suits and use suntan lotion, their Vitamin D levels drop through the floor and they suffer disproportionately from coronary disease, stroke and diabetes.

More relevant?! Actually not at all relevant. The Masai are meat eaters. Masai descendants who leave the tribe, also leave the diet and assume the typical high carb diet which is WHY their vitamin D levels drop and they suffer from all the diseases all high carb eaters suffer!

These studies don't mean anything to me and I consider them invalid, because they were not done on people who eat zero carbs. Since eating zero carbs for the past 6 months I have more energy, my skin looks 10 years younger, I have more energy than I have had in 10 years, my mind is sharper and I feel better than ever. I have not taken a supplement since March. I ate pretty low carb compared to most people for most of my life and I took supplements for most of my life. I have a whole shelf of supplements that I used to take. I felt like crap! Taking thousands of dollars of supplements couldn't do what a few ribeye steaks did.

suzanneyea Wrote:
HI!
I so wish I had started Andrew on a paleo type diet from birth. I remember him naturally avoiding bread and carb products, but like an idiot I kept giving them, now he craves them. I am doing my best to reduce them in his diet, but it is not easy. I post about this struggle a lot. I also followed lc when nursing, but only nursed for a year. What are your reasons for still nursing him at 2 1/2?

Hi Suzanne! First off, in my opinion, nursing your son for a full year should be commended. Folks have lots of thoughts and feelings about nursing, but a good long stretch like that definitely gives your kid a boost for the rest of his life.

As for us, the ongoing nursing is a natural extension of our 21st century paleo lifestyle. It's also a superb tantrum tamer 😊. Katherine Dettwyler is an anthropologist who is considered a leading authority on the "natural" weaning age of humans, and she mentions for example that the Inuit typically wean around 6 or 7 years of age. I don't want to highjack this thread though, so here are a couple of links in case you'd like to take a deeper look - [http://www.naturalchild.org/guest/priscilla_colletto.html](http://www.naturalchild.org/guest/priscilla_colletto.html) (5th paragraph down) and [http://www.llli.org/ba/Aug94.html](http://www.llli.org/ba/Aug94.html).

I hear you about the food issues though. As my son Ian gets older, he's getting a lot more exposure to foods we don't typically keep in the house. The way I deal with it is simply to compromise. It's an ongoing pain in the rear, but I make him tasty-looking paleo versions of whatever he'll be missing out on. He has tested positive for gluten and dairy intolerance however (we tried introducing it for a brief period), so that gives me a rock-solid position when some well-meaning friend or relative tells me "just one bite wouldn't hurt".
One more quick note, we actually started Ian on meat and liver as his first foods at 6 1/2 months and totally skipped the baby cereal etc. My feeling was that if he's going to be eating something less optimal than breast milk, I may as well give him the most nutrient-dense food available. He did absolutely great on this and is quite the little carnivore these days. He is starting to connect the animals he reads about and the food we eat though, so we'll see how long I'll be able to hold off on that explanation!

Best regards,
Toni

Quote:
Nursing is much more healthy for babies than formula. But you might need to supplement with Vitamin D3 to make sure your child is getting enough himself. The reason is that Americans are typically chronically low in D, as we have been told to avoid the sun and use lotion...by sunscreen manufacturers. That's a problem because the key way we get Vitamin D, a crucial compound, is through sun on our skin. Unfortunately, what we're not told is that avoiding the sun causes many more health problems than it solves. "Vitamin" D (it's actually a crucial steroid, not a vitamin) is massively anti-carcinogenic, reduces cardiovascular disease, prevents rickets, protects against osteoporosis, prevents calcium from being deposited in your arteries -- the list is quite astounding.

Thanks very much for all this great info. I'm aware of the vitamin D issue, but hadn't actually read everything you posted - scary stuff. Although we generally try to avoid supplements, our family does take liquid D3 in the winter, as we live in Seattle and rarely get any sun exposure for months at a time. In the summer we're always hiking etc. and never use sunscreen, so we give the supps a rest.

That said, if our capacity for making our own D truly does start declining at 40, I'd be a tad more concerned. I'm 38 and my husband is 46, so I'm going to look into this a bit more.

Thanks again!
Toni

BeeDub Wrote:
[i]How do you know? Did you pull Holick's paper, analyze his methodology and find it lacking? Dr. Davis seems to find it persuasive.

Because we've seen plenty of research around here, especially that which Taubes has elucidated for us, that clearly demonstrates these associations are present in all the diseases of civilization. Every single one. I don't doubt Holick's observations, I'm just telling you that there is nothing new there. All that was demonstrated was that vitamin D deficiency is correlated with aging. We also know that high insulin levels are also associated with aging and the diseases of civilization.

BeeDub Wrote:
[i]A weird grab, Charles -- clearly the underlined portion is what Davis is saying is speculative. He certainly doesn't doubt Holick's research...nor does he doubt the blood tests he's running on his patients.
These are blood tests upon high-carb eating subjects. Nothing can be gleaned from this as far as we're concerned. If you eat carbohydrates, then yes, you should be concerned with this.

BeeDub Wrote:
More relevant would be the fact that when descendants of the Masai move to Boston, put on suits and use suntan lotion, their Vitamin D levels drop through the floor and they suffer disproportionately from coronary disease, stroke and diabetes.

Not at all. The Masai are meat-eaters as Dana said in her post. They leave the tribe and eat Western foods and immediately get the diseases of civilization just like we do. This same pattern has been demonstrated in populations for the last 100 years. Have you read Taubes? Where do we begin? Ah yes, the Inuit, the Tokelauans, the Pima, the Sioux, the Zulu's, the Aboriginees, -- need I go on? Whenever they begin to eat the diet of Westerners, their health deteriorates and they all suffer from the diseases of civilization. Vitamin deficiency is just one of many symptoms of the metabolic disorder. It's not because they did not get enough Vitamin D in their diets.

BeeDub Wrote:
Now the above really is speculation...unless you can point me to the research that shows a particular diet causes D to be blocked or excreted even though the body needs it.

See, I'm not going to argue with people who haven't read Taubes. After you read the book, then let's return to this because this would take too long. Go and read about scurvy and deficiency diseases. You'll find what causes it and what cures it. This whole notion of consuming essential vitamins arose from Johns Hopkins nutritionist Elmer McCollum and his notions in *The Newer Knowledge of Nutrition.* There, he assumed that scurvy, pellagra, beriberi, rickets, and anemia were caused by a lack of essential vitamins and minerals. Most nutritionists still hold by that logic today. Therefore they say "A safe rule of thumb is that the more components there are in a dietary, the greater the probability of balanced intake."

The dirty little secret is that deficiency diseases were ALWAYS caused by diets high in refined carbohydrates and low in meat, fish, eggs, and dairy products. In 1753, James Lind only demonstrated that scurvy could possibly be prevented and cured by the consumption of citrus juice. He did not however prove that it was caused by a lack of citrus juice.

Stefansson provides plenty (and I mean plenty) of evidence in his book, *Not by Bread Alone,* that the citrus juice rarely if ever worked. As more and more sailors succumbed to scurvy, they kept changing the recommendation that it had to be fresher and fresher juice. However, Stefansson demonstrated that fresh meat ALWAYS cured scurvy. Just like today, that fact gets glossed over in the literature.

You thought the Atkins diet had trouble getting respect, this is nothing compared to that! Carl Voegtlin demonstrated in 1914 that Pellagra and scurvy could be cured by adding fresh meat to a pellagra-causing diet. Nutritionists found that in lab animals, they could induce deficiency diseases simply by feeding diets rich in refined grains and sugar. Guinea pigs were given scurvy in the 1940s when they were given crushed barley and chickpeas. Taubes provides all the studies in the back of his book. You can google them to your heart's content.

The Japanese Navy brought their beriberi under control in the late 1870s by switching from veggies, fish and white rice, to barley, meat and evaporated milk.

Obviously, all of these diets caused deficiency diseases. What is different today? A simple perusal of
history demonstrates that vitamin deficiencies are caused by overconsumption of refined carbohydrates. It is really irrelevant as to what Holick found. This road has already been plowed.

BeeDub Wrote:
But what exactly does that mean? Civilization makes us eat grain? Or civilization makes us wear clothes and sunblock?

Again, until you read Taubes, I'm not arguing with you because there is too much ground to cover here. There are well-documented steps that an isolated population goes through when becoming a civilization. The eating patterns change in predictable ways. As they adapt to more of a grain-based diet, the associated diseases, which were heretofore completely absent, all come upon the people when their sugar consumption reaches about 70 pounds per person per annum.

I realize Dr. Eades is into supplements. If you believe Dr. Eades, then have at them. I'm not at all concerned about colon, breast, prostate or any other cancer because history clearly shows us that those who do not eat refined and easily digestable carbohydrates do not suffer from the diseases of civilization. Read Taubes to understand what is denoted by that term.

Regards,

Charles

nyteez Wrote:
I totally agree w/ Charles on the Vitamin D thing. Again, take a look at the Eskimos, who eat only meat. They also spend 1/2 the year in the dark, yet they had perfect teeth & bones. When the sunny season comes they are all bundled up with barely their noses exposed to the sun. How did they get enough vitamin D?

One thing I really noticed this summer is my skin. I have always been a sun worshiper. In the last 5-6 years I have noticed the sun damage after only a few days in the sun. This year, since I have not had carbs since Feburary, my skinned tanned very nicely, no dark brown spots, no white spots, just clear tan skin, like when I was in my 20's.

On the absorption thing: if you're eating a poor diet, and by this I am referring to a grain-based diet, you will likely not absorb minerals optimally be they contain phytates that bind with minerals and make them basically unavailable. Lectins (in legumes) do the same thing. Long periods of soaking can reduce phytates/lectins, as can sprouting. I'm not sure by how much.

Also, 1 in 111 North Americans are celiac...but only 1 in 40 are actually diagnosed, so there are a lot of undiagnosed folks out there. Current estimations as to gluten sensitivity (without active celiac) are as many as 90 million Americans. Gluten sensitivity and celiac (a disease caused by gluten sensitivity, one of many) result in poor absorption (or total malabsorption) of vitamins and minerals, including Vitamin D.

Many of our "diseases of civilization" are linked, directly or indirectly, to gluten/celiac (also to dairy intolerance). Of course it's not the be-all-end-all, and there are other reasons why a person may be deficient. But in the majority of cases, I'd put my money on poor diet leading to reduced absorption.
Re: sun and skin - it's only been since I went lc and gluten-free that I can stay in the sun for long periods of time and not burn...I even tan, and that's unheard of for me! I used to burn, no kidding, in 10-15 minutes, and get skin rashes from the sun. I could burn waiting for a bus. Now I can walk around all day, and I might get a bit pink on my shoulders, nose and chest. If I am out all day I bring a chemical-free sunscreen that works upon application, and slap some on my burn areas after a few hours (or just cover them with a light scarf or something). I've had this tube of sunscreen for two years 😊

they begin to eat the diet of Westerners, their health deteriorates and they all suffer from the diseases of civilization. Vitamin deficiency is just one of many symptoms of the metabolic disorder. It's not because they did not get enough Vitamin D in their diets.

Another false conflation. Yeah, eating carbs is a disaster. That tells us nothing about Vitamin D. Vitamin D deficiency is a disease of not eating enough D or getting enough sunlight. Meat has little D.

BeeDub Wrote:
Now the above really is speculation...unless you can point me to the research that shows a particular diet causes D to be blocked or excreted even though the body needs it.

See, I'm not going to argue with people who haven't read Taubes.

I've read Taubes. Where does he say meat has every nutrient you need? (Says EXACTLY that?) And where does he say that if you eat carbs you can't absorb Vitamin D? (Says EXACTLY that?) I don't recall anything like that. Page numbers, please?

After you read the book, then let's return to this because this would take too long. Go and read about scurvy and deficiency diseases. You'll find what causes it and what cures it.

Ok, we have condescension, and then another subject change. Now we're talking scurvy? Where did that come from?

The dirty little secret is that deficiency diseases were ALWAYS caused by diets high in refined carbohydrates and low in meat, fish, eggs, and dairy products.

I'll bite. Always? ALWAYS? Care to point me to the PubMed article?

In 1753, James Lind only demonstrated that scurvy could possibly be prevented and cured by the consumption of citrus juice. He did not however prove that it was caused by a lack of citrus juice.

Scurvy? Why are you changing the subject again?

Stefansson provides plenty (and I mean plenty) of evidence in his book, Not by Bread Alone, that the citrus juice rarely if ever worked. As more and more sailors succumbed to scurvy, they kept changing the recommendation that it had to be fresher and fresher juice. However, Stefansson demonstrated that fresh meat ALWAYS cured scurvy. Just like today, that fact gets glossed over in the literature.

You thought the Atkins diet had trouble getting respect, this is nothing compared to that! Carl Voegtlin demonstrated in 1914 that Pellagra and scurvy could be cured by adding fresh meat to a pellagra-causing diet.

ANOTHER subject change? Pellagra? That's B3, not D! Are you saying that since some deficiency diseases can be cured by eating meat, that all can be cured by meat? Why? Because it's your HUNCH?

Nutritionists found that in lab animals, they could induce deficiency diseases simply by feeding diets rich in refined grains and sugar. Guinea pigs were given scurvy in the 1940s when they were given crushed...
barley and chickpeas. Taubes provides all the studies in the back of his book. You can google them to your heart's content.

Scurvy again? **Where is the study that proves carbs block the absorption of D3?** And don't just say "in Taubes", give the study he cited. Because Taubes actually cited proof for everything he asserted.

*The Japanese Navy brought their beriberi under control in the late 1870s by switching from veggies, fish and white rice, to barley, meat and evaporated milk.*

Beri-beri? ANOTHER subject change? Do you have NO proof on D?

Obviously, all of these diets **caused** deficiency diseases.

Caused THOSE SPECIFIC deficiency diseases. Not relevant to D deficiency.

What is different today? *A simple perusal of history demonstrates that vitamin deficiencies are caused by overconsumption of refined carbohydrates.*

SOME are. Not D.

It is really irrelevant as to what Holick found. This road has already been plowed.

No, a bunch of smoke has been blown. But cancer, heart disease, stroke and diabetes ain't "irrelevant."

BeeDub Wrote:
But what exactly does that mean? Civilization makes us eat grain? Or civilization makes us wear clothes and sunblock?

Again, until you read Taubes, I'm not arguing with you because there is too much ground to cover here.

Enough condescension, Charles. You don't need to "cover ground." Just give me ONE citation showing carbs block D3 absorption. ONE citation proving meat is all we need. Two PubMed links, you're done.

There are well-documented steps that an isolated population goes through when becoming a civilization. The eating patterns change in predictable ways. As they adapt to more of a grain-based diet, the associated diseases, which were heretofore completely absent, all come upon the people when their sugar consumption reaches about 70 pounds per person per annum.

Okay, I'll settle for one. Just give me ONE. Do you have ONE?

I realize Dr. Eades is into supplements. If you believe Dr. Eades, then have at them.

He's an MD. He's one of the fathers of the low-carb movement. Has written several books, another about to be published. I think he's smart...in my opinion, far more understanding of biochemistry than Atkins was.
And he's Taubes' buddy. :-) 

I think you're bright, too. But you're a paralegal. So yeah, I'm with Eades here.

*I'm not at all concerned about colon, breast, prostate or any other cancer because history clearly shows us that those who do not eat refined and easily digestable carbohydrates do not suffer from the diseases of civilization.*

Again with the blurring. "History shows" "diseases of civilization" Big phrases, that can mean anything...and nothing.

What about D, Charles? You got ANYTHING on D?

One of Taubes' key points is that nutrition has been hijacked and turned into a religion, not a science. "Vegetables are healthy" is RELIGION. But so is "meat is all you need." Charles, you're a great moderator, but you go too far when you tell people to ignore the advice of expert MDs like Drs. Eades and Davis.

Dr. Eades posted on this irony last week -- any non-MD can tell people any dangerous thing they like, and they can't get sued -- only an MD can get sued.

So you're legally protected when you tell people they don't need any Vitamin D. But since it conflicts with the science that shows D3 is powerfully protective against cancer, circulatory disease and diabetes, and the data proving there's little of it in meat, it is, in my opinion, irresponsible to do so.

**RE: Zero Carb / Meat and Water - caroline - 09-03-2008 09:44 PM**

You know, this is not related to the discussion over vitamin d, but the manner in which people address each other. I just wanted to say, that while you may disagree with someone, you don't need to lash out by denigrating someone's response with a: "Oh, well this person is more creditable than you b/c you are
just a so and so (the so and so being whatever occupation that person is). The point being--what makes this forum nice is that people air their views, but are respectful of each other.

Maybe I'm just "sensitive," but I just think we can all benefit from disagreeing while STILL being respectful of another person. And fyi: just b/c someone is a scientist, doctor, or what have you does not insure that they are undebatable sources. Otherwise, we'd still be believing that the world was flat b/c some "expert" told us so...Thanks for letting me vent...

Sincerely,

Caroline

---

RE: Zero Carb / Meat and Water - caroline - 09-03-2008 09:51 PM

Lastly, (b/c I can never seem to get it all together in one e-mail--perhaps some vestige of old carbs, ha ha) I actually think that the MOST important thing here is not so much that we can prove every bit and detail, but that we are motivated to make our lives better. And we are lucky to have individuals that are sharing their enthusiasm in order to keep bringing home the theme--it is possible to change down to our last breath.

Hey, don't blame me, it's the sodium nitrate in my new bacon that's got me rolling!

Quote:
Enough condescension, Charles. You don't need to "cover ground." Just give me ONE citation showing carbs block D3 absorbtion. ONE citation proving meat is all we need. Two PubMed links, you're done.

I'm not Charles, and I'm not arguing for or against supplementation. But I'll see what I can dig up. This is an issue for me due to celiac/malabsorption - I know that certain conditions affecting the GI tract can and do interfere with vitamin absorption. I don't know that "carbs" per se can be blamed, but certainly the link is there as far as many cereal grains are concerned.

Quote:
From: Treatment of Metabolic Bone Disease: Management Strategy and Drug Therapy
By David Hosking, Johann D. Ringe
Contributor David Hosking, Johann D. Ringe
Published by Informa Health Care, 2000
ISBN 1853177555, 9781853177552
253 pages

"Because coeliac affects primarily the duodenum and jejunum (small intestine), malabsorption of calcium and Vitamin D is common in this condition..." p.5

They go on to say (on page 6) that once a person has been on a gluten-free diet for awhile, supplementation will have to be carefully watched, because they will now be absorbing vitamins normally.

Does this only apply to celiacs? See previous post for how often celiac and gluten sensitivity is either misdiagnosed, or missed completely. It really is awful how many ppl have it and don't know it.
I've read many studies on PubMed that show D3 supplementation improves glycaemia and insulin secretion in patients with T2 diabetes...but I do wonder if this is a chicken/egg situation, ie which came first, the insulin trouble or the Vitamin D deficiency? Speculation on my part, not proof of anything. But since celiac/gluten sensitivity has been associated with T1 diabetes (http://spectrum.diabetesjournals.org/cgi/content/full/15/3/197), I wouldn't be bowled over if it also related to T2.

More info on the T1/T2/gluten connection here: http://members.cox.net/harold.kraus/gluten/anno_symptoms_files/diabetes.htm#_ftn2

In addition to osteomalacia and osteoporosis, D3 deficiency is also associated with other funky stuff...from http://en.wikipedia.org/wiki/Vitamin_D#Diseases_caused_by_deficiency:

Quote:
Zinc and Iron are often found to be poorly regulated or even deficient in Vitamin D deficiency. Vitamin D enhances the activities of Vitamin A, and Zinc reduces the toxicity of Vitamin A, while Iron reduces the toxicity of Zinc.[citation needed] These four are seen as part of the pathology of Alzheimer's, Parkinson's and some peripheral neuropathies including Restless legs syndrome.

Vitamin D malnutrition may also be linked to an increased susceptibility to several chronic diseases such as high blood pressure, tuberculosis, cancer, periodontal disease, multiple sclerosis, chronic pain, depression, schizophrenia, seasonal affective disorder, peripheral artery disease[21] and several autoimmune diseases including type 1 diabetes (see role in immunomodulation).[14][22]

Okay...if we look at celiac/gluten sensitivity, it is also related to alz and other degenerative brain diseases (Huntington's, Parkinson's). Peripheral neuropathy is the second most common manifestation of gluten sensitivity. Schizophrenia, depression, a host of autoimmune diseases, heart disease, chronic pain etc are all associated with celiac/gs as well. (http://www.theglutenfile.com) Does this prove that carbs cause D3 deficiency? No. It does provide ample evidence that diseases that are associated with D3 deficiency are also associated with an intolerance to cereal grains, and that an intolerance to cereal grains leads to malabsorption of vitamins/minerals, including D3. So...at least in some people, certain carbs do cause D3 deficiency.

Malabsorption syndromes (which includes "carbohydrate intolerance") will result in numerous vitamin and mineral deficiencies, including D3. Diarrhea and bloating are common signs. I've read this so often that I don't have a quick link on hand, but I'll look for one!

On to meat and D3:

Quote:
However, recent assays of meat in New Zealand have reported levels of 0.10 [micro]g vitamin D3 and 0.45 [micro]g 25-OH D3 per 100 g in beef and levels of 0.04 and 0.93 [micro]g/100 g respectively in lamb. (21) Given the higher biological activity of the 25-OH vitamin D, this means that 100 g of cooked beef could provide 12% of the estimated adequate intake of 10 [micro]g/day for a 51- to 70-year-old individual, (8) and cooked lamb could provide more than 25%, and hence be an important source of this nutrient, especially for housebound elderly people.

Nutritional composition of red meat.(Section 2: Key nutrients delivered by red meat in the diet) Article from: Nutrition & Dietetics: The Journal of the Dietitians Association of Australia Article date: September 1, 2007
Author: Williams, Peter
They were speaking of the lean portion of meat in this case, not the fat, so levels may be higher depending on the animal's diet and amount of time spent outside.

Quote:
Mosby Medical Encyclopedia:
The natural foods containing vitamin D are of animal origin and include saltwater fish, especially salmon, sardines, and herring, organ meats, fish-liver oils, and egg yolk.

Quote:
Concentrations of vitamin D3 and 25-hydroxyvitamin D3 in raw and cooked New Zealand beef and lamb

Meat from four lamb cuts and four beef cuts was assayed for vitamin D3 and 25-hydroxyvitamin D3 (25OHD3) before and after cooking. Vitamin D3 was measured by HPLC, while 25OHD3 was assayed using a radioimmunoassay method developed for blood plasma.

Concentrations of both these compounds tended to increase with cooking for most cuts, but retention levels were often less than 100%. Positive relationships between fat percentage and vitamin D3 were shown before and after cooking, but not for 25OHD3. For lamb, the highest levels of vitamin D3 were in the shoulder chop both before and after cooking, while levels were lowest in the rack muscle. Similar cut differences were shown for 25OHD3 concentrations.

For beef there were no significant differences between the cuts for vitamin D3, but concentrations of 25OHD3 were lower in the striploin before and after cooking. Vitamin D3 levels tended to be higher in beef cuts than in lamb cuts, but the opposite held for 25OHD3. Concentrations of vitamin D3 were similar to those in other reports, but the 25OHD3 levels were at the high end of reported ranges.

With 25OHD3 being more potent than vitamin D3, it is concluded that meat can make a useful contribution of this vitamin to the human diet.

http://tiny.cc/MVKTf

I know also that lard is a source of D3, since pigs (like humans) synthesize D3 from sunlight and store it in their fat. No clue how much D3 is in lard though.

Wow. Possibly the longest post in history. And now it's 2am and here I am, typing away and thinking about vitamins and fat and stuff when I should be sleeping. Thanks guys! 😊 Interesting discussion though.

paleobabe Wrote:
On a slightly different note, I have several questions/observations about strength and endurance on a VLC/zero carb diet. I think I'll save them for a separate post, but I hope you don't mind if I pick your brain a little more.

My carb intake has been dropping steadily over the last few years as I learn more about what works best for my body. About three weeks ago I started experimenting with 5 net carbs or less a day (mostly from organ meats) and 70-80% of calories from fat. I'm not seeing any major issues so far.
Prior to going VLC, I read everything I could get my hands on about low-carb nutrition in athletes to make sure I wasn't going to do some serious damage. That gave me an idea of what to expect and most of the changes so far have been fairly predictable. For example, I'm able to lift as much as before, but it definitely takes a lot more effort now. I'm also not progressing as fast as I used to. My speed has also been affected somewhat, although my endurance is already better than ever.

Being a nursing mom puts me in a different hormonal state than most, but I can't help but wonder whether the reduction in strength is permanent. Given the improvements I'm seeing in my staying power however, I guess it may be worth it.

I'd love to hear your thoughts on this Charles.

**RE: Zero Carb / Meat and Water - suzanneyea - 09-04-2008 02:28 AM**

I hate when we get into all this technically junk, with people citing and quoting studies to prove their point, it is sooo not what this board is about to me. I know a lot of people like doing it, but not me.

Quote:
Charles, you're a great moderator, but you go too far when you tell people to ignore the advice of expert MDs like Drs. Eades and Davis.

Charles is expressing his opinion. He or anyone else can have their opinion. Charles can say eat only onions for the rest of your life for all I care, it still is his opinion and does not change what I chose to put in my mouth. If you want to take Vitamin D, take it. It is not like Charles is going to hop on a plane and physically stop you.

Wow. Possibly the longest post in history. And now it's 2am and here I am, typing away and thinking about vitamins and fat and stuff when I should be sleeping. Thanks guys! 😊 Interesting discussion though.

Great post, Miss T.

**RE: Zero Carb / Meat and Water - Richard - 09-04-2008 04:44 AM**

For so long my diet was...excuse the expression...CRAP. I sit here now with a screwed up thyroid, no gallbladder and testosterone levels of a man 20 years my senior! I was a carb addict and my body proves it! While vitamins supplements may not be necessary I am using them now to help my body make up for the sins of the past. I will not be on them forever but as but blood test come in and I see the changes (which I know I will because I don't want to be pumping the Dr. pills) I will reduce the supplements. One day I too will be 'supplement free'.

I think it is up to each individual to be informed as to signs of a problem and possible solution and other options. I look to Charles and others here for information because this way I can make an educated choice AND I am a firm believer in listening to people that have the experience so I don't make the same mistakes but, it is my choice as to what to do.

For too long I listened blindly to the 'establishment' and tried to follow the USRDA...go figure....this from the people that brought you the income tax and the line "I'm here from the government and I'm
As I said, now I use supplements....the future I probably will not.

To paraphrase one of my favorite lines from a show 'I ain't never seen a subject so dangerous it can't be talked about.' Steven Hopkins from 1776

And thanks for all the information, now to go do some reading.

starting meat and eggs today - pamela702 - 09-04-2008 05:13 AM

Hi everyone! My weight loss has slowed down alot, and i have finally decided to start with the meat and eggs to see if i can get it moving again. I have read alot on here (and talked to a few people also) who have done this with great results. Here is todays menu:  
breakfast: 2 scrambled eggs in butter, and 1 sausage patty  
lunch: 2 hamburger patties  
dinner: 2 chicken drumsticks and a hardboiled egg  
I would appreciate any advice, i want to do this the right way. I will post my menus for a few days, to get everyone's input.  
Thanks! Pamela

Charles Wrote:
Okay, listen. Our Zero-Carb/Meat and Water thread is about to break 100,000 views in the coming days. This is about 80,000 more than the next closest thread on this entire forum. That means the interest is very high concerning this topic.

Is that enough interest to get our own forum? This thread has several threads going on within it and combined with the activity level, it makes it hard to find information you just read read yesterday and want to look at again.

**RE: Zero Carb / Meat and Water - Tana - 09-04-2008 06:06 AM**

I look forward each day to following this topic. I value the opinions and experiences from others regarding the zero carb lifestyle. I used to spend hours searching for information regarding zero carb, or trying to find others who embraced this way of eating.

I feel fortunate to have found this site, and the information provided by Charles and others who take the time to share their experience and knowledge is very much appreciated.

😊

Thank you mrw549! You said that so well!

I am sorry BeeDub, but there is no way you have read this entire thread, or read Taubes book. You might have read it, but you didn't "get it". There are people here who have read thousands of pages and studies regarding zero carb and how healthy it is.

You are making a fool of yourself.
RE: Zero Carb / Meat and Water - suzanneyea - 09-04-2008 08:15 AM

I have no problem with people citing studies and I do understand that is one of the main reasons people come here, but I do not like it when threads get this negative feel, like we are fighting each other to be right, rather than learn. That is all I meant.

RE: Zero Carb / Meat and Water - travis t - 09-04-2008 08:49 AM

If someone wants to call me a fool, please do so.
I have some lingering doubts about an all muscle meat diet and it's ability to supply all of my vitamin and mineral needs for the long term.
if i had no doubts about this my children would be on an all meat diet, but as of now they still are not.
my wife and i are reducing the amounts of refined carbs in our household and that is as far as i am going to go for now.

To me the ultimate test of how our rubber meets the road is how we feed our children. I would think that there are few here that are doubt free.

I hope my reply wasn't taken in that spirit - the discussion between the two of them got me curious. I actually take supplements, albeit sporadically!

I enjoy friendly debate - it forces me to think (ouch) and to revisit what I know, and what I think I know. The principle of complementarity in quantum physics can illustrate that everything has a dual nature (particle/wave, blah blah) and that we tend to find what we are seeking (if you're looking for waves, you find waves etc), so I like it when ppl bring up stuff that I wasn't looking for, bc then I can 'see' it too and add to my perspective and understanding.

On another note, I finally found 'medium' ground beef in the grocery store, and am also making sausage patties! Once I find a recipe, that is. As of this morning I am back to my lowest ever adult weight, 112lbs 😊I've no clue where my weight has to land to get this roll of chub off my midsection already. Guess my body will figure that out for me.

RE: Zero Carb / Meat and Water - suzanneyea - 09-04-2008 09:07 AM

I personally would love for my family to eat an all meat diet and I encourage it. However, I do not believe in forcing my child or husband to a certain diet. My husband is a grown man and can make his own choices, as for my son, I speak to him about nutrition and serve a most meat diet, but he has to feel like he has some control over his food. The best I can do is lead by example.

There are so many differences between what the native populations ate and today's food sources. Who's to say what is optimal? Healthiest? Is grass fed better? Maybe, maybe not.

Who really knows what they ate before modern agriculture came to the fore? How healthy they really were. One can make very good educated analyses. Doesn't mean they are 100% correct. Doesn't mean they are optimal.

Do I believe refined carbs contributed to the diseases of civilization? Absolutely. But even Taubes called for more studies regarding carbohydrates.

Do I believe that all products of civilization are necessary? No.

All I can do is keep an open mind and not shut off the possibility there are some food sources that may be more optimal than others and that possibly some supplementation may improve health.

Charles Wrote:
You're welcome, Robin!

MAC, I tried it, but it just tasted like fat to me. I didn't get the frosting bit, but oh well.

This is SO interesting to me. I am curious about the "adrenaline flashes" described. Late last year, I started having "anxiety attacks" shortly after dinner...about 20 minutes into dinner actually, almost every night. My doctor gave me xanax and put me on paxil. I REALLY thought it was related more to my diet than any stress I was under, especially because of when it typically happened.

Yesterday, I mentioned to my doc that I had gained 15 lbs in the last year. I thought it was due to quitting smoking (yay for me). My diet didn't change when I quit. I was on a weighed and measured food plan and as a food addict, I didn't change it at all when I quit smoking. So, not sure how I gained the weight.
I am wondering if the high amounts of carbs in that food plan led to the "anxiety attacks" and weight gain. I am very curious about any more info on this meat/water thing.

Thanks all.
carrie

The nicotine in cigarettes metabolically supresses weight gain. When you quit you gain weight. Your diet can remain the same and you will most likely gain weight when you quit. This is something teenage girls now do to lose weight - start smoking.

Glucophage or metformin is meant to increase your sensitivity to insulin as I assume your doctor
believes you are insulin resistant. Also, given for those women with PCOS for other reasons. Given your age I doubt it is for PCOS.

I don't think he posts anywhere anymore, but he did invite anybody to email him from his web site.

**RE: Zero Carb / Meat and Water - MAC - 09-04-2008 10:34 AM**

Too bad he doesn't post anymore. Having seen the thread where he said why I can understand. Is he aware of how often he is still quoted? He still has a huge influence in spite of no longer posting.

**RE: Zero Carb / Meat and Water - suzanneyea - 09-04-2008 10:35 AM**

Carrie,
I used to have huge problem with stress and anxiety when I was on a low calorie and low fat diet. I barely have any anxiety since I started Atkins, I take no medications, just a healthy diet and moderat excercise.

**RE: Zero Carb / Meat and Water - daveo - 09-04-2008 10:36 AM**
Update: I am wearing a shirt today that 3 weeks ago fit like a wetsuit 😊

I continue to be amazed at how much easier it is to eat this way than it was to eat an Atkins type diet. The difference is all in the cravings. I have none eating this way, but back when I was eating veggies and low carb tortillas, I always wanted other carby stuff.

By the way, I am drinking coffee which luckily isn't giving me issues so far, and after reading about Steffanson's later life diet, I have also reintroduced some red wine. It hasn't given me cravings, but I am not feeling as sharp and wanting to exercise on mornings after I have some. I'll try keeping it to one glass at dinner and see how that goes, otherwise I'll just cut it back to a night a week or something. If I have to eliminate the wine I'll live 😞

Hmmmm....what I really wondered was, what can I expect if I go VLC and continue with the glucophage. I'm so confused. Honestly, I just want to lose the rest of my weight without going insane. I've always intuitively known that LC was the best way for me. I had never considered the VLC I am reading about here, but am now very curious.

Thanks

RE: Zero Carb / Meat and Water - paleobabe - 09-04-2008 10:55 AM

As intelligent human beings, it is vital that we remain open to incoming information, yet always critical in our thinking.

Quote:
Critical thinking is...

1. Using logic, reason and the scientific method over abstract theories and emotional judgements.

2. Awareness of heuristics (shortcuts) and biases (errors) that influence human thinking.

3. Using these abilities systematically on everything in your life. From that, using the results to make improvements.

The third point there is perhaps the most important. Actually using the skills of critical thinking allows you to question your habits, goals, beliefs, relationships and methods. From that questioning you can make calculated improvements.

Given our cultural context, eliminating all vegetable matter is an extreme adaptation and requires careful investigation and ongoing evaluation. To that end, this forum has been a very useful source of links to studies, anecdotal observations, analyses etc.

I personally doubt that an all-meat diet is truly the optimal diet for all humans under all conditions,
although I am curious about the effects of VLC/zero carb on my own body. However, removing all phytonutrients from my two-and-half-year-old son's diet is a bigger risk than I'm willing to take.

RE: Zero Carb / Meat and Water - travis t - 09-04-2008 11:33 AM

Paleobabe wrote "However, removing all phytonutrients from my two-and-half-year-old son's diet is a bigger risk than I'm willing to take."

thats why i wrote "To me the ultimate test of how our rubber meets the road is how we feed our children"

What we do feed our girls is high fat beef, dark chicken meat, butter, fruits, whole milk, white rice (they are all three Chinese after all). Where we concentrated on first was getting rid of pure junk sugars, wheat, soy, and grain fibers. Trying to stick with real foods for them and we will see where this leads.

tavis t
p.s. i have myself been less than 20 grams of carbs for the most of three months and i still feel awesome.

paleobabe Wrote:
Given our cultural context, eliminating all vegetable matter is an extreme adaptation and requires careful investigation and ongoing evaluation. To that end, this forum has been a very useful source of links to studies, anecdotal observations, analyses etc.

It may appear extreme, but if one takes a step back, or several steps back, from what we have been brought up to think of as "normal", it is not necessarily so extreme. For example, I was brought up to think that eating bread and potatoes was both normal and essential. But I've now been bread-free for nearly a year and it now seems perfectly normal; and we know that plenty of people simply cannot tolerate wheat, so how could it be an essential? Similarly, potatoes were unknown in my country until "Nutty Wall" (cf. Bob Newhart) brought them back across the ocean, and even then, people didn't like them much at first.

My main lingering doubt is based in the feeling that the cattle from which we get most of our red meat probably bears little relationship to the animals that our evolutionary ancestors were eating. Sure we may be carnivores, but what sort of "carne" did we actually evolve to eat?

On the other hand, the idea that red meat is a complete food in and of itself is a very tantalising, liberating one (if true, that is). Not even the most faithful vegan or vegetarian could make that claim of any single veg or fruit. In fact to eat a "complete" veg+fruit diet is quite a complex issue. There is always something else you seem to have to add. This or that is always a good source of something or other....where do you stop?

**The Bear:** I have now completely read the "short" version of the thread that Mac posted, and am well into the "long" version. He's an impressive character all right. I note that in some ways, he is less of a purist than Charles, e.g. he eats eggs, cream and some cheese, and even his own home-made ice-cream, complete with sweeteners. The most surprising thing was the protein drink, albeit home-made.

Most interesting is that he says he never gets hungry, and says that one should not get hungry once completely keto-adapted. (I presume that I am not fully keto-adapted then, since I get very hungry, as already discussed). I guess he would simply say that my carbs are not yet low enough, which may well be the case.

Regards,
Mike

Hey travis, please don't take my "fool" statement wrong. I am not calling people fools for not believing an all meat diet provides us with all the nutrition we need. I am calling BeeDub a fool for vehemently arguing about how we (meat eaters) can not get enough vitamin D from our diet. There simply is no proof of this anywhere.

Couldn't we agree to disagree, without calling anyone here a "fool"?

I certainly have some doubts about getting literally everything we need from an all meat diet; while I'm still eating VLC, I am going to try all meat before the year is up, but I will still take supplements, for my peace of mind, if nothing else.

RE: Zero Carb / Meat and Water - deedum - 09-04-2008 01:06 PM

Quote:
Enough condescension, Charles. You don't need to "cover ground." Just give me ONE citation showing carbs block D3 absorbtion. ONE citation proving meat is all we need. Two PubMed links, you're done.

I think what charles is getting at is it is very safe to assume that D3 deficiency is caused by refined carbohydrates because the hunter gatherers did not have any deficiencies and they did not consume refined carbs. Charles cites beri beri, scurvy, etc. because they are from nutritional deficiencies. Heart disease, cancer, T2 diabetes can also be from nutritional deficiencies (D3). Why would a deficiency is D3 be any different from any other vitamin deficiency.

There do not need to be any studies that prove D3 deficiency is caused by refined carbs to safely assume that it is true. Because, hunter gatherers provide plenty of unambiguous evidence. Especially the Inuit, they ate very little of any carbs, got very little of any sunlight and had no nutritional deficiencies as evidenced by having no diseases of civilization.

I've said this I don't know how many times, that zero-carb is my own experience and I don't get any brownie points for someone choosing to eat zero-carb, take supplements, or whatever. However, I do take exception to people suggesting that perhaps I'm somehow lacking something because I don't take an unproven supplement.

Even the "experts" are nowadays advising people not to take multivitamins because they may cause more harm than good, especially as it relates to the prostate.

Other experts advise us to take Vitamin D:

Quote:
The combined use of calcium and vitamin D supplementation helps protect postmenopausal women's bone health.

However, we know that there are populations such as the Inuit, where an examination of their diet reveals that they don't eat the recommended allowance of these nutrients daily, yet they don't suffer from bone diseases or calcium deficiencies. If they don't show a deficiency in their skeletal remains then it's quite clear there was no deficiency.

When we begin the book discussion, you'll quickly see (if you haven't already) that the nutritionists made these same arguments in the 1920s when Stefansson and Anderson undertook the all-meat trial at Bellevue.

Stefansson in Not by Bread Alone Wrote:
Every aspect of the results would be studied, but special attention would be paid to certain common views, such as that scurvy will result from the absence of vegetable elements, that other deficiency diseases may be produced, that the effect on the circulatory system and on the kidneys will be bad, that certain harmful microorganisms will flourish in the intestinal tract, and that there will be insufficient minerals, in particular calcium.

Is this not vitamin D?

Everyone wants to talk about a primitive diet, but Stefansson and Anderson ate meat from butcher shops in New York City during the Bellevue experiment and the results were exactly similar as they were when they were in the Arctic.

Stefansson from Not by Bread Alone Wrote:
In the Arctic and in New York we were fond of eating skin. I always eat bacon rind. I am fond of pickled pig's feet, mainly, I think, because I like the skin and the tendons, for there is not much else to pig's feet, except fat. If there is any part of a fried chicken that tastes better to a meat devotee than the chewable bones, then it is the skin. The like applies
to all birds unless one has been on the verge of fat-overeating, in which case the fat attached to the skin may repel him.

Sure, their meats had more fat on them, but we've learned how to fix that! 😁 We just posted information last week about how Stefansson's wife prepared meat locally to feed her husband who regained his health. This wasn't some ancient primitive diet.

The "experts" make the following claims:

Quote:
The panel did manage to make the following recommendations:

-- The combined use of calcium and vitamin D supplementation helps protect postmenopausal women's bone health.

-- Anti-oxidants and zinc should be considered for use by non-smoking adults with early-stage, age-related macular degeneration.

-- Women of childbearing age should take daily foliate to prevent neural tube defects in infants.

-- There is evidence that smokers should avoid taking beta carotene supplements regularly as there is a raised risk of lung cancer.

Bone deficiencies, age-related degeneration, neural tube defects and lung cancer are all diseases of civilization. The undeniable fact is that **people that do not eat carbohydrates (or even excessive carbohydrates) do not get these diseases, plain and simple.**

I can't tell you any of you what to do and I'm sure the overwhelming majority of you understand this as evidenced by your posts. Personally, I don't find the arguments for supplementation to be compelling. In fact, I find the opposite; that they can be dangerous because there is no evidence as to what the body does with too many minerals.

Everyone talks about well, what if we don't have enough nutrients. Another good question is what happens when we over-mineralize ourselves?

Quote:
There is a high health risk associated with consuming too much vitamin D. Vitamin D toxicity can cause nausea, vomiting, poor appetite, constipation, weakness, and weight loss. It can also raise blood levels of calcium, causing mental status changes such as confusion. High blood levels of calcium also can cause heart rhythm abnormalities. Calcinosis, the deposition of calcium and phosphate in soft tissues like the kidney can be caused by vitamin D toxicity.

Consuming too much vitamin D through diet alone is not likely unless you routinely consume large amounts of cod liver oil. **It is much more likely to occur from high intakes of vitamin D in supplements.** The Food and Nutrition Board of the Institute of Medicine considers an intake of 1,000 IU for infants up to 12 months of age and 2,000 IU for children, adults, pregnant, and lactating women to be the tolerable upper intake level. Daily intake above this level increases the risk of adverse health effects and is not advised.

By the way, what is the **function of vitamin D** in the first place:

Quote:
The major biologic function of vitamin D is to maintain normal blood levels of calcium and phosphorus. Vitamin D aids in the absorption of calcium, helping to form and maintain strong bones. It promotes bone mineralization in concert with a number of other vitamins, minerals, and hormones. Without vitamin D, bones can become thin, brittle, soft, or misshapen. Vitamin D prevents rickets in children and osteomalacia in adults -- skeletal diseases that result in defects that weaken bones.

So if we don't consume dairy products, eat fish or stay out in the sun excessively, then we can look forward to bone deterioration?

So if the Native American of the Great Plain (before the settlers came), the Inuit that Stefansson mentioned who never ate fish, or the other meat-eaters of the sub-Sahara who Dr. Price mentioned never ate fish or cod liver oil didn't have bone deficiencies, what then?

Stefansson from Not by Bread Alone Wrote:
Thus calcium deficiency is as absent from those meat-eaters who practically never eat bones as from those who eat them nearly every day of their lives.

I can confidently say for myself that I am not concerned with bone deficiency now or in my lifetime, nor the lifetime of my children who also eat a zero-carb diet for the most part. I don't have to force them, they voluntarily choose it 95% of the time.

As Taubes wrote on 322, citing Harris, Abrams, Davidson and Passmore:

Taubes Wrote:
Meat contains twelve of the thirteen essential vitamins in large quantities. Meat is a particularly concentrated source of vitamins A, E, and the entire complex of B vitamins. Vitamins D and B12 are only found in animals products (although we can usually get sufficient vitamin D from sunlight on our skin).

This is all it takes for me. Of course, everyone is free to make their own choices and decisions as always!

Regards,

Charles

Charles, you're a great moderator, but you go too far when you tell people to ignore the advice of expert MDs like Drs. Eades and Davis.

Charles is expressing his opinion. He or anyone else can have their opinion. Charles can say eat only onions for the rest of your life for all I care, it still is his opinion and does not change what I chose to put in my mouth. If you want totake Vitamin D, take it. It is not like Charles is going to hop on a plane and physically stop you.
Amen to that! I value what Charles offers and dislike the negativity too. Thanks for saying it.

RE: starting meat and eggs today - BIKINIBOUNDINTX - 09-04-2008 01:50 PM

I'm not sure what the correct amount is for FAT, but fat is your fuel and replaces your carbs for energy. Check out the [http://www.fitday.com](http://www.fitday.com) that many peeps on LLVLC use. It's a great tool for weight loss. Many of us here also use coconut oil. Are you using that yet? Some even add it to their coffee in the morning. Is your hamburger the fatty 73/27 kind?? You can get that at Walmart in the plastic rolls. Also, make sure you are eating enough calories... eat until full. Happy Low Carbin'!!!

RE: Zero Carb / Meat and Water - Charles - 09-04-2008 01:55 PM

BeeDub Wrote:
I've read Taubes. Where does he say meat has every nutrient you need? (Says EXACTLY that?) And where does he say that if you eat carbs you can't absorb Vitamin D? (Says EXACTLY that?) I don't recall anything like that. Page numbers, please?

Page 322. Check the bibliography for the proof text.

He doesn't say that one can't absorb vitamin D, with carbs, but he cites plenty of examples of populations who did not eat dairy products yet showed no vitamin D deficiency. At the same time, those people who eat Westernized diets (read: high-carb) are routinely found to be deficient in vitamin D especially as they age.

On 323, Taubes cites the Bellevue experiment where one of the chief arguments against it were that Stefansson and Anderson would experience bone loss due to lack of calcium. No calcium deficiency was found. Nine articles were published in 1930 on this study.

I don't eat dairy products and I'll put my bones up against anyone's, at any time!

I'm not telling you not to take your precious supplements (as if I could) but don't tell me that anyone else needs to take them, with all due respect to Dr. Eades and anyone else you mentioned.

Regards,
Charles

RE: starting meat and eggs today - Charles - 09-04-2008 02:08 PM

Doesn't look like much food, but if you're full, then it's fine. The drumsticks and the sausage patty can be problematic. Who knows what goes into most sausages these days so I'm leery of them. Some ground beef in place of that might be better. The drumsticks can be lean so I would tend towards two chicken thighs with the skin instead. Other than that, it looks good.

More than fitday, it's about eating to appetite and closely following your hunger. Eat only when you're hungry and don't eat when you're not. This might sound easy, but it can be difficult to put into practice. For some, it will mean not eating very much. For others, it will mean eating more than they think they should. Some may eat only once a day while others may eat three or four times. It all depends on you.
The markers for success are lasting 6 hours without hunger between your meals, sleeping through the night (not waking up hungry), a positive outlook on life, and good energy (after the first week or two). The energy part is where you know how much fat you need.

Eating fat is like bordering between slight nausea with tons of energy and lean meat with lethargia. You want to stay on the side of the former. I'm not saying you should get nauseous, but it's good to be close. If you feel that way during a meal, then eat more lean and a little less fat.

Our bodies were designed to tell us these things. Carbohydrates jam the communications. Do this and all should be well!

Regards,
Charles

RE: Zero Carb / Meat and Water - cbnebraska - 09-04-2008 02:16 PM

Is there a way someone would know they were deficient in vitamin D? A yearly bone density test perhaps?

I have female friends who are under 40, don't smoke, do all the dairy products that are recommended, exercise moderately, take multivitamins, but follow the low fat dogma and stay away from "fatty" meat..... and they've already been diagnosed (via x-rays or bone density tests) with signs of osteoporosis! What else can they do? Start on meds this early? Something has got to be wrong with the recommendations! I still fall back on my favorite saying from Dr. Phil "So.......how's that workin' for ya?" Obviously, it's not.

I'm like Charles, I'll stick with what I'm doing until I've got some reason not to, because what I'm doing IS working for me. "The studies" of the established medical community don't impress me because there are just too many variables that make them useless to me in my particular situation. I am my own test subject, come what may.

As far as my kids, I feed them very low carb at home, but they still consume carbs at other places, in situations beyond my control and for that reason I don't yank ALL their carbs at home. They are not ketoadapted, so I just don't see how I can make it work for them. I don't know if their bodies can take the swing from a high carb meal at school to no carbs for two at home. They are old enough to rebel against taking a no/low carb sack lunch everyday and old enough to look around and see what everyone else is eating. They are NOT old enough to see the big picture as to how they will benefit their health in the end. So, I allow them school lunch and treats outside the home and feed them as low carb as I can get by with at home. We set a good example and teach them why we do what we do. Our hope is that when they ARE old enough to choose, they will choose as we did.

Charles,

I see many posts on LLVLC that say to eat only when hungry. Many of us here have a very small appetite while eating low carb OR maybe cannot distinguish between being hungry or not for whatever reason. I've always thought that it's important to supply our bodies with nutrients at least 3 times a day... especially breakfast. I've heard that Dr Oz said in his book - that when your body has not eaten in 12+ hrs. it goes into Starvation Mode. Is this true?

Thanks for your input! 😊

Yes. There are blood tests for this. You want to measure Vitamine D, 25OH. Below I think a level of 30 indicates deficiency.

Oooh, one of my faves - the folate recommendation! Grains interfere with folate absorption, big time. Big connection with celiac/gs as well. I have two genes for celiac/gs, one from each parent. My mum had two children with neural tube defects (and she supplemented folate with every pregnancy). Many food allergy docs recommend that any woman who has had a child with neural tube defects gets tested for celiac/gs, because she was not absorbing enough folate from her diet.

Side note: the earliest skeletal evidence of spina bifida/neural tube closure failure dates between 10-12,000 years ago and was found in Morocco. What else happened between 10-12,000 years ago in and around that general region? (though I'm sure it can happen for other reasons, ie famine/shortages)

I got this from Good Calories Bad Calories.

I did work with one person who gave up a two pack a day habit and he gained weight the first two months after giving them up.

RE: Zero Carb / Meat and Water - Charles - 09-04-2008 02:30 PM

Cynthia, that is very sage parenting. We parents all understand that at some point our children are going to have to choose to be healthy on their own. If we knew better when they were infants, perhaps we could have chosen different paths for them.

Everyone eats zero-carb at home, but school lunch has always been a problem.

I still take comfort in the fact that my 16-year old, who does eat more carbs outside the house than anyone else (he'd die if he thought I knew), still eats a very low number of carbohydrates in comparison to what I ate as a child. The magic number is 70 pounds per year and I'm sure he's well under that figure.

I'm pleased to report that my younger two have fallen into my zero-carb trap very well. I don't particularly approve of their food (it has higher sodium and nitrates), but I don't have any pemmican for them. Therefore, I use summer sausage and a pepperoni roll. I cut exactly four pieces of each and I give them a cheese stick for lunch. Their ages are 12 and 11 and they are in middle school (sixth and seventh grade).
They eat this modest snack for lunch and they informed me that they are able to last from 11:00 a.m. until 7:00 p.m. when they eat dinner without feeling hungry. They tell me that if they eat nuts or fruit for lunch, they are usually hungry within two hours.

I was afraid they didn't get enough food in their lunch, but James Sidbury's studies showed me that children really don't need very much food as long as it's nutrient-dense.

Until I can make my own pemmican, this is it for now. After two weeks of school, they have come to prefer the meat. The first couple of days they took lunchmeat (smoked turkey and ham) on a low-carb wrap, along with the meat and cheese I described. However, they stopped taking the lunch meat sandwich on Day 2 because it was too much food. Now, they just eat the meat and cheese.

I'm stoked!

Charles

I agree that it was in GCBC, but what it leaves out is the diet that ex-smokers consumed. Taubes brought out that those ex-smokers had a marked preference for carbohydrates after they stopped. While smoking, the nicotine allowed them to mobilize more fatty acids which was why Taubes referred to nicotine as the ideal weight-loss drug.

For me, it clearly left open the clear possibility that beginning a very low or zero-carb diet upon quitting would suppress weight gain and not slow the metabolism the way carbohydrates do. It seems our not-so-
"waywardsister" is proof of the notion, albeit anecdotal. 😐

RE: Zero Carb / Meat and Water - **montmorency** - 09-04-2008 02:47 PM

Vitamin D: One of the problems with vitamin D supplements is that if they contain synthesised vitamin D, then they may be toxic. I believe that toxicity from all natural sources has not been demonstrated. (Check out the Weston A Price and/or Barry Groves' second-opinions sites for more, much more in this area).

This is all right as far as it goes. However, thanks to a letter from a reader, the Weston A Price people alerted us to the fact that the Seven Seas brand of cod-liver-oil which is marketed in the UK, includes synthesised vitamins A and D, and does not mention the fact that they are synthesised on the labelling! This reader had contacted Seven Seas, and I did the same, and eventually had a letter back confirming this. They say that the natural A and D is removed in the purification process and has to be put back, and of course it's synthesised stuff that goes back.
I did find another brand (Nordic Naturals Arctic Cod Liver Oil) which claims to have only all natural Vitamins A & D in it. However, it also has alpha-tocopherol Vitamin E derived from Soy, as a stabiliser ... this set alarm bells ringing for me. I emailed the Weston A Price people, who said it was probably ok, but even so, it just goes to show that with supplements "all natural" may not be quite all that it seems.

This was before I had discovered the concept of an all meat and water diet, and the simple but revolutionary principle that meat, just meat, may be a complete food without _any_ need for supplements.
I am certainly not glugging the cod-liver-oil down at the moment. It's possible I might do so in the winter though. I realise that's not 100% logical thinking, but there we are; "lingering doubts", I guess.

cnebraska: (oops, almost forgot this): you said "Is there a way someone would know they were deficient in vitamin D? A yearly bone density test perhaps?"

If you look on this site (sorry don't have the exact reference...try the search), I am sure they talk about just such a test: http://www.westonaprice.org/

Carlson's Cod Liver Oil is supposed to be a good brand. Comes from Norway. It is the EPA & DHA that is of value (omega-3s).

Carlson also makes Vitamin D3 oil capsules. D2 is worthless which is what they use to fortify milk. It is impossible to know your level of D3 without testing.

If I had high calcium scores on an EBT heart scan, I may be very willing to take D3 supplements. Once you have the diseases of civilization due to a poor diet, supplementation could be a useful tool in controlling or stabilizing heart disease. At least that is what Dr. Davis has found in his research. Which is why I don't dismiss supplementation out of hand.

Yep. Dr. Davis sees calcium(plaque) in arteries decreased or at least halted with D3 supplementation. He
is pretty cutting edge with this to the best of my knowledge. But this is a case of the damage already being done by bad diet and if D3 supplementation improves calcification in arteries am I going to drag out Taubes and say there is no vitamin deficiency on an all meat diet so you shouldn't supplement with D3? I don't think so.

RE: Zero Carb / Meat and Water - sean - 09-04-2008 04:04 PM

[BeeDub] Deedumb, give it a rest. "Just give me one..." Charles doesn't have to give you a damn thing. This reminds me of why the BEAR closed shop on what was probably the most informative forum I have ever seen. Fools come out of the woodwork, to insecure to try something that goes against their indoctrination and suddenly they are demanding proof proof proof form a guy that is only offering advice and discussing the way he does things PERIOD.

He is answering millions of questions and helping even more people. He is taking his time and effort to help others FREE OF CHARGE. Naturally a know it all comes along, more than likely with a masters degree in self esteem and becomes even too much for the most gracious host.

Forget your test tubes and read up on the Inuit, Comanche, Aborigines (australia), Guachos of Argentina, Mongols etc etc etc.

Charles is too nice of a guy to deliver any heavy blows, but I can assure you when this nonsense started on Bear's forum each and every time his rebuttal put the fool through the ropes until he just got sick of wasting his time.

If you're concerned about deficiencies go to a nice vegan forum and talk to guys like David Wolfe about eating fireants as he now needs to "respect his bodies needs for B-12." Serious quote I swear....

If you think Charles is wrong then go elsewhere, why even read this ???? I dont see Charles and MAC on other forums lecturing people, demanding proof. Nobody cares. Clearly most people are finding much success with this lifestyle. If you don't tough break, start marketing some Vit D and everyone on this forum will be a customer of yours as we will all be rotting away form deficiencies.

I have no issues with Beedub asking for proof only because as GBGC points out there has been so much bad science with respect to nutrition that it behooves all of us to ask for proof as much as that can be ascertained. He may have done it in a better fashion than he did but I don't begrudge him for asking for proof.

RE: Zero Carb / Meat and Water - sean - 09-04-2008 04:17 PM

MAC,

I used to take Carlsons but was told it is also synthetic due to shipping laws in this country. Dr. Ron Schmid (I'm not a big fan) claims his has the only pure kind on the market. Anyway I was on his for awhile and my inflammation issues became worse and worse. At one point my face looked like I spent some time at the equator with a pair of shades on.

Schmid had no answers other than to keep buying more bottles of his COd liver oil. Once I stopped all supplementation the inflammation gradually subsided. I am a huge fan of Weston Price info, so it was tough to quit the Cod liver oil, but after reading Ray Peat's article on the dog experiment where the cancer rate went from 5% to 100% due to the use of fish oil, it explained (at least in my mind) exactly why I was getting worse, not better on Vit D supplementation.

I really have no idea about this stuff, just offering some real life experience as to what happened to me when I got on the bandwagon of Omega this or that, more and more cod liver oil.

As a matter of fact I saw an exchange online between Mary Enig and I think Peat (I forget) about the Price foundations stance on Cod Liver oil and I've never seen an instance OTHER than this one where Enig was outmatched. Google it and see, interesting stuff.

RE: Zero Carb / Meat and Water - MAC - 09-04-2008 04:29 PM

Sean Wrote:

Geez. Is nothing safe? You can't even eat fish these days to get the benefits of fish oil due to the mercury.

If you had your issues then you had your issues. Dr. Davis is big on fish oil & D3 these days but then his patients have heart disease so maybe it is a trade-off in that case.

I keep seeing this Peat guy mentioned lately a lot. Thanks for the lead I'll have to go dig it up.
MAC Wrote:

I don't think so.

No, I guess dragging out Taubes isn't the best approach always, although it's big enough to hit some of the more obtuse ones :-)

Just finding my way around his site ... I think I see what you mean about EPA/DPA ... under the "Fish Oils" (not cod liver oil, but I presume it's similar...?) heading on his site, it only talks about EPA/DPA and not vitamin D (or A). Vitamin D is dealt with under other headings. Just looking at my bottle of Nordic Naturals, I guess I see why: the dosage of vitamin D is pretty low, whereas he is talking about much higher doses isn't he?

Looking elsewhere, he seems pretty "sound" on low-carb, but then (looking at random) what do I find: "Most people with some level of common sense and health awareness no longer use butter or whole milk..." woah! OK, so we know milk has carbs, but we aren't worried about the "whole"-ness of it, and he doesn't like butter ... so is he just a conventional "saturated fat is bad"-type guy after all? hm...

Regards,
Mike

Montmorency Wrote:
Looking elsewhere, he seems pretty "sound" on low-carb, but then (looking at random) what do I find: "Most people with some level of common sense and health awareness no longer use butter or whole milk..." woah! OK, so we know milk has carbs, but we aren't worried about the "whole"-ness of it, and he doesn't like butter ... so is he just a conventional "saturated fat is bad"-type guy after all? hm...

Dr. Davis is coming around to low carb. It is taking him awhile to get there. He is anti wheat. He really is a non-conventionally thinking/acting cardiologist.

Dr. Davis is about everything and anything that works to stop/reverse heart disease. He is a HUGE believer in D3 as it has reduced/stopped calcification of arteries. He can prescribe as much as 10,000 IU/day if necessary to get D3 levels optimized to 60/70 ng/dl. He is a HUGE proponent of fish oil for the EPA/DHA. You really have to become a member of his Track your Plaque site (of which I am not a paying member) to get all his reasons and research. He is a HUGE believer in EBT Heart Scans to assess your risk levels for heart disease.
Kathy....Hi! I have heard about the coconut oil, but must admit i don't know what to use it in or how much to use or what the benefits of it are. If you don't mind, please let me know😊!

Charles....Thanks for the info! I will definitely start using the chicken thigh instead of the drumstick, and is the chicken wing ok too? (That's my fav!). The sausage patties did have corn syrup in them! I will not be eating that again. Eating the hamburger for breakfast instead sounds like a great idea!

nyteez....I used to eat 5 small meals a day too, and it was a pain in the but! lol.

suzanne....Hi there! I did not find myself hungry today. Actually i was quiet full! But i had been counting my calories and trying to stay around 1200 calories. I guess my body is used to that now. I will take all the advice and eat untill i am full and only eat when i am hungry. I still log everything i eat on sparkpeople. Just to keep an eye on things. Today i was at about 1300 calories, and 5 carbs. Today was a good day though, not hungry at all. I will post again tomorrow...have a great evening!

Pamela

RE: Zero Carb / Meat and Water - nyteez - 09-04-2008 05:06 PM

If Dr. Davis is about everything and anything that works to stop/reverse heart disease, then why is he just now coming around to low carb? There are many more studies linking carbohydrates and insulin to heart disease, than there are studies of vitamin D reducing or stopping calcification of arteries.

Even though he may be prescribing a vitamin instead of a drug, he is still just treating a symptom and ignoring the cause of the problem. Unlike Atkins who made his patients change their diet first then suggested vitamin therapy.

RE: Zero Carb / Meat and Water - Daryl - 09-04-2008 05:20 PM

Davis is a forward thinking doctor that is far more open to new ideas than a majority of the medical field. He isn't "just now" coming around to low carb, but he is more recently opening up to the idea that sat fats aren't the boogeyman they've been made out to be.

RE: Zero Carb / Meat and Water - MAC - 09-04-2008 05:52 PM

Daryl Wrote:

Yep you are right about Dr. Davis and his change about opening up on saturated fat Daryl.

Nyteez you have a good point about heart disease and low carb and insulin. Other than the claims about reversal of heart disease by Dr. Ornish there isn't to my knowledge been any studies about low carb and reversing heart disease. It has been pretty much focused on losing the weight as a means of reducing the risks factors. Dr. Davis like a lot of the medical establishment was heavily influenced by the saturated fat is bad low fat is good bunk. Correct me if I am misstating things about Dr. Davis Daryl. This is all from memory.
What you said sounds about right, Mac.

There have been some good studies done on starvation mode. One was the Minnesota semistarvation study 1950 and another in Cambridge. Both found that starvation mode means eating less than 50% of what the body requires.

They found that the metabolic rates DO LOWER but the subjects continued to lose fat. Women shut down harder and faster. When they cut to 50% of BMR then the metabolic rate dropped 10%, but that still was a 40% deficit. Recommend not going below BMR for GOAL WEIGHT.

Also, it doesn't matter if the change is from eating less or exerting/exercising more.

If a person has fat to lose, they will lose it. Starvation mode will decrease lean tissue from someone who doesn't have the fat to burn.

Anorexia nervosa occurs when someone eats much less than they need for BMR. They continue to lose weight but not as efficiently as when they were heavier. I know. When I was 18-20yrs old I was eating <500 cal day and exercising for hours daily. I had anorexia nervosa before anyone was diagnosing it. It is deadly for your health. The deficiency affects you mentally.

To me, that is the real danger of long-term starvation mode. Your body pays the price big time. But, a day or two won't hurt you.

Mona

Didn't many of Atkins patients avoid bypass surgery by following his diet? Wouldn't that be considered reversing heart disease?

With all due respect to Dr. Oz, I don't think that this can be said so generally. It is axiomatic that when we reduce intake, we reduce energy expenditure and vice versa. At the same time, all living organisms have a long-term fuel supply and we're no different. We store fat during the day and we live off the stored fat during the sleeping hours. There are times during the day when we should also be running off of that stored fat but for many of us, this doesn't happen due to hyperinsulinemia. Because of this, we are compelled to eat more often which is called by experts as the "diurnal drive to fatten."

Hunger has been outlawed by most of the "experts" and it's something that they want you to simultaneously ignore and also listen to. The metabolism slows when we ignore hunger, not when we merely live off our long term fuel supply.

This is why it is so difficult to only eat when hungry because insulin will cause a person to want to eat at
times when they should be living off of their own fat. Because of this, it is absolutely necessary that insulin be controlled. This is the secret to the low-carb diet. It's not the number of carbs that we eat; rather, it is the way we control our insulin responses in anticipation of and in response to the food we eat.

Therefore, always eat when hungry. If you're not hungry, that's a sign that your insulin is being controlled and you are in no danger of slowing your metabolism or going into starvation mode. Believe me, after 75 pounds, I am much more active than I was at 221.

Regards,

Charles

That is probably very true. My limited understanding of reversing heart disease falls along the lines of say having a 90% blockage in a coronary artery and say having it regress to 70% and thus improving blood flow. I asked Jimmy one time to ask Dr. Volek if he had any intention of doing research into reversing heart disease and he had no intentions. I for one would really like to see this kind of research.

---

RE: starting meat and eggs today - MAC - 09-04-2008 06:24 PM

Here's an interesting viewpoint on the 12 hour thing. Depends on your point of view it seems as to what technically is 'starvation' and the composition of your diet.

http://en.allexperts.com/q/Nutrition-Dieting-939/Meal-planning-starvation-mode.htm

"In human body, starvation mode, speaking biochemically, doesn't occur sooner than 72 hours of a complete water fast. However, the doctor can be right though for a different reason. The matter is, when using carbohydrates for fuel, one is getting hungry every three to four hours or so. This happens because when carbs are available with foods, the body prefers to run on them rather than on by-products of fat metabolism, ketones."

RE: Zero Carb / Meat and Water - Charles - 09-04-2008 06:34 PM

Dana Wrote:
he is still just treating a symptom and ignoring the cause of the problem.

I wish I could say things this powerfully and this simply.

People don't want to confront the possiblity that whole wells of research and medicine spring up as a result of mere symptoms. There is no (or very little) cooperation between these specialties so they each go on their own little tangents and spend ever-increasing sums of money to detect more and more symptoms, all the while claiming to look for a cure. Somebody uses a wonder pill to decrease a symptom and all of a sudden it becomes the rage, while ignoring the fact that some folks just don't get
the disease.

It seems that what they really want is credit for finding the cure, not so much doing whatever it takes to find the cure.

We need a Homeland Security for medicine -- an office with enough power to pool research from all the specialties and combine it. Ideally, it would be run by someone in the metabolic syndrome camp, but that would be Gerald Reaven and he can't see the forrest for the trees either. 🙁

I think anyone who has reversed their lipid markers for heart disease -- triglycerides and HDL, all qualify as people in whom heart disease was reversed. After all, these are the only markers that accurately predict the disease. You can't even point to arteriosclerosis because some in the Masai have arteriosclerosis yet they never have strokes nor heart attacks. The same is true in the elderly who don't get Alzheimer's. They all have amyloids but some of them get dementia and some don't. Insulin is the only marker that is common.

Regards,

Charles

I would answer "no", but it *is* stopping heart disease in its tracks.

An aside: it always bugged me that the Atkins diet was/is so roundly criticized as a heart attack waiting to happen, when the man was a cardiologist, and a successful one. I mean, if he wasn't good at what he did, patients would have been keeling over, and the press would have been all over that.

RE: Zero Carb / Meat and Water - KimPossible - 09-04-2008 10:00 PM

Wow. I can only dream of ever catching up with this thread. EEK! Just wanted to check in while I had a minute (avoiding my other duties LOL). I am still low to zero carb and have hovered around the 161 mark for a week or so. I wanted to pop in and say that I have finally ordered GCBC to read for myself and a copy of Slow Burn, b/c I'm ready to define some areas...I intend on kicking it back down to very low carb to break through the 160 barrier to the 50s...I am now where this WOE seems second nature and normal. I was at a function on Sunday, and there was smoked chicken and pork, along with all the other sides that accompany a potluck. I had the meat, and tried a salad with spinach and a few strawberries, as well as string cheese. It felt like a feast to me and someone actually remarked that I was going to starve. Someone I don't really know....which is funny. I'm now immune. LOL

Hope you all are doing well! Keep the lively discussion going! 😊

RE: Zero Carb / Meat and Water - pennypritty1 - 09-04-2008 10:20 PM

Charles Wrote:
Okay, listen. Our Zero-Carb/Meat and Water thread is about to break 100,000 views in the coming days. This is about 80,000 more than the next closest thread on this entire forum. That means the interest is very high concerning this topic.

That's because it's taking some of us forever to catch up so that we don't end up repeating something that's already been discussed. LOL

Hey, peeps. I've been offline for a couple months but good grief!!! So much has been discussed during this time. It's amazing!!!! My head's buzzing with so much that's been discussed, agreed and disagreed upon. I've been more low carb during my time offline but I've not slipped or cheated, thank heavens.

Still trying to catch up but it's 1:14am now and I'm tired. So I'm back here in the AM and back to catching up. I think I'm almost done but now it's all getting blurry so now's the time to stop. I might have to reread some pages as I was glazing over a bit... 😊

RE: starting meat and eggs today - suzanneyea - 09-05-2008 01:52 AM

All I know, is that on low fat and reduced calories I was constantly eating and always hungry. I also was not getting a monthly cycle and the endocrinologist said my body was in starvation mode. Now, I am much thinner than before, have a regular cycle, never hungry and can go long, long periods of time without any hunger.

cbnebraska Wrote:
Is there a way someone would know they were deficient in vitamin D? A yearly bone density test perhaps?

They need the blood test for D3.

Quote:
I have female friends who are under 40, don't smoke, do all the dairy products that are recommended, exercise moderately, take multivitamins, but follow the low fat dogma and stay away from "fatty" meat..... and they've already been diagnosed (via x-rays or bone density tests) with signs of osteoporosis! What else can they do?

Start on meds this early?

They need to know their D3 blood levels asap. D3 is needed to get the bones to absorb calcium. Without adequate D3, calcium can wind up in the arterial walls...a major contributor to vascular disease.

Quote:
Something has got to be wrong with the recommendations!

They are finding that the current recommendations for D (which are essentially just the minimum to prevent rickets) are far too low. In fact, many individuals will have to ingest 10-15 times the recommended DV to get a good blood D3 level.

**Vitamin D and heart disease**

Here's Dr. Davis:

Quote:
Despite the paucity of scientific documentation of this phenomenon, I am continuing to witness extraordinary increases in HDL cholesterol levels with vitamin D supplementation.

At first, I thought it was attributable to other factors. In real life, most people don't modify one factor at a time. They reduce processed carbohydrates/eliminate wheat and cornstarch, lose weight, add or increase omega-3 fatty acids from fish oil, begin niacin, increase exercise and physical activity. All these efforts also impact on HDL.

Among the many things I do, I consult on complex lipid (cholesterol) disorders (complex hyperlipidemias) in my office. A substantial number of these people carry a diagnosis of hypoalpalhipoproteinemia, a mouthful that simply means these people are unable to manufacture much apoprotein A1, the principal protein of HDL cholesterol particles. As a result, people with hypoalpalhipoproteinemia have HDL cholesterol levels in the neighborhood of 20-30 mg/dl--very low. They are also at high risk for heart disease and stroke.

Encourage these people to exercise, attain ideal weight, eliminate wheat and cornstarch: HDL increases 5 mg/dl or so.

Add niacin, HDL increases another 5-10 mg/dl.

Perhaps we're now sitting somewhere around an HDL of 35-40 mg/dl--better, but hardly great.

Add vitamin D to achieve our target serum level . . . HDL jumps to 50, 60, 70, even 90 mg/dl.

The first few times this occurred, I thought it was an error or fluke. But now that I've witnessed this effect many dozens of time, I am convinced that it is real. Just today, I saw a 40-year old man whose starting HDL was 25 mg/dl increase to 87 mg/dl.

Responses like this are supposed to be impossible. Before vitamin D, I had never witnessed increases of this magnitude.
Not all therapies for raising HDL raise the important large (also known as HDL2b) fraction. With lipoprotein analyses, it appears that is principally the large fraction of HDL that rises with vitamin D supplementation.

Why? How?

That I can't tell you. But for those of you struggling with low HDL cholesterol despite your best efforts, vitamin D can make a world of difference.

An interesting corollary: If super-high HDL cholesterol is associated with extreme longevity, as they are with centenarians, does raising HDL to extraordinary levels with vitamin D lead to longer, healthier life, all the way up to age 110 years?

I have some lingering doubts about an all muscle meat diet and it's ability to supply all of my vitamin and mineral needs for the long term.
if i had no doubts about this my children would be on an all meat diet, but as of now they still are not. my wife and i are reducing the amounts of refined carbs in our household and that is as far as i am going to go for now.

To me the ultimate test of how our rubber meets the road is how we feed our children. I would think that there are few here that are doubt free.

travis t

Hey travis, please don't take my "fool" statement wrong. I am not calling people fools for not believing an all meat diet provides us with all the nutrition we need. I am calling BeeDub a fool for vehemently arguing about how we (meat eaters) can not get enough vitamin D from our diet. There simply is no proof of this anywhere.

Are you kidding? Do you really think it isn't known what's in beef?

Here's the National Institute of Health on the subject:

**Sources of Vitamin D**

**Food**

Very few foods in nature contain vitamin D. The flesh of fish (such as salmon, tuna, and mackerel) and fish liver oils are among the best sources [5]. Small amounts of vitamin D are found in beef liver, cheese, and egg yolks. Vitamin D in these foods is primarily in the form of vitamin D3 (cholecalciferol) and its metabolite 25(OH)D3 [19]. Some mushrooms provide vitamin D2 (ergocalciferol) in variable amounts [20-22].

**Fortified foods provide most of the vitamin D in the American diet** [5,22]. For example, almost all of the U.S. milk supply is fortified with 100 IU/cup of vitamin D (25% of the Daily Value or 50% of the AI level for ages 14-50 years). In the 1930s, a milk fortification program was implemented in the United
States to combat rickets, then a major public health problem. This program virtually eliminated the disorder at that time [5,14]. Other dairy products made from milk, such as cheese and ice cream, are generally not fortified. Ready-to-eat breakfast cereals often contain added vitamin D, as do some brands of orange juice, yogurt, and margarine. In the United States, foods allowed to be fortified with vitamin D include cereal flours and related products, milk and products made from milk, and calcium-fortified fruit juices and drinks [22]. Maximum levels of added vitamin D are specified by law.

Beef doesn't even make their list. Beef liver does...with a trivial 15 IU/serving. (Current research indicates that most people will need thousands of IU/day in winter to maintain an adequate blood D level.)

What, more pesky DATA? Quick, Dana -- call me another name! Dock me another rep point!

Bad, bad man with the mean, mean science!

An interesting corollary: If super-high HDL cholesterols are associated with extreme longevity, as they are with centenarians, does raising HDL to extraordinary levels with vitamin D lead to longer, healthier life, all the way up to age 110 years?

Now you've got me curious. Best efforts? Doing what, I wonder? Not low carb, I'm assuming. My HDL is 115. (I wouldn't mind living to be old, as long as I'm healthy old!) The lab re-tested it and my doctor about fell over. I ate mostly low carb for 9 years and am now pretty much no carb, meat, water and coffee only. Wonder where I've been getting my vitamin D? I've never been huge on dairy and I've been told my coffee and all my meat is leaching my bones of their calcium. Occasionally I used to pop an Omega 3 capsule when I didn't feel like we'd eaten salmon in a while, but no other supplements, ever. I'm 40 though, so now it will be interesting to see if it drops due to my inability to get it from the sun at my age (as I just found out)?
How many of you saw a rise in HDL when going VLC or no carb? I'm guessing many of us have high HDL levels? But, it's not just related to losing weight or being thin, cause once again, I've got skinny friends who don't have such a high HDL levels. Once again, I am my own test subject, but I'm thinking I don't need any supplements. I get my blood tested every year as I promised my mom & dad I would do. They were concerned about all my saturated fat intake, so I said I would make them feel better by lipids testing annually. Amazing that no matter the results, everyone still attributes it to "all the exercise" I do. (Generally, a whopping hour a day 5 days a week. Good lord. Just cause I look muscular everyone assumes I am some sort of obsessive exerciser. I do enjoy new challenges and activities, but I've got 2 kids and work, how obsessive can I be?)

From those of you who know, what all should one request for a blood test? The standard lipids, fasting glucose?, D3? My doctor always asks me because I'm making the request and not her, but I've never really known how to respond besides lipids. Are any of the tests mega expensive?

Input appreciated.

Here's Dr. Davis on the importance of getting your D blood level tested:

*There's only one way to individualize your need for vitamin D and thereby determine your dose: Measure a blood level.*

Nobody can gauge your vitamin D need by looking at you, by your skin color, size, or other simple measurement like weight or body fat. A vitamin D blood level needs to be measured specifically—period.

Unfortunately, many people balk at this, claiming either that it's too much bother or that their doctor refused to measure it.

I would rank normalizing steroid hormone-vitamin D as among the most important things you can do for your health. It should never be too much bother. And if your doctor refuses to at least discuss why he/she won’t measure it, then it’s time for a new doctor.

If you’re worried about adding to rising healthcare costs by adding yet another blood test, think of the money saved by sparing you from a future of cancer, heart disease, osteoporosis, diabetes, etc. The cost of a vitamin D blood test is relatively trivial (around $40-50, a fraction of the cost of a one month supply of a drug for diabetes.)

So how much vitamin D should you take? Enough to raise your blood level of 25-hydroxy vitamin D to normal. (We aim for a normal level of 60-70 ng/ml.)

(I'd be willing to bet that, as a Nebraskan, your D blood levels in February are under 20 nanograms/milliliter -- all meat diet or not.)

My HDL went from 29 to 52, triglycerides from 352 to 55, on VLC.

I get quite a bit of tests run, but I have health issues, so my situation isn't "normal"; this is also why I use some of my precious supplements lol.

Glucose, A1c, red and white blood cells, kidney and liver function, and while I do get my lipids checked, I worry less and less about them.

I'd suggest an a wide-ranging checkup, and if all comes back clear, then a simple, yearly test like you're already doing should be fine, I'd think. Add the D3 test if you feel the need.

This is better, Pamela, but a pork chop is also very lean. When I eat such lean meat, I render some pork fat in a pan, dip the meat in the fat, and eat it along with the meat. Monitor how long this meal keeps you full today. If it's less than 5 or 6 hours, then you should consider adding more fat to it.

The same is true with the pork steak. Cook the pork steak in a pan or in the broiler, but make sure to collect the fat that drains in the pan and try to eat it along with the meat or else it will be another lean meal.

**RE: Zero Carb / Meat and Water - montmorency - 09-05-2008 05:55 AM**

Vitamin D: with some misgivings, I emailed The Bear to ask what his take on this was. He replied,
politely enough, but with characteristic bluntness that I should forget about it. Zero-carb works, and the body will make its own vitamin D.

**Arterial Blockage Reversal:** Not even The Bear believes low or zero carb will do this. (I'm going by his public postings; this wasn't in the email).

He says there may be some improvement due to reduction in consequent fat clustering around the plaque, but only at a marginal level. As Kendrick says, the heart can in some cases form new pathways, but Bear says this only happens when you are young, and it seemed to happen in his case, but it still left him with a blockage or two. This only really caused him serious problems in later life when he'd put on a load of muscle and his heart capacity was then not sufficient, which is when he went for the bypass.

Nevertheless, it would be interesting to hear if any people who were suffering angina, probably in middle-life, probably due to a life of mixed-diet/high carbs, then went over to low, very-low, or zero-carbs, and then found relief from the angina. This would imply an improvement in function at least, even if it did not signify reversal per-se.

Regards,

Mike

Sometimes the implication of this statement gets lost in the translation and it comes across as patently unfair to Taubes. We tend to lump the information in Taubes as if it comes from the man himself. Taubes is no doctor; he is a science researcher. He presented information from the top scientists, clinicians, and researchers of the past hundred years. These are Nobel-winning scientists so it should not be so easy to dismiss the research he has presented. Therefore, I rarely quote "Taubes" and prefer to quote the researchers because the work was theirs, not Taubes.

I don't pull "Taubes" out to refute the notion of deficiency disease, I pull out those many populations that simply don't get them despite not consuming these so-called valuable nutrients in their diet. Everyone doesn't eat fish nor dairy yet they don't end up with low calcium and bone disorders. This is more potent to me than any study. It compels us to look deeper.

Regards,

Charles

**RE: Zero Carb / Meat and Water - Charles - 09-05-2008 06:36 AM**

Dr. Davis Wrote:
Despite the paucity of scientific documentation of this phenomenon, I am continuing to witness extraordinary increases in HDL cholesterol levels with vitamin D supplementation.

At first, I thought it was attributable to other factors. In real life, most people don't modify one factor at a time. They reduce processed carbohydrates/eliminate wheat and cornstarch, lose weight, add or increase omega-3 fatty acids from fish oil, begin niacin, increase exercise and physical activity. All these efforts also impact on HDL.

Among the many things I do, I consult on complex lipid (cholesterol) disorders (complex hyperlipidemias) in my office. A substantial number of these people carry a diagnosis of hypoalphalipoproteinemia, a mouthful that simply means these people are unable to manufacture much apoprotein A1, the principal protein of HDL cholesterol particles. As a result, people with hypoalphalipoproteinemia have HDL cholesterol levels in the neighborhood of 20-30 mg/dl--very low. They are also at high risk for heart disease and stroke.

These increases in HDL are commonly seen around here on low-carb and very low-carb diets. I've recently reported on my office receptionist who raised her HDL from 50 to 92 in about six months of eating meat.

Low HDL is a common side effect of a high-carb, low-fat diet. I had the same experience myself. Even in the podcast with Jimmy I talked about my panel with my doctor who thought I was in great health with my low cholesterol and higher triglycerides. My HDL was low and I consumed milk and cheese. When I changed my diet, these numbers reversed. My HDL skyrocketed and my triglycerides plummeted. Those are the only markers that impact heart disease. Why would someone want to ingest tons of vitamin D when they could just eat more saturated fat?

That's the whole point. Sure, Dr. Davis can raise HDL with his methods and that's commendable but he's not accomplishing any more than we are by eating zero-carb. As I've said, if you want to take all this vitamin D, then go right ahead. I counter that it's hardly necessary if one eats a proper diet.

Regards,

Charles

For the umptehnth time I am going to reiterate that Dr. Davis is concerned with heart disease. You already have one of the diseases of civilization if you are being treated by him. He uses D3 to reduce
calcification in the arteries. His patients are already sick not on their way to becoming sick. There is a difference.

RE: Zero Carb / Meat and Water - Charles - 09-05-2008 06:59 AM

cbnebraska Wrote:
Now you've got me curious. Best efforts? Doing what, I wonder? Not low carb, I'm assuming. My HDL is 115. (I wouldn't mind living to be old, as long as I'm healthy old!) The lab re-tested it and my doctor about fell over. I ate mostly low carb for 9 years and am now pretty much no carb, meat, water and coffee only. Wonder where I've been getting my vitamin D?

That's the whole point, right there. You haven't necessarily had it in your diet, yet you have extraordinary HDL. If Dr. Davis normally had people like you walk in his office, I'm sure he would view the situation a little differently.

This is the exact same situation as the Inuit and Masai, yet for you, once you get older, all of a sudden those numbers are supposedly going to magically fall and your bones will deteriorate. Even Dr. Davis reports treating people with low HDL, which is characteristic of a low-fat diet. You can't just examine food to determine whether or not a person is deficient in some nutrient. The bones will tell. You've had yours tested and you're fine. Doctors commonly assume that when a person is standing before them with low vitamin D, that means that they haven't been consuming enough. Why did the person lose their vitamin D in the first place?

Show us someone with high HDL who also has calcium or vitamin D deficiencies and perhaps I'll get interested.

This is a common theme in Stefansson's writings about the "experts". They always sit back and theorize from afar but they seldom have any real experience with objects of their theories. The experts will sit back and say that citrus juice cures scurvy, but they ignore the first-hand testimony from people who have actually tried it in the field.

Eating calcium-poor meat seems like a horror story from afar, but when you eat it exclusively, you find that you don't have any vitamin D deficiency. Yet, there are all these experts who just know that our bones will deteriorate. They don't bring us any evidence of zero-carb people in whom this has occurred, they only bring up high-carb people with low-HDL.

montmorency Wrote:

**Arterial Blockage Reversal:** Not even The Bear believes low or zero carb will do this. (I'm going by his public postings; this wasn't in the email).

He says there may be some improvement due to reduction in consequent fat clustering around the plaque, but only at a marginal level. As Kendrick says, the heart can in some cases form new pathways, but Bear says this only happens when you are young, and it seemed to happen in his case, but it still left him with a blockage or two. This only really caused him serious problems in later life when he'd put on a load of muscle and his heart capacity was then not sufficient, which is when he went for the bypass.

Hard to argue with his logic and it seems he would know, but I always have to wonder about him because he had some very dangerous carbohydrates in his diet and who knows how effective his own diet might have been had he not continued to indulge.

montmorency Wrote:
Vitamin D: with some misgivings, I emailed The Bear to ask what his take on this was. He replied,
politely enough, but with characteristic bluntness that I should forget about it. Zero-carb works, and the
body will make its own vitamin D.

I came to this same conclusion in the shower this morning (where I do my best thinking!). Even if my
levels come out low, what does it matter if I don't have any of the symptoms of deficiency? Our bodies
are intricate organisms that constantly strive for self preservation. If my levels aren't high, then they
must not need to be. My body must be making what it needs.

I googled "symptoms of vitamin d deficiency" and I have not one of those symptoms! I fear more what
my body would do with the extra D I'd stuff down it. Toxicity is a bit scary to me. Once again, I think
my body would do its best to deal with the extra stuff I ingest, but I've tried that with vitamin C and iron
and I end up with canker sores and constipation. I haven't tried too many other things besides fish oil,
which didn't seem to do any harm at least.

I will still do my yearly blood test and will definitely ask for the tests you all recommended, but more
for the "that's interesting" value of it. I would much prefer a bone density test, because that would test
for a symptom, not a marker. I've never had a cavity and my teeth are perfectly straight, so I'm good
there. Same would go for tests for blockages and anything else they can show me from within that are
symptoms rather than gauges or markers. I guess I don't trust snapshot levels of anything at this point.
Once again, mostly for the "that's cool" value of it because everything always comes back so stellar.

Thanks for you help with the blood test requests.

con Wrote:
I don't get this statement. When your insulin is controlled your metabolism is slowing down/going into starvation mode??

Sorry, Con, I didn't proof-read. I meant to say, you are in no danger of your metabolism slowing.

The calorie-counters and the believers in the BMR realize that one can only lower calories to a certain point before the body responds by decreasing energy expenditure. This is the very thing that should convince us that calories cannot be the marker that we use when determining how much to eat.

None of us can predict the future.

Not too many would disagree with that statement. However, people seem to think that they can predict that "X" number of calories will take care of their body's energy requirements for the next day. This varies every hour depending on what's happening in your life. You might have to go save someone's life this afternoon or run for your life, yet you only provide a certain number of calories. On the other hand, the day might be a lazy day where you lie around and watch the U.S. Open Tennis tournament and you may not need much fuel.

It's better to rely on hunger to determine what your body needs in terms of calories and if you do this, there is no need to worry about your metabolism slowing down.

Good morning all! So this morning i had 2 fried eggs in olive oil and 1 thin sliced breakfast porkchop. My planned lunch will be chuck steak, and planned dinner is pork steak and a hard boiled egg (all depending on my hunger 😐. Hopefully i will see some loss by Monday. Have a great day!
Pamela

This is better, Pamela, but a pork chop is also very lean. When I eat such lean meat, I render some pork fat in a pan, dip the meat in the fat, and eat it along with the meat. Monitor how long this meal keeps you full today. If it's less than 5 or 6 hours, then you should consider adding more fat to it.

The same is true with the pork steak. Cook the pork steak in a pan or in the broiler, but make sure to collect the fat that drains in the pan and try to eat it along with the meat or else it will be another lean meal.

Regards,

Charles

Thanks Charles! I will definitely use the fat drippings 😊. Sounds yummy too! Have a great weekend....Pamela

RE: Zero Carb / Meat and Water - Charles - 09-05-2008 07:33 AM

You're doing fine, Cynthia. I enjoyed your last post and I think that is a very level-headed approach. Okay, that's exactly the approach I take as well, so I suppose I'm biased. I felt the same way when my children were being born. I didn't need tests because however they came out, they were my children and I would deal with whatever I faced.

With my body, I am healthy today by every objective marker and I am convinced that as long as I continue to eat properly, there is just no reason to fear any future deficiency or problem. However, just like those so-called primitives, as soon as I start to eat improperly, I can expect the same fate that befell many of them. When they eat their traditional foods, people think they are genetically superior.
However, when they start eating like the traders, they become just like the traders.

No problem Charles. I just don't want anybody who could have high calcium scores on an EBT heart scan to avoid taking D3 supplementation if it will help. That is why I am defending Dr. Davis. I don't want those people to be misout on something that could help.

This whole issue of supplementation as you pointed out yesterday via the article questioning supplementation sure leaves very much in doubt the whole necessity of supplementation on a zero carb meat & water diet. Yes even for D3. I think Nyteez point was a good one given that the norhen most Inuit would have gone long stretches w/o sun in the winter. Given how high the latitude is, in the summer one has to wonder how much sun they could absorb. If it is true that after 40 your body pretty much shuts down production of D3 via the skin then why did the elderly Inuit not suffer from diseases of civilization? And as you have said a lot of Inuit did NOT eat a fish diet. So that may rule out D3 via the diet for them.

I don't dismiss supplementation outright but w/o the phytonutrients that come in natural foods I do have grave doubts about vitamin pill supplementation.

Here is an open question. Did the Inuit suffer from SAD (seasonal affective disorder)? I.e. were they were moody & depressed in the winter? Just curious. This disorder is linked to lack of sunshine.

Dr. Davis in addition to D3 very much has his patients change their diets. He has found that if you eliminate wheat products and a I think a lot of grains he sees reductions in calcification. He is very focused on diet and other means to reverse stop calcification of arteries.

I know, shame on me!

When I go away, it's comforting to know that people like you are around to keep presenting science. Your signature is proof that you know what you're talking about.

I understand the calorie-counters because they observe properly that lean people tend to eat smaller meals. However, they then take the next step and assign calorie-restriction as the cause. That is where they run into trouble.

They fail to realize that we eat less only because we're not hungry. Eating less food amidst out-of-control insulin only leads to more fat storage.

This is exactly what obesity is. Out of control insulin and not enough proper fuel which leads to fat storage. Eating less only exacerbates the problem. The body stores a greater percentage of the food we eat to compensate for decreased intake.

What else can they do?

Again, anecdotal but here we go. My mum tested the same (and followed all the same recommendations), and a few years later tested totally negative - her bone density improved. I can't really say why, bc she was travelling around the world at the time so I've no idea what her regular diet was like. Point being, it can and does improve. She is now looking at low carb bc she's seen how much better my health is, and how much slimmer I am 😊 You could advise them to stay away from grains, that will (should) help.

MAC Wrote:
I got this from Good Calories Bad Calories.

I did work with one person who gave up a two pack a day habit and he gained weight the first two months after giving them up.

I read that in GCBC too and it does seem to hold true for most people. Held true for me in my pre-LC days. Low carbing, I didn't gain a thing when I quit and didn't have the munchies that many ppl have.

sean Wrote:
I used to take Carlsons but was told it is also synthetic due to shipping laws in this country. Dr. Ron Schmid (I'm not a big fan) claims his has the only pure kind on the market. Anyway I was on his for awhile and my inflammation issues became worse and worse....

...after reading Ray Peat's article on the dog experiment where the cancer rate went from 5% to 100% due to the use of fish oil, it explained (atleast in my mind) exactly why I was getting worse, not better on Vit D supplementation.

This is very interesting to me. Thanks. Going to do some further reading. I happen to know a woman who started getting sick all the time after starting Vit D - guess the advice to get levels tested beforehand is sage advice!

MAC Wrote:
Daryl Wrote:
Davis is a forward thinking doctor that is far more open to new ideas than a majority of the medical field. He isn't "just now" coming around to low carb, but he is more recently opening up to the idea that sat fats aren't the boogeyman they've been made out to be.

Yep you are right about Dr. Davis and his change about opening up on saturated fat Daryl.

Nyteez you have a good point about heart disease and low carb and insulin. Other than the claims about reversal of heart disease by Dr. Ornish there isn't to my knowledge been any studies about low carb and reversing heart disease. It has been pretty much focused on losing the weight as a means of reducing the risks factors. Dr. Davis like a lot of the medical establishment was heavily influenced by the saturated fat is bad low fat is good bunk. Correct me if I am misstating things about Dr. Davis Daryl. This is all from memory.

BeeDub Wrote:
Are you kidding? Do you really think it isn't known what's in beef?

What, more pesky DATA? Quick, Dana -- call me another name! Dock me another rep point!

Bad, bad man with the mean, mean science!

Umm...I don't know if you happened to catch my post, it's several pages back now bc this thread moves so dang fast. Anyway, there are studies trickling out that are finding more D3/25 hydroxy vitamin D in red meat (lamb, beef) than was previously thought. Unfortunately I required a subscription (paid) to get a real look at them. IIRC, most are coming from Aus/NZ and looking at their beef/lamb, so the difference could be due to geography/rearing methods, though they were testing muscle meat and not fat, which is where I think D would be stored (correct me if I'm wrong there). BTW, I also covered
malabsorption situations - you might be interested in having a look.

And let's keep this friendly, eh? On all sides? I'm Canadian, arguing and name calling and sarcasm make us cry hot tears that sog up our back bacon and melt our igloos.

What else can they do?

.....You could advise them to stay away from grains, that will (should) help.

Ha, ha. If only... I try to convince people purely by example, but for whatever reason they excuse my perfect health and lack of issues as genetic, exercise related and due to my muscular build. My eating just makes me eccentric and rigid, not necessarily informed. One is a dietitian and they both place very high value on eating a little of everything for "balance". "Portion control" is their Holy Grail. Since they aren't overweight they both just jump on the supplements bandwagon...... and nothing really changes. They aren't people who seek out change or live by my guiding question of "How's that workin' for ya?"

Just more and more of the same and bewilderment when it doesn't really work. Since we're still relatively young, not a whole lot has befallen any of us, but I have this feeling that time will tell. We'll see...

Surprisingly, these are 2 of my closest friends, so we all get along well, they seem to tolerate me and my weird ways. I've learned not to bother to preach because it's not in either of their natures to go against the "rules". They see low carb as weight related only and they aren't overweight, so end of story.

Oh well. I really truly wish I could meet some flesh and blood people around here who are "like me" because converting any of my existing friends sure isn't an option. My athletic friends certainly don't "buy it"!!

Anybody ever found a way to locate people close by who share our dogma?

And, lastly, I've heard just a few comments about the Metabolic Research Center chain of weight loss centers. I gather they are somewhat low carb oriented? Anyone heard of them or know much about them?
I also ask because I am still interested in finding a doctor who is at least sympathetic to our WOE who won't throw everything back on "the diet". Would this place have any connection to one? This is not really for me, since I never see a doctor, but I do have one single solitary co-worker who has shown an interest in this WOE but keeps asking if I have a doctor I could recommend who could help her deal with her issues from our point of view. Again with the rule followers. Not really willing to read what I recommend for herself, trust her own gut or even to trust what she sees in me as an example. She needs the credibility of a title after the name to give it a whirl. She isn't overweight by societies standards, but not really thin either and does have other health issues like allergies, bone density issues, etc...

Enough rambling....... too much energy today because I didn't exercise this morning and not enough students interrupting me. Ha ha!

I came to this same conclusion in the shower this morning (where I do my best thinking!). Even if my levels come out low, what does it matter if I don't have any of the symptoms of deficiency?

Dr. Davis blogged on this subject two days ago:

Quote:
Is waiting for symptoms a rational way to approach diagnosis of heart disease? Well, when symptoms appear, it means that coronary blood flow is reduced. Stents and bypass surgery may be indicated. The risk of heart attack and death skyrocket. Sudden death becomes a real possibility.

In the 30 or so years required to establish sufficient coronary plaque to permit the appearance of symptoms or the development of an abnormality detectable by stress testing, there were many years when the disease was early--too early to generate symptoms, too early to be detectable by stress testing.

That's when heart scans uncover evidence for silent coronary atherosclerotic plaque.

Should we call this a “false positive” just because it doesn’t also correlate with “need” for a catheterization, stent, bypass operation or result in heart attack within the next few weeks?

The detection of early plaque is just that: early disease detection.

Imagine, for instance, that the breast cancer that will grow into a palpable nodule or mass detectable by mammogram is detectable by a special breast scan 15 years before it becomes a full-blown tumor, metastasizing to other organs. What if effective means to halt that earliest evidence of cancer could put a stop to this devastating disease decades ahead of danger? Is this a “false positive” too?

In my view, this is the knuckleheaded thinking of the conventional practitioner: “Don’t bother me until you’re really sick.” Prevention is a practice that has become fashionable only because of the push of the drug industry. Nutrition is an afterthought, a message conceived through consensus of “experts” with
suspect motivations and allegiances.

So, no, heart scans do not uncover “false positives.” They uncover early disease--true positives--years before it is detectable by standard tests or by the appearance of catastrophe. But that is the whole point: Early detection means getting a head start on prevention.

Quote:
Our bodies are intricate organisms that constantly strive for self preservation. If my levels aren't high, then they must not need to be. My body must be making what it needs.
That's assuming your body is getting the hours of equatorial sunlight it evolved to rely on...whoops! 😅

Quote:
I googled "symptoms of vitamin d deficiency" and I have not one of those symptoms!
The symptom of heart disease is angina or heart attack. The symptom of breast cancer is a lump. The symptom of osteoporosis is a broken hip. As Davis points out, with many of these diseases, by the time you're symptomatic, your prognosis is radically worse.

Quote:
I fear more what my body would do with the extra D I'd stuff down it. Toxicity is a bit scary to me.

This is Dr. John Cannell writing about the April 9th vitamin D symposium at UCSD in the newsletter of the Vitamin D Council:

Quote:
The next speaker was Professor Bruce Hollis. He reviewed basic physiology of vitamin D and emphasized that the entire system is designed to deal with an excess not with an insufficiency of vitamin D. Numerous mechanisms are available in your body to prevent vitamin D toxicity but few are available to deal with insufficiency. Then he briefly mentioned one of the most important discoveries about vitamin D in the last few years, one where Professor Neil Binkley of the University of Wisconsin was senior author. As I have pointed out before, Hollis and Binkley's crucial discovery was that the body doesn't start storing the parent compound, cholecalciferol, until 25(OH)D levels reach about 50 ng/ml. They showed, using basic steroid pharmacology, that 50 ng/ml should be considered the lower limit of adequate 25(OH)D levels.

Bruce kept the audience enthralled with a review of all the disease states that indicate 25(OH)D levels need to be much higher than they are now, that is, the multiple biomarkers that suggest the lower limit of 25(OH)D levels should be above 40 ng/ml and closer to 50 ng/ml.

Some more interesting excerpts regarding the UCSD Vitamin D presentations:

Quote:
On cancer:
The first San Diego speaker was Dr. William Grant. Since leaving NASA to begin a full-time career as a vitamin D researcher, Bill has published dozens of studies and has another dozen in the works. Using ecological studies of UVB irradiance and cancer, Bill reported that 15 cancers (colon, esophageal, gallbladder, gastric, pancreatic, rectal, small intestinal, bladder, kidney, prostate, breast, endometrial, ovarian, Hodgkin's lymphoma, and non-Hodgkin's lymphoma) are associated with lower UVB light.
He concluded that 257,000 cancer deaths in 2007 in the USA were accounted for by inadequate vitamin D levels. Of course the problem with ecological studies is that it easy to be vitamin D deficient in Miami, all you have to do is listen to your doctor's advice and stay out of the sun. Recently, a group from the Arizona Cancer Center found almost 80% of Arizonians had levels below 30 ng/ml. So much for sunny spots.

The next speaker was Professor Cedric Garland. I found myself wondering how he did it. I became convinced that vitamin D prevents cancer five years ago. Cedric and his brother Frank and his colleague Ed Gorham knew it 30 years ago! I know what it is like to tell someone that vitamin D prevents cancer and see them think, "Here we go again, another miracle vitamin." I know what it is like to try and explain and watch people die unnecessarily. But I've only had that experience for five years. Cedric has dealt with that frustration for thirty years. Almost thirty years ago, Cedric and Frank Garland published evidence that vitamin D prevents cancer. In fact, it was Cedric's first publication. Thankfully, the paper was recently recognized as being so important that it was republished in 2006 by the International Journal of Epidemiology. You can read the entire paper for free by clicking on the second link below and then clicking on "free final text", courtesy of Oxford Journals.

On type-1 diabetes and multiple sclerosis:
Cedric began by showing the incidence of type-1 diabetes and multiple sclerosis by latitude. I had no idea that the latitudinal data was so strong for type 1 diabetes in children. This disease is almost nonexistent around the equator. Type-I diabetes is but one of the three modern childhood epidemics caused by the sunlight-hating dermatologists, the other two, I think, are autism and asthma.

More on Toxicity:
Professor Robert Heaney went last, discussing 74 slides. So much of what we know about vitamin D today is due to Robert's unceasing dedication to vitamin D, the most recent example being his and Joanne Lappe's randomized controlled trial showing that increasing baseline levels from 29 to 38 ng/ml reduced the risk of getting cancer by around 70%. He again pointed out that the body does not begin to consistently store much vitamin D until your levels get to around 50 ng/ml. He also went through multiple biomarkers of vitamin D. That is, what level or intakes do you have to have to reduce the incidence of multiple diseases? He covered calcium absorption, osteoporosis, risk of falling, muscle function, death and disability of the aged, TB, influenza, cardiovascular disease, hypertension, diabetes, cancer, multiple sclerosis, and gum disease. How can one vitamin be involved in so many diseases? Simple said Dr. Heaney, "vitamin D is the key that unlocks the DNA library."

He then reviewed toxicity and concluded there is no evidence that it occurs at levels below 200 ng/ml or with intakes (total) below 30,000 IU per day. Of course, we have no reason to think anyone needs 30,000 IU per day or levels of 200 ng/ml, which would be irresponsible. But someone with a serious cancer should consider getting their level up to 70-90 ng/ml and that may take 10,000 IU per day or even more in some people. As a rule of thumb, 1,000 IU will raise 25(OH)D levels by about 10 ng/ml.

Then Professor Heaney addressed a public health question. How much would we have to give all Americans to get 98% of people above 32 ng/ml without causing toxicity in anybody? The answer: 2,000 IU per day. Of course 32 ng/ml is not adequate but it would be a great first step. Furthermore, of the people left out, a high percentage would be African Americans. In fact, Dr. Talwar recently reported that 40% of African American women fail to achieve a level of 30 ng/ml even after taking 2,000 IU/day for a year. Talwar SA, Aloia JF, Pollack S, Yeh JK. Dose response to vitamin D supplementation among postmenopausal African American women. Am J Clin Nutr. 2007 Dec;86(6):1657-62.
Fascinating, at least to me. 😊

RE: Zero Carb / Meat and Water - Charles - 09-05-2008 09:10 AM

See, MAC, he's talking about prevention. But again, this is prevention for those on the SAD and for them, Dr. Davis surely has a point. In fact, I've argued the same thing for the past year. If you eat carbohydrates, you should be concerned about supplementation.

Regards,

Charles

RE: Zero Carb / Meat and Water - cbnebraska - 09-05-2008 09:32 AM

All right, I'm so done until this moves on. See you all in a few days (hopefully?). I still won't be taking supplements of any kind, but great for those choose to. I'm sure there are plenty of you who still have lots to learn and share on the topic, but I'm done. The science is all very compelling, but I'm now bored with it.

What's everyone doing for the weekend?

RE: Zero Carb / Meat and Water - Charles - 09-05-2008 09:38 AM

BeeDub Wrote:
You still haven't supplied a whit of evidence that meat-only eaters don't need to supplement. Not one. (And you can't -- those studies have never been done. And are unlikely ever to get past a university ethics committee.)

Well, you have fun with your science, BeeDub. I'll be the good guy without any.

Show me some exclusive meat-eaters with this deficiency and perhaps I'll be interested. So far, you've only shown that a sick population needs to supplement and for that, you may be correct.

Epidemiology is conclusive enough for me, thank you. The Masai of Tankanika, Chewya of Kenya, Muhima of Uganda, Watusi of Ruanda and the Neurs tribes on the western side of the Nile in the Sudan were all cattle-keeping people. They never suffered from vitamin D deficiency and they did not supplement. We can also add the Samburu nomads, the Australian Aborigines, and the Native Americans of the Great Plain, along with the Hunza of the Himalayas and the Kikuyu of Kenya.

Deficiency diseases of any kind only appeared after Western diets were introduced.

The Inuit who did not get much sun most of the year, drink milk or eat fish did not supplement. Their skeletons showed no evidence of vitamin D deficiency despite the fact that their diets were poor in calcium.

I respect your decision to supplement now please respect mine not to.

Regards,
From Regina Wilshire's column in LowCarb Examiner comes this THOUGHT PROVOKING article, in the Journal of the American Medical Association [JAMA] researchers from Tuft’s University question the use of supplements for vitamins, minerals and nutrients, Essential Nutrients: Food or Supplements?

The consumption of adequate levels and proper balance of essential nutrients is critical for maintaining health. The identification, isolation, and purification of nutrients in the early 20th century raised the possibility that optimal health outcomes could be realized through nutrient supplementation. Recent attempts using this approach for cardiovascular disease and lung cancer have been disappointing, as demonstrated with vitamin E and beta carotene. Moreover, previously unrecognized risks caused by nutrient toxicity and nutrient interactions have surfaced during intervention studies. The most promising data in the area of nutrition and positive health outcomes relate to dietary patterns, not nutrient supplements. These data suggest that other factors in food or the relative presence of some foods and the absence of other foods are more important than the level of individual nutrients consumed. Finally, unknown are the implications on public health behavior of shifting the emphasis away from food toward nutrient supplements. Notwithstanding the justification for targeting recommendations for nutrient supplements to certain segments of the population (eg, the elderly), there are insufficient data to justify an alteration in public health policy from one that emphasizes food and diet to one that emphasizes nutrient supplements.

I think understanding our metabolism is comparable to seeing dark matter in the universe--so much is not visible. Every so often a new vitamin, a new fact, a new something is discovered but how much still is unseen??????????? Or misunderstood when seen? And there are studies disagreeing with studies etc.

So my question for BeeDub is--------what study do YOU accept and which study do YOU discard? Or is it still just a matter of BLIND GUT FEELING-i.e. faith?

con

BeeDub
why don't you start a thread in the general discussion area about vitamin d.
Some of this stuff is very interesting to me and vitamin d is one of the only supplements i would consider taking.

A great deal of my forty years has been spent eating cap'n crunch and drinking mt. dew

Anything i can do to better my health from past damage is welcome by me.
travis t
p.s. can you give us a first name to associate with your log in name (beedub)
"Although nutritionists don’t like to talk about this in an era that considers fruits and vegetables to be the sine qua non of a healthful diet, animal products happen to contain all the amino acids, minerals and vitamins essential for health, with the only point of controversy being vitamin C. And the evidence suggests that the vitamin C content of meat products is more than sufficient for health, so long as the diet is indeed carbohydrate-restricted, absent the refined and easily digestible carbohydrates and sugars that would raise blood sugar and insulin levels and so increase our need to obtain vitamin C from the diet."

Well done, MAC! I never get tired of reading that!

RE: Zero Carb / Meat and Water - montmorency - 09-05-2008 10:25 AM

MAC: As they say here: Result! (almost).

Only proviso is probably that the meat needs to be fresh and not overcooked (or at least a good proportion of the meats eaten need to be).

It's kind of ironic actually that one of the few public health messages to have really taken hold here (apart from the earlier fat/cholesterol mistaken message), is that eating lots of fruit and veg is "good for you", expressed in that most idiotic mantra "eat your five a day", just as the science (or the appreciation of the science (e.g. GCBC)) is beginning to show that not only is this not necessary, it may even be harmful. (I figured out for myself that fruit was not doing me personally any good; ditching veg has been a slower journey).

I agree with you on this aspect of supplementation travis t.

Having lived long enough to be bombarded with the vitamin craze and now to see the evidence that it is all wet IMHO (especially now that phytoneutrients are important as well), I have to wonder if we will find the same thing about D. Is the science on D3 really there (excluding D3 to correct calcification) or is this just the bandwagon phase like it has been for other vitamins in the past.

Now you bring up the rare. Man I don't want to go there as the Raw Paleo Group believes rare is the only way to get proper nutrition from meat. Personally, I don't buy that approach. The Inuit boiled their meat. We need to look for this when we discuss the Fat of the Land book. I am not going to eat chicken or pork rare (due to salmonella and trigonosis issues) nor am I going to eat my beef anything but cooked (I do like beef medium rare). Best of my memory serves that mankind has been cooking his food for like 500,000 years at least. Long enough for genetics to play out.

Charles Wrote:
The issue is, do those of us without any vitamin D deficiencies need to be concerned about adding supplementation so we don't end up as patients of Dr. Davis. That's the issue. My point was that we don't. If one is already in this condition, then perhaps they should read Dr. Davis' blog and perhaps even give him a call!

The scary thing is that you may not know if you are a candidate for Dr Davis or not. Symptoms of arterial blockage do not usually appear until you have 90% or more blockage. If the diet does not reverse the calcification of the arteries then some of us could still be in great danger and not know it. The best way to find out is to have the CT heart scan thing done.

I am going to ask my Doctor to prescribe one for me the next time I see him. I don't know if I can get my insurance to pay for it or not, but I think I will spend the money anyway if they don't. Once a baseline is established I can get it checked again in a year only doing VLC and see if there is a difference.

I had the vitamin D test about half a year ago and was low (24 ng/mL of 25(OH)D) so I started taking 5000 IU of D3 each day. My last test showed 68 ng/mL. So that's much improved. I have been on VLC only a few months and have been on and off of it in that time. I keep slipping up and eating a few carbs, then binging on them and then getting back on plan. Once I get steady on this I can check my levels again and decide if I need to keep taking the supplements or not.

Try and get one that is via an EBT machine if you do. A lot less radiation exposure that way. I haven't had one but I've seen prices of $200-$400 quoted on the internet. Don't let any of them talk you into any catheritization procedure to check. These have a lot higher risk so I read.

I don't know that I buy all of that either. When you have some blockage there has got to be some other things going on in your body as well. Homeostasis can never be ignored. You can't tell me that you have 90% blockage in your artery and otherwise you're perfectly healthy. Lipid profiles are overblown, but LDL is still LDL and give us some insight as to what our particles look like.
As I said, if you eat any carbohydrates, then you have every right to be concerned about this and any other symptom. By the same token, one cannot blame their diet if they don't adhere to it. Based on that, it is sound logic to have the test ran so you can make good decisions based on what you see.

Good point.

Charles

I do agree with this and therefore I enjoy my meats at medium. Too much the other way and my stomach lets me know. Of course, Stefansson ate his medium-well according to his book, and Anderson ate his medium to medium-rare.

I'm with MAC on the cooked food issue. We've been doing this too long to be concerned now.

We'll see shortly that scurvy was prevented with fresh meat cooked medium to medium well, but it was not effective if the meat was boiled and the person only drank the broth. (They couldn't eat it because their teeth were too loose or missing.)

That's arguing for a general approach to public health policy that we need to fix basic nutrition before we concentrate on supplements. I agree with that. It's why I dropped carbs.

But I don't see anything in there that indicates we get all the D we need from eating meat, which is all I'm taking issue with. The evidence seems to indicate that we cannot.

(Why don't you email the author of that study and tell him you're eating meat-only, and ask him if that was what he was talking about when he meant good nutrition.) 😞

There's a basic logic failure with many posts here, the idea that if eating meat cures one deficiency disease, it must cure all of them. That's nonsense, but some people can't -- or won't -- grasp that.

That's the part of my argument that you appear to miss. I'm not saying we get all the vitamin D we need from eating meat, although Taubes reports on Vitamin D on page 322 and waywardsister has presented information that perhaps meat has more vitamin D than we think.

I'm saying that it's irrelevant if you don't eat carbohydrates. The Inuit did not get enough calcium in their diets either, as evidenced by the food they ate. However, an examination of their remains concluded that they had no calcium deficiencies (which is clearly vitamin D). All of the cultures I listed did not eat adequate vitamin D-containing foods yet did not suffer from bone deficiencies or heart disease. This would indicate that there must be some gross aspect of a so-called balanced diet which causes the body to either lose vitamin D or not absorb it such that it becomes deficient.

The studies you all have been producing are all from the perspective that we need to consume certain foods in order to have these nutrients whereas the Bear and I agree that our body will make the vitamin D we need as long as carbohydrates are not present.

Regards,

Charles

HAHAHAHA! Way to cherry-pick your quote to distort the meaning! Why didn't you post the title of the article, which is:

Researchers at Johns Hopkins are reporting what is believed to be the most conclusive evidence to date that inadequate levels of vitamin D, obtained from milk, fortified cereals and exposure to sunlight, lead to substantially increased risk of death.

Or you could have quoted this part:

This translates overall to an estimated 26 percent increased risk of any death

...or this part....

"Our results make it much more clear that all men and women concerned about their overall health should more closely monitor their blood levels of vitamin D, and make sure they have enough," says study co-lead investigator Erin Michos, M.D., M.H.S.

...or maybe this part...

"We think we have additional evidence to consider adding vitamin D deficiency as a distinct and separate risk factor for death from cardiovascular disease, putting it alongside much better known and understood risk factors, such as age, gender, family history, smoking, high blood cholesterol levels, high blood pressure, lack of exercise, obesity and diabetes," says Michos.

...or even this part....

"Now that we know vitamin D deficiency is a risk factor, we can better assess how aggressively to treat people at risk of heart disease or those who are already ill and undergoing treatment," says Michos, who adds that test screening for nutrient levels is relatively simple. It can, she says, be made part of routine blood work and done while monitoring other known risk factors, including blood pressure, glucose and lipid levels.

or this part....

Michal Melamed, M.D., M.H.S., study co-lead investigator who started the research as a clinical fellow at Johns Hopkins, says no one knows yet why or how vitamin D's hormone-like properties may protect the heart, but she adds that there are plenty of leads in the better known links the vitamin has to problems with muscle overgrowth and high blood pressure, in addition to its control of inflammation, which scientists are showing plays a stronger role in all kinds of heart disease.

(BTW, what does your esteemed "jury" think about zero-carb?) 😐

RE: Zero Carb / Meat and Water - KimPossible - 09-05-2008 12:02 PM

Go Huskers! 😊Go Razorbacks, too. I for one, am looking forward to the weekend. As far as this thread
it is getting to be a bit...focused....and perhaps others are afraid to post because it will get lost in the shuffle? A separate thread is a great idea, if you are going to discuss it anyway (which is being done here). Just an observation...

I for one was down to 158 today, so I'm finally through that barrier after 10 days... :-) My lowest ever was 151 (after coming off KK last fall) then I gained about 20-25 lbs. Now it's almost all off again.

I saw that you can get Not by Bread Alone (is that it?) on Amazon just last night when I ordered my books. FYI.

**RE: Zero Carb / Meat and Water - MAC - 09-05-2008 12:15 PM**

How about the following from the same abstract:

"If vitamin supplements are used, **Michos says there is no evidence that more than 2,000 international units per day do any good.** Study results show that heart disease death rates flattened out in participants with the highest vitamin D levels (above 50 nanograms per milliliter of blood), signaling a possible loss of the vitamin's protective effects at too-high doses.

That negates Dr. Davis' recommended levels of supplementation.

"But more research is needed to determine the nutrient's precise biological action."

Yep. This jury which are the scientists in this study made that statement.

""We think we have additional evidence to consider adding vitamin D deficiency as a distinct and separate **risk factor** for death from cardiovascular disease, putting it alongside much better known and understood risk factors, such as age, gender, family history, smoking, high blood cholesterol levels, high blood pressure, lack of exercise, obesity and diabetes," says Michos."

The above implies association not cause.

The jury is still out because the science of nutrition is bad, was bad, and will likely continue to be unscientific in a lot of cases. In fact see this link as to how bad some of the science is these days: [http://www.drbriffa.com/blog/2008/09/03/is-it-right-for-scientists-to-put-the-links-between-cholesterol-reducing-medication-and-cancer-down-to-chance/](http://www.drbriffa.com/blog/2008/09/03/is-it-right-for-scientists-to-put-the-links-between-cholesterol-reducing-medication-and-cancer-down-to-chance/)

GCBC in one page!!

Found this from a poster in Dr. Eades' blog:

http://www.motherearthnews.com/print-article.aspx?id=139058

"Although nutritionists don’t like to talk about this in an era that considers fruits and vegetables to be the sine qua non of a healthful diet, animal products happen to contain all the amino acids, minerals and vitamins essential for health, with the only point of controversy being vitamin C. **And the evidence suggests that the vitamin C content of meat products is more than sufficient for health, so long as the diet is indeed carbohydrate-restricted, absent the refined and easily digestible carbohydrates and sugars** that would raise blood sugar and insulin levels and so increase our need to obtain vitamin C from the diet."

I emailed Jimmy and asked him to forward a question to Taubes I had about this paragraph a while back.

My Question was.
What about Iodine? It is a required mineral.
In some areas of the US, like the Midwest the soil is Iodine deficient going back to the ice age. So if your on an exclusive animal diet, from animals who do not ingest Iodine where does it come from?
No reply yet
Scott

If I remember right Iodine is most deficient in mountainous areas. I remember Googling this. If your eat sea animals this is not a concern if I remember right.

RE: Zero Carb / Meat and Water - Living_healthy - 09-05-2008 12:48 PM

From the National Institutes of Health:
What foods contain a lot of iodine?
Many things affect how much iodine is in foods. Naturally-occurring iodine in the oceans gives seafood its high levels. Dairy products are high in iodine because of processing and cleaning agents. Some breads are made with iodate dough conditioners. Meat, poultry, and eggs contain varying amounts of iodine due to feeds and natural plant foods, and the possible use of iodine-containing drugs and cleansers. The iodine in fruits, vegetables, and grains varies with local soils, irrigation water, fertilizers, and processing.
Major dietary sources of iodine include:
• iodized salt • foods containing iodized salt
• milk and dairy products • seafood
• breads containing iodate dough conditioners • a red food dye (FD and C Red #3)
• supplements (like vitamins) containing iodine.

I, truly, believe I get everything I need from eating only meats.

Wow, everyone is doing so well!! I have been working so hard and I know my weight is up. I have been eating...... hate to say it......Replacement bars....to be able to cope with lack of time. I am averaging about 4 hours of sleep a night and then I got pluerisy(sp) and had inflamation in my lungs....AGH!
However, I have finished antibiotics...which have made me fatter and I need to get on the wagon! I am irregular, bloated and look like the walking dead.
I am back now~~
Everyone looks so good and fit and thin~

RE: Zero Carb / Meat and Water - Catin - 09-05-2008 01:28 PM
Hi all! I'm new here and wanted to say thanks for all of the info you guys share about the daily living details of zero carb.

I just started eating meat and water and it's great to have a place to go where people don't think you're crazy, or that eating meat and fat is going to give you a heart attack. 😄

I've basically tried every fad diet out there--low fat, low cal, lots of exercise--and nothing stuck, and I was always hungry, cranky, depressed, and had episodes of ED and comfort eating of junk foods. My heaviest bodyfat level was 34% at 175 lbs. I tried Atkins for a month or two, but got stuck at 33% and 166 lbs (wasn't eating enough fat, so I lost muscle mass) and didn't feel too great on the veggies and fiber, which gave me gastrointestinal distress.

As I went through the Induction period, I read Gary Taubes's Good Calories, Bad Calories, and on closing the book, I wondered why anyone needed to eat veggies at all. I read Eat Fat and Grow Slim. I read almost all the books Taubes mentions in GCBC. I googled meat and water...and found this board, where many have come to same conclusion of: why not go straight meat and water?

I've been doing somewhat zero carb and high fat for a week, and I already feel so much better. I never feel deprived, like I did on low cal or low fat. My pants are getting looser, my tightest shirts are looser in the arms, and my skin just glows. I have more energy, but I'm not bouncing off the walls. I don't exercise much--in fact, I exercise much less than when I was on those crazy diets and exercise plans--and yet I'm losing fat. I'm at 30% bodyfat and 163 lbs and losing (I can't wait to see what I look like with less of this blubber layer I've been carrying around for years and the social and psychological issues associated with it.).

I already feel much more even-tempered---I used to get anxious episodes, be sluggish times after meals, and get shakily hungry if I didn't eat every three hours, and now, I can go six before I realise I should probably eat.

Now I eat, and I stop eating when the meat isn't tasty any more. I get up, and slightly bemused, I go about living my life.

I mean, my god.

Eat as much as I want of food that tastes good (meat, fat, butter) and then get up and go on with your life, and if you're overfat, lose fat and improve energy and health by doing so. It sounds too good to be true, right? And yet the Bear and Charles and Suzanne and others are proof positive that zero carb works.

It now makes me mad to see the carb-pushers and low-fat pushers ruining people's lives. They've certainly done their best to ruin mine! My family has a history of Type II diabetes in the recent generations on one side and stroke on the other. I'm obviously concerned about my insulin resistance and health, and yet, until recently, the ADA was *recommending* a high-carb high-fiber diet to diabetics.

Suffice it to say, I'm learning to think and eat for myself. Thanks to those who share their experience here, I can do that a little better now.

I've promised my loved ones that I'll get my lipids and things checked, despite looking healthier than ever and having more steady and sustained energy than I ever did, so I hope the bloodwork comes out happily. Unless the bloodwork comes out disastrously, I'm on zero carb for life.
Catin

Welcome the the forum Catin. Thanks for sharing your story. When you do get your bloodwork please feel free to share. We have a lot of posters who have been told their bloodwork is bad and it is anything but.

And besides the fact that low carb is a healthy way to eat, the lack of hunger is IMO one of the real strong suits of low carb. Which you already know.

RE: Zero Carb / Meat and Water - MAC - 09-05-2008 02:06 PM

The Inuit Paradox

"What the diet of the Far North illustrates, says Harold Draper, a biochemist and expert in Eskimo nutrition, is that there are no essential foods—only essential nutrients. And humans can get those nutrients from diverse and eye-opening sources."

"But vitamin A, which is oil soluble, is also plentiful in the oils of cold-water fishes and sea mammals, as well as in the animals’ livers, where fat is processed. These dietary staples also provide vitamin D, another oil-soluble vitamin needed for bones. Those of us living in temperate and tropical climates, on the other hand, usually make vitamin D indirectly by exposing skin to strong sun—hardly an option in the Arctic winter—and by consuming fortified cow’s milk, to which the indigenous northern groups had little access until recent decades and often don’t tolerate all that well."

"In fact, all it takes to ward off scurvy is a daily dose of 10 milligrams, says Karen Fediuk, a consulting dietitian and former graduate student of Harriet Kuhnlein’s who did her master’s thesis on vitamin C. (That’s far less than the U.S. recommended daily allowance of 75 to 90 milligrams—75 for women, 90 for men.) Native foods easily supply those 10 milligrams of scurvy prevention, especially when organ meats—preferably raw—are on the menu. For a study published with Kuhnlein in 2002, Fediuk compared the vitamin C content of 100-gram (3.55-ounce) samples of foods eaten by Inuit women living in the Canadian Arctic: Raw caribou liver supplied almost 24 milligrams, seal brain close to 15 milligrams, and raw kelp more than 28 milligrams. Still higher levels were found in whale skin and muktuk."

Just a side note. If you had pleurisy be sure to look at a flu shot in a few month. I had it a few years ago and then about 6 month later got pneumonia and I was about a day away from serious problems according to the Dr. The Dr. did not consider them related BUT if it looks and walks like a duck....

RE: Zero Carb / Meat and Water - travis t - 09-05-2008 02:46 PM

MAC quoted "In fact, all it takes to ward off scurvy is a daily dose of 10 milligrams, says Karen Fediuik, a consulting dietitian and former graduate student of Harriet Kuhnlein’s who did her master’s thesis on vitamin C. Still higher levels were found in whale skin and muktuk."

this is my area of concern on a meat and water diet. Cuts of beef are the muscle meats only and not of any organs. I don't eat the organs and skin, only muscle meat. These "native foods" are doubtful to be in any appreciable amounts of anyone who posts on this site. There are still parts of my brain that are unsure about all of this no matter how awesome i feel three months into this. muscle meats could very well have everything we need and this is something i will enjoy finding out.

After 3 months you would likely be symptomatic if you were going to get scurvy, I would think.

Travis, that's the problem with these "Eskimo Experts." I've already sent you the book *Not by Bread Alone*. Go and check Stefansson's own words and he says quite clearly that there were many Inuit who never ate fish. There were also some Inuit who did not eat caribou. Despite this fact, they all enjoyed excellent health. It's not about eating the nutrients. It's about not expending them. Your body will synthesize what it needs.

Quote:
The way in which Eskimos divide, for instance, a caribou between men and dogs has been described with some detail; here the fact is emphasized that the organ commonly spoken of as richest in vitamins, the liver, is nearly always given to the dogs—as are the sweetbreads and, indeed, all things from the body cavity except the heart and kidneys. The kidneys are usually given to children, somewhat as if they were candy.

These experts make these assumptions because they know the Inuit never suffered from any deficiency diseases. Fortunately, we have the worlds of someone who studied and lived among them for an entire decade. He didn't just sit at a university in America and speculate.

Regards,

Charles

**RE: Zero Carb / Meat and Water - daveo - 09-05-2008 03:14 PM**

Seems to me if someone was losing sleep over just eating muscle meat, you could take a Vitamin C pill and a teaspoon of cod liver oil each day and you would be covered.

In good time, you will probably feel like exercising more ... not to lose weight, but to get, and keep fit. It seems that we were designed to be physically active, and we seem happiest when we do so regularly. Mainstream dieting gets it the wrong way round, and sends obese people off jogging for example, way before they are ready to do so.

*Quote:* I already feel much more even-tempered---I used to get anxious episodes, be sluggish times after meals, and get shakily hungry if I didn't eat every three hours, and now, I can go six before I realise I should probably eat.

Sounds like you are well on the way to keto adaptation. The more fat you eat, the happier you will feel; the low-fat movement has a lot to answer for, IMHO.

*Quote:* Eat as much as I want of food that tastes good (meat, fat, butter) and then get up and go on with your life, and if you're overfat, lose fat and improve energy and health by doing so. It sounds too good to be true, right? And yet the Bear and Charles and Suzanne and others are proof positive that zero carb works.

Good, isn't it!

*Quote:* It now makes me mad to see the carb-pushers and low-fat pushers ruining people's lives. They've certainly done their best to ruin mine! My family has a history of Type II diabetes in the recent generations on one side and stroke on the other. We get other people who spend a lot of time analyzing plan and after plan because they are analytical, get totally confused by the contradictory nature of a lot of these plans and then don't know that to do. They get analysis paralysis.
So when they say choose a plan and stick to it. It means pick one and stick to it for a reasonable amount of time to find out if it works. But yes, if it isn't working for you, then as I think you are implying, then time to make some adjustments or find a new plan.

In the interest of full disclosure, I have had bypass surgery in 2002, and my Dr. thinks this puts me at further risk, and I already have osteoporosis.

P.S. I had no symptoms at all when either one was discovered, My Dr only did the tests to find the heart problems because I told him that three of my four sisters had had open heart surgery and that both my parents died from heart disease.

Thankscon

I know, shame on me!

When I go away, it's comforting to know that people like you are around to keep presenting science. Your signature is proof that you know what you're talking about.

I understand the calorie-counters because they observe properly that lean people tend to eat smaller meals. However, they then take the next step and assign calorie-restriction as the cause. That is where they run into trouble.

They fail to realize that we eat less only because we're not hungry. Eating less food amidst out-of-control insulin only leads to more fat storage.

This is exactly what obesity is. Out of control insulin and not enough proper fuel which leads to fat storage. Eating less only exacerbates the problem. The body stores a greater percentage of the food we eat to compensate for decreased intake.
What about the obese people who go on shows like "Survivor" and "The Biggest Loser"? They restrict calories and lose weight. I would think that eating less food with no carbs (except vegetables) would also train your pancreas to secrete less insulin. Wouldn't eating a small amount of food but with no carbs force your body to run on stored fat?

**RE: starting meat and eggs today - Jimmy Moore - 09-05-2008 05:55 PM**

Actually, Dr. Vernon recently said in my podcast show that even low-fat dieters who consume less dietary fat are eating a "high-fat" diet because the fat being used for energy is stored fat. Go listen to what she had to say in that interview...it was quite fascinating!

By the way, Charles, she also said in that interview that she didn't think there was anything wrong with a zero-carb diet. 😊

I worked for a company that had it. They analyzed things to death and never ever got anything done. Well at least in a lot of cases.

RE: Zero Carb / Meat and Water - lowcarbrun - 09-06-2008 01:22 AM

Here is some more confusing information about vitamin D.

Quote:
Most alarming, however, is the fact that the medical community is currently oblivious to yet another public health disaster of epic proportions - one that is affecting the entire population. In an effort to curb chronic disease, well-intentioned researchers are promoting vitamin D, a substance that, according to recent molecular modeling research, can act as an immunosuppressive steroid.

Studies which incorrectly interpret the reason for low vitamin D in patients with chronic disease have been seized upon by the media, and form the basis of massive advertising campaigns – which, along with ill-informed recommendations by doctors and researchers, have created a perfect storm of misunderstanding and bad advice.

If I can throw away all vitamin supplements by going zero carb then that is a good thing, yes?

Thanks for the article. It certainly makes one pause. The jury is still out on Vitamin D. The verdict may be guilty AGAINST D supplementation.
1. Vitamin D is not a vitamin; it is an immunosuppressive steroid.
2. The vast majority of studies fail to account for the long-term effects of vitamin D.
3. Chronically ill people are not deficient in vitamin D.
4. Healthy people are not deficient in vitamin D and do not need to consume extra amounts of this steroid.
5. The public does not require extra sun exposure in order to prevent vitamin D “deficiency.”
6. Vitamin D does not reverse osteoporosis.
7. Extra vitamin D does not reduce the risk of cancer.
8. Vitamin D deficiency does not cause rickets.
9. Most researchers fail to consider the alternate hypothesis about vitamin D.
10. When it comes to vitamin D, the current medical climate of consensus is hostile to new ideas.
11. Research touting vitamin D’s benefits is often biased, methodologically weak, and ultimately misleading.
12. The dairy and supplement industries are intent on heavily promoting vitamin D.
13. The media is neither well-informed nor objective about vitamin D.
14. We must take immediate action to remedy the health crisis that has resulted from faulty conclusions about vitamin D in chronic disease.

RE: Zero Carb / Meat and Water - susanneyea - 09-06-2008 02:52 AM

Well, I have a doctor's appointment in about two weeks, shall I get a vitamin D test? If it comes back normal can we end all this?

RE: Zero Carb / Meat and Water - cbnebraska - 09-06-2008 03:41 AM

Wow, than you really must have had just too much damage before 1996. I guess I don't know how old you were at that point either. Actually, your numbers got better if your tris dropped to 51 and your HDL went up to 96, right? I've heard over and over again on this forum that these are the only 2 numbers that count, although it still seems to me like a ratio of some sort should matter. If your total was 377 and now it's 226, it all seems to have improved lately. If I have the sets of numbers reversed chronologically, then I guess they did go down...

How lucky for you that you had a family history to go on. Are you doing well and feeling good now?

RE: Zero Carb / Meat and Water - Daryl - 09-06-2008 03:47 AM

susanneyea Wrote:

I'm not sure we could all take the fallout if your numbers were low, Suz. We'd never get off this topic. Ha ha! I still think that if they're "low" they're still where they need to be for your body. I'm planning to get all the tests everyone recommended when I go in May, but I'm still planning to go by how I feel and look. I have never felt better and I just can't believe that doesn't mean something... I would really like to get a bone density test myself. You are of such a tiny frame that I wonder if that might be a better gauge for you? I do NOT have a tiny frame - my ankles and wrists are quite sturdy, so I have always believed myself to be pretty safe from osteoporosis - plus I have dark hair, darker eyes, muscular build, tan well, am of mediterranean descent, no family history, etc... Low risk factors by all standard accounts (although "standard" has a whole new meaning to me these days...)

If you do get the tests run though, I would love to hear how they come back..... Just PM me if they aren't "up to snuff" so you don't set the screens ablazin'!! Ha ha.

RE: starting meat and eggs today - pamela702 - 09-06-2008 06:04 AM

Hi everyone,
Things are going pretty good eating this way. I have a little bit of nausea this morning (nothing i can't handle though). Here is my planned menu for today: breakfast- 2 fried eggs in butter and 1 hamburger patty, lunch- baked beef short ribs, dinner- hmm, i was thinking maybe baked chicken wings and deviled eggs (not too sure yet). I will check my weight tomorrow or Monday and post. Hope everyone has a great weekend.
Pamela

Ok, so you are saying between your last labs and the most recent on Aug 4, your cholesterol went up from 226 to 377 and your HDL went down, right?

Your triglycerides are more or less the same.

My understanding from my reading is that total cholesterol levels take a long time to change and vary on a number of factors. While losing weight, for example, cholesterol will be higher because it is being released from your fat cells. Also, your diet up to a full year previous to the test could effect the results. Personally, I don't plan to get my lipids checked until my one year anniversary on zero carb, and even then only if my weight as been stable for a while, if I am still losing I will wait.

By the way, are you taking statins now, and/or were you at the time of the last test?

RE: Zero Carb / Meat and Water - caroline - 09-06-2008 06:44 AM

Hey Guys,

If we can "spring" for it (our insurance won't pay for it--), I may get tested for D as well. But before any of us do or if they do, what did someone on here say about one of the tests that was too radioactive versus another. Anybody know which particular one to get?

Not to start another hailstorm, but as to Vitamin C--who's taking it? Suz, didn't you mention you take it? I do have to say, I am suspicious that a little pill supposedly concentrated with things does stuff. We had gone through phases prior to low carb where we took vitamins, and to be honest, I never noticed a diff. I certainly didn't feel worse without, but I never felt better either. Now I am like the anti-science--I am an intuitive, so take that for what you will. But I base everything on how I feel. Frankly, I feel a little like Charles in terms of something he said once, which was to the effect of, if he didn't live quite as long, but lived well, and healthfully, he would be very grateful.

I just want to be vibrant and have my cognitive faculties about me and maintain a good disposition on life. I'm going to drop dead of something (that's the law)--but if I can leave a healthier life (translated: have nice energy, not so many aches, and can think clearly enough to follow my dreams) then I'm fairly satisfied.

FYI: I do appreciate all of you, (MAC et al.) who are doing this research. I enjoy reading it. For instance, it made me think twice about Carlson's. We used to take it--

IF you were to get a CT heart scan, assuming you had reason to, you would want to get one where they use an EBT scanner. A lot less radiation. About 6 chest x-rays is the level of radiation if I remember correctly. The others scanners which are 32 bit & 64 bit scanners are a lot higher in the amount of radiation.

LindaSue Wrote:
If The Bear never gets hungry, why does he eat and how does he know when to eat?

This one baffles me too, Linda. I certainly get hungry. It's only about twice a day these days, but it does happen and it's acute! 😐

LindaSue Wrote:
Are you thinking about doing that? Do they sell pemmican in stores?

Oh yes. How could we not after reading so much about it in Bread? There is a brand of beef jerky called "pemmican" but it's nothing like the real thing. Most people have settled on the Englishman's description of it, where they put berries and other crap in it. It was clear from Stefansson and Admiral Peary that the authentic stuff was just dried shredded meat and liquid fat poured all over it to preserve it, and then put in a bag made from the animal. Two pounds of this stuff per day for the average 180 pound male working very hard. This stuff is probably the most nutritious food in the world and if you eat it forever, you'll do the best you can from a nutritious standpoint.

For those of us without pemmican, the ratio is instructive. A half pound of fat with two pounds of lean per day and that, to me, is the equivalent and the true secret to what I've managed personally. I can effortlessly keep my weight at or below 150 just eating this way and drinking water.

MAC Wrote:
Here is an open question. Did the Inuit suffer from SAD (seasonal affective disorder)? I.e. were they moody & depressed in the winter? Just curious. This disorder is linked to lack of sunshine.

Stefannson emphatically said, No. The "happy Eskimo" is a true paradox. They live in such meager accommodations, without high definition television and most other creature comforts such as BMW's, yet they are so content and happy. Most of the studies I've seen with very low carb diets report the same thing, that there is increased calm and optimism. That's why I'm sure that zero-carb cures adrenal fatigue. The adrenals don't need to hypersecrete when insulin levels are low.

On the other hand, he also clearly states that when the Eskimo takes the dietary of the European, they quickly display the poor health and outlook of the European, so there is definitely no genetic advantage.

In the interest of full disclosure, I have had bypass surgery in 2002, and my Dr. thinks this puts me at further risk, and I already have osteoporosis.

I think that makes a world of a difference, don't you? I mean, really.

rozi Wrote:
P.S. I had no symptoms at all when either one was discovered, My Dr only did the tests to find the heart problems because I told him that three of my four sisters had had open heart surgery and that both my parents died from heart disease.

But I don't see how you can say this looking back? What were your HDL, triglyceride numbers, and vitamin D levels in 2002 before your bypass surgery? That's the information that is sorely needed.

I'm betting the farm that your numbers now compared to back then are one whale of a reversal, and you have never gone true zero-carb since 2002. These variables are monumental and without them, your case can in no way solve the issue.

You've clearly lowered your "risk" substantially --heck, I would argue that you reversed the situation compared to what was going on in 2002 by changing your diet. Were there other medications you took since then?

Regards,
Charles

RE: Zero Carb / Meat and Water - daveo - 09-06-2008 07:08 AM

I've made pemmican a few times, it isn't difficult. It is edible to be sure, but I would probably only make it if I wasn't going to have easy access to fresh meat for a few days, like if I was going camping or something. It isn't the tastiest thing in the world 😄
You can buy it too from [http://www.grasslandbeef.com](http://www.grasslandbeef.com), but it is way salty and I didn't like it very much.

**RE: starting meat and eggs today - Charles - 09-06-2008 07:10 AM**

Lauren Wrote:
What about the obese people who go on shows like "Survivor" and "The Biggest Loser"? They restrict calories and lose weight. I would think that eating less food with no carbs (except vegetables) would also train your pancreas to secrete less insulin.

When one restricts calories, they also restrict carbohydrates in the majority of cases -- especially since people on those shows rarely eat a true Atkins diet. This confounds the results because it appears that the calorie reduction was the culprit when it could have also been the fact that they ate less carbohydrates. In other words, if they had merely just cut the carbohydrates, they could have eaten more fat and protein and achieved the same thing. In fact, many of our low-carb studies show that very thing. The higher calorie low-carb plans have consistently produced the most weight loss.

Lauren Wrote:
Wouldn't eating a small amount of food but with no carbs force your body to run on stored fat?

It seems like this would work, but it doesn't. By the same token, if you fast, shouldn't you lose more weight than if you ate even a small portion of food?

Fortunately, we don't have to speculate. Keckwick and Pawan tried this very thing. They put seven people on a fast and seven people on high fat diet. Both groups lost weight but the high fat group lost twice as much fat as the group who ate nothing. The fasting people lost lean muscle mass which is the worst thing to do, and the high fat people retained their muscle and only lost fat. No one wants to look like Gandhi. They want to be lean and muscular.

This means that it takes fat to burn fat. You don't just get there by semi-starving yourself. Semi-starvation weight-loss ALWAYS returns, and usually it returns with interest.

People on these shows are generally very obese and you can probably do about any diet and get some results. However, this kind of thing doesn't play out so well in the real world. Who can afford to just eat, sleep and live in the gym every single day for six months at a time while being yelled at by a hot-looking coach?

Regards,

Charles

**RE: Zero Carb / Meat and Water** - **LindaSue** - **09-06-2008 08:02 AM**

Here's the description from the site that daveo posted:

**Quote:**

Beef Pemmican honey and cherry free bar - 3.2 oz.

Due to customer requests, we now offer a pure pemmican bar consisting of only dried beef with sea salt and tallow. Powerlifting champion Josh Bryant is a great fan of pemmican consumption prior to weight lifting competitions for the concentrated energy and protein delivered without additives.

3.2 ounce bars will average 45% tallow and 55% dried jerky. Each bar contains 20 grams protein and approx. 400 calories. No additives or preservatives.

Direct from the freezer is an excellent way to consume pemmican to prevent a soft texture. When thawed 10-20 minutes, the bars have the texture of a snickers candy bar.

Pemmican bars are a great way to start the day!

**Ingredients:** beef jerky, beef tallow, water, sea salt

**PRICE:** $3.42

From reading Stefansson's book, real pemmican doesn't have added salt. It's a shame that this company is apparently over salting theirs. How did you make yours, daveo? Once I get my NuWave oven I will be able to make my own jerky and maybe give this a try. I don't know where to buy beef fat or tallow around here though. Would rendered pork fat work? Is there such a thing as pork jerky or pork pemmican or is there some reason why pork isn't suitable?

---

Get some moose, elk, fish, buffalo. etc. Seems you can make pemmican from any meat you want but the flavor may not be that good: [http://www.calverley.ca/Part01-FirstNations/01-047.html](http://www.calverley.ca/Part01-FirstNations/01-047.html)

"Moose and elk meat was sometimes treated similarly but the results were not so satisfactory. In some regions fish pemmican was made by pounding dried fish, mixed often with sturgeon oil, but it was more usual, as it is now among the Crees, for the pounded fish and the fish oil to be kept separately, the oil in animal bladders."

RE: Zero Carb / Meat and Water - LindaSue - 09-06-2008 08:29 AM

Fish pemmican doesn't appeal to me AT ALL and it's doubtful that I'm going to buy buffalo or elk anytime soon. Beef pemmican sounds the best to me but then I've never tasted buffalo or elk. I suppose there must be some place in Texas that raises buffalo. I remember seeing some up in Michigan when we used to live there. From what I remember hearing on Food Network, buffalo meat is very lean which is why it would make good pemmican. Lean meat dries more readily than fatty meat.

RE: Zero Carb / Meat and Water - Charles - 09-06-2008 08:39 AM

LindaSue Wrote:

Right. This is the only time I would want leaner meat. However, you would ultimately need a bunch of fat to mix in with it after you pounded it into shreds and dried it.
So would you pound it into shreds and then dehydrate it or is it enough to just dehydrate it?

Charles

LindaSue Wrote:
If The Bear never gets hungry, why does he eat and how does he know when to eat?

Well LindaSue, you'd have to read the threads that MAC posted the links to earlier to get a better picture. However, if I remember correctly, he says he does sometimes forget to eat. I guess normally he eats more or less to a schedule, depending on what else he is doing. He says he cooks for his wife too, so maybe that drives meal-times somewhat. I think he says that appetite comes with the meal, in a similar way to what Taubes describes, although Bear doesn't quite put it the same way.

He doesn't say this, but I would presume that if he didn't eat for several days, then he would get hungry, i.e. once his body fat was used up.

This general question was one I had after reading GCBC: In a perfectly keto-adapted low-carber who still has some body fat to burn, what is it that ever makes them hungry? I asked the question on Dr Eades' Forum, and got a reply, but I don't think he really knew; he seemed to think leptin might come into it.

Pemmican: I'd like to make some too. I think The Bear gives a method in one of those threads. As well as for camping, touring, etc, it could be useful in any situation where one is away from home, and with little control over how the food one eats is prepared. It could make one a very cheap date. "I'm having the sirloin; what are you having Dear?" - "Oh, just a glass of water, and I'll nibble my pemmican once the waiter has gone..."

Can someone tell me what "Jerky" is please? It's not a term I've come across in England.

---

That would be my answer. Insulin controls leptin and indirectly the counter regulatory hormone for hunger ghrelin. But having said that isn't there a point in true starvation where hunger shuts down?

Jerky is dried meat that has been seasoned. Sold in 3-5 oz packages. Beef and turkey are the common jerky meats.
This general question was one I had after reading GCBC: In a perfectly keto-adapted low-carber who still has some body fat to burn, what is it that ever makes them hungry? I asked the question on Dr Eades' Forum, and got a reply, but I don't think he really knew; he seemed to think leptin might come into it.

Le Magnen (reported in Taubes) said that hunger was a response totally driven by the cells. When the long-term fuel supply begins to falter, then the cells prompt us to want to eat via the appetite and the central nervous system. Most people don't take the time to learn about the long-term fuel supply, the stream of nutrients that runs in your bloodstream. That's the true source of energy and the fat tissue is part and parcel of that entire system. It has nerves and blood vessels all throughout and our hypothalmus is a big part as well. The gut is a small part of energy regulation and is termed the "short term" fuel supply. This is covered thoroughly in Chapter 24.

When we're hungry, it's not that we have "exhausted all of our fatty acids." We have a great capacity to ignore hunger if we want to. After a few minutes, the hunger feeling goes away and it was like we were never hungry. This all shows that hunger is an energy request from the cells to basically top off the long-term fuel supply. That doesn't mean it's depleted. The physiological feelings of hunger will grow in intensity depending on how depleted that long term fuel supply is, of course. Because nerves run through the fat tissue, cells can directly communicate their needs to the central nervous sytem and the intensity can be varied.

If someone says they don't get hungry, I would say it's because they aren't conditioned to wait for the physiological reaction to hunger, or they eat at relatively regular intervals such that those responses aren't necessary. Back when I was in my 20's, I could identify with what Bear is saying. I used to forget to eat many times as I would get busy and just not think too much about it.

Regards,

Charles

---

If you would indulge me by commenting on another scenario...

What if you had two groups on Zero Carb diets. One group eating 1200-1500 ZC calories (low I think, but not starvation) and the other, eating unlimited ZC calories.

I would think that both groups would have reduced insulin and therefore would both be running on fatty acids. What is the mechanism that would cause the high calorie group to lose more weight?

---

I have a food dehydrator that I make the jerky with. You can pick one up for less than $50 I'm sure. You can also make it in the oven (bear gives instructions for doing that somewhere in his thread). The key with pemmican is to make the Jerky VERY dry. If you do that, you can pretty well powder it in a
The fat part, I like to use beef fat trimmings. As others have said here, you can often get those free at the butcher counter. I have a feeling pork would be a little soft. A lot of people say to use suet (kidney fat) but I don't like the texture as well. You can render fat just by putting it in a large cast iron type pan (or a regular frying pan) and melting it over several hours. You want to make sure all the water is out (it'll stop bubbling) and cook it low enough so it doesn't smoke. Then I pour it through a cheesecloth (after it cools) to get the little bits out.

So now you have a pile of powdered beef and a pan of liquid fat, you just pour the fat over the beef to about the consistency of brownie batter. Let it dry and you have pemmican.

Hopefully that helps, if not, this link will take you to a list of variations:

http://w4.lns.cornell.edu/~seb/pemmican.html

Edit: Just found another page with pictures that looks almost exactly like I do it.
http://wilderix.wordpress.com/2007/02/28/the_pemmican_brief/
Thyroid - Normal (They didn't give me numbers).

Blood Sugar - 92 (after 14 hour fast, it felt like it was alot lower).

Total Cholesterol - 282 (206 about 1.5 years ago).

HDL - 72
LDL - 200
Trig - 53

I was hoping my hdl would be higher. My Trig's are unchanged from 1.5 years ago.

LDL was alot higher than I expected. Maybe its falsely high because it was calculated and not tested directly?

I have also lost 4 pounds in two weeks. This is my first weight loss since I started low carbing.

Deanna

You mentioned that you are currently losing weight. I read somewhere (maybe in Taubes book) that cholesterol is released from the fat cells and cholesterol can be higher until weight stabilizes. Everything looks pretty good though!

MAC Wrote:
Thanks for the article. It certainly makes one pause. The jury is still out on Vitamin D. The verdict may be guilty AGAINST D supplementation.

The bacteriality pages recommend the "Marshall Protocol" as a way to improve health and a low carb diet is recommended.

Another interesting quote:

Quote:
Similarly, the results of a recent study conducted by a team of researchers at the National Institute on Aging at the National Institutes of Health in Baltimore who assessed the telomere length of 41 people caring for loved ones with Alzheimer’s disease and 41 individuals matched by age who weren’t caring for an ill person. Caregivers had been looking after the Alzheimer’s patients for an average of five
The fact that bacteria almost certainly drive the pathogenesis of Alzheimer’s is supported by a recent issue (May 2008) of Journal of Alzheimer’s Disease which was entirely dedicated to exploring the role of bacteria in causing Alzheimer’s.

The team reported in the Journal of Immunology that the telomeres of the Alzheimer’s caregivers were significantly shorter than those of the control individuals – suggesting that the Th1 pathogens from the Alzheimer’s patients had been transmitted to their caregivers over the course of the 5-year study period, shortening their telomeres in the process.

“So, it appears that in the patients with Alzheimer’s (and in the caregivers who are likely infected with the Th1 pathogens too), the telomeres are shortened,” says Joyce Waterhouse PhD of Autoimmunity Research Foundation. “I guess with our experience with the Marshall Protocol, we could conclude that Th1 disease and its associated inflammation cause this ‘premature aging.’” That view would go along with people seeming to get “younger” on the MP.”

lowcarbrun Wrote:
Here is some more confusing information about vitamin D.

Quote:
Most alarming, however, is the fact that the medical community is currently oblivious to yet another public health disaster of epic proportions - one that is affecting the entire population. **In an effort to curb chronic disease, well-intentioned researchers are promoting vitamin D, a substance that, according to recent molecular modeling research, can act as an immunosuppressive steroid.** Studies which incorrectly interpret the reason for low vitamin D in patients with chronic disease have been seized upon by the media, and form the basis of massive advertising campaigns – which, along with ill-informed recommendations by doctors and researchers, have created a perfect storm of misunderstanding and bad advice.

If I can throw away all vitamin supplements by going zero carb then that is a good thing, yes? 😊

Thanks for the article. It certainly makes one pause. The jury is still out on Vitamin D. The verdict may be guilty AGAINST D supplementation.

1. Vitamin D is not a vitamin; it is an immunosuppressive steroid.
2. The vast majority of studies fail to account for the long-term effects of vitamin D.
3. Chronically ill people are not deficient in vitamin D.
4. Healthy people are not deficient in vitamin D and do not need to consume extra amounts of this steroid.
5. The public does not require extra sun exposure in order to prevent vitamin D “deficiency.”
6. Vitamin D does not reverse osteoporosis.
7. Extra vitamin D does not reduce the risk of cancer.
8. Vitamin D deficiency does not cause rickets.
9. Most researchers fail to consider the alternate hypothesis about vitamin D.
10. When it comes to vitamin D, the current medical climate of consensus is hostile to new ideas.
11. Research touting vitamin D’s benefits is often biased, methodologically weak, and ultimately misleading.
12. The dairy and supplement industries are intent on heavily promoting vitamin D.
13. The media is neither well-informed nor objective about vitamin D.
14. We must take immediate action to remedy the health crisis that has resulted from faulty conclusions about vitamin D in chronic disease.

It must be true -- it's on the internet! 😁

Mac, it's worth noting that Bacteriality is a site specifically for sufferers of chronic fatigue disease promoting the "Marshall Protocol" as an alternative treatment for that disease.

The Marshall Protocol is an internet phenomenon, not peer-reviewed science. It requires avoiding bright lights and all sunlight for years while concurrently taking antibiotics and massive doses of the blood pressure drug Benicar.

But Vitamin D Council head Dr. Cannell still felt obliged to respond:

Quote:
I have been inundated with letters asking about Professor Marshall's recent "discovery." Some have written that to say they have stopped their vitamin D and are going to avoid the sun in order to begin the "Marshall protocol." The immediate cause of this angst is two publications, a press article in Science Daily about Professor Marshall's "study" (which is no study but simply an opinion) in BioEssays. Dr. Trevor Marshall has two degrees, both in electrical engineering. Before I begin, I want to again remind you that I am a psychiatrist who works at a state mental hospital. In my duty to full disclosure, I must say that I have known a lot of psychiatrists in my life and a few electrical engineers. If I knew nothing else of a disagreement between two people but their professions, I would believe the electrical engineer, not the psychiatrist.

In reading his two articles, Dr. Marshall's main hypotheses are simple.

(1) Vitamin D from sunlight is different than vitamin D from supplements.

(2) Vitamin D is immunosuppressive and the low blood levels of vitamin D found in many chronic diseases are the result of the disease and not the cause.

(3) Taking vitamin D will harm you, that is, vitamin D will make many diseases worse, not better.

If you read his blog, you discover that the essence of the Marshall protocol is: "An angiotensin II receptor blocker medication, Benicar, is taken, and sunlight, bright lights and foods and supplements with vitamin D are diligently avoided. This enables the body's immune system, with the help of small doses of antibiotics, to destroy the intracellular bacteria. It can take approximately one to three years to destroy all the bacteria." That is, Dr. Marshall has his "patients" become very vitamin D deficient.

Again, Dr. Marshall conducted no experiment and published no study. He wrote an essay. He presented no evidence for his first hypothesis (sunlight's vitamin D is different than supplements). From all that we know, cholecalciferol is cholecalciferol, regardless if it is made in the skin or put in the mouth. His second hypothesis is certainly possible and that is why all scientists who do association studies warn readers that they don't know what is causing what. Certainly, when low levels of vitamin D are found in certain disease states, it is possible that the low levels are the result, and not the cause, of the disease. Take patients with severe dementia bedridden in a nursing home. At least some of their low 25(OH)D levels are likely the result of confinement and lack of outdoor activity. However, did dementia cause the
low vitamin D levels or did low 25 (OH)D contribute to the dementia? One way to look at that question is to look at early dementia, before the patient is placed in a nursing home. On the first day an older patient walks into a neurology clinic, before being confined to a nursing home, what is the relationship between vitamin D levels and dementia? The answer is clear, the lower your 25(OH)D levels the worse your cognition.

These studies suggest that the low 25(OH)D levels are contributing to the dementia but do not prove it. Only a randomized controlled trial will definitively answer the question, a trial that has not been done. So you will have to decide if vitamin D is good for your brain or not. Dr. Marshall seems to be saying demented patients should lower their 25(OH)D levels. Keep in mind, an entire chapter in Feldman's textbook is devoted to the ill effects low vitamin D levels have on brain function.

It is true that in some diseases, high doses of vitamin D may be harmful. For example, in the early part of last century, the AMA specifically excluded pulmonary TB from the list of TB infections that ultraviolet light helps. They did so because many of the early pioneers of solariums reported that acutely high doses of sunlight caused some patients with severe pulmonary TB to bleed to death. Thus, these pioneers developed very conservative sun exposure regimes for pulmonary TB patients in which small areas of the skin were progressively exposed to longer and longer periods of sunlight. Using this method, sunlight helped pulmonary TB, often to the point of a cure. Furthermore, it is well known that sunlight can cause high blood calcium in patients with sarcoidosis. In fact, sarcoidosis is one of several granulomatous diseases with vitamin D hypersensitivity where the body loses its ability to regulate activated vitamin D production, causing hypercalcemia.

Furthermore, although medical science is not yet convinced, some common autoimmune diseases may have an infectious etiology. I recently spoke at length with a rheumatologist who suffers from swollen and painful joints whenever he sunbathes or takes high doses of vitamin D. As long as he limits his vitamin D input his joints are better. To the extent vitamin D upregulates naturally occurring antibiotics of innate immunity, sunlight or vitamin D supplements may cause the battlefield (the joints) to become hot spots. I know of no evidence this is the case but it is certainly possible.

However, If Dr. Marshall's principal hypothesis is correct, that low vitamin D levels are the result of disease, then he is saying that cancer causes low vitamin D levels, not the other way around. The problem is that Professor Joanne Lappe directly disproved that theory in a randomized controlled trial when she found that baseline vitamin D levels were strong and independent predictors of who would get cancer in the future. The lower your levels, the higher the risk. Furthermore, increasing baseline levels from 31 to 38 ng/ml reduced incident cancers by more than 60% over a four year period. Therefore, advising patients to become vitamin D deficient, as the Marshall protocol clearly does, will cause some patients to die from cancer.*

I will not write again about Dr. Marshall's theories. No one in the vitamin D field takes him seriously.
Personally, I admire anyone willing to swim against the tide and raise alternative theories. I have done the same with influenza and autism. However, I agree with the New York Times' An Oldie Vies for Nutrient of the Decade and Jane Brody's conclusion, "In the end, you will have to decide for yourself how much of this vital nutrient to consume each and every day and how to obtain it."

I agree. You will have to decide for yourself.

John Cannell, MD
The Vitamin D Council

*This is one of the reasons I continue to believe that Charles' advice is irresponsible. If his theory is wrong, and zero carb has no D-increasing effect, low D blood levels are increasing people's risk.

There is a link with low vitamin D and insulin resistance:
Quote:
Vitamin D isn’t just for bones anymore. Researchers at The Rockefeller University Hospital have begun a clinical study to explore a possible connection between vitamin D deficiency and insulin resistance. The hypothesis, that raising blood vitamin D levels in an obese, insulin-resistant population will improve the subjects’ ability to metabolize sugar, could have eventual implications for patients with type 2 diabetes and their doctors.

If low carb diets improve insulin functioning, then increasing vitamin D through supplements may not be necessary. There is a lot of information out there on the internet. Dr. Davis recommends that vitamin D levels need to be checked often in order to adjust the supplementation.

Beedub Wrote:
It must be true -- it's on the internet!

Consider the following in hind site:

It is 1960 or whatever year Ancel Keys is purporting to put forth his BS regarding saturated fat now being the reason for heart disease and obesity in this country. You are on the internet and you find this. He has credentials just like Canelli. Is he right? Is he wrong? He makes a very convincing case as you read his position. Has anyone looked and considered an alternative hypothesis. Who you going to call?

Look at the current research that is now coming out about vitamin supplementation perhaps causing more harm than good. Adell Davis was preaching about vitamin supplementation for 40 years before she
died of cancer. Now they preach about phytonutrients. All I am saying is that it pays to be skeptical. Seriously skeptical. Even regarding Dr. Davis who I have vigorously defended in his approach to heart disease. It takes eons for the scientists to get it right. BTW I also don't believe mankind is responsible for global warming in spite of dire warnings from 'I invented the internet' Al Gore. No one but no one who is PRO global warming wants to listen one whit to the skeptics of global warming. In fact they are doing what as far as I can tell the same thing that Keys did to his critics. Cutting them off. Deriding them, etc.

One more thing. Consider peptic ulcers and their root cause. What was the common wisdom about that at the time? Stress, spicey food, etc. It took an Australian researcher to figure out that it was the H. Pylori bacteria at the root cause of ulcers. I can't recall the whole story of how he came to find this but there are still doctors to this day that believe ulcers are not caused (in a lot of cases, maybe not all) by H. Pylori bacteria.

I am basically a skeptic and a cynic at my core. I don't say Canelli and his D council are wrong. But researchers have a vested interest in furthering their own ends. Basic human nature. That is what was SO compelling about GCBC. The science wasn't science. We want to trust what we read. Humans are basically trusting individuals. They want to believe what they read is true especially when it comes from what they believe are reliable sources. Sometimes it is just better to let it all pass until it has all been decided as best it can be.

I am with you here lowcarbrun. The following study attempts to explain how gastric bypass rapidly reverses diabetes symptoms. As far as I can tell the reversal has nothing to do with Vitamin D. This is important as diabetics are generally regarded as insulin resistant.

---

Gastric bypass: I like this part: "The bottomline, according to Mithieux: the intestine deserves more respect. "Up to now, the intestine had been considered like a machine to assimilate nutrients. We've now begun to realize that it is a complex endocrine organ" with particular importance when it comes to glucose metabolism."

Interesting ... it was a similar story with adipose fat wasn't it? Considered at one time just a sort of dumping ground, but now understood more as a functioning organism.

The human body is a wonderfully complex entity; as I've said before, we tinker with it at our peril. At least tinkering with the diet (especially if we believe we have about 4 million years of evolution on our side) seems to be less risky than tinkering using pills, or (gulp!) surgery. (I realise the gastric bypass example was used to illustrate a specific point MAC; I know you weren't advocating it! 😊).

---

On intestines, and blood glucose:

Quote:
The upper part of the small intestine contains cells that release hormones into the bloodstream when they are stretched, as after a meal. These hormones signal the pancreas to produce some insulin to prevent the blood sugar rise that might otherwise follow the digestion of a meal. Large meals will cause greater stretching of the intestinal cells, which in turn will secrete proportionately larger amounts of these hormones. Since a very small amount of insulin released by the pancreas can cause a large drop in blood sugar, the pancreas simultaneously produces the less potent hormone glucagon to offset the potential excess effect of the insulin. If you’re diabetic and deficient in producing insulin, you might not release insulin, but you will still release glucagon, which will cause gluconeogenesis and glycogenolysis and thereby raise your blood sugar. Thus, if you eat enough to feel stuffed, your blood sugar can go up by a large amount, even if you eat something undigestible, such as sawdust.

The first lesson here is: Don’t stuff yourself. The second lesson is: There’s no such thing as a freebie.* Any solid food that you eat can raise your blood sugar.

Charles Wrote:
So would you pound it into shreds and then dehydrate it or is it enough to just dehydrate it?
I think you're supposed to dehydrate it first (turn it into jerky) then shred and pound it before adding the fat. At least that's what it says in Stefansson's book.

montmorency Wrote:
This general question was one I had after reading GCBC: In a perfectly keto-adapted low-carber who still has some body fat to burn, what is it that ever makes them hungry? I asked the question on Dr Eades' Forum, and got a reply, but I don't think he really knew; he seemed to think leptin might come into it.

I can think of a couple of reasons. One, that the person is still producing too much insulin. Two, that other nutrients are needed by the body other than the fat that's stored in the cells. Protein is one example.

daveo Wrote:

Yum, meat brownies! Thanks for the links. The homemade recipe instructions were very interesting. It sounds like a lot of work though. Maybe I'll wait until Charles makes some and order some from him. I'm feeling a bit lazy.

RE: Zero Carb / Meat and Water - sean - 09-06-2008 02:14 PM

"Researchers at Johns Hopkins are reporting what is believed to be the most conclusive evidence to date that inadequate levels of vitamin D, obtained from milk, fortified cereals and exposure to sunlight, lead to substantially increased risk of death."

John Hopkins, why didnt you say so Beedub?? I would have bought even more Vit D pills. Hopkins being the most prestigious cancer/health research institute in the world one can only stand in awe at recent developments there. Why a little less than a year ago the Director, yes the head honcho of the incredibly prestigious Kimmel Cancer Center of Hopkins died in his 60's of um er ah well, cancer....Leukemia to be exact. Does anybody else see the lunacy of this????

But but but, Mr Martin Abeloff (before his death) did, and I quote, "double the size of the faculty, raised research funding six fold, and the cancer complex grew to almost 1 million sq. ft. of treatment and research space."

Could the 1 million additional sq ft have been too much distance for his colleagues to warn him of his demise from lack of Vitamin D supplements??

I dont mean to make light of Abeloff's death, however, the fact that he is remembered for money raising and building aesthetics should maybe put some of Hopkins' research into perspective.

*This is one of the reasons I continue to believe that Charles' advice is irresponsible. If his theory is wrong, and zero carb has no D-increasing effect, low D blood levels are increasing people's ris

Another classic quote. Please please please share the other reasons. So far the Vit D talk has been riveting...dear Lord

Charles adapts a certain lifestyle, has dramatic success, tells people actively searching for help exactly what he did and now his advice is IRRESPONSIBLE???

I actually live fairly close to John Hopkins and maybe I will take some pics of their "researchers" walking around and we can oh I dont know juxtapose them with some of Charles' pics.....Maybe get a better feel for who might be irresponsible.
I have been contemplating making pemmican too. But it kind of sounds disgusting LOL! I like beef & beef fat but I just can't imagine eating a cold beef fat bar. Wouldn't it be greasy? I have seen recipes that had nuts & berries in it, that sounds better, but I don't eat nuts & berries! Maybe I'll try making some tomorrow. If I don't like it I can always throw it in w/ my ground beef breakfast.

I just LOVE Sean's posts!

Thanks Sean!

Not sure what's so great about kvetching about increasing funding in the battle against cancer.....

I'm beginning to join the ranks of those who are about sick of this subject. If you think you need vitamin D, then by all means, please take vitamin D. I'll continue to be irresponsible and ignore the hype.

Best regards all,
Charles

I understand how Pemmican is made, but I was just hoping to get some modern pointers on it. Daveo makes it sound easy. I know we have modern dehydrators and blenders so a lot of the work would seemingly be eliminated. Fat is easy to procure and render as well. I think it would be great to have as portable food and it would be much better for my children than the salty jerky and summer sausages that they currently take for lunch. Interestingly enough, they still control their hunger very well and they are able to go 6 to 8 hours between lunch and dinner. For that, I'm thankful.

Regards,
Charles

LindaSue,
This part of a column in LowCarbExaminer San Francisco on August 25th, 2008--Cleochatra's column--it's much simpler using ground beef. Extra fat could still cover the dried meat. She has more info and variations on her site including info on the jerky extruder.
MAKE YOUR OWN BEEF JERKY

Must-have: Jerky extruder. Don't use Pla-Dough toys. Basic beef jerky

1 pound ground beef
1 tsp pepper
1 tsp salt

Mix hamburger with seasonings until well blended (I use my Kitchenaide mixer with the dough paddle) about 1-2 minutes.

Using an extruder, pipe jerky onto trays.

Food dehydrator: Let dry for 6-7 hours or just before meat snaps in half. Practice with this method will show that you can dry slightly less than the snap-point for more tender jerky.

Oven: On the lowest setting possible, and with the door ajar ever so slightly, let dry on racks for or until meat is close to breaking when bent in half.

Store in a ziploc bag.

Each pound makes 8 ounces of dried beef jerky. The beauty of this method is that the carb count is 0, and your caloric count is only as high as the amount you consume of, essentially, only ground beef.

RE: Zero Carb / Meat and Water - seann - 09-06-2008 03:07 PM

The easiest way I've found to make pemmican is this:

Buy a 3 lb bottom round roast as lean as you can find.

If you get grocery store suet fine, I have 150 pounds of suet from a farmer up in NH that tastes like liquid gold. Either way I use about 3 pounds of suet to match the meat. Probably too much but it's been working.

So, some store bought lean and grass fed fat just to be on both sides of the argument. Plus most of the arguments are about what's in the FAT of standard vs. grass fed, and grass fed fat is dirt cheap.....

I put my oven on the lowest setting (170) and leave it open as that is too much heat. Bear recommends no more than 104, and with the door open mine was about 110.

Slice the lean into very thin slices and lay on baking tray (I don't know what it is called, but I'm talking about the thin metal cage looking things.) which is set on top of pan to catch drippings. 2 of these is enough to fit all thinly sliced meat.

I then cut up the 3 pounds of suet into small chunks and fill four pots (one on each burner) with chunks that I melt on very low heat.

The meat dries in about 8-9 hours, and the suet is rendered in about the same time.

When the meat crumbles it's ready. I break it up in my hands and then use a food processor/blender (either works fine) until it is stringy and dust. I line a brownie glass pan with all the shredded dried meat and then pour the suet over it. I mix it all in and put the extra suet in a glass jar for ribeye dippings. Put
the pan in the fridge and soon it looks like iced brownies. I also add a little cayenne pepper to the meat.

At first taste it's not bad, bland but edible. After a day or two it was all I wanted. I don't know if it was the nutrients or what, but I gave it to my 2 young boys and the same thing happened. At first it was no big deal, but I threw a couple shakes of Tobasco and now they want it everyday for their school lunch.

There is definitely something to it.

Very easy to make, everything prepares itself while you carry on with your business.

Cleanup is greasy to say the least but very worth it.

I've had US wellness meats version, way overpriced and not that good in my opinion.

This is cheap, good and it holds you over for a very long time.

Dana Wrote:
I completely agree w/ MAC here. I am also skeptical about everything. Only after reading thousands of pages of studies & writings can you begin to see a common thread of truth about something. No one person or study knows everything.

You may not believe it, but I'm a skeptic too. If you read GCBC then you know that it wasn't at all about the many studies and the considerable science that was presented. The story was quite simple. He demonstrated that the diet-heart controversy was not at all scientific.

He does recommend certain studies, but that's only if you want to prove the contention in a scientific way. There is a way to do science but it has not been applied to obesity and disease research. The same is true with these vitamin D studies. They want us to drink the Kool-Aid and just start popping pills before the results are in just as they did with cholesterol.

There are basic observations that we can apply to many, many nations and populations. For instance, in Tokelau, the people ate coconuts and fish and they were healthy for centuries. A trading ship started to come among them and gave them European foods. The population got sick with all the diseases of civilization. The ship, the Cenpac Rounder, went aground once and the people were cut off from the traders, they returned to their coconuts and fish. The people all lost weight and regained their health in a miraculous fashion. Once the Cenpac Rounder got going again, the problems re-surfaced. Does it take all sorts of complicated theories to explain what happened here?

In this country, Ancel Keys was not a jerk, he was a well-meaning scientist. He noticed that we were all sick with heart disease and the diseases of civilization. Our sugar consumption tripled and we ate a bunch of meat in those days. However, the war began and during the 6 years of World War II, we had an
almost complete reversal of our diseases and people were healthy and active. He only sought to recreate the success by attempting to pinpoint the culprit. There were only three choices, physical activity, sugar or fat.

Whatever was responsible caused us to be more active and we can be sure that food rations required us to eat less food. There is no doubt that these observations were true. The culprit was either lower fat due to rationing, lower sugar since it wasn't so readily available or the lower calories? He bet on the fat and calories since fat has less calories than sugar. He was wrong.

The point is that the solution was not very complex or scientific. Dr. Spock and your grandparents knew that carbohydrates were fattening and fat was good for us. Keys and his fellow "experts" came along and told us differently. Guess what, we're still sick. All I did was took the blue pill and went with fat and discarded sugar. It has miraculously returned my health. Now someone wants to tell me that I also need supplements when I never needed them before.

Why does the solution have to be so complicated that we all have to use computers and fitday to eat a decent meal? Why do we all have to take pills concocted in a laboratory to be healthy? Surely the solution is simpler than this. I'm betting my life on the fact that it is and so far so good!

Regards,

Charles

**RE: Zero Carb / Meat and Water** - LindaSue - 09-06-2008 03:34 PM

Thanks for posting the jerky recipe, con. I also want to try my hand at making jerky so that might come in handy. However, ground beef wouldn't work for making pemmican. The meat used to make the jerky has to be pretty nearly fat free for it to work. Ground beef is loaded with fat and there's no way to extract the fat before turning it into jerky.

---

**RE: Zero Carb / Meat and Water** - suzannevea - 09-06-2008 03:36 PM

I make my own jerky all the time, it is really easy

---

**RE: Zero Carb / Meat and Water** - FormerDonutJunkie - 09-06-2008 04:01 PM

Here's a [Jerky Pan and Rack](https://www.ganderoutdoors.com/) from Gander Mountain, costs $19.99 and extra stackable racks are $9.99 each. Reason I know about these is there's a Gander Mountain nearby and I've been considering these for making my own jerky. These can be used in the oven and therefore not as much cash outlay as a dehydrator. However, they also have a [Gander Mountain Guide Series Dehydrator](https://www.ganderoutdoors.com/) for $299 and a [LEM Products Dehydrator](https://www.lemproducts.com/) for $199 if you're interested in the whole ball of wax.

Here's the [Aluminum Jerky Extruder](https://www.ganderoutdoors.com/) also available at Gander Mountain for $49.99. They also have a [plastic one available for $29.99](https://www.ganderoutdoors.com/).
Con, I had read Cleochatra's Jerky Recipe when she posted it and it sounds like it might be a good alternative to the over-processed excuse for jerky you buy in the stores. And being ground beef, I'm sure it won't be tough as shoe leather. Problem around here, even among local jerky producers, is they want to load it up with sugary marinades.

And with the ground beef it would be easier to blend in any spices you wanted to add. I think salt and pepper might just be the way to go, but whatever floats your boat. I kind of like the minimalist approach.

---

Yeah I thought it would be a little easier to chew-if fat is a problem perhaps one could buy ground sirloin or grind your own chuck minus the fat?

---

Interesting LindaSue. Do you know why that is though (why ground beef wouldn't work for pemmican)? I'm curious since the pemmican is going to end up with a whole lot of fat in the end. I've never knowingly seen pemmican so I know very little about it.

Before someone posted the picture, I had wondered if jerky was the same as corned beef (what I think you call bully beef). Corned/bully beef always looks nice and fatty. I guess the problem with it is that it's probably too salty, and possibly hasn't been made in a way that preserves its nutrients. I remember it was a staple here in the 50s and 60s, but went out of fashion; can still get it though. I guess it was also a staple in the war years, probably alongside pemmican.

BTW, I think you are right in your reply to me about what makes an adapted low-carber hungry. If one's metabolism is broken (after maybe decades of high-carb), maybe one will always produce too much insulin, and this may last for life. Low/zero carb may be an excellent preventive, and also ameliorate a broken metabolism, but it can't work miracles.

I hadn't thought of the protein requirement as being another hunger "wake up call", but it sounds plausible. Wonder how it would work?

The reason is that the excess water won't be rendered out of the fat in the beef like it will the suet. This will cause it to go rancid quickly. One of the features of pemmican is that it will last a long time outside of the fridge. Also, a fatty meat won't dry very well and will hard to grind down.

You're right. Jerky is nothing like corned beef. We do have corned beef here and I've never heard of bully beef. According to Wikipedia, it sounds like bully beef is the corned beef that they sell in cans/tins over here. It tastes a bit like real corned beef but it's a processed pressed ground meat product.

RE: Zero Carb / Meat and Water - Mel - 09-07-2008 10:04 AM

Mike said: "BTW, I think you are right in your reply to me about what makes an adapted low-carber hungry. Mike,

I read somewhere that the minimum amount of insulin released at any time is directly dependent on the amount of body fat on the body. So I'm thinking that my "fully adapted to low-carb" body will release ever decreasing amounts of insulin as my body fat goes away. But, I may be one of those people who cannot get the last 20 or 30 pounds off due to so much time in metabolic disorder and therefore always have to deal with the hyper insulin secretion. I have recently tried giving up coffee and it has helped some but providing food for my kids keeps food in the front of my thinking and I get unwanted insulin surges.

Melinda

due to so much time in metabolic disorder and therefore always have to deal with the hyper insulin secretion.

I fear that I may be in the same category. I'm around 28 lbs away from my perceived goal (not sure how realistic it was to begin with though), and it's sure going slow. I'm not totally zero-carb yet, but I can't be that far off. There may be other factors at play of course. Not sure how long I was seriously overweight, but I've probably been somewhat overweight for a couple of decades.

Quote:
I have recently tried giving up coffee and it has helped some but providing food for my kids keeps food in the front of my thinking and I get unwanted insulin surges.

I know what you mean. I seem to have conquered snacking (thanks to plenty of fat), but I have to try to keep temptation foods well out of sight.

Well that's where I am at Charles!!!!!! I now eye ball my portions don't eat carbs and have forgot about vitamins and I have never felt better😊

RE: Zero Carb / Meat and Water - suzannevea - 09-08-2008 01:35 AM

I am 100% in the group of just eating till satisfied. I punch in my numbers every so often so when people worry about eating too much fat, calories, or protein, I can tell them how much I eat. I read all these posts about people eating 100 grams of protein and thinking it is too high, then I can tell them mine is over 300 a day. My fat could never be measured cause I have no clue how much fat and caloried are in the beef fat I eat. I know how hard it is when you start, after years of controlled eating and trying to stay under a certain number of calories a day, but you have to trust that it will work. And by "work" it does not mean you will get a supermodel body. You will be healthy emotionally and physically. People all have different bodies and we will all have different results. I also believe that people who have been overweight since childhood MAY have a harder time achieving their ideal goal.

RE: Zero Carb / Meat and Water - FatGirlOnAtkins - 09-08-2008 06:40 AM

Oh, wow... I don't come on here for 5 days and look how far behind I am! I'm trying to catch up. The stupid cut on my finger turned out to be a staph infection and I kept getting worse and worse until the doctor put me on antibiotics. I have been eating terribly this week, but I did get on the scale this morning anyway. Up 4 pounds, ugh. I am back on it today, getting ready to go running. Feeling SO much better!
RE: starting meat and eggs today - pamela702 - 09-08-2008 06:54 AM

I weighed today and since i started m/e (which was Friday) i have lost 1.8 pounds. That's great! I feel really good eating this way, i have had no headaches or anything like that. And i definitely am not hungry. My calories are higher than when i was on induction too. Now i am trying to decide how long to stay on this, because my body seems to catch up with me and adjust fast to what i am doing. I have read where some do the m/e for a week and on the weekends have normal induction foods. I know when i get closer to my goal weight i will definitely stay with m/e or even go to just meat. I really do have more energy, and i am sleeping better also. Hope everyone has a great week....Pamela

The thing that confuses me about this theory is how would anyone ever be able to lose weight? How would one get insulin down if they have a lot of fat and how would they burn fat if their insulin is too high??? It also implies that eating the right things wouldn't help because you're still going to release just as much insulin eating zero carbs as long as you still have too much fat on your body. So, how would a person get rid of any of their fat to bring their insulin down? Maybe I'm missing something but it just doesn't make sense to me.

There are really two types of insulin secretion as I understand it. That which is released by the pancreas in response to a meal (Phase I and Phase II response) and the constant drib drib of insulin you are always secreting. Note the low insulin levles while sleeping when you are living off your fat stores in the graph below.

See this article on Stargazey's blog that shows you how the level of insulin went down in diabetics after 2 weeks on Atkins induction. They also had weight loss during this 2 week period. The lower insulin response is in blue.

I agree with you, LindaSue, I don't buy the theory either. Taubes doesn't say this. What he does say (not necessarily in the book) is that it all depends on the sensitivity of fat tissue to insulin. If a person has been obese for the majority of their life, it may be that their fat tissue is just that sensitive to insulin that even small amounts of insulin will stimulate fat storage.

We certainly can condition our insulin response and anyone who has improved their response can readily attest to this. Even after I've lost weight, I've recently conditioned myself to eat only twice a day. I used to eat breakfast, lunch and dinner during the weekdays, but on the weekend, I would only eat twice. I wondered why this was so. Therefore, I stopped eating breakfast and just decided to wait until lunch to eat. This works so much better and extends my hypophagic stretch during the night and forces me to eat a little earlier in the evening. Since changing this regimen, I've been able to stay in the 140's weight-wise and I go longer periods without eating much more effortlessly.

Regards,

Charles

Some antibiotics like Bactrim or Septra (drug of choice for Staph) can cause a drop in your blood sugar. Resulting in that unwanted four pound gain.

That's great, Angela. I get crazy when I see the "portion" word, but I understand what you mean. In *Not by Bread Alone*, we find that when people were getting adapted to eating pemmican, they were advised not to overeat because one can get nausea and feel bloated if they eat too much of it. They said it was better to eat a good portion and then nibble if necessary, so you can stop when you're full.
I've found personally that I have to work really hard at eating until I'm full. I no longer enjoy the "Thanksgiving Full" feeling each time I eat; however, I am careful to make sure I'm full. I think it gets harder to recognize satiety as you get closer to what you perceive to be a goal. On the other hand, I think that overeating only results in 2 to 5 pounds above what you should be anyway.

This is the reason I want to try pemmican. I want to make it and then eat it for a month or two. Should be easy for a zero-carb person. The reason is that it is easier to portion and find out how much fat and protein it takes to satisfy you. Moreover, you don't have to worry about the fat to protein ratio since it was taken into account with the production.

I found that Stefansson was better able to manage his all-meat diet after pemmican because when he ate fresh meat, he knew what the correct fat ratio should be based on his experience with pemmican. I think it's hard to get the correct amount of fat if you've never experienced what the correct ratio should be.

Charles

RE: Zero Carb / Meat and Water - LindaSue - 09-08-2008 07:43 AM

About what time do you eat your lunch when you only have two meals, Charles? I find it so much easier to put off eating first thing in the morning than to go long stretches without food later in the day. If I eat my last bite of food before 7:00 pm the night before, I can often go at least 13-15 hours before eating my first meal the next day. However, I can only seem to last 2-4 hours between lunch and dinner before I'm very hungry and have to eat something. Maybe it would be to my advantage to try and hold out until closer to noon before having my first meal since it's not so hard for me to do that. I'm much more busy in the mornings so my mind isn't on food as much as it is later in the day when things slow down.

If this is the fact it would explain the reason I can be on 30 grams of carbs and not lose weight but if on less than 10 I can, all be it very slow. I have been overweight for all but about 1 year when I was on less than 800 cals a day.

---

**RE: Zero Carb / Meat and Water - montmorency - 09-08-2008 08:08 AM**

Charles, I was thinking of GCBC, page 439, para 2:

"What's been clear for almost forty years is that the levels of circulating insulin in animals and humans will be proportional to body fat..." et seq.

The way I had interpreted this was that quite possibly it's not directly proportional, and the more overweight you are the higher your baseline insulin is, and therefore the harder it is to burn stored body fat.

Once you go to LC/VLC/ZC, you would reduce your baseline insulin and find it easier to burn stored body fat, the lower the carbs, the easier.

I don't know exactly how the mechanism of net fat loss would work, but since your insulin is still going to be higher than it "ought" to be, you can't just easily burn body fat, for fuel, and it's possible you'd feel hunger sooner than a person who is not overweight, even on the identical diet. I'm still finding this hunger issue quite confusing actually. I read your earlier reply to me on this Charles, and it's given me food for thought, but I'm not quite there yet. I get confused when people talk about short term and long term fuel, and coarse and fine tuning. Taubes drops hints about all this, but I don't think it's fully explained in the book.

Looking back, you said:

"When we're hungry, it's not that we have "exhausted all of our fatty acids." We have a great capacity to ignore hunger if we want to. After a few minutes, the hunger feeling goes away and it was like we were never hungry. This all shows that hunger is an energy request from the cells to basically top off the long-term fuel supply. That doesn't mean it's depleted."

Yes, I think I understand that, but if someone's insulin levels are too high, such that stored body fat is not available to them as fuel, then it will be as though (will feel as though) that fuel were depleted, i.e. they will feel hungry. That has been the way I interpreted Taubes on hunger.

I think when I mentioned depletion, I was referring to someone like Bear who is down to minimal body fat, and presumably would actually deplete it if he went without food for a few days. (Might also apply to you Charles, though I appreciate that you do get hungry, unlike what Bear reports - His age might also be a difference here, as I think some people have alluded to).

---

**RE: starting meat and eggs today - Charles - 09-08-2008 08:09 AM**
Lauren Wrote:
I would think that both groups would have reduced insulin and therefore would both be running on fatty acids. What is the mechanism that would cause the high calorie group to lose more weight?

Your question is a great question in theory but the truth is that it probably wouldn't play out like that. What do I mean?

It's hard to call one of the groups a "high calorie" group because every time you try to get people to eat a high number of fat and protein calories, they have an exceedingly difficult time due to the satiety factor. Ethan Sims related how people were "staring at stacks of porks chops" and they refused to eat the required number of calories because they couldn't stomach anymore.

Because of this, I'll call your "high-calorie" group, the "unrestricted calorie" group. It's well-known that people on very low carb diets voluntarily lower their calorie intake because their hunger is controlled.

The "unrestricted in calories" group would lose more weight because they would better respond to their hunger than the low-calorie group. When hunger is satisfied, the body is better able to manage weight and mobilize fat. The body can readily use more energy and doesn't have to be concerned with storage and the long term fuel supply.

The restricted calorie group would not be able to mobilize fat as readily because the cells would not be getting the required fuel for its activity. Because of this, the metabolism would slow and the body would store a greater percentage of fatty acids than it should. If the body is deficient in dietary protein, then it goes after the muscles to get the protein it needs. This weakens us and causes us to lose muscle mass. When you lose muscle, you will store more fat to protect against starvation.

This is the reason I stress that it is so important to "eat to appetite" and don't eat when you're not hungry. It's difficult to do this because we don't always have the proper fat to protein ratio present in the fresh meat we eat. When protein is high, we tend to eat more and don't get sated as fast.

Charles

I would advise you not to think too much about goal weight and that sort of thing. Weight is regulated by your body not your eating habits. All you can do is stay out of your body's way and let it do its thing. Your weight and health will improve as you eat properly. Your body will decide when you've lost enough weight and will fight very hard to keep you at the weight it arrives at.

The better thing to do is find the diet that you will likely use for the rest of your life, adapt to it, and let your body take it from there.

Regards,
Montmorency Wrote:
Charles, I was thinking of GCBC, page 439, para 2:

"What's been clear for almost forty years is that the levels of circulating insulin in animals and humans will be proportional to body fat..." et seq.

Thanks for finding that. I went looking and didn't find it but knew it was in GCBC as well.

However, from what I have been able to get by googling, it is not total body fat but the size of the fat cells that determine plasma insulin levels.

"The usual covariates of adiposity--adipocyte size, total body fat, and food intake--were experimentally dissociated using three new models of altered adipose tissue morphology in the rat. It was thereby possible to test the hypothesis that plasma immunoreactive insulin level (IRI) is a function of mean adipocyte size. In two of the models, experimental and control rats differ substantially in total body fat but show no difference in mean adipocyte size. In these models, no difference in plasma IRI was found between experimental and control animals. In a third model, experimental and control rats differ in mean adipocyte size but not in total body fat or daily food intake. In this model, plasma IRI was found to differ between experimental and control rats. These observations demonstrate a close link between adipocyte size and plasma IRI and suggest that the hyperinsulinemia and peripheral insulin resistance of obesity are more likely due to adipocyte hypertrophy than to increases in total body fat or daily food intake."

In other words, big fat cells lead to higher insulin levels.

As well as this study in humans:

"Adipose tissue biopsy and an oral glucose tolerance test (OGTT) (50 g) were performed in 17 non-hyperlipoproteinemic subjects without overt diabetes mellitus. All the persons were weight stable at the time of investigation. A significant correlation between fasting insulin concentration and the mean adipocyte size was observed, whereas no correlation was noted between the ideal body weight index and fasting insulin level. Persons with larger adipocytes had elevated insulin levels as well as higher and longer lasting increments following the glucose challenge. They also exhibited significantly higher mean glucose levels during the OGTT. When these patients were matched for glucose tolerance with the subgroup having smaller mean adipocyte sizes, the difference in insulin levels was still demonstrable. The importance of adipose cell enlargement regulating basal and stimulated insulin output is underlined."

Also found this study:
"CONCLUSIONS: beta-endorphin and insulin concentrations in overweight and obese prepubertal children are not only higher than in non-obese children but also are positively correlated with each other and with the percentage of body fat."

This bears out what Taubes said. It does not mean that the obese do not have bigger fat cells as indicated by the previous studies are wrong.

A question: is a person obese porportional to their insulin overproduction/resistance? So the 200 lb. person is more hyperinsulinemic than the 100 lb. person who is more HI than the 50 lb. overweight person etc. Therefore, sometimes the heaviest people just can't get their insulin low enough?

---

**RE: Zero Carb / Meat and Water** - PatTee - 09-08-2008 08:47 AM

I find that eating 2 meals a day works for me most of the time.

My 1st meal eaten between 11am -3 pm . Depending on time of 2nd meal , the night before and what it
is. Beef seems to hold my hunger levels down more so that chix, fish, pork even with added fats. Then there are the days that defy what I've just said and I want to eat 3x's a day or more!

And then the written words of Charles appear in my mind - eat when you are hungry and don't when you are not 😊

My system seems happy with this approach (also zero carbs), so I'm sticking with it, in hopes that I'll get to the fat burning machine, lol !!!

😊's, Patti

Charles Wrote:
pamela702 Wrote:
I know when i get closer to my goal weight i will definitely stay with m/e or even go to just meat. I really do have more energy, and i am sleeping better also. Hope everyone has a great week....Pamela

I would advise you not to think too much about goal weight and that sort of thing. Weight is regulated by your body not your eating habits. All you can do is stay out of your body's way and let it do its thing. Your weight and health will improve as you eat properly. Your body will decide when you've lost enough weight and will fight very hard to keep you at the weight it arrives at.

The better thing to do is find the diet that you will likely use for the rest of your life, adapt to it, and let your body take it from there.

Regards,

Charles

I had never thought of it that way, and you make a good point. I will take it to heart, thanks Charles.

Pamela

RE: Zero Carb / Meat and Water - Charles - 09-08-2008 08:59 AM

montmorency Wrote:
"What's been clear for almost forty years is that the levels of circulating insulin in animals and humans will be proportional to body fat..." et seq.

The way I had interpreted this was that quite possibly it's not directly proportional, and the more overweight you are the higher your baseline insulin is, and therefore the harder it is to burn stored body fat.

It's not that it's harder, he is showing that the amount of fatty acids that get stored is directly proportional to the amount of circulating insulin. A person at this stage has not taken any steps to change their diets, thus affect their insulin levels. In fact, oftentimes the more obese you are, the easier it is to drop a tremendous number of pounds. It gets harder after significant weight is lost.

Mike Wrote:
Once you go to LC/VLC/ZC, you would reduce your baseline insulin and find it easier to burn stored body fat, the lower the carbs, the easier.

That's right.

Mike Wrote:
I don't know exactly how the mechanism of net fat loss would work, but since your insulin is still going to be higher than it "ought" to be, you can't just easily burn body fat, for fuel, and it's possible you'd feel hunger sooner than a person who is not overweight, even on the identical diet.

This is true as well, but circulating insulin is not the same as insulin secretion as MAC has pointed out. When we contemplate a meal, insulin we secrete insulin and the serum insulin level increases which traps fatty acids into fat tissue. When we actually eat the food, if there are carbs present, then we secrete more insulin which even further increases the circulating insulin. However, once the food digests and hunger ebbs, then the liver instructs the pancreas to shut off the insulin and the level decreases. Once it decreases, the fatty acids get released from fat tissue and they again flow. This is what we refer to when we say "stabilizing blood sugar."

In an obese person, this cycle happens even between meals so that fatty acids spend more time trapped in fat tissue than that of a normal person. When going on the VLC/ZC diet, you are conditioning the pancreas to secrete less and you are trying to increase the time that fatty acids remain in circulation. When the fatty acids are circulating, you are "burning fat." When they are trapped, you are "storing" fat.

Mike Wrote:
I get confused when people talk about short term and long term fuel, and coarse and fine tuning. Taubes drops hints about all this, but I don't think it's fully explained in the book.

[...]

Yes, I think I understand that, but if someone's insulin levels are too high, such that stored body fat is not available to them as fuel, then it will be as though (will feel as though) that fuel were depleted, i.e. they will feel hungry. That has been the way I interpreted Taubes on hunger.

No. The feeling of hunger comes when insulin gets secreted because insulin will drive all the nutrients (I mean all of them) out of the bloodstream. The bloodstream is the long term fuel supply. Insulin acts upon the bloodstream by basically clearing it out. Once it's cleared, practically all the organs and tissues are temporarily without any nutrients or fuel. They communicate the problem through the central nervous system which provides the signal of hunger.

Because this event may have started as a "hypersecretion" due to hyperinsulinemia, the person may not actually be hungry. However, insulin doesn't care and goes about its business of clearing the bloodstream and causing this feeling of hunger, regardless of whether we're hungry or not. That's the major problem and that's what Taubes (citing someone else) meant when he said that a person who is overweight has "lost the ability to lose weight." Some gross aspect of their diet makes a person unable to mobilize fatty acids for longer periods of time than what is natural. By the same token, removing that gross aspect can reverse the situation as MAC's chart makes clear.

Mike Wrote:
I think when I mentioned depletion, I was referring to someone like Bear who is down to minimal body fat, and presumably would actually deplete it if he went without food for a few days.

I've read somewhere that even a person with minimal body fat still has enough fat to walk from Miami
to New York. The long term fuel supply is the bloodstream and fatty acids are always circulating and moving throughout the stream. The short-term supply is the gut. When we get prompted to eat, the stream is just showing signs of faltering, not that it's empty. You would receive hunger signals quite severely if your bloodstream were actually depleted of fatty acids. I think it's possible to eat before feeling any signal from the nervous system and therefore not experience feelings of hunger.

For instance, Taubes cited research from Bistrian and Blackburn that said if a person is fasting and they break their fast with fat and protein, they could eat a small amount and not experience any hunger. However, if that same person breaks their fast with carbohydrates, they will experience all the symptoms of food deprivation. We found that Donaldson and Sidbury both used very low-calorie diets that were predominantly fat and protein and they controlled hunger remarkably. The zero-carb diet is the ultimate fast. During a fast, (which doesn't really happen, by the way) our bodies eat fat and protein. During a meal, we eat fat and protein.

Stefansson has shown that it only takes small amounts of pemmican to control hunger and enjoy perfect health. This all shows me that with the correct diet and a little conditioning, a person would not experience hunger in the conventional sense.

Regards,

Charles

**RE: Zero Carb / Meat and Water - Charles - 09-08-2008 09:04 AM**

Richard Wrote:
If this is the fact it would explain the reason I can be on 30grams of carbs and not lose weight but if on less than 10 I can, all be it very slow. I have been overweight for all but about 1 year when I was on less than 800 cals a day.

That's correct and that's the dirty little secret of the low-carb diet. It has ABSOLUTELY NOTHING to do with the amount of carbs a person eats. The real issue has to do with insulin and how well a person can mobilize fatty acids.

The carb total is important, but the relationship to weight gain is indirect. When reducing carbs, you're reducing your body's insulin response to the food you're eating. This also explains why some people can eat 30 grams and lose weight one year, and then the next year, those same 30 grams will cause weight gain. The insulin resistance continues to get worse when eating carbs of any kind and therefore over time your capacity to eat carbohydrates decreases.

Insulin resistance is closely associated with aging so it should not surprise us that as we get older, we can eat less carbohydrates.

Regards,

Charles

**RE: Zero Carb / Meat and Water - Charles - 09-08-2008 09:26 AM**

con Wrote:
A question: is a person obese proportional to their insulin production/resistance? The 200 lb. person is more hyperinsulinemic than the 100 lb. person who is more HI than the 50 lb. overweight person etc. Therefore, sometimes the heaviest ones just can't get the insulin low enough?

Not always in the way you think. When we talk about insulin resistance we have to understand that we can be resistant at different levels in different tissue and muscle sites within our bodies. Our serum insulin only measures that which is in our bloodstream. Insulin is also found in muscles and in fat tissue. The resistance can vary greatly.

You can have a person like me who became obese over a 17-year period. Most of my resistance was in my muscles so the insulin could not push glucose into all of my cells so my muscles could dispose of it. Most of America is this way. My fat tissue was resistant but not as much as my muscle tissue. Therefore, when I removed the carbs, I was able to shrink my fat tissue rapidly even on 20 to 30 grams of carbs. Of course, the lower my carbs went, the more I lost.

Another person may have been obese the majority of their lives and they might have more insulin resistance in their fat tissue. The years of low-fat dieting and little protein have likely atrophied their muscles and the fat tissue became the main repository for glucose and it became super-sensitive. For these people, even the smallest amounts of insulin can keep them storing fat. Even Taubes reports that obese people tend to have a much more intense "urge for the sweet" than others. They typically love bread and carbohydrates. For them, going zero-carb is a much more daunting task than it might be for others.

Most people go on a low-carb diet and they try to come up with low-carb versions of their favorite snacks thinking that it's all about the carb totals. If you understand the impact of insulin, then you can clearly see why they have so much trouble. The food in question does not have to contain any carbohydrate. If you associate "food" with sweet, you are in big trouble, period. Some people even associate meat with sweet, because they are used to Asian-style ribs and sweet-tangy barbecue.

**RE: Zero Carb / Meat and Water - chris_m - 09-08-2008 10:10 AM**

Good a.m.,
I extended an invitation to "THE BEAR" to join our discussion thread on meat and water. His response: You don't understand. I have already said all there is to say- it was, in fact all in my INTRODUCTION to the thread you mentioned.

All I can do is give you the simple rules, which no doubt were excised from my thread by the food-obsessed 'moderators' who conspired to allow the nutters to attack me and prevented my from a reasonable defense. You either accept the rules or not. There is no and cannot be any 'scientific' proof. I reach my fiftieth year on zero-carb, high-fat meat eating in October.

I am no different in my body than anyone who gains bodyfat on a standard menu.

IF you can overcome the deep-rooted food biases set in stone (learned social behaviour overwrites instinct)

--
Cheers.

Bear

http://www.thebear.org

I am on page 93 of 173 pages I printed out and I don't much blame him for his response. Dealing with the attacks that KEPT coming at him - you would have to wonder why he kept on as long as he did!! Having read this much of him - I have an idea what he would have said to our recent Vitamin D set-to!!

Chris m

RE: Zero Carb / Meat and Water - nyteez - 09-08-2008 10:21 AM

I read the Bear's thread, The WHOLE thread LOL! Took me a month. He really did answer every question I could have thought of concerning Zero carb. I was appalled at what the Moderators said to The Bear and how they treated him. I don't blame him one bit for not participating in forums anymore. I was so turned off by the rudeness of the moderators over there that I will never be a part of that forum.

Chris - the thread I read is 251 pages. Is that the one you are reading?

You would receive hunger signals quite severely if your bloodstream were actually depleted of fatty acids. I think it's possible to eat before feeling any signal from the nervous system and therefore not experience feelings of hunger.

This all helps (not just the part I am quoting) and it's somewhat clearer. The only part where I am still somewhat unclear, and in a way this is where we came in:

Compare someone like me who has started to do something about the obesity, been low-carbing, then very low carbing for some time, now eating mainly meat, very fatty and can go 4-5-6 hours between meals without any hunger, until bang, hunger strikes.

Now, I know I have at least 28 lbs of body fat that in theory could be mobilised for fuel. My generally high insulin level presumably means I cannot get access to that fuel, or I tend not to be able to get access to it ... I'm sure it's a "progressive" thing, rather than a binary either/or thing.

Compare that with yourself who is much longer adapted to very low carb, all meat, now normal level of body fat (or even slightly below normal from what you say). You also experience intense hunger when it strikes.

I don't think we are talking here about the insulin response when one thinks of a nice juicy steak, (or carbs) and clears the bloodstream of all fuel in preparation for a meal. I think here we are talking about "real" hunger, presumably caused, as you mention, by the fuel in the bloodstream beginning to falter.

Well, in your case it could be that at some level, the body "knows" you don't have that much spare body fat, and even though it's not depleted, it could soon be unless not topped-up, so it issues a hunger signal, and you eat.

In my case, if it "knew" how much spare body fat I really had, it would just mobilise some of that, and have no need to "falter".

The difference between us, I beg to speculate, apart from our now very different weights (for about the same height), is that (almost certainly), my baseline insulin level is higher (plus age differences, and probably my having been overweight for longer).
This is basically where I was coming from with my comment about circulating insulin being proportional to body fat. The fact that I still have significant excessive body fat is a kind of outward sign that I still have excessive circulating insulin, and for that reason, I cannot magically burn off all that fat for fuel ... not right away anyway. If that were not the case, I'd never get hungry, well not until I'd walked from Miami to New York and back a few times :-)
All I can say is that I have stuck to zero carb and water like glue for over a month. I was, initially, dropping weight. Lots of energy. No complaints, until....... The last 2 to 3 days I've been hungry all day. I do keep up with my intake via fitday. I eat the same foods over and over.....see Zero Carbohydrates: 100 Days Cheat Free Challenge for what I've actually been eating. I weigh weekly and I have not dropped an ounce this week. Today, I'm trying to eat even more fat, but it, usually, makes me nauseated, when I consume too much. However, today I haven't been sick, but I'm still hungry. I have a desire to eat vegetables, but I won't cross that line. I am 100% committed. It's odd that I was doing great and this week I'm not.

Just wanted ya to know what's going on with me. I'm not lean. I have 60# that I need to lose.

Okay, let's fill in the blanks. The difference between you and I is the rate of fuel to our cells, our insulin sensitivity in fat tissue, and the amount of insulin resistance in our muscles. Basically, it's only a matter of equilibrium. Both of our body's are at equilibrium. It might seem to you that mine is and yours is not, but that's not really the case. Even you are at equilibrium. Meaning, your cells prompt your body to replenish its fuel needs just like mine. Both of our bodies have fat tissue at a size that ensures our cells get nutrients at a particular rate.

My fuel rate is faster and more efficient than yours. My body is able to mesh my stored fat and dietary fat more efficiently than yours which has the net effect of me getting more energy out of my food than you get from yours.

Your body has decided that if it keeps your fat tissue at that size, your cells will get the proper nutrients at the proper rate. As you increase the rate and availability of fatty acids, then your body will respond by
decreasing your fat tissue because it can achieve that rate by solely relying on your stream without as much bolstering from your fat tissue. This is all dependent on how well and how consistently you manage your insulin because hypersecretion will gum up the works.

In a computer, the comparable situation would be adding more random access memory. When Windows does not have enough memory, it goes to the hard drive and creates virtual memory to bolster the random access memory. Using virtual memory is slower than using RAM so each time the body has to drop down to using slower virtual memory, the system slows down. When you add more RAM, the operating system makes fewer calls to the hard drive and it runs faster.

The same thing happens in your body. If your long-term fuel supply (RAM) can keep getting replenished from your gut, then it will not need to keep such extensive stores in your fat tissue (VM) to keep your equilibrium rate balanced. However, high insulin levels will keep you from mobilizing fat for fuel at the correct rate (not enough RAM), so your body has to compensate by dropping down to the fat tissue (VM) to get more fuel.

Hunger is the same for both of us. You probably don't eat any more than I do. My body is just better able to utilize what I eat than yours is right now.

So now the million dollar question is why is my body able to mobilize more of my fat than yours is? Because I secrete less insulin in contemplation of my food than you do. My fatty acids stay in circulation a little bit longer than yours. Taubes said that the metabolic defect only accounts for .001 of a percent slow down which accounts for the weight gain. It's not that big of a difference but it's enough to make the body compensate in radically different ways.

I never get hungry enough where I just "have" to eat. I can always ignore that hunger and go several hours longer. I ate dinner last night at about 7:00 p.m. I didn't eat today until almost 1:00 p.m. I meant to eat at noon, but I was busy so I just didn't get around to it. We all have the ability to do that, but in some people, the feeling of hunger will be too acute such that it cannot be ignored. Some people will get light-headed and dizzy and have real intense reactions. Insulin is that powerful.

Regards,

Charles

I don't think a tablespoon of coconut oil is enough to compensate for pork chops which are notoriously lean, even the fattier ones. You would have been better served with rendered pork fat. I can only eat pork with rendered pork fat.

I like coconut oil, but I don't think it's as satiating as the fats from the meats themselves. I had two pork steaks for lunch but I had a big chunk of rendered pork fat and I'm stuffed.

Regards,
Charles

Can you believe I still have not read the Bear? I can't believe it either. One of these days I'm going to get started on it. Practically everything I've seen from him has been spot-on and I think what I've heard of his story is incredible. I'm on a crash-course with the Bear so I know it's coming. Maybe it will be after the book discussion......

The pork chops had huge chunks of fat on them. As far as the coconut oil goes, I had quit using it for about 3 weeks now because the coconut taste had become sickening to me. I couldn't tolerate another bite of it, but I started it back today in hopes that it would help.
Hello everyone,
I've been lurking for a couple of weeks now. I was going to wait to post until I read the whole thread, but it's sooooo long 😔I've read about 100 pages so far. I started out doing Atkins '72 (meat, eggs and 2 loosely packed cups of lettuce a day) but have been cutting back on the salads. I've been totally meat and water (and coffee) the last week or so. I was losing well on Atkins '72 and am losing now, but prefer the ease of not counting carbs at all. I still drink coffee, but no cream or artificial sweeteners.

Charles, your body of knowledge is impressive. You really help break down some complicated subjects. I know you've written about hunger but I still have a question about it if you don't mind?

I don't seem to be able to go more than 5 hours without eating something. This WOE is great, but I find it hard to find acceptable food when I'm out. Meat always seems to come with some kind of sauce which inevitably has sugar in it and there is little meat that can one can eat while walking. I generally bring lunch and snacks with me, but sometimes this isn't practical. I would love to be able to go 10 hours without having to eat. Whenever I try to "overeat" in preparation for a long period of not eating, I get sick so I know this won't work for me. As my body gets more adapted to this WOE will I be able to go longer between meals? Thanks

The stupid cut on my finger turned out to be a staph infection and I kept getting worse and worse until the doctor put me on antibiotics. I have been eating terribly this week, but I did get on the scale this morning anyway. Up 4 pounds, ugh. I am back on it today, getting ready to go running. Feeling SO much better!

Some antibiotics like Bactrim or Septra (drug of choice for Staph) can cause a drop in your blood sugar. Resulting in that unwanted four pound gain.

I wish it were that simple!!! I'm fairly sure all the frankenfoods I ate for 5 days resulted in the weight gain. Ugh. I am doing much better today.

I guess I should have elaborated, but that is what I was saying. I just left a bunch of words out. The sugar dropped, the insulin spiked, cravings abound, and the rest is history. Glad you are better.

RE: Zero Carb / Meat and Water - suzanneyea - 09-08-2008 01:20 PM

When you go to a restuarant just tell them you have food allergies and to cook your steak or whatever you order with nothing on it. The words food allergies scare them enough to listen.

chris m Wrote:
Actually I'm not sure where I got it !!
Mine is only 173 pages but has no one's questions and only his answers. All very good info from a man who has actually eaten this way for longer than most of his detractors have lived much less stuck to a certain way of eating. While reading it - that is the frustrating part - how he has to continually fend off his detractors.

The only other part I wonder about - If his heart blockages started in his teens and were well advanced by his early 20's - why did the bypasses have to be done in the year 2000. In other words why did the meat and water diet have an effect on his need for a bypass? Or did it? Does anyone have a take on this? I got a little confused reading the thread.

I like the condensed thread, it cuts out all the BS, but the whole version gives you a better perspective. It is a frustrating read, because of all the narrow minded people who totally lashed out at him.

The heart blockage issue was explained in depth somewhere in that thread. It had something to do with the fact that he started weight lifting when he was 55 (I think).

The Bear is actually VERY scientific and understands scientifically why Zero carb is so healthy. He just does not explain it so eloquently as Charles does. LOL!

Charles, I am surprised you have not read Bears thread. I am only surprised, because your view on Z/C is just like the Bears. You basically say the same things he does, just in a better more understanding way. 😊

RE: Zero Carb / Meat and Water - cbnebraska - 09-08-2008 01:37 PM

Okay, I'm sorry, could someone re-post the link to the condensed version then? I'm at work and flitting back and forth to the computer. Don't have time to scroll back through everything to determine which is the condensed link.

Thanks!
condensed version of Bear's thread:

Bk_Metro Wrote:
As my body gets more adapted to this WOE will I be able to go longer between meals? Thanks

Thanks for the kind words, Bk-Metro and welcome to our forum!

Yes, I think you will be able to go longer between meals.

When I am out and I have to pick something to eat, I tend to go for fast-food burgers over anything else. I prefer Wendy's or McDonald's because I can't taste any perceptible salt on their burgers when I order them plain. After eating them, I find I can go 6 or 7 hours very easily. I love Hardees, but I think they have more sodium because they taste very "seasoned."

Going longer between meals is something that will kind of happen to you rather than something that you want to force.

When I cut out breakfast, I just noticed that it didn't take very much food in the morning to make me full. I found it easy to eat too much at breakfast plus I noticed that on the weekends, I only ate twice per day. That made it pretty simple to cut it out. I was slightly hungry for 5 minutes the first two days I did without it, but the feeling went away and I found I could skip it pretty easily. It seems to be all a matter of conditioning.

What you're describing makes me want to explore creating my own pemmican all the more. You need some portable food that is good for you, that fills you up, and that is entirely healthy. I think this week will be my week to do it. Several of our posters, in conjunction with Stefansson's book have made it sound terribly easy.

Regards,

Charles

Thanks, Dana. He probably didn't have the work of Nobel-winning scientists in his back pocket when he answered.
I tell you what, as good as Taubes is, if I would have only read *Not by Bread Alone*, that would have been more than enough to convince me about zero-carb. It's not very scientific in many places, but if you read it, you'll see that it didn't have to be. It looks rather obvious, especially when you get to "The Second Pemmican Wars."

By the way, when reading the book, I think you can substitute the words "zero-carb diet" any place you find the word "pemmican."

I am going to read the thread. I wonder if it's possible to get the entire thread in a PDF.....I love to print stuff out like that and read it as one does a novel.

Charles,

I just sent you a PDF of BEAR Wisdom. You can turn anything you can print into a PDF with the free utility PrimoPDF.

RE: Zero Carb / Meat and Water - Charles - 09-08-2008 02:25 PM

I did follow the link to the Bear's website and read his general statements. I think I might like the condensed version without the comments from the others. I agree with all of the Bear's preliminary statements except for this part about the women.

Quote:
The female hormones seem cause a strong craving for carbs, as the female body isn't fertile without a layer of fat. This makes this diet very hard for women to follow. Traditionally the women are the gatherers of fruits and (starchy) roots, while the men are the hunters. This is shown today in the different ways men and women go about buying things. The gals "shop" which is a trip through the entire store or mall in search of things to buy. They may not actually buy (gather) anything. The guys on the other hand know what they are after, and then seek it out (hunts it down) and buys it, usually then taking it home right away.

This is where Taubes was helpful. Wade and Schneider's research supported our alternative hypothesis which said that it's not that women need fat in order to be fertile; rather, it's the availability of proper metabolic fuels which is the determinant. In other words, "it would be expected that ovulatory cycles would be inhibited by treatments that direct circulating metabolic fuels away from oxidation and into fat storage in adipose tissue." We already know that one can be fat and still on a zero-carb diet. That alone should not hamper their fertility just because they couldn't gain weight.

Stimulating fat storage is obviously what insulin does and they've shown that infusing insulin into animals will shut down their reproductive cycles. If "an excessive portion of available calories" is locked away in fat tissue, then the animal will act as if its starving. There will be insufficient calories to support both the reproductive and the other physiological processes essential for survival. Reproductive activity shuts down until more food is available to compensate.

Interestingly enough, obesity is only an association in these cases. I know of many women who are infertile and they are in no way obese. Of course, there are also many obese women who are infertile as well.

Like so much good science, this metabolic-fuel hypothesis of fertility has escaped the attention of clinicians. We've discussed this in this thread with relation to pregnant and nursing mothers and I firmly believe that if one consumes a healthy zero-carb diet, their children will also be healthy. Moreover, a
pregnant zero-carb mother doesn't have to worry that her child will grow to need braces in their teenage years! That would be enough to make me rejoice!

Regards,

Charles

RE: Zero Carb / Meat and Water - lynn hopes - 09-08-2008 02:38 PM

I remember quoting that to you before Charles. I do think the Bear has a point here. Men don't have the same hormonal fluctuations that women have so I can follow his logic that ZC would be easier for a man.

Like everything though it all depends on the person as clearly there are a lot of happy ZC women here.

Charles, if you could come up with an easy way to make pemmican I would be forever grateful. I really stress about traveling or being out and not having anything to eat. Eating room temp hamburger patties that have been in my purse all day is just so gross!

Deanna

RE: Zero Carb / Meat and Water - daveo - 09-08-2008 03:52 PM

One thing I have discovered is that at Carl's Jr, you can order the Big Hamburger plain, which has a pretty big, un-salty patty. Then they will add as many extra patties as you want for $1.25 each. I've been eating the triple 😁

Welcome to the forum, Bk_Metro.

Nicola, what is a himalayan sole?

Charles Wrote:

I was very thin when I got pregnant with my son back in my late 20's. I weighed less than I do now but wasn't eating low carb by any stretch of the imagination. I was without a doubt VERY fertile and got pregnant the first time that I didn't take precautions. Unless a woman is anorexic, she should have enough fat on her body to be fertile if she isn't starving herself.

Everything changed for me after I had my son. Even though he was breast fed for about two years, I was never one of those women who could return to their pre-pregnancy weight just by nursing. It was an uphill battle from that point on for me and that's what got me to try futile diets like Weight Watchers only to find that I couldn't lose any weight no matter how little I ate or how strictly I followed the diets. Obviously my hormones had changed in some way during my pregnancy. I finally was able to get back down to the weight I was when I got married (119) after I started a low carb diet a few years ago. If I'd known about low carb or zero carb all those years ago, I could have saved myself a heck of a lot of grief.

RE: Zero Carb / Meat and Water - sean - 09-08-2008 07:36 PM

If I could offer my 2 cents on the BEAR.

He is a genius. That is very evident. He is far from an angry old man. He has responded to every one of my emails and from what I understand he gets quite a few. This is the guy that invented LSD (right or wrong who knows just a fact), and he takes the time to respond to some dope's (me) questions.

Ive talked to a guy that has dealt with him and he looks basically like a 40 something athlete.

Now the guy is 75, had bypass surgery and throat cancer, did 3 years in the federal clink and hasn't aged. Yet people want to debate him, insult him, and basically spill their emotional problems to defend their silly ways and claim it is science. He put up with way too much nonsense before bailing from that other forum.

Just think, Charles is a Godsend who has been at it only a year. BEAR has been at it for 50 years. I can certainly understand his lack of patience when he has to explain for the millionth time the Vitamin C scare or maybe even the Vit D nonsense. 50 years of answering the same silliness has got to get old.

I think Charles will thoroughly enjoy the read, and I am fascinated he hasnt read it yet as I thought certainly that is where the bulk of his information came from. Incredible.

One point that I know Charles will love is that the BEAR actually corresponded with Steffanson, who has clearly had a dramatic impact on Charles and most others familiar with his works. BEAR's knowledge base comes from the man himself and there simply is no greater authority. We are all stuck reading the works of the guy that actually mentored the BEAR in the truth.
Remember this guy invented the 60's. He was surrounded with the bulk of the vegetarian, peace, love, dont kill, animals are our friends nonsense yet he remained a true carnivore. He knows more about the vegetable/herb kingdom than any living human and refuses to eat them.....Interesting

Finally the song "Purple Haze" is a tribute to him and his product, what else does anyone need to know?????

---

**RE: Zero Carb / Meat and Water - daveo - 09-08-2008 08:54 PM**

I would agree. Bear is a good guy who always takes the time to answer my questions. In fact I just got an email from him an hour or so ago with some great ideas on preparing liver (I had asked him if he thought I would want to supplement Vit A or take Cod Liver Oil since I don't like liver).

By the way, if you haven't tried his "tasty chook" recipe he mentions near the beginning of his thread, you need to. It's been a staple in my house for a long time now 😊

---

**RE: Zero Carb / Meat and Water - suzanneeya - 09-09-2008 02:10 AM**

Quote: Interestingly enough, obesity is only an association in these cases. I know of many women who are infertile and they are in no way obese. Of course, there are also many obese women who are infertile as well.

Fertility has been a big issue for me. When trying to get pregnant I was not getting a cycle and was not underweight, the endocrinologist said my diet was way too low in fat, but I had been so programmed to eat low fat at that point it was very hard for me too change. Now, I am so much thinner and older and I get a cycle every 28 days.

I do not know why this diet is so much harder for some. It has been so easy for me to stick with, so it just cannot be hormones. I see lots of men who struggle with zero carb and I just breeze through.

---

**RE: Zero Carb / Meat and Water - cbnebraska - 09-09-2008 06:45 AM**

First, let me apologize, I had not taken the time to read any of the BEAR's writings when I made the comment about him. I should be more careful what I say. I read the one post made here where he was, in my opinion, quite flippant and a bit condescending. I did not know his background. I have since read a half hour's worth of his condensed thread. Wish I had more time...... How interesting that he actually communicated with Steffansen. I would love to see a picture of him since he looks like he's 40 but he's actually 70+? That's amazing. Has anyone ever seen one? If I had time, I would google it myself, but I don't.

I want to comment on a post that was made quite a few pages back about hunger. I wish I could keep up with you people and jump in when something is actually being discussed, but life doesn't always allow it, plus, I'm definitely a ponderer, which doesn't always set well with these forums that move at rocket pace. There was a discussion at one point about some people getting hit hard with acute hunger and some saying they can forget to eat, how long each can go between meals, etc... My only comment is on the feeling of hunger. Is it possible that hunger feels different in each of us? It seems to me that for some reason I, as well as many people, associate hunger with something coming from the stomach. I am always waiting for something to go on in my stomach before I will admit I am truly hungry. I used to do this to the point of letting myself become so ravenous that I finally gave up and ate anything I could get my hands on - I felt out of control and nearly animal like in my behavior. I would just shove things in -
hence all the binging. This happened even on low carb. I shoved in oodles of "low carb" food, which added up to......... too many carbs. I think I am realizing, finally, that hunger to me isn't in the gut, it is in my energy level. Once I start to feel tired, it is time to eat. Actually, I would prefer to eat before I get to that point, so I need to establish more of a schedule. Now I know that I have to be sure to eat plenty of fat or I will not ever get the energy I'm so badly needing and some protein to feed my muscles and organs so they'll want to keep moving and working for me. I don't think I've found the right mix of the two for me yet because my energy is way to erratic at this point. Too many highs and lows, but I'm working on it.

Anyways, that's the "ah-ha" moment I wanted to share. It's not the stuff of science, but I thought maybe somebody could relate to it.

---

RE: Zero Carb / Meat and Water - Living_healthy - 09-09-2008 07:28 AM

I'm feeling better as long as the hunger/cravings go. I'm beginning to think that this was a hormonal fluctuation that we women get. Although, I am in perimenopause, I feel this was the cause. I stuck to my zero carb plan and today I'm better. I'll keep this in mind for next month.

I am working on this as well. I too have erratic energy levels and trouble getting in touch with hunger. What I really like about your post is using energy levels to determine when to eat. I'm a painter and while I'm working, I don't feel hungry but I can tell when I need to eat because I stop being able to focus on my work.
"THE BEAR" I have known many personalities like his and it is easy to misconstrue his actual intentions. From reading most of his thread I believe him to be "the real deal" !! for a personality like his you have to admire his patience. Sean and others have experienced the good side - having said that I don't blame him for not participating in another thread. As he said I said all I have to say. The link between Steffanson thru the Bear to all of us is an amazing thing and I think we should be grateful. I believe if you read those two and this thread you have all the answers you need to at least start your journey to amazing health!!

Thanks for your suggestions. Fast food probably won't work for me, I've always dislike the burgers there, but I think Pemmican might be a real solution. I looked online and found a company that makes a version with only meat and fat (a lot of the commercially prepared ones seem to have berries, sugar and other stuff added). I'm going to order some today.

This thread is great, there is such exciting discussion here. I have read much of Bear's writings in the past. I don't much care for his characterization of women, but other than that he has a lot of helpful and wise things to say about this WOL.

Bk_Metro Wrote:

This was my experience for the most part. Breakfast really complicated my weekday routine as well. I have a group of co-workers who I enjoy socializing with. The lunchroom conversation and the visits to area restaurants are quite fun from a social perspective. I don't get at all hungry or envious of what they eat.

Most of the time, I am never hungry when they are ready to eat so usually I just go out with them and just talk while they all eat and I would eat later when I got hungry which wouldn't be until almost 3:00 in the afternoon. Now, that I skip breakfast, I'm ready to eat around noon so it works out perfectly.

Some days, like yesterday, I don't get around to eating until 1:00 because I get busy and just put it off. It's not all difficult to do.

Having said all that, I don't encourage anyone to skip breakfast by going hungry. However, if you find
that you don't need very much food in the morning, it might be a good idea to keep tapping into that long-term energy supply a little longer.

I also prefer to eat earlier in the evening. In my family, we would typically eat dinner at 8:00 or 9:00 (sometimes later on gym nights) and I didn't like doing that either. Now we try to eat around 7:00 which makes for a better night sleep for all and it extends our hypophagia period during the night.

Regards,

Charles

**RE: starting meat and eggs today - DebbieDoesAtkins - 09-09-2008 08:19 AM**

I would advise you not to think too much about goal weight and that sort of thing.

I know this isn't a 12 Step Forum, but we do have a saying in OA that covers this idea and the longer I'm in program, the more I see it's value:

If you focus on weight, you'll lose your recovery; if you focus on recovery, you'll lose weight.

If I'm focusing on goal weight, what I'm eating/not eating, I'm right back "in the food" as far as obsessing goes, whether I'm eating or not. My aim is to define a food plan (right now, Atkins), stick to it one day at a time, and live in between meals...wisdom from a foodie and just my $.02.

Peace y'all,

carrie

---

**RE: Zero Carb / Meat and Water - Charles - 09-09-2008 08:36 AM**

Okay, I have been reading throughout all of last evening and more this morning and I have to tell you, I have the greatest respect for the Bear. This guy was all over it for sure. I wish I had the intestinal fortitude to answer some of the questions in the matter of fact way that he does. It's funny, people think I'm an angry black men when I get slightly agitated by certain questions and suggestions. I think I'm pretty docile compared to the Bear! He is voracious! You can certainly tell his level of frustration at times with the attackers, especially when he was only there to help. I can certainly identify and have considered ending my participation many times. However, when I get a PM from someone asking for help, there is just no way I can turn away from that if there is a chance I can help.

I would also say that I tend to agree with 90% of all that he writes, for sure. Some of the differences will become apparent to all of you when we start the book discussion of Not by Bread Alone. There are a few of Stefansson's comments that were misquoted and the rammifications are significant.

I'm not sure I was ever correct about the glucose burning associated with exercise. He may indeed be correct in his assertions even though he can't find the studies. I don't mind being wrong about those and I sincerely hope he's correct because it impacts my own athletic pursuits.

On the other hand, he does drop down into some of the dogma from time to time when he mentions things like basal metabolism and burning calories. These two theories have been clearly shown to be bogus but this is not at all important in the grand scheme of things.
It's now obvious to me that the leader of the raw-paleo forum did not read Stefansson's book. Rather, he read the Bear's thread and he quotes Bear's comments concerning Stefansson. For instance, the Bear says that the Inuit preferred and ate mostly raw food and did not eat boiled fish.

However, Stefansson says the following:

Not By Bread Alone (NBBA) at 44 Wrote:
From knowledge of other white men, the Eskimos considered the trout most suitable for me and would cook them specially, roasting them against a fire. They themselves ate boiled fish

and this:

NBBA at 44 Wrote:
Against my expectation, and almost against my will, I was beginning to like the baked salmon trout when one day of perhaps the second week I arrived home without the children having seen me coming. There was no baked fish ready but the camp was sitting around troughs of boiled fish. I joined them and, to my surprise, liked it better than the baked. Thereafter the special cooking ceased and I ate boiled fish with the rest.

As I've written before, it's very difficult to single out the Inuit and say they do this or that because there were many groups of Inuit and they had their own practices. For each group of Inuit who ate a particular thing, there was another that rarely or ever ate that particular food. The more important thing was that ALL of them were in perfect health and there were no signs of the diseases of civilization:

NNBA at 39 Wrote:
If we compare the whole diet of a strictly carnivorous group of Eskimos with the carnivorous portion of our diet, they would be found to eat, on the average, a higher percentage of raw or rare meat than we do. But if we compare our whole diet with theirs, remembering that our milk and cream are sometimes raw, our fruit and vegetables frequently raw, our eggs usually soft-cooked while Eskimos invariably cook theirs hard, and that our roasts are more rare than theirs though their boiled meat is more rare than ours—

**if we consider the whole picture, we doubtless use nowadays a far higher percentage of uncooked food than did the prewhite Eskimo world.** The Eskimos cooked whenever convenient.

If they breakfasted on raw food it was either because the group did not want to waste time in cooking or else because they awoke with too keen an appetite—pre-white cooking was usually slow, requiring two or three hours. The same would be true for lunch. At dinner time, in the Eskimo way of life, there was ample leisure, and this meal was seldom eaten raw. The fourth meal of the day, just before going to bed, normally
consisted of cold boiled food left over from dinner.

Some Eskimos eat a good deal of dried food and others never taste it for years or decades; there are also pronounced variations of diet in other ways. Some groups, for instance, hardly ever have any appreciable amount of food except fish, while others seldom taste fish, living chiefly on the flesh of mammals.

No frying was ever practiced before Europeans came—apparently frying is a rare form of cooking among primitive people everywhere. Roasting was occasional, and usually by Eskimos who lived in forested districts. Even in the woods, boiling is the normal method, while on sea coasts or at sea it is practically the only form.

The next difference comes with the way the particular Inuit who ate caribou divided the food that they ate and what was given to the dogs. On the one hand, the Bear seems to suggest that liver is good and that the Inuit ate it, but in other places he correctly identifies it as not so good.

NBBA at 171 Wrote:
We traveled a few miles inland, established a camp, hunted caribou (there were two of us well, out of four), and began the all-meat cure. Fuel was pretty scarce, so we cooked only one meal a day; besides, I thought raw food might work better. We cooked the breakfast in a lot of water. The patients finished the boiled meat while it was hot, drank some of the broth warm and kept the remainder to drink cold during the rest of the day. For their other meals they ate slightly frozen raw meat, with normal digestion and good appetite. We divided up the caribou in ordinary Eskimo style, so the dogs got organs and entrails, hams, shoulders, and tenderloin, while the invalids and we hunters got heads, briskets, ribs, pelvis, and the marrow from the bone.

As you can see in the quote, the raw food was only taken on the move when there wasn't time to cook. There were times when this was appropriate but you can easily see that the preference was to cook.

The Inuit ate certain livers occasionally, but not the "vitamin-containing ones" that one would think. Those who did eat livers were careful to stay away from certain livers entirely, like the ones from polar bears.

NBBA at 33 Wrote:
The cause of the trouble with bear liver is unknown, but there have been many theories. One of these is that the symptoms are produced by an overdose of vitamins, in which these livers are known to be rich. There is in them, no doubt, as in other vitamin-bearing livers, a great variation in amounts contained, which has been offered as an explanation of why one may eat half a dozen livers with complete
satisfaction and become violently ill at the seventh. There would be a greater danger if a second liver were eaten immediately after the first: the danger of vitamin overdosage.

The liver of caribou and moose is eaten by the family occasionally; that of mountain sheep frequently, and that of the seal nearly always, for it is the favored part. The flipper is liked, too, and the leg above the flipper, fore and aft.

Apart from this, there seem to be no strong preferences; and that is probably true also for the walrus, but I have never lived where they were hunted.

Now, by showing these differences, I am not at all suggesting that anything is materially wrong with what the Bear says and the outstanding advice he provides. I think this is important because based on reading the Bear, one might conclude that raw meat is the way to go in every case as our brothers and sisters at raw paleo seem to believe.

So what's the answer? Charles is not 100% right, nor is the Bear, and nor is Stefansson. Why? Because although Stefansson had the right outlook, he did not trust his perceptions enough to remain on the all-meat diet. It is noteworthy that he returned to this way of eating later in life when he ran into trouble, but one wonders if he stayed on it more than the 10 years he did, would he have ever developed the health issues he did.

You have the main text in your own hands so you will be able to read it for yourself and make your own determinations of what is true and what is not. I do, however, believe that between our thread here, the Bear's thread and Stefansson's book, you certainly have all the answers necessary to understand how to keep yourselves as healthy as possible without fear of ANY deficiency or the diseases of civilization.

It is appropriately said that those who do not learn their history are destined to repeat it. I can think of no other material area in life where this dictum is more true. Rather than relying on one of us to tell you, you have the tools to make the choice for yourself.

Regards,

Charles

Hi Pamela, I have been doing meat/eggs now for almost a month now and have never felt better. I no longer track my calories, thinking I was going to be too low - obsessing about it, I never was. No more. I've also taken to heart Charles' words, eat when hungry, don't when not. It was amazing to me to actually FEEL hunger - I was an emotional eater. I am not obsessed with having to lose #'s every week - , but have been doing ok and losing the inches too.

I have found eating 2x's a day has been sufficient for me and not that I hold to that forcefully, that's just what my body is telling me. There are days when I can't seem to eat enough - and then I eat until satiety. I know when that happens too - that uncomfortable feeling of overstuffing myself has left also. Just listening. Food doesn't seem to have that hold on me now at this point. I'm happy for that transformation.

Trust in your own body's signals and go with them.

I truly believe in what Charles has extensively written here.

😊's, Patti

Well, you sparked my interest here Charles......... Please explain and apply. I would like to see how it might impact me as well. I have a 6 hour or more Adventure Race this weekend and I am trying very hard to plan out my eating. I just don't know how I will manage to stay on plan. The pemmican idea is tempting, but I simply don't have the time to prepare it. I am leaning towards some energy bars that are
mostly nuts and towards taking along some low sodium bacon. Unfortunately, I can't eat like I train for such a long race because I never train that long, I simply go for it - relying on my body to pull me through. It usually does, but I've never done such a long one with zero carb. I am worried about going without any food for such a long time. I know the African Tribes do it, but I am not African and am not so conditioned!!

Thanks!!

Here is the exact quote:

"If you ask an Aboriginal man what traditional food is, he will name all the animals he can hunt. If you ask him about other food, he will than tell you about the 'bush tucker' you can eat when you can't find any animals. Both men and women will hunt, but men rarely gather. The Aborigines are modern hunter-gatherers, their prehistory (dreamtime) is not known to science."

RE: Zero Carb / Meat and Water - lynnhopes - 09-09-2008 10:14 AM

Still not offensive to me............

RE: Zero Carb / Meat and Water - DebbieDoesAtkins - 09-09-2008 10:37 AM

Actually, I kinda like having a scientific reason to justify my shopping behavior....

RE: Zero Carb / Meat and Water - Nicola - 09-09-2008 10:44 AM

Some interesting information about protein and fat:

http://www.uswellnessmeats.com

Here's a couple articles from this week:

Al Sears, MD
Author of The Doctor's Heart Cure

The Importance of Protein
If you want to shed pounds and build lean muscle you should eat protein at every meal.

Protein is the only daily essential macronutrient. Fat is also essential, but you can survive longer without fat than you can without protein. Carbohydrates, the third macronutrient, are completely inessential to your diet. In other words, your body can make whatever carbs it needs on its own.

Quality protein is your single most important nutritional concern. It's composed of 20 amino acids, eight of which you can't make and must consume. To be optimally healthy, you must consume all eight of these essential amino acids every day.

Protein is an important component of every cell in your body. Hair and nails are mostly made of protein. Your body uses protein to build and repair tissues. You also use protein to make enzymes, hormones, and other body chemicals. It is an important building block of bones, muscles, cartilage, skin, and blood.

But unlike fat and carbohydrates, the body does not store protein, and therefore has no reserve to draw on when it needs a new supply. Over consuming protein actually programs your body to burn fat. It throws on a "metabolic switch" and tells your body that it's okay to burn fat.

Here's why: Your body is not a machine. It's a living, sentient being that makes decisions based on the challenges it faces everyday.

Your body's number one priority is survival. And protein is your body's most prized power source. Under normal circumstances, your body keeps fat on reserve for one reason: to prevent starvation.

But when your body has more protein than it needs, its survival is not threatened. It then feels "safe" enough to start burning off its fat stores.

Over-consuming protein is one of the easiest, most reliable ways of triggering high-speed fat loss. In addition, you'll guarantee your body has the building blocks it needs for optimum health.

---

Love the Bear thread, and glad to see it getting some play here! That thread is what turned me on to all-meat as healthy. I came on the ALC forum just after the thread was closed (May '06) and I figured anything that inspired that much vehement opposition must have something to it! I figure that for pretty much everything I don't agree with everything he says, but then I don't agree with everything anyone says. He had so much info to offer, and it's too bad he was treated the way he was -- though he could dish it out as good as he took it.

Anyone here eating eggs and cheese - his 'cheese eggwich' is frickin amazing. Or 'egg cheesewich'. Whichever 'wich you like. Haven't tried the chook one yet but I hear rave reviews.

This WOE appealed to me immediately, especially after learning about my own food sensitivities and how common they are. Not that I think all veg matter is 'poison' (though some of it certainly is), but there's something about this WOE that, IMO, appeals to some inner knowing, some deep primal cellular
memory we carry around. I remember the first time I really went all-meat...it was the first time I really felt GOOD, as opposed to good. I'm not totally all-meat now, fairly close, but the best I ever felt was on all-meat/fat.

Re: hunger feelings -- I feel them in my throat (a sensation I can't describe), or I just start to feel kinda tired and/or empty. Not unpleasant at all, nor urgent. Nice change from how it used to be!

"Whenever you find yourself on the side of the majority, it's time to pause and reflect." - Mark Twain

When I was eating eggs and cheese, I tried a few times to make the cheese eggwich. I couldn't flip the friggin thing without the top eggs just sliding off, but it still tasted pretty good. Oddly, the thought of eating eggs now kind of nauseates me.

RE: Zero Carb / Meat and Water - Charles - 09-09-2008 11:16 AM

lynhopes Wrote:  
What do you mean Charles? Can you elaborate further on this? Are you saying glucose is or is not burnt during exercise?

On zero-carb, I know that it's not generally burned because insulin levels are low which means there is nothing to move any glucose into muscle cells to be burned. Low insulin primes the muscles to only burn fatty acids and spare glycogen in the muscles and in those tissues that need it in the body.

The common view, which I've always ascribed to was that when you push your heart rate about 85% of capacity, then you get into anaerobic exercise where you can deplete muscle glycogen. I've been skeptical about this because I know what it feels like when our muscles get glucose to eliminate. It generally results in a burning sensation. Anyone who has ever run the 400 meters in high school knows exactly what I'm talking about.

However, when I run a hard 400 meters now, I never get that burn even though I get thoroughly wiped out by my effort.

The Bear says that even on high carb diets, the muscles do not burn glucose at all. He counters that the energy boost they feel is more related to insulin. He does acknowledge that glycogen does get replenished but it happens naturally and the body does it on its own. He rejects the idea that one can replenish glycogen using carbohydrates.

He also advised that it is best to provide two or three days between weight training workouts, and I have found that to be the best thing for zero-carb athletes as well.
Dr. Groves says that glucose gets converted to pyruvate and it is burned in the muscles with lactic acid as a byproduct. I tend to believe Dr. Groves because this dovetails with my experience. It's also obvious that there are many high-carb athletes who have no visible body fat and they tend to metabolize carbohydrates very well. I also think it's been conclusively demonstrated in Taubes that the muscles are the first repository for dietary glucose once in triglyceride form (after being assimilated in fat tissue).

However, the Bear does not believe that fatty acids go into fat tissue at all. He believes them to just circulate when glucose is absent from the body. That has been effectively disproved by David Rittenberg and Rudolf Shoenheimer when they were able to tag molecules with deuterium. They were able to follow fatty acids, protein and glucose as it traveled through the body. They learned that a considerable portion of the calories we consume in all forms, first goes to adipose tissue before being assimilated for fuel by the rest of the body. Carbohydrates were the surprise finding, but the same was found to be true with regard to fatty acids and proteins as well. This has been known since 1948 and caused the great scientist Ernst Westheimer to conclude that "the classical theory that fat is deposited in the fat tissue only when given in excess of the caloric requirement has been finally disproved."

Fatty acids only accumulate in fat tissue when they are trapped there for some reason (carbohydrates).

I tend to agree with the Bear when he says that the process of "burning carbs is only the process of converting them into fat which puts a severe load on the body during exercise." It is true that many studies (especially Phinney's) show that endurance is increased on the high-fat diet.

Regards,
Charles

For one thing, it's not even true. Stefansson says in *Adventures in Diet* that a considerable portion of the women went out to gather food and work with the men and only some stayed behind for the care of children and work in the camp. These Inuit women were obviously quite capable and kept up with the men just fine.

Yeah, I can't go with the Bear on some of his dietary choices. He loves the cream and eggs and he even
enjoys a little nastytame with one of his concoctions. Never in a million years! It's amazing he doesn't feel any palatable signs of hunger because if I ate some of the things he does, I would definitely feel hunger.

It's highly possible that salt was my downfall when I did include eggs. I didn't like eggs without salt so who knows, maybe today I would like them and they could stay. However, they are certainly not something I miss. I prefer to keep it simple.

This brings up a question. I have seen and used the online protein calculators and they say I should have anywhere from 80-120 grams of protein per day.

Currently I shoot for 120 grams per day but this is not a pin and paper, keep the record thing.

What IS the best method for figuring a 'ball park' protein intake...if necessary.

What is the definition of overconsuming? Your body is only going to use the amino acids it needs for repair for that day. Protein is not stored like fat. Glucose gets converted to glycogen but the body only holds so much. After that glucose is converted to triglycerides and those get put into fat storage. Protein is inherently more metabolically costly to use for fuel than fat or glucose. Protein is anabolic (meaning muscle building) but I don't know if overconsumption is going build more muscle just because you over consume it. The body uses what is needs. If you were protein deficient you may build some muscle.

I know, I know. I won't mention it again. I find it fun and I'm not beating my body up that badly, really. It's not like I crawl across the finish line. I sleep well that night and am a little lethargic the next day, but that's about it. I don't really know if I need the carbs, but I am going to bring along the low carb energy stuff. It's mostly about portability, not so much anything else. I think my body will survive one or two nut based energy bars 6 times a year. To each his own I guess. Sorry to bring it up.

You're making this far too complicated. What is going on in your body? When you eat your food, do you feel strong and energetic, or are you lethargic and lazy? You should be able to tell whether you are getting leaner and more muscular or if there any muscle definition in your body. If you don't eat enough protein your body will take the protein it needs from your muscle. You should be able to tell if this is happening. Too much protein weakens us and if there is not enough fat to go along with that protein, you will build up ammonia in your blood and this will weaken you and could kill you in short order.

Just find some fatty protein and eat it with every meal. If you're hungry, then eat more of it. That's the simplest way. If you eat a little too much your body will get rid of the extra and all will be fine. However, this shouldn't be lean protein. If your protein is fatty protein then it's difficult to really know how much protein and fat is actually in it. The counters are typically using trimmed meat and it's an average. You have to look at meat to determine how much fat and protein is present. Most of the red stuff is water and protein and the white stuff is fat. Get a lot of white stuff and if you feel nausea after a little bit of fat, then eat more lean. When you're full, stop eating. Don't try to eat according to some number on a chart.

Over-consuming protein is one of the easiest, most reliable ways of triggering high-speed fat loss. In addition, you'll guarantee your body has the building blocks it needs for optimum health.

This brings up a question. I have seen and used the online protein calculators and they say I should have anywhere from 80-120 grams of protein per day.

Currently I shoot for 120 grams per day but this is not a pin and paper, keep the record thing.

What IS the best method for figuring a 'ball park' protein intake...if necessary.

Use the calculator found on this page. It is approximate and errs on the high side.

The results...187.8 grams of protein!

I guess I better start eating!!!!!!!

I got 129. But then I am in ketosis. The usual rule of thumb is 1 g per kg of LEAN body mass. That is everything BUT your body fat. If you are zero carbing then you need protein to convert to gluconeogenesis at the rate of 1 g protein for every .58 g of glucose. You need 30 grams of glucose from gluconeogenesis on a zero carb diet or about 52 additional grams of protein. Add more protein to err on the high side. Every gram of carb you ingest reduces this amount. If you are not in ketosis then you need a lot more protein until you do if you are eating less than 50 g of carbs a day. But this calculator does this all for you. I just want people to understand what is underneath the calculations.

The Bear says, No. He says we have the gluconeogenesis all wrong and I tend to agree with him.

the Bear Wrote:
This is a fact and is history, so all the conjecture and theorising in
the world will not change it. If the body was able to create glucose on demand from ripping he core out
of protein,
then why is 100% protein so deadly it can kill you in about a week to ten days? Adding dietary fat or
carbs
prevents this poisoning. The fact is gluconeogenesis is rare except under two conditions, severe fasting
and
recovery from starvation-induced bodyfat depletion on a zero carb diet. Then the adipose tissues are re-
built by
diverting a small amount of blood sugar which stimulates mild gluconeogenesis.

The conversion rate you cite happens during fasting and people have extrapolated that to mean it
happens all the time and I disagree. Even Dr. Eades admits that he took the figures from fasting in his
Ketosis and Metabolism article. The Bear makes a solid point:

the Bear Wrote:
Gluconeogenesis is a fasting process that only begins after the point where there are NO more ketones
OR
glycogen available. The body always spares protein, and it is only under severe conditions that protein is
ripped
apart for the glucose spine it contains.

When glucose is required beyond that from glycogen, or to replenish glycogen, it is produced by
GLYCEROL
CONVERSION (ketones and glycerol are derived from triglycerides, the standard 'fuel' of the body-
they have
nothing to do with gluconeogenesis). This is not conjecture. I have definitely said there are some
structures in the
body that are dependent of glucose, and cannot use ketones (read the thread).

It's certainly clear that even on a zero-carb diet, we still have some triglycerides. They are significantly
lower than before, but nonetheless they do exist. I always kind of wondered why we need any
triglycerides once the dietary glucose is removed, but the Bear's explanation makes a lot of sense to me.

Regards,

Charles

RE: Zero Carb / Meat and Water - Richard - 09-09-2008 12:18 PM

I have been ZC except for a cups of coffee over the last week with some heavy cream and some cheese
(really not that great after 10 days on ZC).

Using Charles notation I do need to eat more. I am finding I can only go 4-5 hours now (when I first
started 2-3 hours) before hunger sets in. I am having mostly 25-27% fat burgers with some sausage
thrown in here and there. I have also just (3 days ago) added coconut oil.
I don't think I have found the perfect balance yet.

RE: Zero Carb / Meat and Water - MAC - 09-09-2008 12:20 PM

I also have my doubts about gluconeogenesis and when it occurs but I can never seem to find a definitive answer. All seems to be a guessing game. I sure wish BEAR would have cited his sources which he was reluctant to do as he said he had misplaced them. No one but no one seems to have a definitive answer to this question or can cite the proof.

Some cells must run on glucose. The amount of glucose necessary for this is 30 g glucose per day according to Dr. Mary C. Vernon. So if you are eating zero carbs, where does the glucose come from?

The only plausible explanation is the glycerol in tryglycerides as all fat consumed is in the form of triglycerides. We do not consume free fatty acids that are not part of triglycerides. It takes 10 g of fat to provide 1 g of glucose. Something even Eades says provides part of our glucose needs.

Even in true starvation your body is going to use your fat stores and break down triglycerides into free fatty acids and glycerol. So why does the body need to convert actual protein to glucose in real starvation if it has glycerol from TG? The body gets very sparing of protein in true starvation and reuses it.

Hi Pamela , I have been doing meat /eggs now for almost a month now and have never felt better . I no longer track my calories , thinking I was going to be too low - obsessing about it , I never was . No more , I've also taken to heart Charles' words , eat when hungry , don't when not . It was amazing to me to actually FEEL hunger - I was an emotional eater . I am not obsessed with having to lose #'s every week - , but have been doing ok and losing the inches too .

I have found eating 2x's a day has been sufficient for me and not that I hold to that forcefully , that's just what my body is telling me . There are days when I can't seem to eat enough - and then I eat until satiety. I know when that happens too - that uncomfortable feeling of overstuffing myself has left also . Just listening . Food doesn't seem to have that hold on me now at this point . I'm happy for that transformation . Trust in your own body's signals and go with them . I truly believe in what Charles has extensively written here . 😊's , Patti

Hi Patti ,
I have been feeling good too. And i am working on listening to my body. We get into this cycle where you think you 'have' to eat breakfast , lunch, and dinner. But i used to not eat breakfast at all, then when i started dieting i just 'had' too. I don't feel hungry in the mornings, but i noticed if i don't eat something i feel nauseated. And it goes away after i eat. But i usually only eat a little at breakfast anyway, unless i am starving.

MAC Wrote:  
Some cells must run on glucose. The amount of glucose necessary for this is 30 g glucose per day according to Dr. Mary C. Vernon. So if you are eating zero carbs, where does the glucose come from?

We learned from Francis Benedict's starvation studies that this initial requirement of glucose only lasts for 7 days. After that, the body doesn't use glucose at all. That's pretty clear to me.

Taubes relates Harper's studies on 319 that the liver increases its synthesis of ketones to supply the necessary fuel for the brain and central nervous system. This supplies 3/4th of 100 grams that the IOM report says is necessary (even though this report acknowledges that those carbohydrates are not necessary. The 130 figure was just to allow for error.) That leaves the 25 grams, not 30 that Dr. Vernon speaks of.

The Bear claims that the liver can convert enough ketones to handle this last 25 grams. Taubes says that in addition to protein and the breakdown of muscle, glycerol comes from triglycerides broken down from fat tissue. There is always fat tissue even on a zero-carb diet so this explanation seems highly plausible to me in addition to the following.

MAC Wrote:  
The only plausible explanation is the glycerol in tryglycerides as all fat consumed is in the form of triglycerides. We do not consume free fatty acids that are not part of triglycerides. It takes 10 g of fat to provide 1 g of glucose. Something even Eades says provides part of our glucose needs.

This is what the Bear is saying as well. If fat is the major component of our diet then the glycerol must come from here which means it's not coming from gluconeogenesis. The body doesn't differentiate getting triglycerides from fat tissue or the circulation. All fats start in adipose tissue and then they are incorporated into the stream. It's not surprise that the liver grams some of them to ramp up its production of triglycerides when necessary.

MAC Wrote:

Agreed, although it would go after your muscles if there was not enough fat. I don't think it would until it exhausted your fat tissue and the muscles as the Bear says.

The science of all this is over my head, but it is possible that there is a limit to the amount of body fat that can be mobilized in a given period of time? If so, in the case of true starvation perhaps the body can't get everything it needs from the fat stores even if that's what it tries to do first. Just a guess...

Hmm. I wonder if Benedict's studies are in PubMed? Would like to see those studies.

So why the claims then that certain cells MUST run on glucose if the req is only for 7 days? E.g. the rods in your eyes.

For me this is all an intellectual exercise to further my knowledge. I eat enough protein and fat so it is not of grave concern.

Maybe that is why Stefansson would eat his fat first before his protein. So as to get the glycerol from the fat. Too much lean protein w/o fat causes issues because of the excessive nitrogen from the protein. Rabbit starvation. So why if you eat excessive amounts of protein with adequate amounts of fat do you not get rabbit starvation? One can assume you can eat just as much fatty protein as too lean protein with the same protein amount.

RE: Zero Carb / Meat and Water - Charles - 09-09-2008 01:10 PM

MAC Wrote:

I'm sure we could e-mail Taubes and ask him if he has the study. The bibliography notes that the report was in 1915.

MAC Wrote:
So why the claims then that certain cells MUST run on glucose if the req is only for 7 days? E.g. the rods in your eyes.

That's the question Taubes asked on page 385. He said that nutritionists still insisted on the 130 grams despite Benedict's finding. They rejected the idea that fat had such a prominent role in the body.

MAC Wrote:
So why if you eat excessive amounts of protein with adequate amounts of fat do you not get rabbit starvation? One can assume you can eat just as much fatty protein as too lean protein with the same protein amount.

Dr. Groves would say that the only time proteins are used for energy is in the absence of dietary fats:

Quote:
Proteins, however, also contain nitrogen and other elements. When proteins are used to provide energy, these must be got rid of in some way. This is not only wasteful, it can put a strain on the body, particularly on the liver and kidneys.

When the protein is broken down for energy, the nitrogen is released. When there is plenty of dietary fat, this simply doesn't happen. This also would explain why gluconeogenesis would not be something that the body would ordinarily do as it would produce too much nitrogen.

I like it!

I don't think so because fatty acids are always on the move. The body will sacrifice all the muscles to get fat and glycerol and I think that gluconeogenesis is just the last straw due to increased nitrogen that would result from using too much protein. Therefore, if Benedict is right, the body stops this practice altogether after 7 days. Most accounts of rabbit starvation state 10 days and they start getting really weak when dietary fat is inadequate.

Stefansson says that fat-hunger can be so violent that it prompted the canibalists to eat human corpses looking for fat. And we thought only carbohydrates made us crazy. Protein is some serious poison under the right conditions.

I love deductive reasoning. Very nice Charles. I guess the missing piece is that nitrogen is NOT produced when breaking up protein sources for ordinary protein needs but is when used for fuel. The only thing would be to see diagramatically the chemical sequence of gluconeogenesis and that of protein used for energy to confirm it. One could have gluconeogenesis w/o nitrogen creation I guess.

I would bet the farm that the extraction of amino acids from the stream only occurs in the absense of fatty acids. All of these nutrients are available in the stream at all times and via the stream they make their rounds and are offered to every organ and tissue in the body. The organs take the nutrients that they can use directly from the stream. This part is clear from the *Handbook of Physiology*.

I e-mailed Gary Taubes and asked about the Benedict source study. Hopefully, he will say go to http://www.whatever and download it, or maybe he'll even provide a copy.

Interestingly enough, Taubes implies that Cahill and Owen were aware of this study when they insisted on the 130 figure in 1968, as well as Newsholme and Start in 1973. Maybe we can find their studies and see what their reasoning was.

Hi Pamela - just wanted to tell you that if you like sausage patties, there's a great recipe in the recipe section here. Breakfast sausage, I think it's called. It's on the first page. I just made a batch and it's really good! You can add fat to the ground meat before you make the patties too.

---

**RE: Zero Carb / Meat and Water - Charles - 09-09-2008 02:38 PM**

It's some hard reading MAC, but it seems clear to me that carbohydrate combustion pauses at day 7 for
two days and then it continues at a reduced rate for a few days and then completely stops at Day 13.

However, the body uses more and more fat as the fast goes along. This would indicate to me that on a zero-carb diet, as the person gets ketoadapted, the body uses more and more fat and less glucose, which may be less than what is commonly thought. The subjects who were involved in the fast were obviously high-carb eaters prior to the fast. In order to get anything definitive for our purposes, we would need to have the subjects be ketoadapted zero-carb subjects so they could observe the changes in their bodies. I would bet that the changes during the fast are similar but not nearly so pronounced as they were in these subjects. The 100 grams are clearly recommended for a person coming from a high-carb background. When my PDF stops recognizing the text, I want to check the table to see how much carbohydrate was actually used during the first two days. Either way, some protein is broken down but not that much and it drops off considerably as well as the fast goes along. This would seem to re-enforce the Bear's opinion that gluconeogenesis is something that just doesn't happen very much, nor does it happen very long.

The greatest loss of heat falls upon the fat, with the greater part of the remainder. As a matter of fact, the carbohydrate (glycogen) is rapidly drawn upon and available supply is quickly depleted, sufficient glycogen for the first day of the fast to furnish somewhat more heat than the protein on that day. After the first 3 days, the heat is almost wholly from a fat-protein katabolism, with a minimum of glycogen. The combustion of glycogen ceases after the

As Charles has said this source is all nonsense. Insulin levels control whether or not you burn fat. Yes you need enough protein for your needs but insulin levels are the determinant of fat storage and fat release.

Carbs drive insulin and insulin drives fat storage. The one sentence summary of GCBC.

I for one...am SO GLAD there are folks like Charles that actually understand all this science and chemical process that is going on inside our miraculously made bodies.

Most of the time...in this thread...my eyes glaze over because I only kind of, sort of, understand what is being talked about.....

....it makes me brain hurt...

I need some fatty chunk of meat to help my brain stop hurting....😊
Hi, I'm brand new here...I'm also starting meat and eggs today. I've read all of the advice and I will let you all know how I do. I think the most difficult part for me will be figuring out whether I need more fat or less fat. Charles, I read your advice on that too, hopefully I can figure it out!

I do have a question about butter though....should it be avoided except to cook in?

Welcome, chiara.

Well, I don't want your eyes to glaze over or your head to hurt. We do tend to delve into the esoteric sometimes but it makes a huge difference when it comes to the treatment of this metabolic disorder. There are many opinions out there when it comes to raw meat or too much protein, etc, and it's my hope that all of us will independently be able to weigh whether the opinions are valid or not. It doesn't have to be very complicated when you think of the Inuit, but I think that when we study the Bellevue experiment and the Second Pemmican war, you'll see that this isn't complicated at all.

As my favorite Heath Ledger movie said, many of these ideas have "been weighed and found wanting."

Regards,

Charles

My only comment is on the feeling of hunger. Is it possible that hunger feels different in each of us? It seems to me that for some reason I, as well as many people, associate hunger with something coming from the stomach. I am always waiting for something to go on in my stomach before I will admit I am truly hungry. I used to do this to the point of letting myself become so ravenous that I finally gave up and ate anything I could get my hands on - I felt out of control and nearly animal like in my behavior. I would just shove things in - hence all the binging. This happened even on low carb. I shoved in oodles of "low carb" food, which added up to......... too many carbs. I think I am realizing, finally, that hunger to me isn't in the gut, it is in my energy level. Once I start to feel tired, it is time to eat. For me hunger is a gnawing feeling in my stomach. My energy doesn't flag and I don't get tired when I'm hungry. Unless I'm doing very strenuous labor, I rarely feel tired at all during the day. I always assumed that hunger was that rumbling feeling in my stomach. I guess I never feel hungry then if the signal is something else entirely.

**RE: Zero Carb / Meat and Water - Charles - 09-09-2008 06:25 PM**

I've been moving along through the Bear's thread and I'm 3/4's of the way there.

I finally figured out what he meant by "never being hungry." What he said is that "hunger comes when smelling the food." He's saying that if he is not around food then he never gets hungry. He has the same phalic insulin response as the rest of us, but he doesn't get insulin secretions at other times.

This simply means that his insulin is controlled and I would say the same thing. When I am not smelling food, I am not the least bit hungry. The thought of it can be nauseating. However, if you walk by with a piping hot steak, then I might get a sensation of hunger which I can easily ignore if I choose to. The zero-carb diet, over time, should keep your blood glucose steady and equal to your fasting glucose number without much variation, according to the Bear, and I see no reason to disagree with that.

Those with severe hyperinsulinemia will spend inordinate amounts of time hungry. These are times they should be running on their own fatty acids yet they cannot due to hypersecretion.

As the Bear says, "meat-eaters never get hungry" (unless they are in the prescence of the meat).

I agree with the Bear!

**RE: Zero Carb / Meat and Water - Bk_Metro - 09-09-2008 07:35 PM**
He said women's role is as a gatherer and men are hunters. Something like that.

I don't consider that offensive. Surely that was the way it was in caveman times? What's offensive about that?

Here is the exact quote:

"If you ask an Aboriginal man what traditional food is, he will name all the animals he can hunt. If you ask him about other food, he will than tell you about the 'bush tucker' you can eat when you can't find any animals. Both men and women will hunt, but men rarely gather. The Aborigines are modern hunter-gatherers, their prehistory (dreamtime) is not known to science."

He's made a number of flippant comments about women and our role as gatherers. I have a PhD in Anthropology and studied bio anthro as well as archaeology extensively. Perhaps these comments disturbed me because I feel he made a lot of assumptions about what male and female roles must have been like in the past based on his own sense of gender roles in the present. It can be dangerous as an academic to do this because it clouds the actual evidence. It just made me read what he's written with a grain of salt. I don't mean to discount all he's written, it's just something I noticed.

---

**RE: Zero Carb / Meat and Water - suzanneyea - 09-10-2008 02:18 AM**

Everything I have read has been pretty clear that the men did the hunting, woman took care of children and the home, are you saying that you think woman were hunting? In what society? Also, I never get the too much protein thing. How could you control your protein or limit it on an all meat diet? Mine is always above 300 grams a day and I have no clue how it could be lower unless I just ate less.

I have to fight for 150 grams!!!

Maybe that is why the weight loss has stalled...need more protein and fat!!!

Pass the hamburgers and hold the bun....

**RE: Zero Carb / Meat and Water - chris m. - 09-10-2008 05:44 AM**

I too am about 3/4 of the way through "The Bear" one question that keeps nagging me though is:
I get the zero carb - adequate protein and the rest fat
The Bear suggests that over-cooked meat is almost worthless. I've been cooking mine more rare but frankly, just like my meat cooked. I know the nutrients are more available as you move toward raw.

This is why jerky - produced under 104 degrees - is so good for you as the dehydration process is considered raw. Then when you add back the fat to produce pemmican - you have almost a perfect food.

The old trapping companies bought it by the ton from the indians to feed the trappers. They also paid a premium for it if made from marrow inside the bones.

I can't wait til we get into the book for this subject alone!!!!

I am not recommending cutting one's protein but what one would do is basically figure that each oz of meat contains roughly 7 g protein. So eat whatever ounces of meat to give one a protein target, say 6 oz, which is 42 grams of protein more or less. Then cook strips of fat for additional calories.

I looked online and found a company that makes a version with only meat and fat (a lot of the commercially prepared ones seem to have berries, sugar and other stuff added). I'm going to order some today.

Would you mind sharing that link? I want to try making my own, but I'd like to check out what they have.

Here's the link. They have quite a lot of other products that look good too.

http://www.grasslandbeef.com/Detail.bok?no=600

That's the one we were talking about earlier. It's not just meat and fat though, there is a lot of salt in it.

Suzanne, would you post a sample of your daily menu. I'm curious to see how you're getting so much protein. I can very easily get in between 100-150 grams per day but I don't think I could eat much more than that.

If Suzanne is eating > 300 g of protein/day then she is eating 300/7 or 43 oz meat or nearly 3 lbs meat or about a 16 oz steak for breakfast, lunch, & dinner.

RE: Zero Carb / Meat and Water - lynnhopes - 09-10-2008 06:34 AM

I'm sure steak is the vital clue. If I let myself I can easily eat an 18oz steak sometimes. That adds up to 126g right there 😁

RE: Zero Carb / Meat and Water - jeepifer - 09-10-2008 07:38 AM

Mmm, steak. Leftover ribeye for me for lunch!

Sorry, not on the current topic, but I loooooooooove a good steak. LOL

I nuke it for 30 seconds or so, just enough to get the cold off. I wish I had a toaster oven at work, since I like the way that reheats better, but oh well.

OTOH, reheating hamburger patties... Blech. I'd love someone to give me a way to do that, cuz they're just gross to me.

I am having leftover ribeye right now. I put it in a hot frying pan w/ butter or fat and fry it just to warm it up & get the fat crispy again. Takes about 5 mins or so, 2-3 mins per side.

Well, if they do, it doesn't work very well. This pemmican, unlike homemade which can be left out for long periods of time, grows mold extremely easily. This may be due more to the water though. Pemmican is supposed to be made with completely dehydrated beef and tallow with the water completely rendered out, but for some reason, Grasslands adds water as an ingredient.

I love steak but I get tired of chewing it after a while so I could never eat more than about 1/2 pound in one sitting. I eat a half pound of ground beef every morning and that's much easier to get down because there's not much chewing involved. When I'm done I'm stuffed and couldn't squeeze in another bite of food. If I ate those three times a day, that would only be 1 1/2 pounds of meat. Like I said, three pounds of meat per day is way out of my league.

jeepifer Wrote:

I'm careful not to over cook my patties when I fry them so that they don't get too well done when I reheat them in the microwave later. I reheat my half pounders (6 ounces cooked weight) for 2 minutes on 40% power in the microwave and they come out perfect. I don't like my meat too hot. I reheat my steaks about the same as you do. Just long enough to warm them a little without cooking them more.

**RE: Zero Carb / Meat and Water - nyteez - 09-10-2008 09:14 AM**

I'm going try making some this week. I am getting some lean meat today and make the jerky tonight. (in my nuwave oven LOL) I already have 3 jars of tallow, so I figure if I put the jerky in my food processor and just pour some melted tallow over it until is is the consistancy of brownie mix then I will have pemmican? I think I will add a pinch of sea salt. That's my plan, I'll let ya'll know how it turns out.
LindaSue Wrote:
How do you make a cheese eggwhich?
Crack two eggs in a fry pan, put cheese on top, then crack two more eggs on top and move them around to cover. Works better if you break the yolks bc it's hard to flip - you can finish it under the broiler, much easier. If you have a really small pan, you could do one egg per layer.

Charles Wrote:
I finally figured out what he meant by "never being hungry." What he said is that "hunger comes when smelling the food." He's saying that if he is not around food then he never gets hungry. He has the same phalic insulin response as the rest of us, but he doesn't get insulin secretions at other times.

This simply means that his insulin is controlled and I would say the same thing. When I am not smelling food, I am not the least bit hungry. The thought of it can be nauseating. However, if you walk by with a piping hot steak, then I might get a sensation of hunger which I can easily ignore if I choose to. The zero-carb diet, over time, should keep your blood glucose steady and equal to your fasting glucose number without much variation, according to the Bear, and I see no reason to disagree with that.

I'd agree too! I don't feel actual hunger until I smell cooking, usually meat. I'll know that I can eat, but until I smell that ribeye cooking I'm not aware of the sensation of hunger or any urgency to eat.

There's a French saying that translates to 'hunger comes from eating', and I've experienced that as well -- not feeling hungry until I start to eat.

Charles Wrote:
I'm still getting through the Bear, and I think I'm pretty close because now he's just repeating himself to the poor souls who won't bother to read the thread before asking questions.

Perhaps today we can slay a couple of low-carb forum dragons that persist despite no evidence they exist.
One of those is the idea that glucose is used for exercise. Gary Taubes has graciously provided me a copy of the notes he took as he reviewed the studies involved with fasting and this has truly been some eye-opening reading.

They've known since the turn of the century that fat is the body's primary fuel even though you won't read this in too many popular publications. In 1956, Dole, Gordon, and Cherkes in the United States, and Laurell in Sweden, independently described the turnover of fatty acids in the body. While these guys were hard at work, Zierler and his group in Baltimore did a study on the utilization of glucose across the resting human forearm, suggesting that glucose played a very minor role in oxidative metabolism by muscle in the basal state and later studies by this same group reported that basically, the average man only uses 30 grams of carbohydrate in 24 hours. This estimate was likely very high for muscle because the major proportion of this glucose being extracted are merely ethrocytes in transit through the muscle.

This idea that I use gluconeogenesis to run my half-marathons is simply not founded.

This is significant because we already know that after 66 hours of fasting, there is no marked decrease in glucose disappearance. However, there is production of lactate from glucose consumed, but even that is diminished during fasting.

This suggests to me that glucose (after undergoing glycolysis gets converted to pyruvate and it burnt in the mitochondria) is only eliminated slowly through the mitochondria and is not at all an "energy source."

This is important to those who consider "carb-loading" for exercise or for quick energy. You may get an energy boost, but it's not from the glucose you're consuming and as the Bear states so many times, this glucose is only going to fat storage because the muscles do not use it. If that's the case, this boost is coming from insulin and that is about as unhealthy as it sounds.

The clinician is too well aware that insulin and exercise work in concert. An excess of one may replace a partial lack of the other, or more problematical to the patient, an excess of one may cause severe hypoglycemia in the face of normal amounts of the other. (Joslin: 1959).

What does this mean? This means that exercise makes you hungry!!!!

People continue to rely on Morgan and Sanders' studies in the mid-sixties that said that vigorous muscle activity accelerates glucose utilization. This suggests that glucose is the preferred fuel for exercise. However, the limited amount of carbohydrate in the body could only provide minimal fuel for prolonged exercise, and fat both brought to muscle from adipose tissue as free fatty acids or endogenous lipolysis provides the greatest proportion of fuel.

This is from Cahil, who still believes that people are fat because they eat too much!

I am getting hungry for lunch (I can smell others' lunch) so I'll deal with the brain and the 120 number after lunch!

Regards,

Charles

RE: Zero Carb / Meat and Water - daveo - 09-10-2008 10:05 AM

Thought I would pass this along. During the discussion a few pages back about Vitamins, I got thinking that I would like to take cod liver oil. I figured it might be a good way to get Vitamin A since I never eat liver, and some Vitamin D since I don't a lot of sun. Also, although I don't totally buy the grassfed beef thing, I thought maybe it couldn't hurt to add some omega 3, so CLO would kill 3 birds with one stone. Even The Bear told me I might want to supplement Vit A if I don't eat liver.

There was mention of synthetic vitamins and whatnot, and since Carlson's is the brand I can find locally, I shot them an email. Here was the response:

In reply to your E-mail, Carlson's Cod Liver Oil contains only natural Vitamins A & D from the liver of the cod fish. Synthetic Vitamins A & D are not added.

If we can be of any further assistance, please let us know.

Sincerely,
Eileen Collins

I am just the opposite. At one point I was eating over 32 ounces of steak a day and could eat more. Ground beef, I can barely eat 6 ounces at a time. For me the steak had much more flavor then the ground beef. Plus with the ground beef I was always looking for something to add to it to make it taste better. The steak just needed a little sea salt and that was it!

If that's the case, this boost is coming from insulin and that is about as unhealthy as it sounds.

So, you're saying, if you're looking for a boost, you do so only at the expense of your health, since insulin is the only thing that will give it to you? How about adrenaline or cortisol? Is there a way to force your body to give up some of that for a boost? Ha ha. So how about the old "fight or flight" response that gives such a surge of energy without food? Insulin again somehow? Or, is the boost all a state of mind?

Charles Wrote:

The clinician is too well aware that insulin and exercise work in concert. An excess of one may replace a partial lack of the other, or more problematical to the patient, an excess of one may cause severe hypoglycemia in the face of normal amounts of the other. (Joslin: 1959).

What does this mean? This means that exercise makes you hungry!!!!
Only AFTER we exercise or during as well? If I feed that hunger with fat and protein how long until it becomes part of the flow of fatty acids and gives me a boost? I'm feeling like the answer is "there is no such thing as a boost".

Or.......... do I have it all wrong again?

And, one very ridiculous question, but I have to ask it. If insulin is the poison it so seems to be, does every tiny secretion of insulin over the span of a lifetime push us closer and closer to our demise? Or, can the body truly overcome some of these insulin surges, like those needed for self-preservation and for catching food (exercise).

This is all scaring me a bit into thinking that I should eliminate exercise from my life and just strive for never, ever secreting even a hint of insulin. What kind of life is that? For me, as an athletic individual, it sounds like my own personal version of hell.

Now, you may get a hint of why my husband says I "over react" to everything! I prefer to call myself "engaged with the new information". I can just see all you scientists shaking your heads at me.

RE: Zero Carb / Meat and Water - DavidBurchall - 09-10-2008 10:43 AM

I'm coming up on two weeks Friday. I started at 260 lbs. I went down to 253 and since the weekend I'm at 255. I can't imagine that I've packed on two pounds of muscle as I haven't even been exercising that much. So, I'm thinking this is just fluid changes.

What concerns me is that this will be like the last two times I went low carb: lose water weight the first week and stay at that weight even after a month. I'm not seeing any difference between no carbs and low carbs so far.

So I'm wonder what others here have typically experienced when starting out..?

RE: Zero Carb / Meat and Water - Charles - 09-10-2008 11:14 AM

daveo Wrote:

Well, that's one of the very few things that Bear got wrong, in my opinion, because the Inuit didn't eat many livers either yet they never had a vitamin A deficiency and many never ate fish either.

Regards,

Charles

RE: Zero Carb / Meat and Water - Kristi31 - 09-10-2008 11:38 AM

But, if I remember correctly, The Bear admitted that he wasn't so sure that liver was needed and that he had gone more than 2 years (or about that time) without eating liver and experienced no problems. He suggested liver, JUST in case and very little of it.
cbnebraska Wrote:
So, you're saying, if you're looking for a boost, you do so only at the expense of your health, since insulin is the only thing that will give it to you?

I'm saying that oftentimes we deplete ourselves to the point of needing an artificial boost when the true answer is that we need to allow for more rest and better training methods. The body will replenish what was lost to exercise, such as microfractures in muscle tissue and depleted muscles, but it takes time. We find the same thing with regard to fasting and exercise. Our bodies bring all of our levels back to where they need to be over time and our bodies usually come back stronger for the effort.

It's like shining shoes. If you use a lot of polish and begin to rub in a circular fashion, the wax will eventually shine, but only to a point. Once you rub beyond the saturation point, the shine will fade.

Lifting weights can make you stronger if you give your body two or three days between sessions. However, if you lift every day, you'll deplete yourself so far that you won't get stronger. Instead, you get weaker and the issue can become psychological.

A little bit of running strengthens your immune system. Too much running will weaken your immune system.

Cynthia Wrote:
How about adrenaline or cortisol? Is there a way to force your body to give up some of that for a boost?

Adrenaline is a hormone that mobilizes fatty acids. When you need the flight or fight response, adrenaline drives all nutrients from your bloodstream and fills your bloodstream and muscles with free fatty acids (yes, the opposite of insulin) This gives you the most speed and power possible. When you tow the line for your race, adrenaline will likely power you to get started quickly. Cortisol will attempt to calm you by slowing the rate of fatty acids which provides a calming effect.

What disrupts the action of these powerful hormones?

Insulin! Too much, and neither can work as powerfully as it should. Why would someone want to eat carbohydrates, which require insulin to process, which will slow the mobilization of fatty acids which should be powering the muscles?

Cynthia Wrote:
Only AFTER we exercise or during as well? If I feed that hunger with fat and protein how long until it becomes part of the flow of fatty acids and gives me a boost? I'm feeling like the answer is "there is no such thing as a boost".

You're getting there. I get a boost just by arriving at the starting line and standing there with the other participants. At big races like the Rock-n-Roll Half Marathon, someone sings the national anthem and there are thousands of people all standing around. This prompts a big adrenaline rush. At the Shamrock half last year, they even had two fighter jets roar past just as the singer was completing the national anthem. That made me tremble.

If you are healthy and strong, the thrill of competition should provide all the "boost" you need. You shouldn't have to artificially create this boost.
We learned from Greenwood that during exercise LPL activity in the muscles increases whereas in the fat tissue, it decreases. When exercise is over, LPL activity increases in fat tissue and decreases in muscle tissue. This means that fat tissue reclaims the lost fatty acids when exercise is finished.

Food (especially fat) should be taken when one is tired to provide a boost. The object of physical exertion is actually a race towards depletion. We were designed to cover long distances and exhibit great feats of strength and speed but we were also designed with a need to adequately recover after these events. The recovery is key to performing the act again.

If I had some long event to prepare for, I would just try to overeat on fat and protein to the point where I could cover the entire activity without stopping for food. I forget this sometimes and don't eat prior to races. I will abolish that practice in my own life. For my next half-marathon in two weeks, I will eat something the morning of the race. A steak or burger about an hour to an hour and a half before sounds about right. I don't have to be hungry to eat something.

Cynthia Wrote:
And, one very ridiculous question, but I have to ask it. If insulin is the poison it so seems to be, does every tiny secretion of insulin over the span of a lifetime push us closer and closer to our demise?

Well, every secretion and every action you undertake brings you closer to your demise if you think of it that way. Insulin is a very normal thing. What is abnormal is chronically-high levels of insulin because our bodies weren't designed to withstand too much of that. Getting hungry and things like that are very normal. Trying to manipulate the insulin levels with poor fuel and over-doing it is what brings us that much closer to death and aging.

Cynthia Wrote:
This is all scaring me a bit into thinking that I should eliminate exercise from my life and just strive for never, ever secreting even a hint of insulin.

I'm beginning to think your husband is a very smart man! 😅 Just kidding.

Listen, I don't read anything of what I wrote today as suggesting that you shouldn't exercise or that you should be fearful. However, we all have to be sensible.

There are many athletic events that we can participate in that don't have the health risk of marathons and full triathlons. These are elite distances which, in my opinion, should only be attempted by elite athletes, perhaps a very few times in their lives. I am not at all fond of this craze people have that as soon as they drop a little weight, they want to go out and run 26 miles or whatever to prove they can do it. This is craziness.

As the Bear said, the original marathon man died after his first and only marathon and today we want to do it for sport. (I'm not talking about you or anyone in particular. You can substitute any event in place of "marathon" in what I wrote.)

There is nothing wrong with 5k's and 10k's or short bike races or swims. Why does everyone have to run the farthest or climb the tallest mountain to have fun? There are so many other things that are just as fun and just as challenging, yet do not compromise our health in the process.

Okay, I'm ranting...
Regards,

Charles

I remember that too, Kristelle. I've noticed as I've worked through the thread, he might have said certain things early on and then clarified his comments or gave more information to let you know what he was really thinking.

For instance, he claimed that fatty acids never enter adipose tissue which is not true because Rittenberg and Schoenheimer watched it do just that. However, he does acknowledge that free fatty acids circulate and are not impeded by glycerol on a zero-carb regimen. This is absolutely true so it doesn't matter in the grand scheme of things whether the fatty acids go through fat tissue or not.

Hello David and welcome to our forum.

Two weeks is not enough time to come to any conclusions. However, it does suggest that perhaps you're a little too concerned about the weight-loss aspect instead of your health. Stefansson said that it can take six months to determine whether or not a person will stay on an all-meat regimen or not.

What you're really treating is the metabolic disorder that causes all the chronic diseases of civilization. Of which, obesity is just a symptom. Don't get sidetracked by the symptom. Instead, focus on the real culprit and the weight loss will take care of itself. Weight is very similar to blood pressure, pulse rate, body temperature, etc. They are all regulated by your body. If you have body fat to lose, your body will discard the extra body fat if you eat a proper diet.

Make sure to eat fat and protein to appetite and drink water. Eat only when you are hungry and don't eat when you're not. Do this, and everything will take care of itself.

Regards,

Charles

also, what are the suggestions on condiments? none? some?
thanks!

Please welcome Chiara to the forum and you all can respond to this here.

Charles Wrote:

Great info and this is what I will do. I have a race Saturday that should take 5-6 hours. I plan to rest
Thursday and Friday and not lift a finger. I've trained in all the things I need to do. I plan to take along
my own really fatty breakfast and will do the entire thing without food. I can go that long without eating
during the week, I should be able to do it in a race. My only concern now will be to not overdrink water
and make myself sick again. My mouth gets dry from all the wind on the bike so I'll have to practice
swishing and holding the water in my mouth instead of swallowing.

Thanks again for the further explanation.

daveo Wrote:

Well, that's one of the very few things that Bear got wrong, in my opinion, because the Inuit didn't eat
many livers either yet they never had a vitamin A deficiency and many never ate fish either.

Interesting that you should say that. Dr. Eades in PPLP says that once you open a bottle of CLO you should consume it in 2-3 weeks to avoid the oxidation of the oils. The CLO is packed with an inert gas in order to avoid oxidation of the oil before being opened.

Two weeks is not enough time to come to any conclusions. However, it does suggest that perhaps you're a little too concerned about the weight-loss aspect instead of your health.

Thanks, Charles. I hear you on that. However, weight loss is why I'm changing the way I eat - not health. By every marker other than weight I'm healthy - thyroid function, blood pressure, lipid panel, blood glucose levels, etc. And I've lost weight with other ways of eating - none of which worked in the long run because they just made me hungry and weak.

Thinking about great health doesn't give me the mental 'umph' I need to be consistent. At least not yet.

So the truth is, I'm not doing this for my health. This is all vanity, baby! I wanna look good again. And I wanna keep a great looking bod! This is what is driving me forward. I think that's good enough.
If it were to take 6 months to see any real weight loss, why would anyone choose this? Who could keep going without some confirmation that it's working for that long? All I'm looking for right now is if my results so far are typical - a little reassurance that this won't be the same as my past failure with low carb. Throw the guy who's trying to get his footing a bone. :-)

**RE: Zero Carb / Meat and Water - cbnebraska - 09-10-2008 01:34 PM**

Something new. Today at lunch one of my friends and colleagues asked if I am just eating meat now. I told her yes and just a few basics about how good I feel and how I've been so glad to get rid of the cravings and constant thoughts of food. She asked me if I missed the variety and I was able to say no - and really mean it. I told her I was very glad to give up food as a leisure activity. I shared a few other things, including a few words about my goal of keeping my insulin low. Then, I became tongue tied.

Now, my question for you all. I have read GCBC and am planning to read FOTL with Charles (although I have read 1/2 way through it already), but I just don't like recommending either of these to someone as an introduction or overview of our WOE. Can any of you recommend a book or a web article or anything that I could recommend to someone who shows interest and doesn't start off their response with "I could never...". GCBC is way too heavy of a read and it has scared off the 2 people to whom I have recommended it. All the forums are too choppy and don't present this WOE in an organized manner. I have Charles' recommended books, but I'm just not sure which ones would be appropriate to recommend to a "beginner". Maybe there's a website out there that presents it with a bibliography? All I'm looking for right now is if my results so far are typical - a little reassurance that this won't be the same as my past failure with low carb. Throw the guy who's trying to get his footing a bone. ;-)

In the log run your health will be the winner.

Eventually the thyroid will have problems (not if but when) and worse there is a VERY STRONG
chance that your testosterone level will drop and do it so slowly you will not notice. (If you want to hear the story I'll related it!).

I could continue but I think the last one would be enough for any man to throw away the twinkies and pick up the protein and fat. AND, the good thing is 4-6 weeks and things will change and you'll feel 10 years younger.

**RE: Zero Carb / Meat and Water - Charles - 09-10-2008 01:48 PM**

Okay, now back to this 120 grams of glucose for the brain business, with all due respect to Dr. Mary C. Vernon.

Francis Benedict's study from 1915 was on a subject who fasted for 31 days. This study remains the most complete of all balance studies in spite of many inadequate analytical methods. He demonstrated that for the first 5 or 6 days of fasting, a small component to the fuel of respiration was provided by carbohydrate and then none at all. After that, it was all about fat and protein. Fat contributed 85% and protein 10%. Benedict remarked that fat was the most abundant and and possibly expendable.

Many problems were unexplained and the general belief in gluconeogenesis was directly under fire. The brain supposedly requires 120-130 grams of glucose daily, although the IOM report that Taubes cited says that really only 100 grams are required. The extra 30 was set as a precaution. Everyone agrees that ketones can provide 75 grams, but they dispute is over the last 25 grams.

Total carbohydrate stores are barely adequate for 1 day's supply for cerebral function and gluconeogenesis must provide this amount. However, data shows that gluconeogenesis falls far short. Nitrogen (protein) excretion in several days decreases to 10 grams per day and in more prolonged fasting, it decreases to levels approaching 3 grams per day.

We all know of people who have fasted considerable longer than 7 days.

This renders impossible rendering more than several grams of glucose even if all amino acids were glucose producing.

The body doesn't use up the limited supply of protein it has making glucose for those tissues that need it which means that the brain has to be using something else. The 100 grams of glucose requirement is more a belief than it is science since it obviously has not been shown in rigorous testing.

Let's put this gluconeogensis from too much protein idea to rest. If you are gaining weight on your zero-carb diet, it has absolutely nothing to do with the amount of protein you're eating. Protein conversion is too expensive and can be toxic since that results in more nitrogen which would build ammonia in the blood and kill you. I was under the impression that the muscles didn't use ketones but indeed they do. They use more than what reserchers thought.

The next problem that is equally frustrating to researchers is the very one that MAC and I were discussing just the other day. What is the signal that mobilizes just the quantity of free fatty acid needed by the liver and carcass from fat tissue and likewise, what is the signal to muscle which directs mobilization of muscle protein as amino acid into the blood to be removed by liver (and kidney) during gluconoeogenesis? In other words, when the liver "goes after the muscles" to get protein, what gets rid of the nitrogen that's left over?

There are two schools of thought. The first is that insulin (its level) is the primary mediator (not
surprising) and some think it is something in the brain which signals the release of peripheral fuel using neural pathways via the central nervous system. This means that the only time that the body would convert protein for energy would be if there were no fat or ketones available, so one would have to be fasting for more than nine months before this would occur. Again, the Bear is very astute.

The researchers tend to equate fasting and diabetes because in one case, insulin is low. In the other case, insulin is not effective due to the high level. This makes a huge difference to me, but the researchers seem to think they are somehow equivalent. The Bear also noted that these two cases were in no way similar.

Taubes provided David Kipnis's studies showing how fat tissue is exquisitely sensitive to insulin and we know that insulin facsitilates release of free fatty acids in response to the changing levels. The Randle cycle, which describes the glucose-fatty acid metabolism informs us how insulin levels effect the release of free fatty acids. This is well-known to all of us zero-carbers because we have no dietary glucose (or very little) and our fatty acids are not inhibited from circulating by insulin. Yet we all know that if we provide a glucose load, the fatty acids will decrease in circulation and the majority of the glucose will be stored.

Another note I found interesting, was that Benedict determined that if a man has enough fatty acids at the start, he may survive a fasting period of 6 to 9 months and probably even longer. At the end of 30 days of fasting, fat provides 90 percent of calories and protein only provides 10%. On an 8 day fast, fat provides 86% and protein provides 14%. On a 40-day fast, fat provides 95-97% and protein only provides 3%. The subjects on the 40-day fast were all obese.

For a man to survive a fast, protein conservation is critical, particularly in a primeval setting where maintaining muscle mass would be necessary. This is why we zero-carbers don't have to live in the gym. If we go once or twice per week, we are not in danger of losing our muscle mass. One-third to one-half loss of total body nitrogen is barely compatible with survival. This is the same for all the animals in the kingdom.

This leaves open the question as to what fuel supplies the gluconogenic precursor to provide the brain its necessary fuel. The probable answer is that the brain gradually decreases its utilization of glucose and uses ketones and hydroxybutyrate to become the most important fuels.

In conclusion, the question of how much the brain needs really depends on the state of the body at the time and the availability of peripheral fuels just as it does with regard to weight management. Insulin is the primary regulator of most of these processes so when contemplating your zero-carb regimen, it's important and prudent to focus on insulin first. If you do this, you will enjoy great health regardless of weight loss.

Regards,

Charles

Hey, at least you're honest. I like that, actually! The point is that it's not fair to judge zero-carb in relation to low-fat or semi-starvation diets because they both work in vastly different ways. If you semi-starve yourself, it is certain that you will lose weight. Of this, there can be no doubt. Ghandi has shown us the way. If you read my latest post, you'll see that you probably have enough fat in your body to last 6 to 9 months on a total fast.

However, this isn't the weight loss that you want. You want to burn fat and Keckwick and Pawan demonstrated quite conclusively in my opinion that one can lose twice as much body fat eating a high-fat diet than eating nothing at all, and the high-fat eater can preserve all of their lean muscle mass. No other "reducing" plan can make this claim.

David Wrote:
If it were to take 6 months to see any real weight loss, why would anyone choose this? Who could keep going without some confirmation that it's working for that long?

I'm not saying it would take 6 months to see any real weight loss. I said that it would take 6 months to determine whether you could overcome your acculturation (the Bear's term) and succeed on an all-meat diet. This is a very difficult thing to do.

A person would choose this because they recognize that insulin is the primary regulator of fat tissue and that it's important to regulate insulin levels if health is to be achieved or maintained. They realize that obesity is only a symptom and the body will regulate it if the proper diet is consumed. Every animal in the kingdom wants to be lean and muscular. No animal fattens for no reason. Correcting this "reason for fattening" is why someone would choose zero-carb.

Chronically-high insulin levels are responsible for all the diseases of civilization and it is a very slow-moving process. Obesity did not begin in our 20s. It began when we were children and we overconsumed refined and easily digestible carbohydrates. We set the groundwork and did the major damage before we saw our fat stick out over our belts.

This led to insulin resistance and our pancreas began excreting too much insulin to do the job. This is the thing that causes our bodies to store fatty acids as opposed to mobilizing them which results in a slow metabolism and great muscle loss.

Therefore, in order to be the leanest and strongest, a person has to regulate their insulin levels and eat the proper diet which will enable them to be their healthiest and strongest. They will stop erectile dysfunction, hair loss, bad teeth, bad body odor (both inside and out), cravings, and a major slowing of all aging-related maladies. And they should lose weight in the process.

Weight loss generally depends on how long one has been obese. If you were only obese for a decade or two in your life, it's highly possible that you will lose weight rapidly. If you were obese most of your life, it's possible your fat tissue has become exquisitely responsive to insulin and even the smallest excretions of insulin will cause you to store fat at a time you should be mobilizing fat. This means you have to get your insulin under control and the weight loss will take much longer.

Therefore, I can only guarantee that your body will look and continue to function as healthy as possible if you consume the proper diet, which I believe the all-meat diet is.

I hate to say it but diet and nutrition can be complicated when you're explaining it to a sophisticated mind. I think it's easy to explain to children because they get it more readily. That said, I love Gary Taubes' article, "What if it's all been a big fat lie?" This is GCBC lite and should get the fires stoked if they're really interested.

Chris m

Life without Bread by Lutz not Stefansson is relatively straight forward and covers the basics of low carbing. Dr. Lutz does not recommend less than 70 carbs per day. He has his reasons for this so his slant is slightly different but he is all about low carb. There is one technical chapter in the book which can be skipped.

http://www.amazon.com/Life-Without-Bread-Christian-Allan/dp/0658001701/ref=sr_1_1?ie=UTF8&s=books&qid=1221080970&sr=8-1

It is shorter and more concise than Protein Power or Atkins. Use the link and you can read the first chapter and decide for yourself its level of detail.

Here is low carb in one sentence, "carbs drive insulin which drives fat storage". All of GCBC boils down to this.

RE: Zero Carb / Meat and Water - con - 09-10-2008 02:32 PM

This is why I say it's easier to explain this to children than it is to adults. If I say that statement to my children, they instantly get it and push the vegetables away.

An adult will say, well, where did that come from?

Personally, I was interested in the philosophy first, and then the diet came second. The truth is that if a person cuts out flour, white rice, bread, flour, and sugar and their products, they will likely lose weight, cut down their cravings, and feel better than they have in years.

If they agree with the basic philosophy which Taubes encapsulates well in his article, then the Atkins Induction is the best place to start, in my opinion. It has all the rules and provides a good transition with the limited amounts of vegetables.

Once they finish the two weeks, then it's time to talk!

I wonder if there ever will be real, believable, mainstream accepted studies regarding these maladies of civilization and diet.

Wouldn't it be interesting if ZC/VLC was at least a long term treatment for and potential cure for things like the various cancers that kill so many of us in the human species.

I do believe there is something to this insulin control thing that involves a WHOLE LOT MORE than weight management.

They didn't eat many but I never do. You are probably right and I probably don't need it, but I figure there probably is no harm in taking some and maybe some benefit. It isn't expensive and a bottle will last a long time.

Interesting that you should say that. Dr. Eades in PPLP says that once you open a bottle of CLO you should consume it in 2-3 weeks to avoid the oxidation of the oils. The CLO is packed with an inert gas in order to avoid oxidation of the oil before being opened.

I'll have to check that out. What I read said it was ok 4-5 months in the fridge after opening, and the unopened bottle I am looking at is good till 7/11. Still, even if it was only good for a few weeks, the 8 oz bottle I have was only $12.

RE: Zero Carb / Meat and Water - Kristi31 - 09-10-2008 03:26 PM

I really enjoy reading this thread, it only gets better...fascinating subject, fascinating studies...I'm lovin' every moment of it!

For those of you that stall on zero-carb, assuming you're only eating fatty protein (excluding dairy and eggs) and drinking water, consider reducing somewhat fat intake and see what happens. If suddenly, your ketones show no more or you are feeling better, have more energy, feel less hungry overall, etc.,
then too much fat may be the culprit. Just something I recently discovered through my journey and thought I'd share with others.

This also challenges the notion that protein automatically converts to glucose because the more protein I eat and the less fat I eat, the slimmer I am. I've been on this path for a little more than one year and this is crystal clear now. If this theory were right, the opposite should happen. Suzanne's experience also corroborates this.

But, please don't take this to mean I'm against fat...far from it. Fat is super important and should be the main nutrient but one can sometimes overdo it. I thought nausea happened when fat was overindulged in but before this happens, others symptoms can also occur such as abdominal cramps, fatigue, constipation, bloating, etc. I didn't realize that until recently.

I do know one woman that has cancer and now has Type II diabetes. Her Dr explained to her that he wanted her to go on a low carb diet so she could control the diabetes and 'starve' the cancer cells of the sugar they fed off of.

If there is 1 doctor doing this can there be many more to follow.

RE: Zero Carb / Meat and Water - Kristi31 - 09-10-2008 03:30 PM

Great to hear! There is still hope...

RE: Zero Carb / Meat and Water - nyteez - 09-10-2008 03:44 PM

Quote:
If I had some long event to prepare for, I would just try to overeat on fat and protein to the point where I could cover the entire activity without stopping for food. I forget this sometimes and don't eat prior to races. I will abolish that practice in my own life. For my next half-marathon in two weeks, I will eat something the morning of the race. A steak or burger about an hour to an hour and a half before sounds about right. I don't have to be hungry to eat something.

I would do the same thing...not eat. The body uses a lot of energy in digestion, I would not want my performance to suffer from eating. I can't even imagine exercising w/ food in my stomach. But then again, I can't even imagine a 5-6 hour competition....unless it was golf. LOL!

Throw the guy who's trying to get his footing a bone. :-)

I have been eating this way for almost 8 months now. I am not losing weight as fast as I had hoped, but I am steadily losing weight and I look and feel so much better. I have stayed on this diet because, although I was not dropping pounds, I noticed other changes that made me stay on the diet.

I also eliminated foods all along the way that I thought were causing problems w/ weight loss. Eggs made a big difference. I have been off eggs for a month, and my weight loss now is faster. I started out on Atkins induction and am now down to just meat, water & wine. I know if I cut out the wine I would probably lose faster. But, as long as I am losing, I am keeping my wine! 😊

Another reason I stay on this diet. Over 4th of July weekend I ate green salads & veggies. I felt terrible! Gassy, bloated, cramping, tired. I figured, why would I ever want to eat another vegetable if it was going to make me feel like that! I have no digestive problems at all on this diet. I had digestive problems my whole life!

Also, I look like I have lost more than I have. My skin no longer has that "puffy" look. In fact my skin looks at least 10 years younger! About 2-3 weeks into the diet, I noticed the puffyness gone. Carbs make me look puffy & older. That's also a reason for me to keep eating this way.

So even though you may not be dumping 10lbs a week, just stick with it for a while. You will see positive changes.

**RE: Zero Carb / Meat and Water - chiara - 09-10-2008 04:11 PM**

okay, this is day two of meat eggs and water...so far so good! i've been trying to read through this thread...i've gotten to page 50. it's fantastic! charles, your knowledge is amazing.
yesterday, i had been cooking all of my meat on the george forman grill. but after reading, i realized that was really dumb. so, now i cook all my meat in a pan and then pour the fat on top. my husband almost threw up when he saw me do it 😊

i am confused on how much water to drink though...i know there is no magical amount. if i only drink when i'm thirsty, i would probably just have a dixie cup of water a day. i've been trying to drink my height in fl. ounces of water. should i stop?

**RE: Zero Carb / Meat and Water - suzanneyea - 09-10-2008 04:17 PM**

Most of us agree that we only drink when thirsty.

abnormalsle Wrote:
I wonder if there ever will be real, believable, mainstream accepted studies regarding these maladies of civilization and diet.

I think there is plenty of information available. It's just going to take either a grass-roots movement of successful people or it's going to take someone who will objectively view the entire evidence without prejudice or an agenda. Epidemiology is rock solid but people don't give it the proper credence because their scientific beliefs don't conform to the many observations.

It makes me sick to think how many sailors went to sea relying on the so-called evidence that lime juice cured scurvy. These ships were losing entire crews to scruvy and when they would return, they were told that their lime juice just wasn't fresh enough or some other stupid reason. They just keep adjusting the treatment hoping to find something that fits rather than looking at populations that don't get the disease.

Vitamin D used to only be about calcium and bones. Hell, now they are promoting it for all the diseases of civilization. How about fiber? That crap was originally supposed to be the cure for all the diseases. When studies couldn't show that it worked, then they changed it and now it's heart healthy and good for digestion. Then, it became good for losing weight since you can get full without digesting it. It just keeps bobbing and weaving and no one will call it for the BS that it is.

The Abnormal One Wrote:

Amen!! I have only lost 6-7 lbs. in about 6 weeks, but it looks like WAY more! I have dropped an entire
pant size and my arms and legs have become more defined than I've ever seen them. The puffiness is
gone and I just look so much "leaner and meaner". I truly can't believe it's only this much weight I've
lost. I still do coffee with cream 2 x a day, salt (when I can't avoid it) and a few glasses of wine a week,
so I absolutely know I could lose more if I gave up some of those. I was not and am not overweight
though, so my motivation has simply been my health and getting rid of the stupid food cravings and
obsessions, which I have accomplished. Since I don't have cravings I feel like I must have my insulin
tackled fairly well. I'm still trying to decide if I'm willing to go all out. Mostly because I'm trying to ease
my husband into this whole thing. He's getting used to it and I'm still settling into it myself.

10 lbs a week?!!? Yikes! I think I was sick if I lost weight that fast. As long as I lose is the point. Six
months with no change in weight...I wouldn't wait that long before deciding to do something else.

RE: Zero Carb / Meat and Water - nyteez - 09-10-2008 05:13 PM

Oh yea, that's another thing, Cynthia mentioned, food cravings. When you eat this way you don't think
about food anymore. If you eat enough fat you are not hungry. My life used to revolve around food.
Eating every three hours, figuring out what I can and can't eat, shopping for ingredients, worrying about
fat content and calories or points. What a waste of time! I even bought a watch with 3 alarms on it to
remind me to eat every 3 hours!

Now, I have so much more free time and money. I no longer have to shop for ingredients! I basically
just buy meat. It is so liberating!

davidburchall Wrote:

I do believe there is something to this insulin control thing that involves a WHOLE LOT MORE than weight management.

I do know one woman that has cancer and now has Type II diabetes. Her Dr explained to her that he
wanted her to go on a low carb diet so she could control the diabetes and 'starve' the cancer cells of the sugar they fed off of.

If there is 1 doctor doing this can there be many more to follow.

My sister died recently of cancer. The dietician told her that cancer loved sugar, but, unfortunately, she didn't tell her to totally eliminate it. She said it would be okay to eat it with a meal because of the body processing everything at one time. What????? I tried to get her to stop sugar, but I wasn't successful. She was never a so called meat eater. Ate very little of it and it had to be lean. One strand of fat was was pulled off and discarded. She was never overweight. Always, looked liked she was in good health.

RE: Zero Carb / Meat and Water - cbnebraska - 09-10-2008 06:54 PM

Thanks for all the pointers to Gary Taubes' article. I read the first few pages of it and I will use that one as well. I think most people are willing to accept LC, it's just the jump to ZC and in particular, the elimination of vegetables that gets everyone in a wad. I would love a link to something that explains why we really don't need them at all - unless I didn't read far enough into the article? I would love to just copy and paste some of the discussions that go on here, but somehow the officialness of a book or medical website adds validity. I like to explain that vegetation only came into the human diet when meat was unavailable, meaning in times of desperation, so the hunters could survive until they could find meat. I explain that we are omnivores in the sense that we can ingest a variety of things and they won't kill us, but that we will not thrive on them, only survive on them. I hope that's an accurate description. Oh well, I don't often talk about my eating, but do like to have something to offer up whenever someone truly shows interest.

Thanks to everyone for your leads. I will look into Not By Bread Alone as well. I do have quite a few Atkins books and could use some of them too.

Me too! And I believe, based on my research, that food intolerances have a lot to do with it also. We've only been eating grains for approx 10,000 years (less depending on geographic location) and not only can we not handle the glucose load from a grain-based diet, we can't handle the proteins in those grains. They cause a ton of autoimmune problems. I think both issues go hand in hand.

Hi chiara! My fella almost barfed when he watched me eat a steak yesterday. It was a chunk I'd cut from a roast, a really fatty end piece. He just can't stand the texture of fat!

Drink to thirst, like others have said. The 8oz/day thing is a myth. I looked in to this when I started my cats on a raw diet -- all the advice I read also stated that cats eating raw meat will drink less, and not to worry bc they're getting a lot of water from the meat they eat. I know we're not cats, but I'd betcha it's applicable to us as well. We get water from most foods.

Also you'd asked about vitamins...not to rehash an earlier vitamin discussion, but I take them sporadically. Actually, I just stopped taking D and fish oil, bc I came down with a cold a few weeks after I started taking them regularly (this has happened before, to me and to a friend of mine who always gets sick when she starts taking D). I can tell, for example, if I'm low on Vit C bc my gums will bleed
when I brush them. On VLC, my gums never bleed. They used to bleed all the time. I don't take any extra C, so this leads me to believe my body is using the C I am getting much better than it was before.

BeeDub Wrote:
It's killing you that you couldn't find a single study, isn't it?

Still waiting on that study, Charles 😞

Really this is getting out of hand. At first I found your post interesting, but after that I noticed your only subsequent posts here are to Charles, even though others have answered you and provided some info that would make for interesting, productive, intelligent discussion. To me, it looks as if you're here simply to argue with Charles. Debate is fine (and you'll see plenty of it in this thread, though you may not notice it bc it's friendly), arguing is not. Start a Vitamin D thread and discuss it with EVERYONE. If you have information to share, SHARE IT. Undoubtedly, there will be people here who will benefit from it. Additionally, Charles is not endangering anyone. We all have our own minds. We're ok. You do not need to save us from Charles, nor Charles from himself, nor the world from Charles or from a lack of Vitamin D. Amen and hallelujah.

I suspect you won't read this post, bc you pick through this thread to find Charles, bc you secretly love Charles but can only express this love via Vitamin D arguments. Hell, we all secretly love Charles. He's totally loveable. We don't blame you. Just send Charles that love you so deeply feel, go tell it from the mountains (over the fields, and everywhere) and all will be well. Love increases Vitamin D absorption. It's the truthiness. (ok I need sleep)

Charles -- interesting posts! Thanks! (see, I'm loving you right now. It's so easy. Shucks, I love you all! Feel the Vitamin D flow!)

RE: Zero Carb / Meat and Water - suzanneyea - 09-11-2008 02:14 AM

I love hearing all the different opinions too, but I just do not want this to become a debate and attack type thing. That is what happened with The Bear and we all lost focus on the true issues of health and it became a "who is right situation." Both points of view have been made on this issue and now I am asking, on behalf of the viewing audience, to end it. I will ask politely once. This is the once. If it helps, Charles is not the Pied Piper of the board, we will not all walk off a cliff after him. I respect his opinion, just like the majority of the people here, but do I follow his diet? Nope. Does everyone here follow all of his ideas? Nope. We are just taking in information here and coming to our own choices. We are not a bunch of morons and are completely capable of making our own choices about food, supplants, and our lives.

RE: starting meat and eggs today - AuntieeM - 09-11-2008 04:24 AM

Good morning. This is my first post here. Here's a short synopsis of my weight loss journey. In January '07 I started the Medifast program which I followed until this past January. I started at 220 and was able to get down to 150. I'm a 53 yo woman who isn't menopausal. I was, naturally, thrilled with the results but couldn't see myself eating rehydrated meals 5 times a day plus a Lean and Green meal for the rest of my life. Don't know if any of you know about Medifast but you eat 5 of their products (soup, oatmeal, shakes, pudding, bars - your choice) and one L&G meal consisting of 5-7 ounces of protein and veggies. My calories never went over 1000 (usually around 900) and carbs were around 75. Since January, I've been trying many different low carb ways of eating and have found myself with a 7 pound weight gain. I've tried '72 Atkins, DANDR, Stella Style, etc. I am very close to my goal weight of 140 - 145 and can
only figure that the reason I've gained instead of loosing is that I'm consuming too many calories. Can someone please explain for me the "rules" of Meat and Eggs or even point me to where I can find the information. Any help, ideas, suggestions will be greatly appreciated! I thank you all in advance. 😊

con Wrote:
LindaSue,
This part of a column in LowCarbExaminer San Francisco on August 25th, 2008--Cleochatra's column--it's much simpler using ground beef. Extra fat could still cover the dried meat. She has more info and variations on her site including info on the jerky extruder.

MAKE YOUR OWN BEEF JERKY
Must-have: Jerky extruder. Don't use Pla-Dough toys. Basic beef jerky

1 pound ground beef
1 tsp pepper
1 tsp salt

Mix hamburger with seasonings until well blended (I use my Kitchenaide mixer with the dough paddle) about 1-2 minutes.

Using an extruder, pipe jerky onto trays.

Food dehydrator: Let dry for 6-7 hours or just before meat snaps in half. Practice with this method will show that you can dry slightly less than the snap-point for more tender jerky.

Oven: On the lowest setting possible, and with the door ajar ever so slightly, let dry on racks for or until meat is close to breaking when bent in half.

Store in a ziploc bag.

Each pound makes 8 ounces of dried beef jerky. The beauty of this method is that the carb count is 0, and your caloric count is only as high as the amount you consume of, essentially, only ground beef.

Just wanted to post that I made this "Jerky" a few days ago. It's actually very good and EASY!! You could season how ever you like! Like others here; I don't eat breakfast but I do start to get some "rumblings" around 10am. I don't get lunch at work until 12:30. I put a couple pieces of my "Jerky" in a zip lock for those times. So far so good. I don't know how long it would last out of the frig but it certainly seems like it would be OK for a whole day for those looking for a zero carb, take along option.

Beth

RE: Zero Carb / Meat and Water - poo123 - 09-11-2008 04:57 AM

Well I am not dead and did not fall off the face of the planet. I did have a bunch of family things come up in the last 2 weeks. And I did go off my new way of life. In 2 weeks I have gained 5 lbs, but I am happy because I really could of put on much, much more. I did not do any emotional eating and I was so proud of myself. I am back home and back on meat and water only. I still have to catch up on the thread,
but I am really happy to be back. The thing I was surprised about was when I was eating off meat and water, "regular foods" I didn't feel sick, or foggy or anything like that. I guess I was hoping I would so I would, so I would remember how bad I felt but it was no problem eating. I am not still doing it and like I said back on meat and water, so the 5 lbs should hopefully come off in the next 2 weeks and then back to normal. I really missed reading what has been going on with all of you.....alison

RE: Zero Carb / Meat and Water - chia - 09-11-2008 05:24 AM
thanks for the advice on the water, everyone. I'm glad about it because i was forcing it down!!

i DO need advice on microwaving burgers because i have real problems with the pan. haha in the morning, even with a lid, fat splashes up everywhere and then i have fat on my clothing (it somehow avoids the apron 😁)

so is there a decent way to microwave a burger without spraying fat everywhere? mine are usually chuck if it matters.

Welcome to the forum AuntieeM. The only basic rules of 'Meat & Eggs' is that the base of what you eat is 'Meat & Eggs'. This is opposed to ONLY Meat which is another thread in this forum. Some people prefer to have eggs in their diet and not eat only meat. Eggs have a bit of carbs in them but if that is the only carbs one is ingesting it should not matter.

IMO the reason you have gained weight is that you were on a restricted calorie diet and perhaps lost muscle mass previously. If you are currently consuming a bit more calories your body is making up for the lost muscle mass.

RE: Zero Carb / Meat and Water - suzanne - 09-11-2008 05:38 AM
Put your burgers in a regular pan and put them in the oven on broil. No mess and they are still juicy.

RE: Zero Carb / Meat and Water - tweety - 09-11-2008 05:44 AM
suzanneyea Wrote:

That is how I fixed my burgers this morning. Used just the bottom of the broiler pan. They were yummy. I still find it strange to spoon some of the fat from the bottom onto the burgers, but I did. Ate one for breakfast and brought 2 to work for lunch.

I cook mine about 20 mins - 10 per side - so I go do other things while they are cooking. About the time I'm ready for work, they were ready to eat.

T

RE: Zero Carb / Meat and Water - LindaSue - 09-11-2008 07:02 AM
Thanks for the review of the ground beef jerky recipe, Beth. I may give it a try when I get my NuWave oven. It's due to arrive sometime today. The only problem for me would be the extruder. I don't have one. What does the meat look like when it comes out and can the effect somehow be simulated using common kitchen utensils perhaps?

Glad to have you back, poo123. I hope you don't have any trouble getting the weight back off. It used to be easy for me to get back on track and lose those few pounds but now it takes months and even years for me to lose anything. Don't waste time getting back on track because you never know when things might change like that for you too. I always had a feeling that the day would come for me when I would no longer be able to lose weight but it still caught me by surprise when it happened.

---

**RE: Zero Carb / Meat and Water** - LindaSue - 09-11-2008 07:05 AM

I started reading The Bear yesterday and I'm finding it fascinating. Does anyone know if the Bear ever had a weight problem? He hasn't mentioned weight at all in the part I've read so far. He seems to only be eating zero carb for his health.

One of the things I do is after cooking let them start to cool. I load them up with coconut oil or butter on them. As they cool they will not loose moisture and compress down as much. With butter or C.Oil this is 'sucked into' the meat as the lost moisture from heat is replaced with the butter or oil. When you reheat they are not as dry and not as 'compact'

---

**RE: starting meat and eggs today** - Kristi31 - 09-11-2008 07:31 AM

Don't worry about calories, stick with meat and eggs only, eat as much as your appetite dictates, eat enough fat and if weight still doesn't budge after a few weeks, drop the eggs. Best of luck!

I don't have one. What does the meat look like when it comes out and can the effect somehow be simulated using common kitchen utensils perhaps?

Sorry- I should have said that I don't have an extruder either. I patted it as thin as I could on an aluminum foil lined pan, scored it with a knife (pushed down on the meat- didn't pull it through the meat), and threw it in my oven on 170 with the door ajar for 10 hours. When it came out it snapped at the score lines. Taste great- not too salty as some commercial varieties. It's about the same thickness as the store bought brands but not stringy- since there no strings! Like I said it is EXTREMELY EASY. I would think you wouldn't even have to use a whole pound of hamburger to try or use more to stock up! Just adjust the seasonings. I'm going to try some tomorrow with alith garlic or maybe a southwest seasoning and leave the salt out. My guess is that it would last pretty long in the frig. A great Grab-N-Go food!

Beth

RE: starting meat and eggs today - AuntieeM - 09-11-2008 08:03 AM

Thanks all for your replies. Not to seem dense, but what exactly am I allowed to eat? I get the meat and eggs but how about mayo, butter, heavy cream and do I have to give up my decaf tea or decaf coffee? And how long should I do it? At this point, I'm so frustrated I really don't know what to do... 😞

You can have what ever you want to have. Mayo, butter, heavy cream, coffee. What you have is up to you. If you are losing weight leave them in. If you stall for more than 4 weeks eating them, then consider eliminating one of them and see if you start losing weight again. There is no right or wrong approach. It is what ever works for YOU. Everyone is different.

Some people consider the following stall items: eggs, heavy cream, artificial sweeteners, coffee. and even butter. Some people eliminate the preceeding and it makes no difference. For some eliminating one of them restarts their weight loss. Everyone is different and what works for one may not work for
another. All you can do is find out what works for you. No reason to be frustrated. There are no right answers. Just what works via trial and experimentation.

thanks for the advice on the water, everyone. I'm glad about it because i was forcing it down!!
i DO need advice on microwaving burgers because i have real problems with the pan. haha
in the morning, even with a lid, fat splashes up everywhere and then i have fat on my clothing (it somehow avoids the apron 😜)

so is there a decent way to microwave a burger without spraying fat everywhere? mine are usually chuck if it matters.
I microwave mine at work:
I put the hard fat and a pat of butter in the bottom of a bowl which I then cover with the hamburger patty. I then drape a WET paper towel over the top which keeps things in the bowl and off the sides of the microwave oven. About 70 seconds and you are ready to eat.
Hope this helps.
Chris m

One of the things I do is after cooking let them start to cool. I load them up with coconut oil or butter on them. As they cool they will not loose moisture and compress down as much. With butter or C.Oil this is 'sucked into' the meat as the lost moisture from heat is replaced with the butter or oil. When you reheat they are not as dry and not as 'compact'

I will try that on my batch this weekend but will spoon the melted fat over the top as they cool. I cook mine in one complete patty filling to the sides of the pan. When cooled they are easy to separate into squares and store in fridge til you need to re-heat them.

RE: Zero Carb / Meat and Water - cbnebraska - 09-11-2008 08:33 AM

Good morning all! I have yet another question that I'm sure is answered somewhere in this monster thread, but I'm sure someone will benefit from me asking it again anyways. It has to do with the time we are asleep, when our bodies are something phagic? (hyper, hypo? Sorry, Charles, I will never be the star science student.)

My question is multifold. How does our body get the signal to kick into this mode? Is it the darkness, some hormone (melatonin, by chance?), the state of being asleep, REM,...? Are those of us who sleep less hours at a disadvantage? How about those don't sleep "soundly"? Dreaming? When does our body know to kick out of this? The first spikes of insulin, the state of waking, light.......?

Charles commented that he is now taking advantage of this state by not breaking his fast til lunch time. I believe this goes against something he said not too long ago about "getting the motor running" and the importance of breakfast. I cannot take the time to locate it, or verbatim it, but he had a good analogy at the time. Charles, I'm guessing you've done a reversal on this?

I just purchased a glucose monitor. I am interested in finding out if a few things raise my blood sugar. My coffee with cream, low carb dairy, eggs, wine, vodka, etc... just to help me tweak my diet. I do understand that glucose is not the same as insulin, so maybe someone can help me figure out when to take the readings and how to relate them to whether or not a food is inducing insulin or blocking fatty acid mobilization. I know this may seem a bit bizarre to some of you but I am curious. I do have diabetes in my family history, as well as obesity - although I suffer from neither.

Thanks a ton!

The word you are looking for is hyperphagic. We eat during the day so as to have fuel when we are asleep.

Insulin is the gatekeeper to the fat cells. If insulin levels are too high then the fat has a hard time exiting to fuel your body. By the time you go to sleep your base insulin levels have pretty much leveled out for the day. Since insulin levels are lower when you sleep the fatty acids can escape from the fat cells to fuel your body.

A blood glucose meter can only tell you what your blood glucose levels are. However, glucose levels track insulin levels. Protein causes much less of a rise in blood glucose than do carbs and is counteracted by glucagon. Carbs do not induce the same counter action of glucagon that protein does. Fat is not supposed to raise glucose levels at all.

First of all do finger tip pricks with your meter. The finger tips are more sensitive to changes in blood glucose than say your forearm. Take a reading right before you eat something and then at 45 minutes to an hour after starting to eat something. This is generally when blood glucose peaks. If you are not diabetic then your blood glucose level should return to the value of your blood glucose before you started eating about 2 hours after you started eating. Your pre-prandial (or before you eat) levels should be in the 70s or 80s. That is considered normal. Prandial levels should go no higher than 120.

See this link for where to prick yourself to take a meter reading:

See this link to find out more than you probably want to know about blood sugar:
http://www.phlaunt.com/diabetes/

I would take my blood glucose readings (for other than the effect of food on blood glucose) in the morning RIGHT after I wake up. If you do it later then your blood glucose may rise up to 10 mg/dl due to something known as Dawn Phenomenom. For diabetics Dawn Phenomenom is much higher than 10 mg/dl. Your blood glucose level at this time of day is called your fasting blood glucose level or FBG for short.
I DO need advice on microwaving burgers because I have real problems with the pan. Haha in the morning, even with a lid, fat splashes up everywhere and then I have fat on my clothing (it somehow avoids the apron 😜)

If it were to take 6 months to see any real weight loss, why would anyone choose this? Who could keep going without some confirmation that it's working for that long? All I'm looking for right now is if my results so far are typical - a little reassurance that this won't be the same as my past failure with low carb. Throw the guy who's trying to get his footing a bone. :-)

Also, I look like I have lost more than I have. My skin no longer has that "puffy" look. In fact my skin looks at least 10 years younger! About 2-3 weeks into the diet, I noticed the puffyness gone. Carbs make me look puffy & older. That's also a reason for me to keep eating this way.

This is heartening to hear. I have had allergies, eczema and puffiness all my life. I definitely notice my hay fever is totally gone on this WOL. My eczema is still an issue, but maybe it will take more time to clear up. I am looking forward to the day that my under eyes and ankles are no longer puffy😊

RE: Zero Carb / Meat and Water - LindaSue - 09-11-2008 10:04 AM

Thanks, Beth. I'm glad that I can try the jerky without having to have an extruder. Would you believe that I've never tried store bought jerky so I'll have nothing to compare it to when I make my own? I also like the idea that you can mix whatever seasonings you like into the ground beef. It sounds like my kind of fun.

Thanks, daveo. I guess that I either missed it or haven't gotten to that part of the Concise Bear thread yet. I edited it to remove the narrow formatting and saved the thread as a PDF file so that I can zoom in to make the text larger. So, my copy is a lot more condensed than the original forum thread. I got my copy down to 35 pages instead of over 100.

In January '07 I started the Medifast program which I followed until this past January. I started at 220 and was able to get down to 150... Since January, I've been trying many different low carb ways of eating and have found myself with a 7 pound weight gain. I've tried '72 Atkins, DANRD, Stella Style, etc. I am very close to my goal weight of 140 - 145 and can only figure that the reason I've gained instead of loosing is that I'm consuming too many calories.

Wow congratulations on losing 70 lbs.!!!!!!!!!!!!!

And you are so fortunate to realize that LC is probably the only way to keep it off long term. I believe like others that you will have a short term small weight gain as the body heals itself from the semi-
starvation diet you were on. Muscles and other tissues will now begin to restore themselves—but you can't regain the fat as long as you only eat M&Es.

I wish I understood this fact when I got off Optifast—I regained 50 lbs. in just a few months. 😞

Be patient—eat to appetite—you'll do it!

RE: Zero Carb / Meat and Water - ANOVA - 09-11-2008 10:56 AM

Jusy an FYI for those wanting studies on zero carbs. A VLC study was done with a small sample of people who suffer from neuro degenerative disorders. The original study proved hopeful and it was my read that they were going to perform the study again with zero carbs. I think the mainstream will come around and start to challenge its own dogma. I forgot who it was who claimed that extreme diet studies would not be passed by an ethics committee. Why wouldn't it?

Charles

RE: Zero Carb / Meat and Water - Charles - 09-11-2008 11:43 AM

MAC Wrote:
Charles,
See the following link. Note the reference to lactate as a substrate for gluconeogenesis during heavy exercise. The Cori cycle occurs during oxygen debt. Seems to imply that glucose is used in the muscle.

This isn't helpful at all, MAC. As I wrote yesterday, it's all about "state." These observations happen in a high-carb environment. Lactic acid is produced in the mitochondria when pyruvate is burned. This only happens in the presence of elevated insulin levels. Glucose cannot go there without first undergoing glycolysis which produces pyruvate. This causes the burning in the muscles that athletes are very familiar with. That does not, however, mean that the muscles are using pyruvate for fuel. This is for elimination.

Baltzan, et al, found in 1962 that the average man can only store about 30g of glucose in a 24-hour period. This estimate is considered high for muscle proper because the major proportion of this glucose being extracted may be by erythrocytes in transit through the muscle. This hypothesis is supposed by the
fact that 68 hours of fasting describe no marked decrease but a thoichiometric production of lactate from the glucose consumed, suggested that the muscle might normally even extract of the lactate produced by the red cells, and this extraction is diminished in fasting.

Studies across heart muscle of man provided similar results, namely a minimal or even an absence of a demonstrable uptake of glucose. (Goodale et al, 1964) and a respiratory quotient of fat oxidation. In fact, heart of a normal man usually exhibits a net extraction of lactate and pyruvate, the two remaining proportion to their ratio in arterial blood.

The only other two events other than anoxia activate glucose uptake by muscle. One has been studied in extenso, insulin, and the other is muscular activity.

During fasting, we already know that carbohydrate does not get used beyond seven days, similar to the brain. Just because certain tissues use them at some point does not mean that they require glucose to function, or even that they function most efficiently.

The studies by Sanders, et al in 1964 and many others have demonstrated directly that glucose utilization is accelerated by vigorous muscular activity. Yet, it is obvious that the limited amount of carbohydrate present in the body, as described by the caloric content of the average man, could provide only minimal fuel for prolonged exercise and again, fat, both brought to muscle from adipose tissue as free fatty acids or endogenously produced by intracellular lipolysis, provides the greatest proportion of fuel.

This association of glucose uptake and muscular activity does not prove that the muscles "use" glucose. If anything, it provides a means of elimination. The only way that glucose even passes through muscles is due to insulin. In a ketoadapted individual, this would not happen at all because (1) insulin would be low; and (2), the muscles would be precluded from even taking up glycerol.

Regards,

Charles

MAC superbly answered the first part of your question and I have nothing to add to it.

I don't remember "getting the motor running" but if anything my advice was to never go hungry. When Dawn's phenomenon hits a person with high insulin (such as a diabetic) they will feel hunger far more acutely than someone who secretes the normal amount (or at least a more normal amount) of insulin. The higher circulating insulin will cause their fatty acids to stay out of circulation longer than it should.

For others, such as myself, I don't get hungry first thing in the morning. I don't usually experience any feeling of hunger until around 10:00 a.m. This usually lasts for about 3 minutes, and then I'm fine. I eat around noon and this lasts until about 7 or 8 in the evening. I eat dinner and that's it for the day.

I used to eat breakfast at 7 or 8 a.m., but this would make me not hungry until 3 in the afternoon. That would push dinner back to 9 or 10 (or make it very small) and this just didn't work for my schedule.

No matter how often a person eats, I recommend eating as soon as hunger strikes in the daytime. I also recommend eating early in the evening if possible so you sleep better and you can take advantage of hypophagia (you're not storing fat). Weigh yourself in the morning at least 8 to 10 hours after your previous night's meal and you should find an accurate weight.

**RE: Zero Carb / Meat and Water - jeepifer - 09-11-2008 12:23 PM**

Well, the fundamental problem with studying the Masai or similar is that people want results from those that are "just like themselves" or ordinary people living in our modern times. Otherwise there will be selective reasoning as to why they are different, even though biologically, it's not the case.

The ones for jerky are made to hold up to the force necessary to push the meat out. They are worth the money and they are made to withstand the use. Check out Bass Pro Shop website. I got one from them last year and it is a dream to use.

Also, don't get a dehydrator that is a 'plug and forget'. You want one with an adjustable temp control. The cost will be a little higher but it will save in the long run. The others will burn out easy and if you get 2 in 1 years it is cheaper to get the good one first. Bed Bath and Beyond had one that looked good when I was in there last week.

Also, Bass Pro had a real good hamburger meat press (good heavy metal) that will do 1/4 inch to close to 1 inch burger.

I thought about the cookie gun but thought what the heck- let's just press in the pan. I think maybe it helped to "compact" it really well. It was pretty greasy when I took it out of the oven but like I said it broke nicely where I had scored it, put it on some paper towel, then the frig. I poured the extra fat into my FAT jar in the frig. Wouldn't dare get rid of that!! Then toss the foil- No mess. Cookie gun or extruder would just be another thing to clean!

Good luck! I'll be watching for what flavorings and or recipes everyone uses.

Beth

**RE: Zero Carb / Meat and Water** - [Nicola](https://www.example.com/Nicola) - 09-11-2008 01:42 PM

I would just like to share a few questions I asked Dr. Groves (the first question is a statement from the "Saturated Fat For Health" Yahoo group, the next one is a statement from the paleoforum). Perhaps someone will benefit from me asking...

Hello Dr. Groves

Is this right?

The reason any fat (including butter) alone or butter without carbs will cause you to be hungry shortly afterwards is that, without glucose (usually from carbs), the fat cannot be metabolized! If it is not metabolized, it cannot be oxidised. It is the oxidation of the fat that produces ENERGY! Glucose activates the citric acid (fat-burning) cycle. It is in the citric acid cycle that the fatty acids are oxidized (for energy).

and...

I believe the idea is that cooked-food contains no enzymes so it needs to be broekn up by chewing so as to allow a great surface-area, and therefore greater contact with the hydrochloric acid in the human stomach. With rawists, the enzymes are already within the food, so chewing is unnecessary. I'm not sure of the exact mechanism, I can only go by what myself and others state, which is that we find we digest raw animal food better if we just bolt it down with minimal chewing;
Ptyalin in your saliva retards the action of protein digesting enzymes so you should expose the least amount of surface area of your food to saliva in your mouth for optimum digestion, which translates to minimal chewing.

Hello Nicola

Eating fat causes you to feel hungry shortly afterwards? Not in my experience. Indeed I find that fat is the best food to prevent feeling hungry for several hours.

There was a belief in the 19th century that 'fat burns only in the flame of carbohydrates'. It was thought that fat and carbs were literally burned in the lungs as they would be in a fire. Just as that was proved to be wrong, so was the belief that carbs were needed to burn fats. Let's face it, if it were true, how would Inuit and Maasai survive?

The 'enzymes' question is actually really simple. All enzymes are proteins. The hydrochloric acid and proteases in the stomach are there to break down proteins. So I doubt that any enzymes in foods make it through the stomach. The only possible exception to this would be enzymes within plant cells. We have no way to break down plant cell walls to release the nutrients within, other than chewing, which is extremely inefficient. Even juicing leaves 50% or more of plant cells intact. So enzymes within these cells would survive - but only to finish up in the toilet.

Ptyalin (better known as amylase) is an enzyme used to break down amylose (starch). As this amylase is produced in the mouth, it has a very short life (It's neutralised in the stomach). The pancreas produces another form of amylase to break down starches in the small intestine. This is where most of the digestion of starch takes place.

I find that lack of salt is more likely to cause muscle cramps than too much.

I try to source my meat from grass-fed animals. It isn't always possible, but as I don't buy meat from supermarkets, only from farmers, I can be sure about most of it.

regards

**RE: Zero Carb / Meat and Water - chiara - 09-11-2008 03:08 PM**

Alright, Day 3 of M and E is coming to a close 😊

So far so good. I had a ton of energy this morning...I ate at 7:30am and then got hungry at noon. Unfortunately my lunch was chicken with butter on it and a hard boiled egg. I got hungry again in about an hour, so that stunk. Tomorrow I'm going to bring fatty beef to work 😊

I stopped off at the grocery store and bought a bunch of premade 80/20 patties that were going to go bad in a few days so they were cheaper (LindaSue I stole that idea from you!). I cooked them all and then
poured the fat on top (my husband is at class so there was no barfing this time).

I forgot to mention earlier...I had cholesterol labs done on yesterday, so I will let you know what they are. I'm going to do them again in 6 months...see what happens.

Thank you everyone for your support and interesting reading!

RE: Zero Carb / Meat and Water - nyteez - 09-11-2008 03:15 PM

I found some lean looking hunk of beef yesterday, sirloin tip round roast, or something like that. Didn't have time to dry it last night, so I'm gonna try today. Anybody know how thin I should slice the meat for making jerky?

RE: Zero Carb / Meat and Water - suzanneyea - 09-11-2008 03:47 PM

I have mine super thin for jerky, the butcher can slice it for you with his handy machine.

RE: Zero Carb / Meat and Water - nyteez - 09-11-2008 05:34 PM

I have mine super thin for jerky, the butcher can slice it for you with his handy machine.

Thanks suzanna!

RE: Zero Carb / Meat and Water - sean - 09-11-2008 05:44 PM

No, but it's obviously killing you that I don't care!

AMEN Charles. Looks like a little of the BEAR has rubbed off. This is exactly why I wrote what I did a few posts back. The high on self esteem low on intelligence types always seem to hijack forums that have actually found the truth and aren't ashamed to stand by it no matter the amount of "acculturation" of the reader.

You were a phenom before Charles, but now with your interpretations of BEAR's forum you're a damn lethal weapon. Thank you very much for all you are doing.

Another recent post that caught my eye was this gem:

He's made a number of flippant comments about women and our role as gatherers. I have a PhD in Anthropology and studied bio anthro as well as archaeology extensively. Perhaps these comments disturbed me because I feel he made a lot of assumptions about what male and female roles must have been like in the past based on his own sense of gender roles in the present. It can be dangerous as an academic to do this because it clouds the actual evidence. It just made me read what he's written with a grain of salt. I don't mean to discount all he's written, it's just something I noticed.

Please Doctor Bk name one flippant comment by the BEAR. If this paragraph isn't a case study in
feminist neurosis......

If primitive women gathering is offensive you, prepare yourself for this one... Ready, they also raised their children, no nannies, no daycare, no clinics. The horror, can you imagine. Not only is it a fact they gathered they had the most important job of all, raising strong sons. As a Phd in anthropology you must have covered oh I don't know the Guachos, Comanches, Mongols, Masai etc etc. Who do you think produced such strong healthy dominant cultures, you got it, those oh so unprogressive gathering women. WOW...Ironically enough I don't think the BEAR has ever had to assume anything about a man's role. It actually comes quite naturally to people that don't live in academia.

Charles, as far as eczema:

A few years back my first go at all meat I did all lean. Had rabbit starvation that probably should have killed me. 2-3 pounds of lean and 4 tablespoons of Cod liver oil (as per Dr R Schmid) per day and after 2 weeks I had so much ammonia running through me my urine smelled like turpentine. I developed eczema from my ankles to my ears. Believe it or not the cure is quite simple and for me permanent.

It is nothing more than acids leaving though the skin as the digestion is not keeping up with the amount of acid waste being produced.

Prepare a bath for your daughter with the water as hot as she can stand it, but it must be hot enough that she sweats. The amounts of the following can vary, but this is what I was told to use and it worked magic. Pour in 2 pounds of epsom salts (magnesium eats acid like candy) and I used 16 oz of Braggs apple cider vinegar. The first time I got in it was the classic high school volcano experiment of acid meeting alkaline. The water actually started sizzling and bubbling.

The ACV will give a good amount of nutrients to repair the skin while the heat opens the pores and lets the epsom salts do their job. In one week the scabs were gone. In 2 weeks my skin healed completely and it never returned. Now I also stopped the absurd diet, but theses baths are magic for skin conditions. You can also use some hydrogen peroxide to add some Oxygen to the mix.

When she gets out after 5-10-15-20 minutes, whatever she can stand she will be dizzy from the stirring up of the acids in her lymphatic system. She must take a very cold shower for 1-2 minutes to stop the acid circulation.

With the diet you have her on and these baths she should kiss any skin condition goodbye.

PS Dana Nyteez, how dare you call BEAR a genius, he didn't even get through one year of college....

**RE: Zero Carb / Meat and Water** - [montmorency](#) - 09-12-2008 04:04 AM

Catching up here, after a period of re-reading and re-re-reading Taubes:
Charles Wrote:
"It's certainly clear that even on a zero-carb diet, we still have some triglycerides. They are significantly lower than before, but nonetheless they do exist. I always kind of wondered why we need any triglycerides once the dietary glucose is removed, but the Bear's explanation makes a lot of sense to me.
"

Sorry if this is old news, but here is a partial answer from GCBC, Page 388, para 2:

"Some of these free fatty acids will be taken up by the tissues and organs and used as fuel. Perhaps as much as half of them will not. These will be incorporated in the liver back into triglycerides, loaded onto lipoproteins [footnote: The VLDL particles we discussed when we talked about heart disease] and shipped back again to the fat tissue. And so fatty acids are continuously being reconverted to triglycerides and transported back to the fat tissue for storage."

OK, so that is one situation in which even a zero-carber will have triglycerides in the bloodstream - on the return path from the liver to the fat cells.

I think there may be another: On Page 387, para 2, Taubes tells us that the fatty acids stored in our food are actually in the form of triglycerides, i.e, we actually ingest triglycerides initially. Now what happens to them after that, I personally do not know; I don't think Taubes spells it out, unless I missed it. Someone here may well know. They could be split up into free fatty acids before passing into circulation, or they could be transported as triglycerides. If the latter, then that is another source of triglycerides in the bloodstream, although it may be short-lived.

Going back to the triglycerides that are shipped back to the liver, I think then the part of GCBC that talks about LPL is interesting:

Page 397, para 3: "[...]When a triglyceride-rich lipoprotein passes by in the circulation, the LPL will grab on, and then break down the triglycerides inside into their component fatty acids. This increases the local concentration of free fatty acids which flow into the cells - either to be fixed as triglycerides if these cells are fat cells, or oxidized for fuel if they're not."

Thus some of those triglycerides being shipped back from the liver won't make it into fat cells, they will be used as fuel, provided that the appropriate LPL activity is taking place, and they won't be burned directly as fuel, but only after "de-esterification" into FFAs.

So when MAC says:

MAC Wrote:
"The only plausible explanation is the glycerol in tryglycerides as all fat consumed is in the form of triglycerides. We do not consume free fatty acids that are not part of triglycerides. "

that would not quite tie in with my reading of GCBC. From the way I read it, all of the fat used as fuel is in the form of FFAs, some of which has come from circulating triglycerides, which have to be broken up, some of which has come from freely circulating FFAs. There certainly seem to be plenty of references to freely circulating FFAs in GCBC, and given that triglycerides are apparently too big to cross cell membranes, and have to be split up in order to enter, I can't quite see why they'd have to be esterified again in order to be burned as fuel; for storage yes.
There are some other references in GCBC that seem to point to direct burning of freely circulating FFAs for fuel, but I am a little pushed for time at this moment to assemble them, and maybe this is enough to be going on with.

I am intrigued by Bear's statement that triglycerides are the standard fuel. If that is the case then I don't think that is the way GCBC expresses it; maybe it's a question of emphasis. As MAC says, it would be good if Bear had stated his sources.

I am also rather intrigued by the issue of gluconeogenesis. Even if it doesn't happen in the case of long-standing zero-carbers like Bear, I wonder if it still happens with relatively recent near-zero-carbers who still have excess body fat and probably are hyperinsulinemic. Either way, it seems we are sometimes capable of actually gaining weight without external carb intake.

Charles: I may get back to you in a later post on the hunger issue which still intrigues me, and is why I've spent the last few days with my head in GCBC (again for the nth time). Although the big picture is clear enough and elegantly simple, it's made up of a complex interlocking jigsaw pieces, and the way they all fit together is not quite clear yet.

RE: Zero Carb / Meat and Water - MAC - 09-12-2008 04:15 AM

Montmorency Wrote:

That discussion was about the source of glucose in a zero carb person not where do triglycerides (free fatty acids) come from in a zero carb eater. Each triglyceride is composed of 3 fatty acids and one glycerol molecule. It is the glycerol that gets turned into glucose at the rate of 10 g fat to 1 g of glucose from triglycerides.

In any case, all the fat you ingest is as triglycerides. One does not ingest free fatty acids.

RE: starting meat and eggs today - AuntieM - 09-12-2008 04:24 AM

Good morning all. I've decided today's the day. I'm going to start meat and eggs. Unfortunately where I live here on Long Island, we don't have any Super Walmart's so I won't be able to purchase those rolls of fatty ground beef you all rave about but I do plan to make a run to BJ's where I know they have big, beautiful, fatty boneless rib steaks. I also plan on getting lots of chicken thighs and some Pernil (pork) in a local hispanic market. It has lots of fat and they leave the skin on. I'm planning on roasting it so the skin will get nice and crispy. Speaking of that, if I have plain pork rinds, can I use them as a coating for my chicken thighs? Oh, I have so many questions! If I decide to leave heavy cream in, which I probably will, can I whip it with some liquid sweetner if want something sweet? I know this is my "WOE" and I can try what I want and see if it works but I guess I'm just looking for some guidelines. As a lifetime "dieter", I think I'm brainwashed into thinking there are only right and wrong ways to do this. Also, is there some formula to figure out what percentage of fat to protein I should be consuming? This morning I weighed 157 which is a gain of 7 pounds since I went off Medifast and starting L/C'ing. That's why I'm so freaked out by this whole thing. I'm terrified that if I start eating lots of fatty meat and eggs fried in
butter, I'm going to keep gaining instead of loosing. And while my ultimate end result is to be healthy, I also want to lose 15 pounds.

So here's my meal plan for today so far:

B - two (2) 1/3 pound 80/20 burgers and 2 extra large eggs fried in butter
L - not sure since I have errands to run and don't know where I'll be
D - one of those beautiful steaks from BJ's or perhaps some pork belly ribs from the Hispanic market

Perhaps it might help me if some of you post what you eat daily so I can get an idea. I should add that I always drink at least 136 ounces of water daily.

I'd also like to say how terrific I think you all are. I greatly appreciate all the support and advice you give so freely. I feel truly blessed to be a part of this community. Thank you all so much!

---

RE: starting meat and eggs today - Charles - 09-12-2008 06:17 AM

AuntieeM Wrote:
Good morning all. I've decided today's the day. I'm going to start meat and eggs.

Congratulations and welcome to our forum!

AuntieeM Wrote:

Generally speaking, that should be okay. Make sure they are not the store-bought ones that contain dextrose or too much sodium. Some people fry pork rinds in vegetable oils which I would avoid. You have to be careful with products, no matter how good they appear.

AuntieeM Wrote:
Oh, I have so many questions! If I decide to leave heavy cream in, which I probably will, can I whip it with some liquid sweetener if I want something sweet?

This is the real issue, the "taste for the sweet". The problem you're trying to counteract is not "too many carbohydrates". That is truly a secondary concern. What you're after is controlling your insulin responses to both perceived tastes and the actual food itself. When you go to consider that sweetened cream, you are secreting insulin so regardless of the true carb count, you are working against your efforts because insulin secretions mean that fatty acids are being stored in your fat tissue and not mobilized. Therefore, it will behoove you on this way of eating to lose your taste for the sweet and over time, with great effort, you'll find that you won't miss it.

This is a very difficult endeavor and not something you want to take lightly. It's very difficult for people to overcome their "aculturation" as the Bear would phrase it. You grew up liking and believing certain things because that is what you were taught to like and believe. It takes a great effort to overcome this and not everyone can. Things like fat, that one may dislike today, can be very enjoyable once you get used to them over time.

There is no formula per se, but you are going to have to listen to your own body. Many people do things
that work for them but you have to find what works for you.

Signs of success are being able to achieve satiety from your meals for a period of 6 hours or more. You should sleep through the night, and you should have a relatively positive outlook on life and good energy levels. If fat makes you nauseas, then eat more lean meat. If you are lethargic, then you need to eat more fat. Follow your appetite and eat only when hungry. Do not eat if you are not hungry. Don't eat according to some calorie number or some ratio. Eat according to your unique needs which will vary widely from one day to the next. Some days you'll spend more energy and some days you won't do much. Why should we expect our calorie needs will be the same each day?

The same goes for water. Drink when you are thirsty and don't drink when you're not. Follow these guidelines and you should have no problem. It sounds simple, but it can very difficut especially at the start. It does get easier once you are ketoadapted and your energy levels will go through the roof.

Regards,

Charles

RE: Zero Carb / Meat and Water - FatGirlOnAtkins - 09-12-2008 06:44 AM

Charles, I don't know about all the eczema stuff above, but my daughter suffered from severe eczema for a couple of years as well. I didn't see if you had checked her for food allergies, but that's what it turned out to be with my daughter. She cannot have any milk product or she will have another flare-up. It's been a 3 or 4 years since she had one now that she's not been drinking milk. Just a thought!

RE: Zero Carb / Meat and Water - Loops - 09-12-2008 07:05 AM

Hi -

I totally healed up my eczema on low carb high fat - it took a total of 2 years to completely heal it, and I was eating a lot of cream, butter and cheese, but not milk. I think it is to do with grains and carbs, and in some people, maybe even vlc dairy products don't help - but for me they actually seemed to help it get better. Before I was low-carb, some fruits really made it flare up. I still get really bad hay-fever though when I go to visit my family in England - the pollen is crazy there now in the early Summer. Even on VLC I get terrible hay-fever - but no eczema. Cats also used to cause my eczema to get worse, but now I am absolutely fine with them.

RE: Zero Carb / Meat and Water - Loops - 09-12-2008 07:11 AM

I forgot to mention - the first time I did Atkins, my eczema actually got worse. I was eating a lot of protein, a few vegetables and quite a bit of soybean mayo (ugh), lots of olive oil and no dairy products. So go figure. I noticed that when I was taking magnesium chloride drops in concert with a high animal fat diet it healed up very fast - mostly fats from dairy plus pork fat was very helpful.

My eczema was at its peak doing a low-fat vegan diet - it spread all over my body and itched like crazy every night. I now believe it is a fatty acid deficiency coupled with sensitivities to a lot of different plants (vegetables and fruits, beans and grains) - as that was what I was eating. It probably also has to do with insulin as well.

And so fatty acids are continuously being reconverted to triglycerides and transported back to the fat tissue for storage."

No, this doesn't answer my query. This quote that you've taken from page 388 is from the description of Sir Randle's triglyceride/fatty acid cycle that we've discussed. This whole sequence begins after a meal containing carbohydrates as it states on Page 386 when the sequence begins:

Quote:
First, the body will burn carbohydrates for fuel as long as blood sugar is elevated and the reserve supply of carbohydrates stored as glycogen in the liver and muscles is not being depleted. As these carbohydrate reserves begin to be tapped, however, or if there's a sudden demand for more energy, then the flow of fatty acids from the fat tissue into the circulation accelerates to take up the slack."

The Handbook of Physiology was attempting to counteract the widely-held notion that carbohydrates were the body's main fuel source. It was recently discovered (by most people) in 1956 that fat was the body's primary fuel even though many knew it at the turn of the century. The Handbook came out in 1965 and it presented what was considered the latest research on adipose tissue metabolism.

As zero-carbers, we're not too concerned about this, except for the few triglycerides that are present in muscle meat which we eat. MAC is quite correct in that we don't consume any free fatty acids. Those triglycerides are broken down in the gut and the fatty acids and glycerol molecules go to adipose tissue initially, according to the Handbook.

The glycerol molecules are esterified upon entering and upon exiting adipose tissue. They do not just sit there as something does in a repository. Because they are part of the stream, they must be esterified upon entering and exiting fat tissue during each pass they make. This slows down the stream (the metabolism) by a very small percentage, yet it is this percentage that is responsible for obesity. That's why Taubes presenting the triglyceride/fatty acid cycle. The Bear correctly observes that in keto-adapted individuals, there is no slow-down of fatty acids. They remain freely circulating. Based on this, he opined that free fatty acids do not enter adipose tissue. However, we learned that they actually do enter adipose tissue, they just don't get "trapped" which is the name for the phenomena that describes the 001% slow down that occurs in obesity.

Mike Wrote:

Now what happens to them after that, I personally do not know; I don't think Taubes spells it out, unless I missed it. Someone here may well know.

Again, this isn't talking about zero-carb at all. This is talking about what happens in obesity generally. The whole point of the exchange on 387 is to inform us of the "primary control mechanism in obesity." He wants us to:

Quote:
"appreciate the differences between free fatty acids and triglycerides" and how they are tied directly to the way the oxidation and storage of fats and carbohydrates are regulated."

Mike Wrote:
I am intrigued by Bear's statement that triglycerides are the standard fuel. If that is the case then I don't think that is the way GCBC expresses it; maybe it's a question of emphasis. As MAC says, it would be good if Bear had stated his sources.

The Bear is not saying that triglycerides are the standard fuel. He says that free fatty acids are and that our muscles do not use glucose at all. MAC is saying that when you eat fat of animals, you are consuming some triglycerides because that's how fat would have been stored in the animal. The Bear's statement is the thing that would seem to be at odds with Taubes.

However, Gary Taubes himself e-mailed me his notes on the subject the other day and he has a reference to Baltzan, et al 1962, where they found that glucose actually plays a very minor role in oxidative metabolism (burning) by muscle in the basal state and later studies by this same group reported that approximately 0-65 mole of glucose was consumed each minute by 100 grams of muscle. For an average man, that is approximately 30 grams in a 24 hour period. They suggested that even this meager usage is high for muscle because the major proportion of this glucose being extracted is the erythrocytes in transit through the muscle. So much for carbo-loading!

What supports this theory is the fasting study that we've been talking about which says that after 66 hours, there is no marked decrease of glucose but there was a stoichiometric production of lactate from the glucose suggesting that muscle might normally even extract some of the lactate by the red cells and this extraction is what is diminished in fasting.

This is all very important because if that's true, the Randle cycle makes the correct observation concerning glucose; however, the inference that we read from it is incorrect. We always viewed the action of muscles as "burning glucose" and indeed, we say that because we recognize the lactic acid buildup from strenuous exercise.

This is the reason I went very low carb in the beginning. Dr. Groves said that burning glycerol (pyruvate) in the mitochondria was the reason for the lactic acid. He said that fatty acid burns clean with no byproducts except water and carbon dioxide which are easily excreted and don't cause the burn, which I have found to be true. However, this comes and teaches us that there is not a burning, but an extraction of lactate by the red cells. The muscles only facilitate the transport of glycerol through them. The heart does the same thing. It doesn't take up glucose but it extracts pyruvate and lactate. This puts a load on muscles and organs.

This is wildly consistent with the Bear's statements that glucose is not burned for fuel in the muscle and that carbohydrates only put a strain on the body.

This is groundbreaking! This means that a much greater percentage of glucose is stored than previously thought and the muscles and every organ take up lactic acid and pyruvate for cleanup which supports my theory that if glucose is taken up by tissues and organs in our bodies, it must be for elimination. Indeed, this seems to be the case. There is no adaptation for carbohydrates and therefore we should not consume them.

Mike Wrote:
Either way, it seems we are sometimes capable of actually gaining weight without external carb intake.
Well, this shouldn't surprise us. Weight gain is brought about by hormonal action on fatty acid storage which is primarily regulated by insulin. However, the body has to have other ways in which it can induce weight gain. Pregnancy is the major one that comes to mind. Other hormones may regulate the flow of free fatty acids as they act upon insulin to accomplish what they would. For instance, in psych patients, they tend to be very thin. Some people gain weight at the beginning of depression as they decrease their activity. When activity is decreased, the body can change the rate of fat mobilization which will cause weight gain. When we get sick, we typically lose weight, but all of us can attest to the fact that once we've healed, our weight returns very rapidly, regardless of how little we eat.

Hormones of psych patients act on the internal environment to keep things stable. They respond by mobilizing fatty acids at a very high rate which keeps them lean. The same is true of an anorexic. The response to food is only happening to keep balance in the internal environment.

Illness and reduced energy intake will cause the body to slow the rate of fatty acids such that weight can be gained. The same is true of the sex hormones. Teenagers and older women know all too well the effects of hormones on fat metabolism. The teens eat voraciously yet they don't gain weight. Older women gain weight regardless of their diet as menopause sets in.

Hormones play a major part and this is why I maintain that a person will only be as lean as their hormones allow.

Regards,
Charles

**RE: Zero Carb / Meat and Water - sean - 09-12-2008 07:17 AM**

But even the food allergies come from poor digestion. There is no such thing as food allergies when your return your liver and intestines to normal. Charles' diet is an exceptional way as well as fasting. Until you heal these organs your flareups will always come and go. Once healed you'd be amazed at what foods you thought you were allergic to you can eat with no problems (if you choose to return to the foods that caused it all).

You have to deal with the cause not the symptoms.

At one point in my life if I ate bread the entire contents of my GI tract emptied almost immediately and violently. After some fasting and flushes I could eat a loaf with no problem whatsoever. Did I become non allergic all the sudden????? Of course not. The GI tract was again working and it could deal with any "food".

Just a tip as I ve seen so many people do these elimination diets, adding one food back at a time nonsense on and on.

I've done every test. flush, protocol you can imagine, and when the organs heal you can eat concrete if you like. No allergies including hay fever. I used to react allergically to getting out of bed in the morning. NowI can cut my grass and roll around in it and not even a sniffle. Clean the fermented waste (undigested carbohydrate) out of your system and everything resets.

Once this happens you'd be wise to pay attention to every word printed by CHarles and the BEAR as they have found the truth in diet. Fatty meat and water is simply the easiest way to health.
RE: Zero Carb / Meat and Water - **Charles** - 09-12-2008 07:24 AM

I didn't see if you had checked her for food allergies, but that's what it turned out to be with my daughter.

Yes, she is allergic to eggs, nuts, certain fish and pet dander (although not our pet for some reason...) The zero-carb diet changed her little life and she looks better than she ever has. She no longer has any scabs or sores and her face is radiant. I'm very happy for her.

RE: Zero Carb / Meat and Water - **jeepifer** - 09-12-2008 08:05 AM

I'm desperately trying to zero carb my oldest. She has ADHD and I believe it would help tremendously. Unfortunately, they eat tons of carbs at daycare, and I can't afford to give her a special diet there. So I do the best I can when she's home.

She's turned into quite the rare steak eater!!! 😊

PS Dana Nyteez, how dare you call BEAR a genius, he didn't even get through one year of college....

LOL! Whats college got to do with being a genius?

Another great post! I tend to hold back from speaking my mind, because I got reprimanded by a mod once here for doing so. Your posts are great, thanks sean!

Since eating zero carb I have noticed or realized, that my body is detoxing and healing. This is another reason I stayed with this. It took me 40 years to mess up my body, I know it's going to take years to fix it. I too believe in time I could eat veggies or soy and not feel horrible, because my system will be healthy, but why would I want to. I will never go back to eating that way.

Quote:
Charles: I may get back to you in a later post on the hunger issue which still intrigues me, and is why I've spent the last few days with my head in GCBC (again for the nth time). Although the big picture is clear enough and elegantly simple, it's made up of a complex interlocking jigsaw pieces, and the way they all fit together is not quite clear yet.

Speaking on the hunger issue. I think for many people hunger is a mind set. They really don't know what hunger is. People think they are hungry at the times they are used to eating. Or they think they should be
hungry because they haven't eaten in 5 hours. Hunger is regulated by blood sugar, but on zero carb it is not. I am not hungry on this diet. I have fasted many times in my life and have learned that hunger was mostly in my head, not real physical hunger. I eat every 12 hours. I am not hungry every 12 hours, I just eat to fuel up.

If ya'll want to read the best article on "FATS" I have come across you can go to [theskinnyonfats Mary Enig] just google it in. Everything you wanted to know and then some. It's part of my collection of articles. It goes into detail on why butter is good for you. There is a link in the article on Chris Masterjohns piece about Vitamin K. Very detailed and interesting as it applies to cardiovascular disease. Hope this was helpful.

**RE: starting meat and eggs today** - AuntieeM - 09-12-2008 09:17 AM

Charles: Thank you so much for answering my post. I was hoping you would as I can already tell that you are a wealth of information! So far, so good. This morning, around 8 AM I had my two burgers and two eggs fried in butter and while it's only 12 PM here, there are absolutely no signs of hunger. I can absolutely understand the need to get away for the need for "something sweet" and will definitely pay attention to how I feel after I eat dinner this evening. I was easily able to get two packages of beautiful, fatty rib steaks in BJ's and was also able to get two boxes of Bubba Burgers which are 1/3 pound and have 35 grams of fat each. So the way I can tell I'm eating enough is if I feel great? Also, I guess I have to let go of the ingrained notion that eating all these fatty foods is going to make me gain weight? I also have another question and I hope it's not a stupid one, but where do we get our fiber and should I actually be worried about that? Oh boy, I hope you all won't get tired of me and my questions!

---

AuntieeM Wrote:
Charles: Thank you so much for answering my post. I was hoping you would as I can already tell that you are a wealth of information!

You're welcome and thanks for the kind words.

AuntieeM Wrote:
So the way I can tell I'm eating enough is if I feel great?

Yes. I know it goes against all you've been taught, but controlling hunger and having good energy are the true benchmarks for success. People think thin people are that way because they eat less. The truth is, they eat less because they are not hungry.

AuntieeM Wrote:
Also, I guess I have to let go of the ingrained notion that eating all these fatty foods is going to make me gain weight?

That's correct. You always had fat in your system but your cells can't get to it because of the other stuff that was trapping it in your fat tissue. Once you get rid of the toxins, you'll find that your fat will circulate readily and your body will only store the little bit it wants. Every animal in the kingdom wants to be lean and your body is no exception.

AuntieeM Wrote:
I also have another question and I hope it's not a stupid one, but where do we get our fiber and should I actually be worried about that?

There are no stupid questions and I don't mind answering questions time and again because that's why I'm here!

Fiber is all a ruse. Dennis Burkitt (Burkitt's Lymphoma) and Hugh Trowell were poop specialists who scoured the sub-Sahara looking at poop samples from isolated peoples who did not suffer from the chronic diseases of civilization. They reported that these people were so much healthier than us because they ate more fiber. Fortunately for us, Dr. Weston Price went along as well and he reported that:

Quote:
Price noted that all healthy African groups had good sources of animal fat, and that the healthiest groups consumed less, not more, of plant foods

and

Quote:
Drs. Williams and Gelfand stress that the likely culprit in the slow emergence of dental caries and diabetes is not animal fat, but refined sugar. Nevertheless, their articles form part of a collection whose editors are firmly committed to the lipid hypotheses, namely that animal products and saturated fat contribute to the Western plague of atherosclerosis, diabetes, hypertension and obesity.

Eating fiber is like putting sandpaper in your digestive tract. Eating fat is like oiling it. You will soon find out how much better your system works when you eliminate carbohydrates altogether!

Regards,
That article is a classic. Believe me I've read everything Enig and Sally Fallon have ever printed. I've talked to Fallon twice in person at two of her presentations. Amazing stuff.

The only thing I want to say is if you can find the exchange between Enig and Ray Peat it is priceless. The Price Foundation pushes Cod Liver Oil and "essential Fatty Acids", although it may work for some temporarily, Peat's science and experiments leave Enig's rebuttal very very weak.

Im not taking sides, believe me I couldn't care less, I only seek truth, but as a recent article on this subject stated the "essential fatty acid" craze (PUFA's) of today is identical to the Crisco vegetable oil of the 60's, and everyone knows where that led....

If I can find some of this stuff and figure out how to include it in a link I will.

---

Here is Enig's reply to Peat: [http://www.apinchofhealth.com/resources/lowcarb/Ray-Peat-Essential-Fatty-Acid-Deficiency.html](http://www.apinchofhealth.com/resources/lowcarb/Ray-Peat-Essential-Fatty-Acid-Deficiency.html)

---

I like Dr. Enig's science as well, but I don't buy the Price foundation's conclusions. I agree with them on the "whole foods" notion but I can't go with them on the vegetable and nutrient stuff. They take it much too far.

They can't change what Dr. Price saw with his own eyes. The healthiest groups in the sub-Saharan ate less of vegetable matter, not more.

Regards,

Charles
There is a guy that uses the name montygram that has a rebuttal of the article you cited MAC, but I can't find Peats. Who knows the truth of the matter, but I did speak to a girl who was being consulted by Peat and she was told if PUFA's are in trace amounts in all foods why on earth would anyone supplement and add more??? This I think falls right back into what Charles and the BEAR continually say, nothing extra is needed with an all fatty meat diet.

Some recent posts talk about supplements but after reading Not By Bread Alone a second time it seems the most strenuous work being done from 15 - 18 hours daily was being done by the guys on pemmican. All in complete health. It would seem that they would be the most depleted of vit/min from their labor, yet they ate only dried muscle meat and fat. No organs in the pemmican. I think it makes sense then fresh rare met/fat really doesn't need anything more. Im not saying organs are bad, just not mandatory.

Charles I dealt with some Masai in Tanzania one time. Dr. Price's work doesn't begin to describe the bone structure of these guys. Dont get me wrong Price's book is my bible, but reading it and then seeing a couple red silk robes coming my way at about midnight in a place I dont think "whitey" was supposed to be in Tanzania is quite an experience.

I quoted somewhere that even Eades says that the amount of omega 3's in grass fed beef versus omega 3's corn fed beef doesn't amount to much.

Charles I dealt with some Masai in Tanzania one time. Dr. Price's work doesn't begin to describe the bone structure of these guys. Don't get me wrong Price's book is my bible, but reading it and then seeing a couple red silk robes coming my way at about midnight in a place I don't think "whitey" was supposed to be in Tanzania is quite an experience.
HEY Sean,
Are you going to leave us with a cliffhanger.............??????????

RE: Zero Carb / Meat and Water - sean - 09-12-2008 04:15 PM

Not my intention at all. I never even thought I would post period, but Charles really has something going on here so I got into it when I saw some people trying to mess up his incredible forum as these same types did to BEAR.

I've been around the world twice and seen all sorts of things. I certainly don't want to bring any of my mayhem to this forum, I only was giving a brief eyewitness account backing up much of what Price's works showed. I could also write about the Alaskan natives on a refuel and what their teeth and bone structure looked like compared to the average American.

In a very condensed version a couple "local" Tanzanian gals took me to a spot in downtown Tanzania where you wont see a soul with my complexion. We went into a local hotspot and after a few minutes I figured my time had come, oh well. Anyway after some back and forth this Masai leaned into my ear and in perfect english said, "I want some p---y (slang for a cat). I laughed so hard it may have saved my life as he started laughing as well. ANyway the point is this guy had teeteh so white it was absurd. Perfectly straight and all in tact. His wrists had to be 12 inches around and he had baseball gloves for hands. His buddy was no different. They were both of the warrior class because of the garb they were wearing. Not an ounce of fat on them. So again their diet was soured milk, meat and blood. It is impressive to read about it, but when you see it face to face it sort of saddens you to think of the lost human potential. Every kid I see in America (atleast where ive lived), has braces, a pinched nose, mouth wide open trying to breath, glasses, an inhaler in one hand and a video game in the other. IF people only knew....

RE: Zero Carb / Meat and Water - Kristi31 - 09-12-2008 10:38 PM

Since protein gluconeogenesis was mentioned in this thread a few times, I thought this belonged here...very interesting stuff!

From [http://www.nutritionandmetabolism.com/content/3/1/16](http://www.nutritionandmetabolism.com/content/3/1/16)

"Amino acids derived from protein are converted to glucose through gluconeogenesis. In 1915, Janney reported that 3.5 g of glucose were produced from 6.25 g of ingested meat protein [11]. Thus, theoretically and actually, for every 100 g protein ingested, 56 g of glucose can be produced. For other proteins the range of glucose produced was 50–84 g.

However, in 1924, Dr. MacLean in England gave 250 g meat, which contains ~50 g protein to a subject with type 2 diabetes whose fasting glucose concentration was ~280 mg/dl [12]. Following ingestion of the beef, the glucose concentration remained stable for the 5 hours of the study. When the subject was given 25 g glucose on a separate occasion, the amount of glucose that theoretically could have been produced from the 50 g protein in the 250 g meat, the glucose concentration increased to nearly 600 mg/dl.

With this [12] and other information [13-18], several years ago, we determined the glucose and insulin responses to 50 g of protein given in the form of lean beef to 8 normal subjects [19] and 7 subjects with type 2 diabetes [20]. When normal subjects ingested the 50 g protein, the plasma glucose concentration
remained stable during the 4 hours of the study. When subjects with type 2 diabetes ingested 50 g protein, not only was the glucose stable, it actually decreased (Figure 2).

Figure 2. Glucose (left panel) and insulin (right panel) response to 50 g protein, given in the form of very lean beef to 8 normal subjects (bottom, broken lines) and 7 subjects with type 2 diabetes (top, solid lines).

In normal subjects there was a modest increase in insulin concentration. However, when subjects with type 2 diabetes ingested protein, the insulin concentration increased markedly (Figure 2).

In normal subjects, the insulin increase was only 30% of that to 50 g glucose [19], but in people with type 2 diabetes, it was equal, i.e. 100% [20]. In addition, ingestion of 50 g beef protein had very little effect on glucose production either in normal subjects [21] or in people with type 2 diabetes [22].

The studies cited above were single meal studies testing the effect of dietary protein alone. From these and other studies we concluded that in people with type 2 diabetes, dietary protein is a potent insulin secretagogue. In addition, protein does not increase blood glucose. Protein actually decreases blood glucose, even though amino acids derived from digestion of the protein can be used for gluconeogenesis. Subsequently we demonstrated that dietary protein acts synergistically with ingested glucose to increase insulin secretion and reduce the blood glucose response to the ingested glucose in people with type 2 diabetes [20,23].

In order to determine the effect of substituting protein for carbohydrate in mixed meals over an extended period of time we designed a study in which we increased the protein content of the diet from 15% in the control diet to 30% in the test diet, i.e. we doubled the protein content of the diet [24]. To accommodate the increase in protein, we decreased the carbohydrate content from 55% in the control diet to 40% in the test diet. Since 56 g of glucose could be produced from each 100 g protein ingested [11], the carbohydrate in the diet, plus the glucose produced from the additional protein, would represent a potential carbohydrate content of 48%. The fat content was 30% in both groups. Twelve people with untreated type 2 diabetes were randomized in a crossover design in which they were on each diet for 5 weeks with a washout period in between. The diets were isocaloric, the subjects were weight stable, and all food was provided.

The plasma glucose concentrations during the 24-hour period at the end of the 5 weeks on the control diet, or 5 weeks on the high protein diet, are shown in Figure 3. The blood sampling was started at 8 am. Breakfast, lunch, dinner and snack are shown on the X-axis. The differences appear modest. However, when these data are integrated over 24 hours, using the fasting glucose concentration as baseline, the integrated glucose area actually was reduced by 38% on the high protein diet (Figure 4).

Figure 3. Plasma glucose response in 12 subjects with type 2 diabetes. The response to the control diet (15% protein) is shown in the top, dotted red line. The response to the test diet (30% protein) is shown in the bottom, solid black line.

Figure 4. Net 24-hour integrated glucose (left) and insulin area responses (right) to ingestion of a 15% protein (red bar) or 30% protein (black bar) diet in 12 subjects with type 2 diabetes.

In spite of the lower integrated glucose area, the integrated insulin area response was increased by 18% when compared to the control (15% protein) diet results.

Most importantly, with the 30% protein diet, the % total glycohemoglobin (%tGHb) decreased from 8.1
Figure 5. % total glycohemoglobin response to a 15% protein diet, (top, broken red line) and a 30% protein diet (bottom, solid black line) in 12 people with type 2 diabetes.

In summary, increasing dietary protein from 15% to 30% of total food energy at the expense of carbohydrate resulted in an increased integrated insulin concentration, a decreased 24 hour integrated glucose concentration, and a decreased %tGHb.

These data were presented in 2004 at the Kingsbrook Conference on Nutritional and Metabolic Aspects of Low Carbohydrate Diets [25], and an adaptation of that presentation was later published [26].

From http://www.biomedcentral.com/content/pdf/1743-7075-1-6.pdf

"This lack of increase in blood glucose concentration following the ingestion of protein was confirmed by Conn and Newburgh in 1936 [3]. These investigators fed a relatively enormous amount of beef, i.e. 1.3 pounds of beef, which is the equivalent of ~136 g of protein and which should yield 68 g of glucose, to a normal subject with a fasting blood glucose of 65 mg/dl and to a subject with diabetes whose fasting blood glucose concentration was 150 mg/dl. In neither case was there an increase in blood glucose concentration over the 8 hours of this study. However, when the same subjects were given 68 g of glucose, there clearly was an increase in glucose concentration in both cases. That ingested protein did not raise the blood glucose was largely ignored, in spite of this evidence in the scientific literature. Indeed, in his textbook in 1945 [4], Dr. Joslin, one of the most influential diabetologists at that time, was still counseling dietitians and patients to consider 56% of dietary protein as if it were carbohydrate."

From http://jcem.endojournals.org/cgi/content/full/86/3/1040

"As expected, when the subjects ingested only water (fasting controls) there was a gradual decrease in serum glucose concentration over the 8 h of the study (33). When the subjects ingested 50 g beef protein there was a small initial and transient increase in glucose, but by 2.5 h the glucose concentration had decreased and continued to decrease until the end of the study. Over the last 5.5 h, the concentration was slightly less than when only water was ingested (Fig. 1)."

"As indicated previously, it has been reported several times that protein ingestion does not raise the circulating glucose concentration or raises it only modestly (3, 4, 5, 6, 7, 8, 9, 10). The reason for this has been unclear.

In 1971, it was suggested that protein ingestion did not raise the circulating glucose concentration because an increased production and release of glucose from the liver was balanced by an increased uptake and utilization of glucose by peripheral tissues (34). The mechanism proposed was that an increased circulating glucagon concentration, resulting from the ingestion of protein, would stimulate
glucose production from amino acids in the liver. The increased insulin concentration resulting from the ingestion of protein then would stimulate peripheral tissues, primarily skeletal muscle, to remove the glucose produced and to store it as glycogen (34). The latter is a well known effect of high concentrations of insulin. However, using direct hepatic vein catheterization techniques, a significant increase in glucose production in the splanchnic bed after protein ingestion could not be demonstrated either in dogs (35) or in humans (36)."

And even those who know have a hard time! I certainly do my best to keep Andrew on meat, but he is 5 and living in a high carb world. Plus, I didn't really realize the importance of low carb until he had already started to eat carbs and had a taste for them. Now Andrew probably eats 1/3 less carbs tha the average kid, may even less. But, compared to my diet it looks like he eats a TON of carbs ( I am meat only).

When I pick him up at school each day I am so saddened to see so many overweight 5 year olds. You know these parents are not doing this intentionally, people just do not know.

**RE: starting meat and eggs today - AuntieeM - 09-13-2008 05:32 AM**

Good morning: So today is my second day of M&E. I woke up this morning with absolutely no hunger whatsoever. Yesterday, I posted what I had for breakfast but wasn't sure about the rest of the day. For lunch I had two Bubba Burgers which are the most delicious burgers I've ever had. That was about 2:30 PM, then I wasn't really hungry until about 8:30 PM at which time I broiled up one of the rib steaks I purchased at BJ's (mind you, they are huge!). I was only able to eat about a third and wrapped the remainder up to have for breakfast today. I guess I'll have to save it to have for lunch! I will confess however that I did cave in and had about 1/4 cup of whipped heavy cream with 2 drops of Sweetzfree. With the two eggs and cream I think that would bring my carbs for the day to 6? Anyhow, I'm looking forward to today and hope I'll be able to repeat my good progress from yesterday.

Wishing everyone a great day!

**RE: starting meat and eggs today - pamela702 - 09-13-2008 06:05 AM**

Good morning everyone,

And hi and welcome to you AuntieeM. I also started the meat and eggs recently. It sounds like you are getting the hang of things. I use to eat 3 times a day because i thought i was 'supposed' to. Now i just listen to my body and eat when i am hungry, which has been about twice a day.

I also wanted to update how things are going for me...since i started (Sept. 5 2008) on m/e, i have lost 3.8 pounds. I have fibromaylgia and have sleep problems, but recently i have been sleeping through the night!

Ok, i have another question for everyone. I know our weight fluctuates throughout the day, but what time of the day is my 'accurate' weight. For example, yesterday morning i weighed 205.2 pounds. That evening, (of course) i was heavier, 207.4 pounds. I'm pretty sure we go by the first thing in the morning weight, but just wanted to get some feedback. Thanks, Pamela

Hi Pamela: I only weigh myself once a week, first thing in the morning, butt naked and after peeing. It's my opinion (and only that) that weighing yourself daily will make you crazy, especially as women. I do think tho, that once I get to my "goal" weight, I will weigh more frequently to ensure that those pesky pounds don't start creeping back. 😊

RE: Zero Carb / Meat and Water - Jeff - 09-13-2008 06:45 AM
Thanks for those studies, Kristelle, Very interresting stuff!

It does drive me crazy, lol. But i do it to keep and eye on things and make sure what i am doing is working. I am so close to being in 'onederland' (as everyone else calls it), and i honestly can not remember the last time i weighed under 200 pounds. Even as a teenager i was heavy. I wish i could have done things differently when i was younger, and i would not be in this situation....but i cant turn back time. I get so angry at myself for what i have done to my body over the years. I'm just glad that now i
have finally seen the light, so to speak. So far i have lost 160 pounds, and now i am having loose skin issues 🫶. I just try to take one day at a time, and move forward. I know that i will never go back to the old way of eating.

Pamela

Pamela: Wow!! Congratulations on your 160 pound loss. That's truly amazing. You should be so very proud of all you've accomplished. Now that you've seen the light, stay focused and try, even tho I know how difficult it is, to take one day at a time. We can only go forward. It's an incredibly long and arduous journey, but thankfully we have this community and all the support and education it provides.

Good morning everyone,
And hi and welcome to you AuntieeM. I also started the meat and eggs recently. It sounds like you are getting the hang of things. I use to eat 3 times a day because i thought i was 'supposed' to. Now i just listen to my body and eat when i am hungry, which has been about twice a day.
I also wanted to update how things are going for me...since i started (Sept. 5 2008) on m/e, i have lost 3.8 pounds. I have fibromyalgia and have sleep problems, but recently i have been sleeping through the night!
Ok, i have another question for everyone. I know our weight fluctuates throughout the day, but what time of the day is my 'accurate' weight. For example, yesterday morning i weighed 205.2 pounds. That evening, (of course) i was heavier, 207.4 pounds. I'm pretty sure we go by the first thing in the morning weight, but just wanted to get some feedback. Thanks, Pamela

Hi Pamela: I only weigh myself once a week, first thing in the morning, butt naked and after peeing. It's my opinion (and only that) that weighing yourself daily will make you crazy, especially as women. I do think tho, that once i get to my "goal" weight, i will weigh more frequently to ensure that those pesky pounds don't start creeping back. 😊

It does drive me crazy, lol. But i do it to keep and eye on things and make sure what i am doing is working. I am so close to being in 'onederland' (as everyone else calls it), and i honestly can not remember the last time i weighed under 200 pounds. Even as a teenager i was heavy. I wish i could have done things differently when i was younger, and i would not be in this situation....but i cant turn back time. I get so angry at myself for what i have done to my body over the years. I'm just glad that now i have finally seen the light, so to speak. So far i have lost 160 pounds, and now i am having loose skin issues 😁. I just try to take one day at a time, and move forward. I know that i will never go back to the old way of eating.
Pamela

Pamela: Wow!! Congratulations on your 160 pound loss. That's truly amazing. You should be so very proud of all you've accomplished. Now that you've seen the light, stay focused and try, even tho I know how difficult it is, to take one day at a time. We can only go forward. It's an incredibly long and arduous journey, but thankfully we have this community and all the support and education it provides.

Thanks so much. And yes, this forum is so supportive and helpful. I learn something new everyday!
Take care...Pamela

Charles
Charles:

With endurance training and meat eating: Is there no lactate threshold? What is happening to the muscle (biochemically) of a meat eater when the load switches from aerobic to anaerobic? All contemporary training talks of lactate threshold training to up the amount of work the muscles can do before lactate build up causes fatigue. What should a carnivore train for in order to shift the level at which the muscles are working aerobically?

Thanks,

John

GO TEAM CARNIVORE

ANOVA Wrote:

I do not get the lactic burn in my muscles that I used to get when I ate carbohydrates. Lactic acid is merely a byproduct of fuel use in cells. The muscles transport the glycerol molecule, but it seems to siphon the lactic acid and pyruvate for elimination and this seems to cause the lactic burn and thus the lactic threshold.

ANOVA Wrote:

I agree about contemporary training and that's why it's so largely ineffective. I like the Bear's explanation where he says that:

Quote:
Muscle cells run on ATP-ADP conversion. The re-conversion is done with free fatty acids. It makes no difference whether the exercise is aerobic or anaerobic, similar to a car that is in first gear or overdrive. The fuel source is the same. Mitochondria mediates ADP to ATP conversion which is why there are two types (fast-twitch vs slow-twitch) of muscle cells. Fiber bundles with more mitochondria have a different response to the two types of work, aerobic or anaerobic. The way you train can alter the mix.

For instance, work that is done at or below 85% of heart-rate threshold is normally what is considered the cutoff and the most improvement happens in this zone. However, above 85% is where the oxygen gets depleted faster and this is obviously the zone where you want to spend the least amount of time, except for short bursts and allow plenty of rest. Let's rename the "lactate threshold" to the oxygen-debt threshold. You still can experience oxygen debt in the muscle but you don't feel the burning that used to accompany it and for that, I'm very grateful!
You can train to the limit, but don't overtrain as so many of today's athletes do. I just read today how Usain Bolt, the world's fastest man (that we know of today) only runs 1 in 10 races all-out. If he is winning, he wants to conserve energy. That is very smart and he will probably be the fastest man for a long time with this type of thinking.

Regards,

Charles

You all should have seen the look on our pediatrician's face when she gave my children their physical on Thursday. They did all the checks like blood pressure and weight. Theirs was 100/60 and 97/60 which is very similar to mine, 105/62. They had to get some shots that are the law, but we declined the flu and HPV nonsense. Anyway, the doctor then began to inquire as to their diet.

Doctor: So, do you drink milk?
Children: No.

Doctor: No eggs or cheese?
Children: Cheese sticks.

Doctor: Okay, but you do eat fruit?
Children: No, just meat.

Doctor: Just meat?
Children: Just meat.

Doctor: Well, how are they so healthy?
Me: They eat an artery-clogging high-fat diet.

Doctor: I see. Well, let's hope they stay healthy.
Me: Do you know of some reason why they shouldn't?

Doctor: No answer.
Me: Priceless!

Much thanks for the links.

John

RE: Zero Carb / Meat and Water - nyteez - 09-14-2008 01:27 PM

Well, I made beef jerky in my nuwave oven. I didn't put any seasoning at all on it and it was delicious. But, the nuwave cooks it and dries it. The lowest setting is 195 degrees. I want raw dried beef for pemmican. So, now I might hit the thrift shops for a dehydrator. Leaving it in the oven for 10 hours is just not an option right now, it is too hot! Maybe in december, but I don't want to wait that long.

I am sure the pemmican would be good w/ the cooked dried beef, I just want to make it the way the Indians did. I think if the beef is raw dried, it may make for a juicier pemmican.

RE: Zero Carb / Meat and Water - Richard - 09-14-2008 03:25 PM

Here is a Jerky site I ran across.

http://www.beefjerky.com/make.html

Invest in a dehydrator. Less cost than running an oven for 10-12 hours.

RE: Zero Carb / Meat and Water - jeepifer - 09-14-2008 06:01 PM

I agree with looking in the thrift shops. I'm also asking around at work, maybe someone has one taking up space in their cupboards that they never use!

RE: Zero Carb / Meat and Water - cbornebraska - 09-15-2008 02:55 AM

Hi all--

I'm just wondering if any of you who AREN'T diabetic have ever tracked your glucose levels? I just purchased a cheap little meter from Wal-Mart and have started tracking mine a bit. I am curious to see how certain things affect my glucose levels - things like caffeine, sleep, exercise, butter, etc... Have any of you ever done this? My assumption is that insulin levels will follow glucose levels? Theoretically, shouldn't my fasting (ie morning) glucose level be lower now that I zero carb? And, if I eat a zero carb meal (meat only), I shouldn't see any rise in the glucose, right?

I tested both my husband and myself before we went out to eat at a Mongolian grill for supper. I ate only meat and water and tried to avoid carbby sauces. My husband ate lower carb by not having rice, noodles or dessert, but other than that he ate whatever he wanted - sauces, veggies, a few breaded meats, diet soda, etc... My glucose was at 48 before the meal and went to 84 45 minutes after we ate. His was at 90 before the meal and CAME DOWN to 71 45 minutes after the meal. WHAT the heck?

Are glucose levels valuable for tracking insulin secretion or not?

Thanks!!

Your blood sugar was 48? That's scary hypoglycemic low. Are you sure this isn't a mistake? Were you feeling very confused?

84 after a meal is great. 83 is ideal, at least according to Dr. Bernstein.

What happened to your husband is that he oversecreted insulin after eating, which made his glucose dip a bit low afterwards.

Although Wal-mart meters are supposed to be reliable I have to wonder about the results you are getting with your meter. Your husband's reading seem like they could be right but the lower score after eating is open to question. Your 48 before eating does not sound right at all.

---

**RE: Zero Carb / Meat and Water - cbnebraska - 09-15-2008 08:08 AM**

Well, my morning fasting level registered as 84 today, which I know sounds more normal, but that's exactly what it was 45 minutes after dinner last night. Last Friday it tested at LO or "less than 20" when I woke up and went up to 48 after my morning coffee. Hmm... I will track it a few more days and then maybe I'll take it back if it is repeatedly testing low. For the record, I was not at all out of sorts with the "less than 20" or the 48 reading.

I will try to convince my husband to let me poke his finger a few more times to see if his habitually goes down after a meal. Does that mean his insulin response is very effective at getting the glucose out of the blood and back to the business of using fatty acids? The insulin hits hard and fast and then it's back to
business as usual? It wouldn't surprise me because he maintains his trim weight very easily eating low rather than no carb and doesn't suffer cravings. He is athletic and muscular, so he's maintaining muscle for sure.

Thanks for posting that article, HaloStatue! The problem is that because of specialization, those outside of the specialty of those researchers may never see their work and apply it to their research. It's clear from the article how so much of these things are related but people still fail to get it. Will the Alzheimer's researchers take notice that veggies are shrinking brains and realize that high insulin makes it impossible to destroy the amyloids necessary to keep Alzheimer's at bay? Probably not.

It's sad!

No. The glucose levels are valuable for testing the "effectiveness" of your insulin but not insulin itself. You have more insulin resistance than your husband does. His insulin effectively moves that glucose into his cells whereas some of your cells reject the insulin which would mean that your glucose would go to fat storage and his would go for storage and elimination.

Plus, on zero-carb, we would have a lower-glucose tolerance (at least initially) because our bodies will stop making the enzymes necessary to process the glucose. Don't think that zero-carb will improve your ability to handle blood sugar. If anything, it will make it worse. Zero-carb makes blood sugar a non-issue because it bypasses insulin resistance by not giving insulin anything to do. I don't believe insulin resistance is reversible. I think it's controllable by ignoring it, but you won't ever be able to return to high-carb meals as you did when you were a youth.

Regards,
Charles

If the meter is reliable, and this is a big IF, it means he hyper secretes insulin in response to carbs. Normal blood glucose levels do not go below the level before you start eating. Even 2-3 hours after eating blood glucose does not usually go below the level before one starts eating. Glucose after eating looks like a bell shaped curve more or less. And insulin has the same bell shaped curve with a time shift delay. Insulin is there to take glucose out of the bloodstream. Some glucose gets stored and some gets used immediately. It takes hours after a meal with carbs to bring the body back to using stored fatty acids.

**RE: Zero Carb / Meat and Water - chris m. - 09-15-2008 09:29 AM**

Hi All,

Need a little help here. Couple of things have occured to me on zero carb vs. low carb. One is - I'm still having some muscle cramping even though my weight work outs are light weight. I'm also experiencing some dizziness even though eating about every 4 to 6 hours. [this just started occuring] I've been strict for about 3 weeks now and losing moderately [1to3# week]. Do these fall under the heading of "what to expect"?

Does anyone have a good definition of keto-adaptation?

I think "the Bear" suggested it might take any where from 3-6 weeks. One of the markers was an increase in energy. I do not have that yet and in fact have periods of time [3 to 4 hours at a time] when my energy level is very low.

Any suggestions would be helpful !!!!

chris m

---

I had dizziness, nausia, and cramps, for several months when I initailly dropped my carbs. I had to get off the treadmill many times cause I thought I would pass out. Not to mention if I had to get up in the middle of the night to pee, I walked like a drunk person. Some people take a longer time to adjust. The leg cramps were also a problem for me. First I cut out salt, but I was still haveing a lot of tightness in my legs, so I cut out all my vitamins. No more leg cramps.

I think the main answer to your problem will be time.

Doctor: No answer.
Me: Priceless!

Ha ha ha! Charles... I enjoyed that!

I had the low energy periodically as well. I upped my fat and after a few meals, I felt much better. Is your fat ratio plenty high? Do you feel nausea set in as you're taking your last few greasy bites? At first, this is what I had to do until I could eyeball how much fat was enough.

I had one bout with a calf cramp, but it was during an intense ride. I don't know what I did differently to combat it. I did lower my salt intake as everyone advised, so maybe it was that.

chris m

I'm exactly like this right now, too... I guess it just takes longer to be adapted for some people. I've also been at it for a little over 3 weeks.

I agree with the others, Chris. Salt, time and more fat. Energy levels are directly tied to fat. I used to think I had enough energy but after reading Stefansson, I realized that perhaps I didn't. The ratio is 1/2 pound of fat to 2 pounds of lean per day. If that ratio is correct, regardless of the amount of calories, you should have great energy.

I had the cramps until I cut out the salt. Even when I'm at restaurants, I ask them not to season the meat at all. They look at me funny, but it works.

Also, don't drink too much water. Make sure you just drink to thirst. That is a big one for me. If I drink too much water, then I dilute my electrolytes and I don't feel so good. I raced yesterday in 94-degree heat without any cramping so it's possible.

Regards,

Charles

---

**RE: Zero Carb / Meat and Water - cbnebraska - 09-15-2008 01:30 PM**

Oh yes! I forgot all about the water. The race I cramped in was one where I drank quite a bit of water (per everyone's urging!) and am guessing I diluted my electrolytes.

---

**RE: Zero Carb / Meat and Water - waywardsister - 09-15-2008 01:59 PM**

Making sure I understand. Being a visual learner, I am not science-y! So I have to go through this painstakingly and work it out as I go. Forgive me.

Charles Wrote:

However, Gary Taubes himself e-mailed me his notes on the subject the other day and he has a reference to Baltzan, et al 1962, where they found that glucose actually plays a very minor role in oxidative metabolism (burning) by muscle in the basal state and later studies by this same group reported that approximately 0-65 mole of glucose was consumed each minute by 100 grams of muscle. For an average man, that is approximately 30 grams in a 24 hour period. They suggested that even this meager usage is high for muscle because the major proportion of this glucose being extracted is the erthrocytes in transit through the muscle. So much for carbo-loading!

Okay - so on average, our muscles only use 30g glucose in a day, and part of this isn't actually being used by the muscle but is passing through the muscle via red blood cells?

Charles Wrote:

What supports this theory is the fasting study that we've been talking about which says that after 66 hours, there is no marked decrease of glucose but there was a stoichiometric production of lactate from the glucose suggesting that muscle might normally even extract some of the lactate by the red cells and this extraction is what is diminished in fasting.

Lactate is a by product of glucose? So muscle is extracting the lactate - from the glucose? not the glucose itself, and in fasting this is not happening as much? Is this because in fasting the muscle is using fatty acids? Oh god, I feel like I'm in Grade 9 again. Where's that frog on a tray...

Charles Wrote:
This is all very important because if that's true, the Randle cycle makes the correct observation concerning glucose; however, the inference that we read from it is incorrect. We always viewed the action of muscles as "burning glucose" and indeed, we say that because we recognize the lactic acid buildup from strenuous exercise.

We feel the 'burn' in our muscles because our muscles have taken up the lactic acid/lactate, which is a by-product of glucose? They haven't taken up the glucose itself. So where is the glucose? Has it gone on to be stored in the fat?

Charles Wrote:
This is the reason I went very low carb in the beginning. Dr. Groves said that burning glycerol (pyruvate) in the mitochondria was the reason for the lactic acid. He said that fatty acid burns clean with no byproducts except water and carbon dioxide which are easily excreted and don't cause the burn, which I have found to be true. However, this comes and teaches us that there is not a burning, but an extraction of lactate by the red cells. The muscles only facilitate the transport of glycerol through them. The heart does the same thing. It doesn't take up glucose but it extracts pyruvate and lactate. This puts a load on muscles and organs.

So the 'burn' is our muscles excreting the lactic acid from the lactate they extracted from glucose? I think I need this explained to me in cartoon form. The muscles (incl. the heart) don't take up/burn glucose, they allow glycerol to be transported through them (to where? to the adipose tissue?) and they extract the by-products (why?) and this puts a strain on them. They excrete them later, hence the lactic acid burn?

Charles Wrote:
This is groundbreaking! This means that a much greater percentage of glucose is stored than previously thought and the muscles and every organ take up lactic acid and pyruvate for cleanup which supports my theory that if glucose is taken up by tissues and organs in our bodies, it must be for elimination. Indeed, this seems to be the case. There is no adaptation for carbohydrates and therefore we should not consume them.

So...we eat carbs, glucose is formed in the blood. It goes through the muscles into the fat, and organs/muscles extract lactic acid and pyruvate in order to clean up the glucose? Does that help them eliminate the glucose or glycogen or whatever? So it only appears that the muscles are taking up glucose/glycogen, but really it's whizzing through and being stored in adipose tissue and what we feel as the burn is the by-product of this whizzing through, bc the muscles etc are taking up the lactate to help clean up the glycogen etc and then excreting it as lactic acid?

sean Wrote:
But even the food allergies come from poor digestion. There is no such thing as food allergies when your return your liver and intestines to normal. Charles' diet is an exceptional way as well as fasting. Until you heal these organs your flareups will always come and go. Once healed you'd be amazed at what foods you thought you were allergic to you can eat with no problems (if you choose to return to the foods that caused it all).

At one point in my life if I ate bread the entire contents of my GI tract emptied almost immediately and violently. After some fasting and flushes I could eat a loaf with no problem whatsoever. Did I become non allergic all the sudden?????? Of course not. The GI tract was again working and it could deal with any "food".

Ive done every test. flush, protocol you can imagine, and when the organs heal you can eat concrete if
you like. No allergies including hay fever. I used to react allergically to getting out of bed in the morning. Now I can cut my grass and roll around in it and not even a sniffle. Clean the fermented waste (undigested carbohydrate) out of your system and everything resets.

But poor digestion can come from food intolerance 😞 Though I get what you're saying, bc when I was healing from gluten damage I reacted to other foods, and those reactions went away after a while, or changed. Thing is, you can "reset" but that doesn't mean you won't accumulate damage again. It's just that the symptoms might start out very slight (like you can eat bread again without immediately experiencing insane D). Eventually, the reactions progress...or the damage progresses, and expresses itself in an autoimmune disease, which very few doctors will link to food intolerance. Intestinal villi can and does heal, but return to eating the foods that damaged it in the first place and...

nyteez Wrote:
Your pet eats low carb and fresh meat. Most pets are fed high carb food which they are allergic to and which causes the pet dander. 😞

My pussies eat raw, and one still has dander. They haven't slimmed down as much as I thought they would either, and they still get what I think are herpes flare-ups (runny eyes, sneezing). One of my cats is a really bog boy and rock solid - I wonder if it's inflammation (like how I had a rock solid belly when I was eating wheat etc)? They prefer beef to any other meat, and I wonder if beef is really the best thing for them based on their weight etc.

sean Wrote:
Charles I dealt with some Masai in Tanzania one time. Dr. Price's work doesn't begin to describe the bone structure of these guys. Don't get me wrong Price's book is my bible, but reading it and then seeing a couple red silk robes coming my way at about midnight in a place I don't think "whitey" was supposed to be in Tanzania is quite an experience.

Such a cool story. Hope I get to travel like this one day! My mum has, and she met Masai in Kenya (spent time in a village with them) - the pictures are amazing, and certainly back up what you said about their appearance. Gleaming teeth, tall, strong, amazing bone structure. Gorgeous babies as well. On that note, I visited a Bedouin tribe in Egypt, and found the total opposite.

Thanks richard! I am going to check out a few thrift shops today. I always see those dehydrators at thrift shops. Now, that I am looking for one, I probably won't find one LOL!

Try a Freecycle group (in Google groups, they may have one for your town/city)

RE: Zero Carb / Meat and Water - Charles - 09-15-2008 02:29 PM

waywardsister Wrote:
Okay - so on average, our muscles only use 30g glucose in a day, and part of this isn't actually being used by the muscle but is passing through the muscle via red blood cells?

Right. This is the amount that can be stored in all muscles during a 24-hour period. When they did a "forearm study" they found that not very much of this glucose was taken up at all and that the muscle was solely using fatty acids despite the presence of the glucose. There are various mitochondria for slow-twitch and fast-twitch muscles and when certain cells burn the pyruvate, they produce lactic acid as a byproduct and this lactic acid gets taken up by the muscle cells which provides the burning sensation.
Waywardsister Wrote:
Lactate is a by product of glucose? So muscle is extracting the lactate - from the glucose? not the glucose itself, and in fasting this is not happening as much? Is this because in fasting the muscle is using fatty acids? Oh god, I feel like I'm in Grade 9 again. Where's that frog on a tray...

Glucose cannot be burned in cells directly. It has to undergo glycolysis where it is converted to pyruvate than it can be burned in the mitochondria. The byproduct of this burning is lactic acid. The mitochondria can accept fatty acids directly and they burn clean. The only byproducts are CO2 and water which is easily excreted.

Waywardsister Wrote:
So...we eat carbs, glucose is formed in the blood. It goes through the muscles into the fat, and organs/muscles extract lactic acid and pyruvate in order to clean up the glucose? Does that help them eliminate the glucose or glycogen or whatever?

All nutrients get absorbed in the bloodstream, which carries them to every organ and tissue of the body. When an organ, tissue or muscle needs fuel, they reach into the bloodstream and pull it out as it floats by. Studies on muscles, tissues and organs reveals that they are not using glucose directly. Glucose always has to be converted to pyruvate and when the pyruvate gets burned in the mitochondria, it releases lactic acid. The muscles burn this lactic acid to remove it.

Regards,
Charles

Here is an article I read today that you can reference if anyone questions your meat eating ways 😃

RE: Zero Carb / Meat and Water - waywardsister - 09-15-2008 06:46 PM

Charles - thanks! I think I've got it. Appreciate your patience and thoroughness. This forum is a great resource thanks to you, Mac and countless others. Wish you'd been my Grade 9 science teacher 😃

RE: Zero Carb / Meat and Water - SLD - 09-15-2008 09:33 PM

I find that I tend to eat a lot of salad veggies before eating fatty protein because I'm afraid that I'll be overeating on fatty protein unless I fill up my stomach first. I did try zero carbing on fatty protein where 80% of calories came from fat and continuously gained weight. I don't have any hormonal or metabolic problem that I know of though. Even if I eat slowly, it takes LOTS of meat to satiate me. I'm afraid of more weight gain that I'm eating several cups of leafy vegetables to stuff myself before even starting on meat. I would really love to go totally carb-free, but zero carbing isn't helping me with weight control. Do you have any advice for me?
RE: Zero Carb / Meat and Water - suzanneyea - 09-16-2008 02:16 AM

How long did you go zero carb? Cause the "trick" you are doing with the veggies won't work either. Give us all some more info on you, your age, weight, weight history, and an example of what you eat in a day. I also need to eat large quantities to feel full, I am often over 3000 calories a day, I always eat 300 to 400 grams of protein a day, so I understand the need to eat a lot.

RE: Zero Carb / Meat and Water - Nicola - 09-16-2008 03:34 AM

I don't know if this is a good place to post this message...but it is some good info for those interested:

Dear prof. Groves,
and what if I play a sport where I push over the anaerobic thresold for more than 2 or 3 hours? Like a mountainbike race? Or 5-6 hours daily on a tour de france?
I know that over the anaerobic thresold is impossible to burn fat but we use glycogen stores and consequently we start to produce lactic acid the same. At a certain point... Our glycogen stores will finish...
What do you suggest to eat in the pre work out, during an endurance event and immediatly before for a cyclist racing in a tour de France 5-6 h/d?
Dr. Cordain wrote a book about this things: "paleodiet for athletes". Do you agree with him or not? And, if not, why?
Thanks a lot.

You are right that fat requires oxygen - and lots of it in endurance sports. This is what you have to train for, so that you don't cross that threshold.

We have little glucose readily available for prolonged endurance events. There is only approximately 5 grams of glucose in the bloodstream, and about 1/2 kilo of glycogen stored in the liver and muscles. A total of, say, 2,000 kcals available. On top of this, anaerobic exercise where glucose is used is very inefficient. Fat, on the other hand is abundant. Even the leanest athlete will have something like 40,000 kcals at his disposal.

The problems with aerobic fat metabolism comes when the athlete who normally carboloads runs out of glycogen and his body switches to using fats. This change from one source of energy to the other brings about the 'hitting the wall' condition so familiar to long-distance cyclists and marathon runners.

But this only happens when the athlete's body is not properly attuned to using fats. This is because fat and glucose metabolisms use different enzymes and it takes a while for the body to rid itself of one set of enzymes and manufacture the other.

What I suggest you eat, not just pre-work out, but all the time, is a diet that derives around 60% to 80% of energy from fats. Your body must attune itself to working with the new fuel; this diet allows that to happen. But it can take several months to achieve.

I haven't read Cordain's book, so can't really comment on it.
By the way, I'm not a professor. 'Barry' is fine. But thanks for the title.

You still amaze me with 300-400gr! I tried to consciously hit 200 this last Saturday but I felt like I ate the whole cow by the end of the day and my estimate was only 180gr. HOW DO YOU DO IT!!!!!

And, on a side note, could this be why my weight loss has stalled? I figure I average 150gr protein and around 180gr fat with 4-5carbs from heavy cream in coffee.

Do I need more protein and fat?

RE: Zero Carb / Meat and Water - Kristi31 - 09-16-2008 07:35 AM

I think if people gain weight on zero-carb or stall, it would be a good idea to drop the fat content a little, increasing the protein in the process. See what happens. But keep the fat % above 60%.

Like Suzanne said, we really need more information. Welcome to our forum, by the way.

If you are gaining weight when eating totally zero-carb and water for two months, then there must be a reason and I assure you, it's not your diet. What other medications do you take, do you sleep through the night, what exactly were you eating and often? What do you weigh now and how tall are you. Plus, are you male or female? Not only that, but what other health issues do you have?

These answers will go a long way to possibly identifying what's happening. However, for you to be gaining weight on a zero-carb diet, regardless of the fat content, is a problem.

Regards,

Charles

You have to understand that the total grams of carbohydrate in a product is IRRELEVANT. It really makes not a single solitary difference whether there are 20 grams or less than 1. If you perceive this drink to be sweet then you are secreting insulin in response to it and trapping your lipids for longer periods of time than what is normal.

You have to shake this urge for the sweet and once you do, I would imagine your weight loss would continue.

I know you are not hungry, but do you have plenty of energy? How much do you weigh and how tall are you?

Regards,

Charles

I have been able to reduce the artificial sweetener to 2 packet of stevia. But this is just in 1 cup (mug) of coffee in the morning.

My energy does not seem to be a problem. I usually put in a long day (10-12 hours) at work and still going till bed time. For the past 5-6 years I can only sleep about 5-6 hours due to a back injury. I'm 5'8" and currently 228 (was 240 2 months ago before starting back on Atkins then switching to ZC 3 1/2 weeks ago).
Things have been stable for about 6-7 days so I am wonder if I am at a plateau for a while or if I need to add or remove something to spark the losing again.

I am due to have blood work done in about 2-3 weeks so I am anxious to see how the thyroid and other levels are. I figure I will have 6 weeks on ZC by that time.

RE: Zero Carb / Meat and Water - **Wendyoh** - 09-16-2008 10:32 AM

Richard, when you have your thyroid levels checked, make sure that they also test your FREE T3 and T4 levels as well. Many docs only test TSH which doesn't tell the whole story.

RE: Zero Carb / Meat and Water - **Richard** - 09-16-2008 10:44 AM

The last run they made was more detailed than the first which was to just 'take a look'. I believe that the thyroid and the testertone levels which were low on the last 2 runs are directly related to the insulin resistance issues. I read up on the Metabolic Syndrome (Syndrome X) issue which can screw up all the bodies hormones. If, as I believe, my levels on everything have come up to normal or above and the triglycerides have gone down (was 199 and 207 on previous test) I am curious to see the doctors face. In the spirit of full disclosure the 2 previous blood test were when I was on weight Watchers and not losing but gaining (I have become a Weight Watchers dropout!!!!).

My goals are:
1. Get all the hormone levels to normal or above and the other stuff (HDL/LDL etc...) to normal also.
2. Lose weight to feel better and live healthier.
3. See the look on the doctors face when I tell him how it was done without pill and HOW I DID IT!!!

Stevia has carbs and two packets in one cup? Wow, that is some sweet coffee!! I'd say you need to desensitize your sweet tooth. It is so true that if you have one, you will salivate and secrete insulin just upon looking at something sweet.

I too still drink coffee, but I have learned to drink it without sweetener, with 1 TBSP of cream only. My
sweet tooth is gone as this is a very bitter concoction! I'll eventually remove it totally, if I see myself stall.

**RE: Zero Carb / Meat and Water - Charles - 09-16-2008 11:00 AM**

Richard Wrote:

This doesn't matter. You have to lose the "amount" from your mind. Our bodies always overcompensate in every system because it will never be unprepared. Do you really think that you burn all those fatty acids that you consume in a given day?

Think about this. The fasting study showed that we humans can fast for 9 months or longer. During this fast, the principle fuel will be fatty acids. Think about that. If we burn them up each day, where does this come from?

Our bodies simply overcompensate so that it will always be prepared. That should tell you something about weight loss. I have lost 73 pounds of fatty acids, yet my body still feels like it can go 9 months or longer without any additional food. You have to provide your body with that same confidence so it can shrink your fat tissues and not that there is a steady stream of nutrients. The single mug can disrupt the process just enough to keep your body overcompensating.

When you drink that single mug of coffee, you have secreted way too much insulin even before you pick up the cup to put it to your lips. Not only that, but you use a good bit of Stevia and your body will secrete insulin even relative to that.

Don't be seduced by the "this little bit won't hurt" mindset. It dooms many.

I have my morning coffee with one equal and less than half a teaspoon heavy cream. Now, I used to drink
4 or 5 cups a day with 4 equals and cream! I first reduced the amount of coffee, then when I was down to one cup I started to reduce the equal and cream. Baby steps.

Charles and ALL Y'all,

I am so glad YOU read the science and dumb it down for chicks like me. Something I read last week really got to me and although I haven't given them up completely, I am down to 2 diet cokes/day. I want to stop them entirely, along with all artificial sweeteners. I realize reading the above, that even if it's stevia, my ANTIPATION of wrapping my lips around something sweet alone causes my poor little ...not sure what organ insulin comes from...but that thing (does it come out of the pancreas?) organ to start putting out the fat-accumulating juice. Bleah...doesn't really sound very nice at all does it?

I have a question about coffee. I have stopped using cream of any kind, and have even learned to like it a lot without any sweetener. My question is, does coffee, all by it's-lovely-self cause insulin surges?

What other things do this?

I apologize in advance if these are silly questions, but I have never been exposed to this kind of info, or if I have, I sure as heck didn't understand it, and I SERIOUSLY believe that my issue is insulin.

I dropped 5 lbs on the scale, but it's back up to 220 this morning so I effectively didn't lose any weight during week one on this plan. That being said, I should probably take this to another forum (?) as I am still having around 20 g of carbs per day in the form of veggies.

I'm 5'7", weigh 220 (highest weight ever was 330 - this is why I think I may at some point have sprained
my pancreas), and I'm 47 years old.

Thanks to all for ANY help at all.

---

RE: Zero Carb / Meat and Water - Charles - 09-16-2008 11:30 AM

Even some of the advertisements on this forum are annoying me as well. Some people seem to think that "low-carb" is just finding low-carb alternatives to the crap they used to eat on their high-carb diets. This is absolutely the wrong way to think. I used to see some value in it, but now I just don't. Sure, I didn't start out zero-carb, but that's because I didn't have someone to tell me. I had to come to it through my own research and examination. I'm trying to spare some of you this nonsense. I would have been at my body-regulated weight much sooner had I known better.

Carbs are not the enemy. High levels of insulin will kill you. You must suck it up and make every effort to control your insulin response in anticipation of, and in response to, food.

As the Bear said, stop measuring and calculating. This is about your lives. Measuring is what dieters do. You all told me that you're in this for your health. If that's true then you must know that it's as simple as finding a piece of fatty meat and drinking a glass of water. Rinse and repeat several hours later when and if you get hungry. These days I find that I feel low on energy and that's when I know it's time to eat. It works like a charm!

Please, don't get mad at me, but take my advice and get this under control. High insulin will send you to your grave much quicker than you should be going. I want you all to be happy and healthy and you're not going to get there taking shortcuts.

If you're overweight or obese, then find a piece of meat and eat it exclusively. Don't worry about variety. This is the time to be bored. Yes, I want some of you to hate your food and hate eating. I don't care about socialization or any of that nonsense. You can be social when you lose the weight. Ladies, you can wear that two piece and host a pool party showing off your great body. I guarantee you will find reasons to be social! Guys, same goes for you. When you conquer this and you can show off that six-pack, you will be plenty social.

I don't want to see most of you on these computers for very long. I want you to go and live life and eventually forget about this forum and all these things. The only time you should bring it up is to tell someone how you did it and perhaps direct them to do the same thing.

I'm very sorry to be so blunt, but someone has to tell the truth. Insulin will kill you and it will rob you of your hopes and dreams. It's time to get tough and control it. Whose body is it anyway?

Regards,

Charles

Charles,
I like the direct way you always write what you are feeling. I don't post much... because a true Zero-Carb doesn't have much to say or write after a while, it gets boring to repeat the same stuff.

It is so simple to eat meat and wash it down with water and beside, everything has already been written before me.

Quote from The Bear:

'Anyone on an 'all meat diet' (i.e.-zero-carbs) who is hungry, is eating carbs, it is as simple as that. 'Hunger' indicates low bloodsugar, and once keto-adapted on a strict meat diet the bloodsugar never varies. Therefore, you will not become hungry, even after several days without food. At first, I had to remind myself to eat and it still is a problem on busy days- evening comes and I might realize I haven't eaten since daybreak. I'm never hungry.'

Take care

RE: Zero Carb / Meat and Water - Charles - 09-16-2008 11:54 AM

DebbieDoesAtkins Wrote:
I realize reading the above, that even if it's stevia, my ANTIPATION of wrapping my lips around something sweet alone causes my poor little ...not sure what organ insulin comes from...but that thing (does it come out of the pancreas?) organ to start putting out the fat-accumulating juice. Bleah...doesn't really sound very nice at all does it?

Pancreas. Insulin is not normally an enemy. It performs many useful functions and is directly involved with other hormones that perform their functions. It's only a problem when it is present in high levels. Blaming insulin is like blaming the fireman who comes to put out the fire. Insulin didn't start the problem but it sure squirted water all over the place. The water damage is enough to make your house uninhabitable.

DebbieDoesAtkins Wrote:
I have a question about coffee. I have stopped using cream of any kind, and have even learned to like it a lot without any sweetener. My question is, does coffee, all by it's-lovely-self cause insulin surges?

That's the thing. Coffee, in an of itself is probably pretty harmless. It all depends on you and how you perceive it. Some people can drink coffee and it has no effect. Others will drink it even though they have no sweetener in it and they will react negatively to it. Some people used to be the kind that put so much milk and sweetener in the coffee, it could easily be mistaken for hot chocolate. If this is you, then it's possible that even though you've removed all the whipped cream and chocolate sprinkles, you will still perceive that drink as sweet and secrete insulin in anticipation.

There should be no food or drink that absolutely cannot do without or your day will not start right or whatever. This is called an addiction and it has no place in your life, period! If coffee is so harmless,
then you should be able to skip it for the next month and not even miss it. That's how I am with all my food.

Not only that, but any food or drink that you have to season or in any way modify so that it tastes like something else, that is probably a food that needs to go as well. Look, if you're already at a reasonable weight for your height and weight and these things don't bother you, then perhaps that is something you can allow. If you have weight to lose, why not just keep it clean for six months and allow your body to heal without any distractions?

DebbieDoesAtkins Wrote:
What other things do this?

It can be anything and the food or drink in question does NOT have to contain any carbohydrates. It's all about perception. Some people only eat meat if it is heavily seasoned or have some high-carb sugary sauce on it. If this is someone's experience, they are going to have a hard time with this cruel regimen I have devised. However, they have to suck it up and get over it if they want to have success.

I realize that the stuff I'm talking about is even more strict than the Bear, but that's just the way I see it.

DebbieDoesAtkins Wrote:
I apologize in advance if these are silly questions, but I have never been exposed to this kind of info, or if I have, I sure as heck didn't understand it, and I SERIOUSLY believe that my issue is insulin.

No apology necessary. There are no silly questions and if anyone has a question, they should ask it and I promise to answer you even if the question has been answered 50 times already. We need a highly educated zero-carb community because when you people start looking fabulous, everyone is going to want to know how you did it. I'll be very gratified if you answer with the words of Nobel-prize winning scientists who have sacrificed their careers and professional reputations to bring it to you. Your doctor probably hasn't consider insulin's role in the fattening process, but if you inform him or her that Rosalyn Yalow and Solomon Berson won the Nobel for discovering insulin's role in fat metabolism, that might get their attention.

I promise you, I am not that smart. I am just relaying to you what I've learned from the greatest minds of the past 100 years.

Regards,
Charles

One week on what plan? Zero carb means zero carbs, no veggies at all. Why are you eating veggies?

It is hard to go from lowcarb to no carb cold turkey. You should try eliminating more carbs each week. If that doesn't work, then try eliminating other problem foods like nuts, cheese & eggs. You will
eventually lose weight once you eliminate the carbs.

Coffee can cause insulin release in some people, has something to do with the oils in coffee. One or 2 cups may be ok, but if you drink a pot of coffee a day that could be a problem.

RE: Zero Carb / Meat and Water - nyteez - 09-16-2008 12:14 PM

And just like Charles said (great post Charles!) any food that you are addicted to has to go. If you HAVE to have coffee in the morning then that is a problem. Even if you don't put sweetener or fake sweetener, your body is addicted to this food/drink and secretes insulin in anticipation of it.

RE: Zero Carb / Meat and Water - suzanneyea - 09-16-2008 12:38 PM

I am addicted to coffee and have zero desire to end my addiction right now! LOL Coffee addicts unite!!!!!!!!!!!!!!!

RE: Zero Carb / Meat and Water - Charles - 09-16-2008 12:43 PM

If I looked like Suzanne, I might drink coffee too! LOL 😊

LOL! It is weird how some people have a problem w/ it. I only drink it when there is heavy cream in the house. I have gone years w/ no coffee. I used to think it was the cause of my stomach problems. (was actually all the fruit & veggies I ate) Since I learned I can have whole cream in it I drink it sometimes. I will drink it most every day until the cream is gone, then forget to buy cream and not have it for a few weeks. I don't notice any negative effect at all from drinking coffee.

I would not drink it ever, if my husband didn't make it every morning. I don't even know how to make it! LOL!

RE: Zero Carb / Meat and Water - suzanneyea - 09-16-2008 12:57 PM

I cannot believe i am able to drink my one cup, I am usually an all or nothing type person.

RE: Zero Carb / Meat and Water - DebbieDoesAtkins - 09-16-2008 01:37 PM

Ok, so...if we feel we absolutely cannot live without it, it makes our insulin go. The end-result of the insulin is that we accumulate fat. My Overeater's Anonymous group is going to love this info...

Thanks y'all,
carrie
RE: Zero Carb / Meat and Water - daveo - 09-16-2008 01:46 PM

Charles Wrote:
Richard Wrote:
I have been able to reduce the artificial sweetener to 2 packet of stevia. But this is just in 1 cup (mug) of coffee in the morning.

When you drink that single mug of coffee, you have secreted way too much insulin even before you pick up the cup to put it to your lips. Not only that, but you use a good bit of Stevia and your body will secrete insulin even relative to that.

Don't be seduced by the "this little bit won't hurt" mindset. It dooms many.

Regards,

Charles

Charles,

When you say you excrete insulin before you even pick up the mug, you are referring to the sweetness of the coffee and not the coffee itself right? I ask because I drink black coffee (so definitely not sweet) at about 3 or 4 cups a day, and I am losing weight steadily.

Edit: Never mind, you already answered this in a later post. By the way, I'm with Suzanne. I'm an addict 😊

RE: Zero Carb / Meat and Water - cbnebraska - 09-16-2008 02:48 PM

Me too!! My one cup in the morning hot and one in the afternoon over ice are very enjoyable to me. Physically addicted - I don't know, but I do enjoy it. I love the meat I eat too, and I don't "forget" to eat it either. My energy or motivation gets low and I feel like it's time to eat. Maybe that's not really true and I'm just not busy enough.... Interesting to think about....

I nevah knew coffee did all that and made you store fat!

Ron.....your avatar is smiling at me and telling me one won't hurt.......😊 I'm just gonna picture a doggy doodle on top of it ......he he

I did Atkins with the veggies,cream,cheese and so forth and stalled after 100 pound loss.........

Then did the Kimmer thing and lost fast..but got into trouble doing that. No fat is not good with no carbs.............just now scared, i will not loose if i eat to much meat with fat. Don't calories matter even if no carb? I can eat 3 chicken breasts in one sitting.

I know this is a long thread, but if you read through it you will understand why calories don't matter on no carb and why you need to eat more fat. No chicken breasts, not enough fat, eat thighs w/ skin on wrapped in bacon & cooked in butter. 😊

This is the time to be bored. Yes, I want some of you to hate your food and hate eating.

Thank you Charles, well said!! I used to adore eating...and now I can't stand eating. I just do it so I don't fall over (maybe every nine or ten hours). Bring on the chuck and ribeyes 😊
Good morning! I would like to join you please.

My history - briefly !!! - I've been overweight almost my whole life though I work out frequently & heavily and have been on many 'starvation' diets where I did lose weight but could never keep it off. I finally lost about 50 pounds on Atkins at end of 2006/start 2007. My son (who was 2 at the time) was in an accident in June 2007 where he had 3rd degree burns to his arms and had to have skin transplants, etc. While we were in the isolation room at the hospital with him we were fed massive quantities of high calorie (starchy of course) food to keep his calorie levels as high as possible. Well, that was the end of my diet!

A few months ago I decided that a liquid diet was the route to take as then I didn't have to 'think' about food and I could deal with all my food issues at the same time. About 3 weeks after I started this liquid diet, I picked up Gary Taubes book. All of a sudden, the YEARS of telling my doctors "but I AM on low calorie, low fat" and "I am NOT cheating" and "I GAIN weight on Weight Watchers even WITH exercise" were explained. As I began feeling worse and worse on this very low calorie diet, I started re-evaluating what I should be doing - for life...

That led me to this forum.... And after a few weeks of contemplating it I'm ready to do a 'reverse' induction. I don't know yet that I want to eat only meat or meat/eggs forever. I DO know that I don't know what my body would like or not like. I've abused it for way too long. So, with that said, I'm going to cut back to the absolute basics. Meat, a few eggs, maybe a tiny bit of cheese. Trying for under 5 carbs a day including those items. Once I start losing again, and get going on this, then I will try to add back in an item at a time and see what stalls me, what makes me feel awful, what works, what doesn't.

So, hopefully you don't mind if I join you ladies on that road!

I am an American living in Denmark so some things will be slightly different for us in terms of food, cuts of meat, etc. but generally I'd say food here is 'healthier' in that they don't add a bunch of junk to good things like Bacon!

I'm also on thyroid meds - which helped lift the fog I was living in for a few years but did absolutely nothing for my weight! So, it wasn't my thyroid even though I HOPED for that as an answer...

I felt great on Atkins before so I'm ready to do this again. I started yesterday - and well, frankly, I feel like )(*^*&% ! Major, major nausea. Hopefully that will pass today or tomorrow. It isn't like I've been eating loads of carbs, I've been on a liquid diet that was fairly low in carbs, high in fiber, but VERY low in fat so maybe that is why I feel so awful.

I look forward to feeling better and being thinner. ALOT thinner! (I have about 70 pounds to lose)

Best regards -
Kacey

Just one more comment about my 'food issues'...

After reading Gary Taubes book, I'm wondering if the whole 'emotional eating', being overweight
because you have 'issues' with food - maybe from your childhood, etc. is all just a BIG FAT LIE. Excuses given to us to use so that we can say why it is we can't lose weight. I'm not saying that there aren't people who have food issues - but I have never been a binge eater. I've never massively overeaten. (I've been on starvation diets but that was the only way I could lose weight)

As I was reading his book, I thought 'Hey, maybe I don't have a FOOD problem which is mental, maybe???? I have a carb/insulin problem which is driven by my bodies needs?? If that is true, then getting my body into a healthy, regulated state is going to 'fix' my 'eating problems' which maybe I don't even really have.

Just think, since I was a child I've been told that being fat is just mind over matter (food) and obviously I was weak minded since I couldn't win the fat war. What if that is all just not true??? That might just change my life!

Kacey

RE: Zero Carb / Meat and Water - suzanneyea - 09-17-2008 02:49 AM

Food to me can be two things. There are times I make an amazing steak and just love every single juicy bite. But, there are times I am out and about for the day and food is nothing but fuel to me. If I am at six flags with my family, we are there to play and have fun, not to eat. I will pack our lunch and we eat in line and it is usually cold ground beef. It is not a tasty treat, but it is the food that will gives us the energy for the day, it has the fat and calories we need to enjoy the day. If I am paying $200 a for a day of family fun I am certainly not wasting a minute of that day eating, we get to eat everyday, but six flags is once a year.

RE: starting meat and eggs today - suzanneyea - 09-17-2008 03:05 AM

Hey Kacey,

So many of us have the same story as you. I was always heavy despite huge amounts of exercise or super low calories. Plus, I was a binge and closet eater, among other things. All I know is I started Atkins (always stayed under 20 grams) and nevr had the urge to binge again. Now, I know I didn't suddenly deal with all my emotional issue over night, the only thing that changed was my carb intake. I am now zero carb, but I got to the point one step at a time. I had a lot of unhealthy habits to change, like drinking soda and too much coffee. Then I started to reduce various carbs, like cheese. One at a time. Now I eat my meat and drink my water (and one coffee) and love my body, physically and emotionally. And, I too had a horrible induction period, I felt like death, so just hang in there and it will pass.

RE: starting meat and eggs today - kacey - 09-17-2008 03:19 AM

suzanneyea Wrote:

HURRAHH!!! If YOU were always heavy (after looking at your pic here) - then I truly, truly have some hope!!! 😋:P万人次

At least I know that under all the fat there are some pretty good muscles! Hope I see them soon... 😊
Thank you for the response! I hope to get past these WAVES of nausea soon....

P.S. I have started with the 1 tsp of coconut oil in my one daily coffee. Could this be aggravating the nausea? Or should I just suck it up?

RE: starting meat and eggs today - suzanneyea - 09-17-2008 03:20 AM

The coconut oil won't make change the nausia, but make sure you are eating enough fat in your meat. What are you eating in a typical day?

RE: starting meat and eggs today - kacey - 09-17-2008 03:35 AM

My daily eating looks appx like this:

Breakfast - 2 or 3 pieces of bacon, 1 or 2 eggs fried in butter
Lunch - ground beef or pork with a little cucumber and/or tomato (if i have it from the garden) or just a hamburger patty with a little cheese
Snack - Egg drop soup (chicken bouillon, 1 egg, teeny bit of onion)
Dinner - last night - steak, bernaise sauce (2 tbsp. 2 carbs), 5 pieces of feta cheese

Bacon in Denmark is nitrate free - so no worries there. I have a few basic veggies in the garden that I use occasionally but I'd say less than 1/8 cup in total all day. Sauce on meat? I do like this! 😊

Today same except I couldn't gag down an egg so only ate bacon. Lunch will be hamburger patty. Dinner will be ham. Dijon as a 'dipping' sauce.

1 cup of coffee in the mornings. Can take it or leave it honestly. Green tea during day (3 or 4 cups) organic. 1 or 2 liters of water depending on how I feel.

I may have had too many eggs? I also like - occasionally - a flax roll (1/4 cup of flax, 1 egg, 1 tsp baking powder, 1 tablespoon of butter). This gets me by any traveling or meetings where I have to bring my own food.

But up til last Friday I was doing shakes/soups (liquid diet). Then I ate mostly meat this weekend (oh and a few glasses of wine😊) and from Monday menu as above. Since Monday night I have been so 'pukey' that I nearly can't look at the food I'm eating. No headache though. Maybe it will pass! I mostly want to wave some MAJOR HUGE signs at my fat cells and tell them I'm not going to abuse them anymore so they can just 'let go and be free' 😄😄!

Since my whole family has weight problems - this is going to be a major show-and-tell project !!! (and my mother for example, eats 4 bowls of bran cereal a day - that's it and is 100 pounds overweight)

Thank you thank you for any help! (sorry for the length)

Kacey

Just checked... yesterday, for example, was 67% fat, 31% protein, 2% carbs.

I have started working with butter on the meat(unsalted) and I also have gotten more serious about a tablespoon of coconut oil (not hydrogenated!) at each meal. I figure this will up my percentages.

RE: starting meat and eggs today - pamela702 - 09-17-2008 04:20 AM
Hi Kacey, I am also doing meat and eggs. I started about 2 weeks ago. I never really had that nausea or 'flu-like' feeling. But it was one of my worries when i started because i easily get nauseated (especially in the mornings). I'm sure yours will go away soon 😊.
Pamela

RE: Zero Carb / Meat and Water - suzanneeya - 09-17-2008 05:35 AM
My advice is to just eat fattier meat and there will be no need to add butter or oil to your food. I try to think like a cave woman when I eat, they certainly did not add butter or oil to their food and it worked, no obese cavemen. My fat levels go up and down, depending on what I eat, do not worry about it too much.

RE: starting meat and eggs today - suzanneeya - 09-17-2008 05:39 AM
Looks good. Always make sure you are not hungry. Obviously I will tell you to stop the sauces on your meat. I used to have to have salt on my steak and when I first cut it out it di dnot taste as good, but now I love the taste. Make the changes slowly and when you are ready. I relied heavily on eggs for many years, then I was finally ready to lose them.

Very true Suzanne! I've never thought of it that way, but I think it's true for me as well. If I am busy doing something I thoroughly enjoy, I forget about it. If it's a run of the mill day, I don't forget about the yummy meat I have waiting for me at each meal time. I wish I could get totally away from even that, but my life just doesn't seem to be busy enough. It just sounds crazy to say this, but I have worked hard to learn to be of a calmer demeanor, to unclutter our days to enjoy time just being together as a family and to limit our social schedule a bit to accommodate my husband's need to refuel at home, with me and the kids. Granted, my kids are each in 2 sports, I work full time, exercise every morning, have numerous
hobbies, tons of friends and train for races, but somehow, I still manage to have time to get "bored or unmotivated" enough to look forward to my meals. What's a person to do once all the carbs are gone to justify true hunger?

Anyone else see any patterns in their life?

**RE: starting meat and eggs today** - **AuntieeM** - **09-17-2008 06:55 AM**

Hi kacey:

Welcome! I'm fairly new here also, having started M&E on 9/12/08. Yesterday I started a thread titled "Feely yucky" because I was feeling headachy and just not myself. Today. I feel much better. Just hang in there, it'll pass. Isn't it nice though not feeling hungry all the time? I love the fact that I eat dinner at 6:30 PM and then don't feel like eating again until around 12 PM THE NEXT DAY!! The other evening I actually had to force myself to eat because I really wasn't hungry. I figured while I was preparing something to bring to work for the next day I should just make another Bubba Burger and enjoy it with home made mayonnaise.

The folks on this board are really nice and have so much information to share which they do most willingly. It's a terrific community that I'm thrilled to be a part of. Best of luck on your journey and remember we're all here to help you in our own way.

**RE: Zero Carb / Meat and Water** - **chris m.** - **09-17-2008 07:00 AM**

Charles Wrote:

Even some of the advertisements on this forum are annoying me as well. Some people seem to think that "low-carb" is just finding low-carb alternatives to the crap they used to eat on their high-carb diets. This is absolutely the wrong way to think. I used to see some value in it, but now I just don't. Sure, I didn't start out zero-carb, but that's because I didn't have someone to tell me. I had to come to it through my own research and examination. I'm trying to spare some of you this nonsense. I would have been at my body-regulated weight much sooner had I known better.

Carbs are not the enemy. High levels of insulin will kill you. You must suck it up and make every effort to control your insulin response in anticipation of, and in response to, food.

As the Bear said, stop measuring and calculating. This is about your lives. Measuring is what dieters do. You all told me that you're in this for your health. If that's true then you must know that it's as simple as finding a piece of fatty meat and drinking a glass of water. Rinse and repeat several hours later when and if you get hungry. These days I find that I feel low on energy and that's when I know it's time to eat. It works like a charm!

Please, don't get mad at me, but take my advice and get this under control. High insulin will send you to your grave much quicker than you should be going. I want you all to be happy and healthy and you're not going to get there taking shortcuts.

If you're overweight or obese, then find a piece of meat and eat it exclusively. Don't worry about variety. This is the time to be bored. Yes, I want some of you to hate your food and hate eating. I don't care about socialization or any of that nonsense. You can be social when you lose the weight. Ladies, you can wear that two piece and host a pool party showing off your great body. I guarantee you will find reasons to be social! Guys, same goes for you. When you conquer this and you can show off that six-pack, you
will be plenty social.

I don't want to see most of you on these computers for very long. I want you to go and live life and eventually forget about this forum and all these things. The only time you should bring it up is to tell someone how you did it and perhaps direct them to do the same thing.

I'm very sorry to be so blunt, but someone has to tell the truth. Insulin will kill you and it will rob you of your hopes and dreams. It's time to get tough and control it. Whose body is it anyway?

Regards,

Charles

BRAVO !!!!
No doubt one of your best posts !!!!!!!
Be blunt - tell it like it is -
I have a brother - 270# insulin resistant 55 years old - I want him to come to this thread TO SAVE HIS LIFE -

I do think we need a simple set of rules with a simple set of explanations - which can be referred to in Charles reading recommendations - it could answer some of the repeated questions - why we do this - what to expect - etc. this would take the place of having read the entire thread which I have done but I know many newbies aren't going to do. The Bear ran into that all the time and he did have his set of rules although more abbreviated than I have in mind.
What do ya'll think?
Chris M
Chris

RE: Zero Carb / Meat and Water - cbnebraska - 09-17-2008 07:43 AM

But yet, here I still am, seeking out camaraderie and further information. I tend to obsess over things for a while and then move on once they are part of "business as usual". Hopefully it won't take too long...

RE: Zero Carb / Meat and Water - chris m. - 09-17-2008 09:14 AM

southern-dahlin,
welcome to this thread!!
I did Atkins which took me from 200+ to 160 # - succumbed to the complex carb low fat BS - went back over 200 - then like you was a Kimkins survivor but did get to 160 again - then back to 190 # - back to low carb and found this thread [thank God] now at 178 - you will find support, patience and plenty of anecdotal evidence as to how and why this may be the best approach.
Kimkins - although I never did go as low calorie as they wanted - can you believe chicken breasts and egg whites and 500 calories a day or less !!!!
Once you get keto-adapted you should find zero carb a real breeze and more than worth the effort.

chris m

I eat similar to this. Don't force yourself to eat when you're not hungry. That's a big thing. Only eat when hungry and do not eat when you are not. I eat at around 12 noon and at about 8 or 9 in the evening and that's it.

When you can go long periods of time without eating and feeling hunger, that's a terrific sign that your body is mobilizing fatty acids and using them for energy. This is also a sign that you are losing weight and using your stored fat.

When you have low energy, that is a sign to eat especially fatty protein to provide the lift you need. After a while, you may not feel palatable "hunger" per se, but you'll eat in accordance with your energy levels.

Some days you'll eat more than others just as some days you do more activities that you do on other days.

This is entirely normal and very good. Don't force it, just live. Don't calculate and measure, just listen to your body and all will be well!

Regards,

Charles

I was ready to go to OA, seriously, before I went low carb. My weird eating behaviours were all linked to the foods I was eating and my body's reaction to them. The day I realized I'd gone all day long without thinking of food and eating, without battling insane urges to stuff crackers into my mouth, without needing to leave the house after dinner so I wouldn't eat more - baby, that was freedom day! The first time I noticed that I'd put my fork down mid-meal, oh man! I couldn't believe it! I can't tell you how eating this way changed my life in this respect. Emotional eating? Nope...it was all about biology.

I'm so excited for you to discover this too 😊 You'll love it!

Hi Chris.........I did the egg whites and fish....I got to where some days I didn't want to eat. I will nevah do it again as I got very sick for a while and it scared me.
Chris, I am hoping perhaps the fat will work if i eat very clean like Charles explains.

Today is officially day ONE for me since yesterday i had coffee with cream.
No coffee today...........boy can i feel it.......call me mopey.........lol
I am making chicken wings in the convection oven with no spices.
Do you guys take any vitamin s? How do we get our vitamin C?

The Bear uses 200mg caffein tablets for a pick-up when he needs it -although he still has a cup of coffee a day.
Some use no supplementation at all - some take a multi-vit low dose.
The need for supplements is not near as great [if at all] when you are eating correctly to start with.
Someone else can answer to the need for "c"
The first 3-6 weeks will be the biggest challenge. Be sure to report often so the members can respond to any problems.

chris m

southern-dahlin Wrote:
Do you guys take any vitamin s? How do we get our vitamin C?

Hello Southern-dahlin and welcome to our forum. I'd like to think our way of eating is perfect for a Kimkins survivor. We're not into laxitives and stuff, but I think in a way Kimmer was on to something. One can't throw out the baby with the bathwater. If you did fine on fish and eggs, then you can certainly handle some fatty protein and water.

The fat is the real trick and that's where most Kimkins folks have problems. Chicken wings are good but chicken thighs are better. Honestly, the best meat anyone can eat is beef, period. If you can eat 73/27 ground beef every day and drink water, that's probably the best diet known to man. An upgrade would be ribeyes and water. Just don't overcook the meat.

Now, about vitamin C. Meat does indeed have vitamin C in it but it's not very much. The truth is, we don't need very much vitamin C at all. Carbs are what causes you to lose vitamin C. You don't get deficiency diseases on an all-meat diet. The "experts" simply refuse to tell us that fresh meat cures scurvy 100% of the time and vitamin C only does it half the time. That's just the truth.
Therefore, I don't take any vitamins or supplements of any kind. I eat fatty protein and I drink water.

Again, welcome to our forum and if you haven't read it, get a copy of Stefansson's *Not by Bread Alone* and join our book discussion which is currently happening in the GCBC thread. If you need the book, e-mail me and I will send you a free PDF.

Regards,

Charles

**RE: Zero Carb / Meat and Water - mlcondiff - 09-17-2008 11:42 AM**

Hi. I'm new to the forum and new to this way of living. I was on a high carbohydrate diet for most of my life and have the damage it does; in my case it wasn't so much gaining weight, but extreme anxiety, bad skin, and I weighted much less than I should have. Since increasing the healthy fat content I have noticed much improvement, and when I got down to 50-80 grams of carbs a day I started noticing that whenever I ate carbs I would feel bad. Right now, I'm getting under 10 grams with eggs being my only source of carbs. I'm mostly eating 75-25% grass fed beef with suet and egg yolks. The only thing that is holding me back from dropping the eggs is the fact beef seems to be missing vitamins A, D, and Manganese. I've read that you can get all the vitamin D you need from the sun, but I don't know if its wise to risk it. I might end up dropping the eggs, and going for some organs instead since they provide these vitamins without the carbs (at least some of them). Any input about the lack of these vitamins?

For me Carbs, Fiber, and PUFAs are the most important to avoid.

I just read what you posted in the zero carb thread at LCF, Southern-Dahlin, and cracked up.

Southern-Dahlin at LCF Wrote:
I just toss a big bullfrog in a blender............drink that sucker down..eyeballs and all.......oh yummy

No judgments either way!!!!!!!

I see that Fawn is still putting in her two cents but she's "not trying to debate". Yeah, right. Go, Suzanne!

Fawn at LCF Wrote:
If you're consuming strictly animal protein, I sure hope it's free range or at the very least, organic. Hormones, antibiotics and the like settle in the adipose tissue of the animal. What steps are you all taking to support your systems in the processing of these xenobiotics? It is a known fact that the ratio of omega 6-3 is far too high and causes disease as well.....namely, heart disease. Just helping to educate not trying to debate.

Fawn at LCF Wrote:
Suzanne, I do know my facts. I have spent the last year in a nutrition program. I'm not sure what you think is not necessary? I mentioned the toxins given to our cattle as settling in the adipose tissue of the animal which in turn when consumed settles in YOUR adipose tissue many times mimicking estrogens. We call this xenobiotics. Are you familiar with this term? As well, my knowledge of the 3:6 ratio is readily available all over the internet and when cattle are fed primarily grain, there is no omega 3 value. Without higher omega 3 ratios, the body has a great deal of inflammation which in turn has been attributed to heart disease. Hence c-reactive protein.

You've made your mind up. I'm not here to change it, rather to help folks who have not completed their own research a heads up on the consumption of animal proteins strictly. Then there is the acidic state in which you could potentially be in. but that's a big debate so I'll keep it on the low.

RE: Zero Carb / Meat and Water - Charles - 09-17-2008 12:13 PM

mlcondiff Wrote:
The only thing that is holding me back from dropping the eggs is the fact beef seems to be missing vitamins A, D, and Manganese. I've read that you can get all the vitamin D you need from the sun, but I don't know if its wise to risk it. I might end up dropping the eggs, and going for some organs instead since they provide these vitamins without the carbs (at least some of them). Any input about the lack of these vitamins?

Now I know why the Bear always chastised people for not reading the thread as we've been through these arguments many, many times. I get it.

But still, the thread is so long we want people to get the help they need, so Mlcondiff, welcome to the forum.

You cannot analyze your body's absorption of vitamins solely from an analysis of foods. We've examined many cultures who did not seem to get adequate nutrients in their bodies upon simple examination of the foods they ate. However, none of these healthy populations ever suffered from deficiency disease. Most of these "essential vitamins" that people mention have been stripped from the body by carbohydrate consumption.

Some nutritionists have known since the late 1930s that B vitamins are depleted from the body by the consumption of carbohydrates. As Theodore Van Itallie of Columbia University (who is by no-means a supporter of carbohydrate restriction) testified at the McGovern hearings, "There is an increased need for vitamins when more carbohydrate in the diet is consumed."

Therefore, when you remove these carbohydrates, you will find that your levels will be just fine, regardless of what you see in the meat. The same it true for all the vitamins, minerals and the omega 3 and 6's.

The most famous example happens to be in the book we are currently discussing where Stefansson and Anderson undertook the year-long all-meat trial. They only ate two pounds of sirloin per day with the fats and this was purely from muscle meats.

As Dr. DuBois wrote at the conclusion of the trial, "The only dramatic part of the study was the surprisingly undramatic nature of the findings. Both men were in good physical condition at the end of the observation. There was no subjective or objective loss of physical or mental vigor and vitamin
deficiencies did not appear."

There were many dire predictions that these two men would suffer terrible maladies in the first few weeks and that they might possibly die within the first month.

Now this is something that I didn't quite understand the first time I read this, but Stefansson was on a mixed diet for many years prior to entering the Bellevue experiment. Therefore, it's safe to assume that he actually needed many of the vitamins and mineral supplements due to his former diet. However, one year on the meat diet and he lost six pounds even though they were very sedentary. His blood pressure remained low at 105/70 (mine is 105/62), and Anderson's blood pressure dropped from 140/80 to 120/80.

The diet only contained a quarter of the calcium usually found in mixed diets and the acidic nature of the meat-rich diet was supposed to increase calcium excretion and so deplete the body of calcium. None of this happened.

Therefore, you can eat ground beef or ribeyes all your days and drink water and I am more than confident that you nor any of us will suffer from a deficiency disease. However, those who take supplements have to worry about over-supplementation which would be much worse.

Regards,

Charles

I actually have read through most of the thread, but I didn't know how to search for specific pages that might contain this information. I suppose it is just better to try something out for yourself, rather than overanalysing it. Once my eggs are gone, I'll stick to just the ground meat with suet and see how that works out. Thanks.

RE: starting meat and eggs today - kacey  09-17-2008 12:33 PM

Thanks to everyone for their support! I was thinking about this while 'sneaking' some fried (in olive oil) cabbage tonight to go with my ham. WOW! I've 'sunk' to a new level of cheating. I've cheated by having cabbage. (only a few bites I promise)

NO ONE IS GOING TO BELIEVE ME!

Here's to a VERY VERY low carb day tomorrow! 🍗

RE: Zero Carb / Meat and Water - suzanneyea  09-17-2008 12:58 PM

I take no vitamins. I used to take a ton, then stopped. I no longer have muscle tightness or extra tartar build up on my teeth. Not to mention all the money I am saving on vitamins.
And yea, I dropped out of the debate with Fawn. Not to mention the moderators gave me a warning for being rude, lol.

RE: Zero Carb / Meat and Water - daveo - 09-17-2008 01:39 PM

Oh, don't worry, I'm not mad at you. I was trying to kind of address the suggestion made by another member that we should have a FAQ section some place that provides answers to common questions and he makes a good point. On the other hand, it's just as easy for me to just rattle off the info again to someone new rather than having them look through this long thread.

I may work on the FAQ thing when I get a free moment; maybe after the book discussion which I encourage you to join. There, we will slay many myths and beasts of nutrition science. Most of the arguments against our zero-carb lifestyle were made in the 1920s and they were no more true then than they are today.

When you use the search tool, you have to click the little checkbox that says read "posts" instead of "threads". The "threads" option is not at all helpful because it just points you to the thread without telling you which part satisfies your query. However, the "posts" one will generally lead you to the post but I don't always have great success with it.

You're right, however, about not overanalyzing things. I know it's difficult not to when you've heard so much about the need for vitamins, minerals, phytonutrients, anti-oxidants, etc. With zero-carb, you can literally "set it and forget it!"

Besides, if the new folks don't ask these questions, many people are not going to read and not get their questions answered and that would be the biggest problem, in my view.

Regards,

Charles

daveo Wrote:
You gave up the Vitamin C too?

That's the first thing I would give up. Meat has very little vitamin C so it's clear to me that we don't need very much of it. Too much vitamin C seems very possible when there is no glucose uptake in the diet.

On the other hand, I don't know what happens when a person has too much vitamin C. I do know that the experts aren't so certain any more that oversupplementation will just be excreted out of our bodies.

Two years ago I was on a fruitarian type diet (Wai Diet) and was probably taking in 10x the recommended daily amount of Vitamin C. I started developing all sorts of problems that I never even had on a normal high carb diet (temporary hair loss, body mass loss, and flu like symptoms). It was either from the fiber (which I tried to limit anyway), vitamin C, or fructose. It is certainly possible it could have been from the vitamin C, because of the fact that throughout history most humans had little access to fruit.

It seems like that what most nutritionists deem essential, such as carbs, fiber, and PUFAs (even omega-3s) can be the most harmful. Perhaps you can add vitamin C to this list, although I could be wrong and it is just an observation.

RE: Zero Carb / Meat and Water - Charles - 09-17-2008 02:21 PM

mlcondiff Wrote:

Actually, I think you're more protected on a high-carb diet from too much vitamin C. In 1997, Julie Will
and Tim Byers of the CDC (Centers for Disease Control) reported that it was "biologically plausible and empirically evident" that high blood sugar and high insulin both work to increase our need for vitamin C. The vitamin C molecule is similar to glucose in that they both compete in the same "cellular uptake" process. Glucose wins the contest so the cells get "globally inhibited" from taking up vitamin C when blood sugar levels are elevated.

Glucose also impairs reabsorption of vitamin C by the kidney so the higher the blood sugar, the more vitamin C will be lost in the urine. When they infused insulin into experimental subjects, they found a "marked fall" in vitamin C levels in the circulation.

On a zero-carb regimen, the insulin levels will be low so if one is taking a supplement, then nothing would stop us from absorbing it and it's highly likely that we would ingest far more vitamin C in this concentrated form than we would from a piece of fruit which would have to compete with the insulin that would rise due to the sweetness. The fruit will use fructose instead of glucose, but the kidney would still excrete a good bit of it due to the insulin surge.

So it again appears clear that how much we ingest is not the salient factor. It's how much the starches and sugar flush the vitamin C from our systems while simultaneously inhibiting our systems to use it.

This hypothesis hasn't been proven, but it sure looks good to me! Whenever I think of this, I think of Tropicana Orange Juice loaded with vitamin C but it also contains 26 grams of sugar. Talk about throwing your money into the toilet!

Regards,
Charles

RE: Zero Carb / Meat and Water - suzannevea - 09-17-2008 02:53 PM

I so did not deserve a warning, there have been much, much ruder posts than mine, but such is life.
Yes,
I gave up vitamin C too. I am so much an all or nothing person. I was taking like 10 vitamins a day, then just stopped. The only changes I have felt are the ones I stated before. My whole way of thinking is going back to cave man times, they ate meat, drink water, and took no vitamins. I want to be a natural as possible. Another reason I do not care how much fat, calories, or protein I eat, I just eat whatever.

---

RE: Zero Carb / Meat and Water - chiara - 09-17-2008 03:24 PM

Sorry about the warning Suzanne.
I went to my primary care earlier this week for a checkup...my total cholesterol dropped 50 points...woohoo!!
Not to mention, she was very excited and in favor of the zero carb diet.
I also stopped the multivitamins. So far so good...

Quote:
I do think we need a simple set of rules with a simple set of explanations - which can be referred to in Charles reading recomendations - it could answer some of the repeated questions - why we do this -
what to expect - etc. this would take the place of having read the entire thread which I have done but I
know many newbies aren't going to do. The Bear ran into that all the time and he did have his set of
rules although more abbreviated than I have in mind.
What do ya'll think?
Chris M

A simple set of rules would be great, but people will still have questions about this seemingly radical
diet.

Rule#1 For the best health and weight loss eat only meat & water.

Rule #2 See rule #1

It is just not that simple. If people truly want to find out how to be healthy and lose weight, they will
take the time to read through this whole thread and then read the Bears thread. There is so much
valuable information in these threads that explains why zero carb is the best way to eat for optimum
health. It would be hard to condense all this great information.

Don't get me wrong, it does not bother me at all when new people ask questions that have already been
discussed. I just think people are missing out on some important information by not reading the whole
thread.

That is the exact reason I won't post over there. The people and mods are so rude & argumentative!

I was thinking today about how people think suzanne eats so much. Charles also eats quite a bit more
than me. I wonder if this is because Charles & Suzanna are already at or around their ideal weight, they
don't have the fat stores, that I do, so they NEED to eat more. I am still packing around 35lbs of fuel!
LOL! I really don't need to eat much and I don't. I probably eat about 1lb of meat & fat per day and I am
not hungry.

Wow! I wish... I'm guessing I eat more like 2 lbs. give or take. It varies a bit from day to day though.
Interesting concept on being at or around ideal weight...

Who is Fawn and where is "over there"?
RE: Zero Carb / Meat and Water - nyteez - 09-17-2008 05:29 PM

Over there is another lowcarb forum. Fawn is some poster from "over there"

RE: Zero Carb / Meat and Water - jeepifer - 09-17-2008 05:34 PM

I grind my teeth reading some of those posts, LOL. Better for me to just stay silent and hang out with you guys, that luuuuuuuu meat as much as I do. 😊

Speaking of which, time to reheat my ribeye. Yum!

RE: Zero Carb / Meat and Water - Charles - 09-17-2008 06:06 PM

Dana

I'm not so sure I eat so much anymore, especially since I gave up breakfast. I'm just not really hungry for longer periods of the day now. Some mornings, I might get a little hungry at 10:30 and I think, I'm not going to make it until noon, then I seem to get distracted and by the time I actually eat, it's closer to 1:00 like today. I think the reason is because I ran this morning and that made me hungry a little sooner, but the feeling quickly passed and I still had high energy today.

So I ate a ribeye that came in package of two for $12. I don't know the size but for that price, it couldn't have been that big, right? They both had a lot of fat on them and that's probably why they were so cheap.

Tonight, I ate about 8:30 and I had some really fatty roast. I always eat a big piece of fat with the lean at the same time and I can only eat so much until I'm about nauseas and then I stop. I would be surprised if I ate more than a pound and a half of meat today and I am stuffed.

I've been eating mainly beef for the past couple of weeks and I am back at 147 (which is what I weighed after completing the Rock-n-Roll Half Marathon). I don't know what it is about beef and beef fat, but that stuff is potent. I think if anyone wants to gain weight, they should eat some pork. If you want to lose faster, confine yourself to beef and hold on tight!

Regards all,

Charles

RE: starting meat and eggs today - kacey - 09-17-2008 09:49 PM

Good morning all. Well I have a nice headache now... So SOMETHING is happening to my body.

I talked with my mother last night (the one who eats 4 bowls of bran flakes a day and is 100 lbs overweight). Her Dr wants her on cholesterol meds because her cholesterol is 220. She doesn't want to go on meds so she's going to 'fix' her diet for the better. She's going to eat 2 bowls of Cheerios and 1 low fat microwave dinner per day.

I am NOT MAKING THIS UP!

I said, "Um mom - is it possible that it could be your diet making you feel bad and affecting your body
in a negative way" (I was tiptoeing... as she knows I lost weight on Atkins)?
Me: "Maybe you could try a few days without so many carbs?"
Her: "I eat VERY FEW IF ANY CARBS PER DAY!"
Me: (with great tact and restraint) "Um, what do you think is in the LOW FAT meal if there is only
LOW FAT? And the, um, cheerios? What is that made up of?"
Her: "Well there are no BAD carbs if THAT is what you are talking about - and I know what works
because the Dr said so."

And - well - how can you argue with 'the Dr said so'????

Which got me thinking... (always a scary thought)... I've read the zero carb forum but when I tried to
explain it to someone (NOT MY MOTHER), I got lost after just a few minutes...

Me: "Well you don't have any glucose running around if you don't eat carbs. So your insulin is wayyyy
low."
Friend: "Yeah. OK. Where does the fat come in? Or how does it get out?"
Me: "Well when you feed your body fat with no glucose then the fat cells (ummm making this up at this
point) say We don't need that fat, so it just runs out of your body and then your fat cells just decide to
release some of their fat too - just to be nice and cooperative."

I think I lost the general scientific argument in there somewhere! So, the question is - "How DO you
explain this in a non-scientific way to someone that is interested, open minded, but not a scientist???

Thanks all!
Kacey

RE: starting meat and eggs today - suzanneya - 09-18-2008 02:05 AM

I just asked Charles and Mac this question yesterday, lol. I think the best thing when Talking low or zero
carb with people is jsut to use the knowledge you have. I totally do not understand the science side of
low carb, so for me touse that in my arguement wouldn't work, but I do get the practical side. I talk
about how man lived in the caveman type days, how our bodies are made to eat meat only. I ask my
friends to look around at the side effects of eating carbs, the obesity, the disease, the depression. Just
watch tv for an hour and look at all the commercials for medications. Then, I have my strongest
arguement, me, and my body. After peolp espend some time with me, share a meal and see my attitude
and energy level, kinda hard to say it doesn't work.

I think I have slowly come to the same conclusion. My recent plateau on weight loss I believe is due to
the fact I was having too much pork sausage. I was having some every few evening for variety. It has
been about 5 days from the last sausage and I have started moving down again.
This brings up a question about nitrates. Could part of the problem in sausage be linked to the nitrates?

Interesting question for us sausage eaters!

RE: Zero Carb / Meat and Water - suzanneyea - 09-18-2008 05:17 AM

When my weight was too low I started to eat the pork fat that came with my steaks. I had thought it was beef fat since it was wrapped around beef, but then I read the label and it said "round steak wrapped in pork fat." I did gain 5 or so pounds. But, I eat ground pork almost everyday and that does not seem to effect my weight.

Hi Suzanne - I really hope I can say that sometime soon! I agree that it is all about your health - because who would care how fat they were (or were not) if they were going to die rather soon. On the other hand, if you have a plan to live a while, then like most of us struggling with weight problems you'd like to be healthy AND lean! Damn but I want that! So, I hope, hope, hope, that on top of at some point feeling better (because today I feel lousy!) that I am also going to be lean. Let's see...

In the meantime, I get to listen to my husband say things like: ARE YOU GOING TO EAT THAT??? It is ALLLLL FAIt! It is DRIPPING with fat! MY GOD - you have lost your mind!

Which given that I was last only eating shakes and soups I can totally 100% understand. So, please oh please - let this be the last diet I ever do. (Prayed DIRECTLY to the whoosh fairy - picture on Out, out Damn Scale thread! 😁)
I want to thank those of you that ARE doing this and HAVE succeeded for helping those of us that are trying! I enjoy your journals and threads and they give me hope! Thank you for that!

Hi Charles -

I wouldn't disagree with this apart from it isn't only sweet fruits that contain vitamin C, so I don't think you can use that argument about the sugar. There are sour fruits as well that contain a lot more vitamin C I think, and some vegetables contain a significant amount - and I don't think you can say they raise insulin very much at all (obviously depending on carb content).

From my own experience - I have had issues with easy bruising on meat only. But my lifestyle isn't perfect - as you know I'm a nicotine junky and I do imibe in alcohol - both of these things do nasty things to vitamin C levels in the body. What that tells me (apart from quitting these things lol) is that meat only might provide everything you need - but don't eff up the system with anything else!

I don't have easy bruising on VLC with vegetables. It could also just be the vitamin K for me - alcohol destroys it in the gut (the gut bacteria makes it in a healthy person).

Loops

RE: starting meat and eggs today - AuntieeM - 09-18-2008 06:35 AM

Good morning all! kacey, I hope you don't mind my asking, but were you doing Medifast before you started M&E? I ask because you've mentioned that you were having shakes and soup and it sounds like what I was doing. From Jan'07 to Jan'08 I did Medifast and lost 60 pounds which naturally, was great. But I couldn't imagine myself eating nothing but reconstituted food for the rest of my life so I started LC'ing and I gained 7 pounds! I guess my guardian angel was surfing the web with me one night because I found this forum and this thread. As I've said before, I started this WOE last Friday and I am thrilled to report that I've already lost 4 pounds. I think I have to pinch myself because I can't really believe yet that I can eat something I really love like juicy, fatty rib steaks or nice, fatty pork belly ribs and loose weight. And on top of that, I can go hours and HOURS without being hungry. I know I must sound like a broken record but I'm just flabbergasted!! And as far as your headache goes, it will pass. On Tuesday I felt the same way. By yesterday I felt great. Just "follow the yellow brick road" and you'll get there.

Also, listen to the advice Charles has given me. If you go back a few responses in this thread, he tells me to only eat when hungry because I said I had to force myself to eat dinner the other night. It's a hard thing to overcome because we're ingrained with the idea that when it's dinner time or any other "normal" time to eat a meal that we have to eat just because. I'm going to really start listening to my body and only eat when hungry not because the clock says 6:30 PM. Like right now I'm sitting at my computer, it's 9:30 in the morning, I haven't eaten anything since 7:00 PM last night and I'm totally not hungry. But
when my body starts talking to me, I'll eat. Hey, I think I'm getting the hang of this!

Wishing you all a great day. 😊

RE: starting meat and eggs today - kacey - 09-18-2008 07:01 AM

Hi Auntieem- I was doing a version of Medifast - only the Danish version as they don't import many 'US' things here (well food products). It was working. But at the same time I got the copy of Gary Taubes book I ordered months ago... and started wondering if I was screwing up my body even worse?

I want to be thin but I don't want to die trying! And I did Atkins before so I know that it works and it tastes wonderful! There is just so much resistance to this way of eating. I don't discuss other people's diets with them - I don't get why everyone has to discuss mine with me. (OK forgetting the fact that people are eye-ing my grocery cart and saying "Look at that Fat woman with all that meat and cheese!") People in Denmark are very trim. They eat very 'well-rounded' diets. Heavy, dark breads with no added crap. Lots of cheese. Lots of fat. Lots of meat. And they exercise a lot - naturally. Biking to work, that sort of thing. So I feel really, REALLY out of place here sometimes. They are enjoying a wonderful Danish pastry on Sunday morning fresh from the bakery and I am starving myself with one diet or another. They are thin. I am not.

I have also been to so many doctors with my little 'diet record of what I ate' - that I can't count them. They don't believe me. Accuse me of lying. (or worse don't OUTRIGHT accuse me - but just sit there with this 'yeah right' look on their face)

Hopefully this is going to be 'the way'! Now if I can just ignore the weird comments and looks! I guess they can't be much more weird than the ones I already get being fat!

Congrats on all your weight loss and thanks for the motivation! I'm hanging in there. Today I'm going for meat and water only!

Kacey

RE: starting meat and eggs today - kacey - 09-18-2008 07:15 AM

A little (lot) of our topic... but something that is going on now with my son that I'm wondering how much I contributed to (if any)?

My son is 4 years old. He has been ataxic (balance problems when sitting, walking, etc) since he was about 10 months old. The doctors can find NO REASON for his problem. He's had every test under the sun and all return normal (including gluten intolerance which is a frequent cause of ataxia). His MRI is fine. Blood fine. Urine fine. Vitamin levels, fine. You get the picture. So, last October the dr's said that his hearing is poor and gave him hearing aids. This seemed to help his slow speech some although he doesn't seem to having much of a hearing problem to those around him.

Then in March we got the bombshell. He has Retinitis Pigmentosa (RP). We were told he is legally blind. Odd news... he can see. We have never noticed that he can't see. So he has an eye test where he points out things and he passes with flying colors. Dr's conclusion - he has a very, very teeny, tiny, circle of vision that he uses efficiently. Well B.S. Anyway - no known treatment without a diagnosis. He has no diagnosis as to the cause of the RP.
Usher's syndrome - a possibility - along with several others. So we have 1200 or more genetic tests. All negative. Tomorrow we are having a test for Bassen-Kornzweig syndrome - which irony of irony is an inability to process fats. Having said that - he eats like a horse. Is fit as a fiddle. Healthy, normal sized, etc. so I don't believe it. I think they just want to rule something else out.

Still, in the back of my head, despite ALL REASSURANCES that it is not possible - is my question about my thyroid problem. I discovered it after he was born (after walking around in an ABSOLUTE fog for 6 months). It is quite severe. And I can't help but wonder if something is wrong with your thyroid while you are pregnant and it is untreated - how would this affect your child? I know that no one is a scientist on here (though Charles does better than 99% of all the Dr's I know!) but I just had to post this because what an irony that they are testing him for this syndrome about not processing fats whilst I am taking my fatty meats in a bag with me to the tests so I have them to eat for lunch!

Life is strange!

---

RE: Zero Carb / Meat and Water - jeepifer - 09-18-2008 07:15 AM

I think for this week I'm sticking to my 75/25 ground beef and some beef short ribs. I'd love to splurge on ribeye (seriously my favorite!) but even at 6.89/lb it's out of my budget for the next 6 weeks unless by some miracle we get lower gas prices. LOL

RE: starting meat and eggs today - Charles - 09-18-2008 07:48 AM

Quote:
Friend: "Yeah. OK. Where does the fat come in? Or how does it get out?"

SIMPLE ANSWER:

The fat "gets out" because there is no longer any glucose in your system to block it. Carbs cause us to secrete insulin which regulates fat storage. Without insulin, we don't store fat. When we control our insulin levels, we allow our bodies to regulate our weight.

SLIGHTLY MORE COMPLEX:

All the fat you see in fat tissue is trapped there because of triglycerides. Our bodies are only designed to process fatty acids and proteins so when it gets something foreign like a carbohydrate or alcohol, it has to convert those glucose molecules to triglycerides (which is the fatty acid molecules combined with one glucose molecule) and treat it like a fatty acid.

The problem is that triglycerides are bigger than fatty acids and they cannot fit through the walls of fat tissue. Therefore, each time they enter fat tissue, they have to be broken down, they enter, then they are re-assembled once inside. When they exit the other side, they have to be broken down, and then reassembled on the other side. This process is called "esterification".

Normally, fatty acids don't just sit in fat tissue, they are constantly on the move circulating through your body and your fat tissue. When triglycerides are present, they cause the flow through fat tissue to slow down a little bit and this causes a "backup" of fatty acids and makes you fat. When you reduce or remove these molecules, then your fat can escape like it's supposed to and your fat tissue shrinks.

Insulin is the gatekeeper to this entire system. If insulin is high, you will store fat. If insulin is low, you
will mobilize (burn) fat. The fat you eat is only combined with the fat running through your body. The body either uses it or stores it. The amount present is immaterial.

Does that make sense?

Quote:

Thanks for the kind words. It is ironic, but that is precisely the case in Type I diabetics. They cannot store fat so they require insulin in order to get their fat tissue to accept fat.

This is non-controversial science. If people recognize that insulin is necessary to store fat, then why would they not make the connection that having high insulin levels will also make a person store fat. Therefore, if you eat things which raise your insulin levels, you are going to store fat.

By the same token, if something is wrong with your regulatory system, then your pancreas will not secrete enough insulin and you will not gain weight, which can also be harmful.

Regards,

Charles

Funny about the bruising. I used to look like a beaten wife when I was on a low fat diet, my legs were always covered in dark bruises. Now, I bang into things and nothing, not a mark.

Charles Wrote:
I'm not so sure I eat so much anymore, especially since I gave up breakfast. I'm just not really hungry for longer periods of the day now. Some mornings, I might get a little hungry at 10:30 and I think, I'm not going to make it until noon, then I seem to get distracted and by the time I actually eat, it's closer to 1:00 like today. I think the reason is because I ran this morning and that made me hungry a little sooner, but the feeling quickly passed and I still had high energy today.

Well dratz! there goes my theory LOL! I am also noticing I am eating less and less, but also eating more beef, less chicken & pork. I don't use butter anymore, just tallow in my morning ground beef.

I used to be able to eat a huge ribeye, bread, a potato, vegetables and a salad! Now I can't even eat a whole ribeye. That is so weird to me.

Richard Wrote:
This brings up a question about nitrates. Could part of the problem in sausage be linked to the nitrates?

I think most store bought sausage has hidden sugars. Most of them list "spices" in the ingredients. They don't list what those spices are.
RE: Zero Carb / Meat and Water - Charles - 09-18-2008 08:54 AM

Richard Wrote:
This brings up a question about nitrates. Could part of the problem in sausage be linked to the nitrates?

I don't think it's so much the nitrates (which can be a problem for many in terms of allergies) but sausage usually has a bunch of crap in it like corn syrup and dextrose. Even the fresh sausage in the store looks bad to me so I never get it. The sodium is also a factor in that it may cause you to eat more of it then you ordinarily would.

Moreover, the fact that you mention "variety" throws up red flags. There are certain foods that people add for this reason and the effect is usually not so good.

Loops Wrote:
I wouldn't disagree with this apart from it isn't only sweet fruits that contain vitamin C, so I don't think you can use that argument about the sugar. There are sour fruits as well that contain a lot more vitamin C I think, and some vegetables contain a significant amount - and I don't think you can say they raise insulin very much at all (obviously depending on carb content).

Good point, but carb content doesn't have much to do with it either. Remember all carbohydrates, regardless of sweetness, require insulin to process them. I'm not at all talking about blood sugar, I'm talking about insulin response.

The sweetness or the perception thereof only has to with anticipatory insulin. When you eat a non-sweet carb from a vegetable, your body breaks this down to glucose in your mouth and insulin is secreted upon detection of the glucose. If you have carbohydrates as a part of your diet, even if you only eat salads, it takes some insulin to process them and you may very well require supplements as your body uses vitamins and minerals to process them.

And alcohol, of course you will secrete insulin in anticipation of it and in reaction to it. We know it's not sweet at all.

I used to love to go to the Texas Roadhouse or Logan's Roadhouse and get the "Cowboy" ribeye which was 24 ounces. Some days I could even handle a half-rack of ribs with this big steak. Now, I can't do it. I can eat the 16-ounce ribeye, but I'll be stuffed at the end. I ate one last Sunday at 7:00 p.m. and I didn't eat Monday until 1:30 p.m.

Oh, and my favorite, the Hardees' Monster? Oh, I can't touch that anymore. I end up going to Wendy's and I get the double because I can't finish the triple without huffing and puffing. However, if you put cheese on the Monster, I used to eat it and another thickburger.

It's sad!

Eating fiber is like putting sandpaper in your digestive tract. Eating fat is like oiling it. You will soon find out how much better your system works when you eliminate carbohydrates altogether!

Sandpaper - ouch! 😅

Lamentably, the UK government has fiber|fibre targets for its "healthy eating" programme, as well as the laughable "five a day" (portions of fruit and/or veg - so apparently 5 bananas would be just as healthy as cabbage, salad, spinach, etc...) mantra. The good news is that these targets are not being met. The bad news is this is not because people are adopting LC...

I'm on week two of getting back to this and I wanted to report that I lost the 4 pounds I gained while I was sick + 3 more... in a week!!!! I'm feeling pretty good, and I can get into a SMALLER SIZE finally! Thank you all for the wonderful support- I don't know anyone around here who eats like I do. It has helped so much to read about other people in the same boat!
I've also noticed that I can't eat nearly as much as I could starting out.

RE: Zero Carb / Meat and Water - jeepifer - 09-18-2008 10:38 AM
I just polished off a whole huge ribeye. I'd better not need to eat again today. I can't afford it!

RE: Zero Carb / Meat and Water - Bill - 09-18-2008 10:52 AM
Hi Charles,
i was wondering i still drink a couple of pots of coffee from around 6 am to noon then eat. But i didn't make the connection in till today but i throw up about every day and its always mid morning or noon could i be having to much caffeine? and i shouldn't drink caffeine any way should i, since i am insulin resistant? i blamed it on nerves but i feel fine besides throwing up and it's more like gaging.

thanks Bill

Uh Bill, I seriously don't know how to answer this.....You absolutely should put down the coffee pot and walk away slowly.... 😊

Regards,
Charles

RE: Zero Carb / Meat and Water - suzanneyea - 09-18-2008 11:53 AM
A couple of pots a day? Are you serious? If so, you really need to stop. A cup or two a day is acceptable. no more. Bill, you have been on this board long enough to not have to ask such a question. You KNOW that too much coffee is not a good thing, and you most definately know that a couple of pots a day is just insane.

RE: Zero Carb / Meat and Water - Fully - 09-18-2008 11:54 AM
Hi everyone! I'm a newbie. I have posted on the general question forum and Charles invited me to jump in here. Lots of good information and I am just thrilled I found this site. Just a little personal info here, I am 41 years old, married and mother of 3 boys. I have been overweight most of my life but not until the last few years have I been morbidly obese....by the charts anyway. I don't have a "set" weight because my body has changed over the years and I really don't know what is the right weight for me. I have a goal of 70 lbs for now but that may change. I will know when I get there. 😊
But I am going to start the meat and water/0 carb plan and would like to join in for support and to learn from you guys. It's going to be hard to give up my wine, coffee and diet mountain dews but I am going to give it my best shot! I quit smoking 2 months ago after smoking for 20 some years. Surely I can give up my dews too LOL!

RE: Zero Carb / Meat and Water - Charles - 09-18-2008 12:10 PM

Fully Wrote:

Surely I can give up my dews too LOL!

Welcome again, to our forum.

This may be a little uncomfortable for a couple of weeks but you can do it. It will feel like going through induction again as your body cranks up the ketones some more.

The biggest thing is to eat plenty of fat. I cannot stress this enough. Many of us have approached our butchers in our towns and just asked for beef fat. In every case the butcher has given it to us for free. They just throw it away when they trim it from the steaks. We don't have a butcher in town, so I just approach the guys in the meat department at the supermarket. I go about 9:00 in the morning and the guy gives me a nice package of it.

When you make your steak, just put a piece of fat in their with the steak and brown it a little and you're ready to go.

The way to know if you're getting enough fat is to monitor your energy levels. If you have good energy, you're doing fine. If you feel lethargic then you need to eat a little more fat. Don't cut calories or anything like that either. Just eat to appetite and you'll be fine.

Regards,

Charles

RE: Zero Carb / Meat and Water - nyteez - 09-18-2008 12:14 PM

Hi Fully and welcome! It might be hard to go from hi carb to no carb. I think most of us started out with 20 carbs or less for a month or so. I started out 10 carbs for about 2 months then went to zero.

There is nothing wrong with starting out zero carb, just don't beat yourself up if you have a craving for safe carbs like cheese, coffee or wine. A few of us still drink coffee and wine in moderation, so it's not like you have to torture yourself!

As long as you eat enough fat, this diet is easier than it sounds. When you eat enough fat you are simply not hungry, you don't even think about food. It's better than any appetite suppressant pill on the market!
RE: Zero Carb / Meat and Water - **Fully** - 09-18-2008 12:16 PM

Oh My! LOL! I am from the south and most people here eat fat back in EVERYTHING! Except me of course...I thought it was going to kill me. So you fry all your meat in extra fat? The best part of the steak is the fatty part. Oh my goodness! And the cheaper the hamburger meat the better basically.

---

RE: Zero Carb / Meat and Water - **LindaSue** - 09-18-2008 12:21 PM

Charles, have you gotten around to making any pemmican yet?

---

RE: Zero Carb / Meat and Water - **Charles** - 09-18-2008 12:29 PM

LindaSue Wrote:
Charles, have you gotten around to making any pemmican yet?

No, but I've pretty much settled on beef and beef fat exclusively and I'm finding it very easy to stay under 150. I'm at 147 and won't be surprised in the morning if I'm not 146. That stuff is potent, so I can only imagine how pemmican would be. My family is terrified that if I make pemmican, that they'll be forced to eat it forever! (They're not scared I'll make them eat it, they're afraid they will like it and then that's yet another change in their food.)

RE: Zero Carb / Meat and Water - **Kristi31** - 09-18-2008 12:59 PM

Say you have a choice between the following 3...which would you choose?:

- fresh bottom blade roast (picture attached), sometimes less, sometimes more fatty. Cheap: $4.50/lb.
- fresh Kosher shortribs (picture attached) which were previously salted but the salt has been mostly removed cause it barely tastes salty, just a little near the bone. Sometimes less, sometimes more fatty. More expensive: 10$/lb
- regular ground beef from **frozen** and fresh parts, 25g fat, 17g protein per 100 grams. Cheapest: $2-2.50/lb

Could the salt in the shortribs be reducing its nutrient value, making it unsuitable for an all-meat diet? But these are definetly the tastiest. Location is ok.

The frozen part bothers me because it spoils quickly and the taste is not as good. They sell that ground beef in bulk and location is not that great...takes me more time to get there. But, VERY cheap and quite fatty.
The blade roast is fatty, but fatty enough? Location is great, very close to home and it is definitely affordable.

p.s.: I'm eating fatty again! 😊

**RE: Zero Carb / Meat and Water - Charles - 09-18-2008 01:09 PM**

Kristi31 Wrote:
Say you have a choice between the following 3…which would you choose?:

I like the fresh blade roast, personally. Regardless of the fat in it, I would get some fat from the butcher and render some along with it so it would always be fatty.

Kristi Wrote:
Could the salt in the shortribs be reducing its nutrient value, making it unsuitable for an all-meat diet? But these are definitely the tastiest. Location is ok.

The salt would scare me away but not everyone reacts the same way to salt.

Ground beef is always a winner in my book, but I'm fortunate to be able to find chuck steak and ribeyes that I prefer a little more. Since I don't eat breakfast, I don't have much occasion to eat ground beef anymore. However, I would never rule it out. This weekend when I travel, I'm sure to have some ground beef.

Kristi Wrote:
p.s.: I'm eating fatty again! 😊

Well, this is good to hear and I'm glad you're feeling better.

Hi Fully,
I'm new to this also…this is day 11 for me. Just have plenty of fatty beef on hand. Eat whenever you're hungry. For the first three days or so, I found that I was eating a lot….maybe every few hours. But then I just stopped being hungry.

Diet soda will definitely ruin anything you do with this plan, unfortunately. I had to give up my Coke Zero (even though I love it).
RE: Zero Carb / Meat and Water - suzanneyea - 09-18-2008 03:24 PM

I used to drink at least 2 2 liter bottles of soda day, so if I can give it up, anyone can!

Suzanne...seriously? Oh my gosh how did you fit all of that soda in you? My husband used to work with a woman that drank a 2 liter bottle of pepsi with her lunch every day. I would barf I think.

RE: Zero Carb / Meat and Water - Fully - 09-18-2008 05:46 PM

Hi Chiara! Yes its gonna be hard for a few days I am sure. I only drink 2 20oz dews a day. Which is still way to much. But I can do it.

One question though. I LOVE mayonnaise. Instead of adding extra fat in the way of fat strips, can I slap a glob of mayo on top of my hamburger patty 😊

RE: Zero Carb / Meat and Water - SLD - 09-18-2008 09:24 PM

I do love my meat, but for some reason my desire for fat is so intense that I even sometimes find rib eye too lean. When I eat my steak, I first eat all the fat then eat the leaner parts. But I end up smearing butter or cream on the top. The idea of eating chicken breast just doesn't appeal to me nor eating turkey. Ham never satisfies me but really fatty bacon does.

Sometimes I wonder if I should try to cut down fat a little and concentrate on leaner parts because if I let my appetite and preference guide me, I'll probably getting 90% of my caloric intake from fat. However, just can't seem to do it without feeling that something is dearly missing. Well, what can I do but to trust that my appetite and my body that it knows what it is doing and that I actually need all that fat. I'll see how it goes.

RE: starting meat and eggs today - kacey - 09-18-2008 10:04 PM

Given this comment about fiber, and since my 'take along so not to cheat' food is flax bread (1/4 cup of flax, olive oil or butter, baking powder, egg). I'm wondering what some ideas are for a good take along food. To meetings, on the train, in the plane, while traveling other places, etc. I'm often stranded for hours and hours with no 'correct' food available. (we don't have the variety that is offered in the US at the airports, etc.) For example, attending several day meetings in a place where bread, cheese, and pastries are breakfast, sandwiches are lunch, and then thank god there is some option at dinner - sometimes. If you go from plane, to meetings, are there 3 days with no transport, then back to plane and home again (flying several hours each way), well, it can get interesting in terms of what foods to bring along.

So, I'm just wondering how others handle this situation? What do you take along? How does it keep?
RE: starting meat and eggs today - suzannevea - 09-19-2008 02:16 AM

I have a couple of things I do when travelling. First, cans of tuna. Second, I bring a discreet cooler with food. I have one "cooler" that looks just like a purse, they sell really nice tote bags too, that can act as a cooler. Also, I have no problem ordering in a restaurant to meet my needs. Now, because I do not fully trust restaurants I always tell them I have food allergies.
If you now you will have no access to proper food all day, eat a lot when you get the opportunity. At this point in my zero carb life I could easily handle one meal a day. Now, this is NOT my ideal, but I am 100% dedicated to my lifestyle and will jump through hoops of fire to stay the course.

RE: Zero Carb / Meat and Water - chiara - 09-19-2008 02:35 AM

Fully Wrote:

One question though. I LOVE mayonnaise. Instead of adding extra fat in the way of fat strips, can I slap a glob of mayo on top of my hamburger patty 😊

I would not use mayo. It contains soy. There are a few organic ones out there that do not contain soy...I don't know if anyone else could comment on those. I think for the best success...try coconut oil instead of mayo. I started putting butter on everything, but now I eat it plain. I find that I don't actually enjoy eating. I only do it for energy.

RE: Zero Carb / Meat and Water - suzannevea - 09-19-2008 02:56 AM

If you love mayo, make your own. It is so easy, there is a recipe in the main section for one made with bacon fat that looks perfect!
I had to give up soda 100%, it was easier. I could not do 1 or 2 sodas a day. I cut out the crystal lite at the same time. Every time I give up a habit, it is hard for a few days, then it becomes a way of life. But, I have always been an all or nothing type of person.

RE: Zero Carb / Meat and Water - Richard - 09-19-2008 04:29 AM

Ice tea was the hardest for me. The last 20 years it was more than a half gallon a day very sweet.

I have cut the coffee down the last week (per urging here) to 2 cups and 1 with cream and 1 stevia (I'm going to reduce the stevia to 1/2 next week and then wipe it out after this).

Thanks for the urging Charles. I think the stevia was triggering the sweet tooth and insulin release (not to mention cravings). Moving away from so much pork and back to beef also seems to have helped. I don't think I'll go totally coffee free but then again I never thought I'd give up my sweet tea!

RE: Zero Carb / Meat and Water - Nicola - 09-19-2008 05:38 AM

What do you think about this:
Hi Chiara! Yes its gonna be hard for a few days I am sure. I only drink 2 20oz dews a day. Which is still way to much. But I can do it.

One question though. I LOVE mayonnaise. Instead of adding extra fat in the way of fat strips, can I slap a glob of mayo on top of my hamburger patty 😋

Nope !!!
carby... soy
Chris m

"...Yet, in spite of the growing awareness of the hazards of over consumption of carbs and calories, the rate of weight gain, obesity and blood sugar related diseases is still accelerating. To make matters worse, people who follow extreme low calorie or low carb diets often face unpleasant symptoms including mental and physical fatigue, chronic cravings for carbs (in particular sweets), loss of libido and severe mood swings. Bodybuilders, who try to slim down via low calorie low carb diets, often face similar adverse symptoms in addition to loss of muscle mass and strength..."

WRONG!!!
"... including mental and physical fatigue, chronic cravings for carbs (in particular sweets)"

Delete all carbs and the cravings go away too.

"...loss of libido and severe mood swings..."

Acutually in men the testertone levels increase and the mood swings decrease also.

"...face similar adverse symptoms in addition to loss of muscle mass and strength..."

I am not a bodybuilder but I have noticed that fat has decreased and muscle strength has increased.

The above view are mine and back by my personal observation.
There, got that off my chest!

RE: Zero Carb / Meat and Water - Charles - 09-19-2008 06:11 AM

Way to go, Richard! Well said!!!!

RE: Zero Carb / Meat and Water - montmorency - 09-19-2008 06:45 AM

Charles, some time ago, Wrote:
"Your body has decided that if it keeps your fat tissue at that size, your cells will get the proper nutrients at the proper rate. As you increase the rate and availability of fatty acids, then your body will respond by decreasing your fat tissue because it can achieve that rate by solely relying on your stream without as much bolstering from your fat tissue. This is all dependent on how well and how consistently you manage your insulin because hypersecretion will gum up the works."

Charles, belatedly much thanks. This does make sense, especially after re-reading about Pennington, e.g. GCBG, page 350, para 2. I wasn't sure if Taubes mentions whether this was ever confirmed by subsequent research, but in any case, it seems to make sense. Pennington really deserves a place in the low-carb Hall of Fame, doesn't he, along with Banting and a few others. (I guess Stefansson and Anderson actually deserve their own Hall of Fame).

As an old computer buff, I love the RAM/swap analogy 😈

This is perhaps only semantics, but I still question slightly the use of "long-term" in the context of fuel supply. For example, if the fatty acids in the blood stream are the long-term fuel supply, and the stomach/gut is the short-term, what then is the adipose tissue? Even longer-term?

It's also slightly debatable whether one should think of the stomach/gut as a short term fuel supply, since (I think in most cases) it can only supply its fatty nutrients via the bloodstream, so the bloodstream is a common path to both sources, even though the mechanism for the nutrients entering the stream is different. An alternative analogy could be that the stomach/gut is the short-term fuel tank, the adipose tissue is both the main and reserve tank, and the blood vessels are the fuel lines. Clearly not a perfect analogy, but my point is this:

For example, GCBC, page 385, para 1, quoting Hilde Bruch, he talks about the fat tissue being more like a coin purse than a savings bank, containing the "ready cash" for all the expenditures of the organism.

On page 386, para 1, quoting Gordon, he talks about the concentrations of fatty acids in the blood stream rising and falling in relation to need. In real-time, as it were.

Elsewhere, sorry, can't find the reference just now, he talks about fatty acids supplying the "minute-to-minute" energy needs of the cells and organs.

So if my flow of nutrients begins to falter, I get hungry, and I get hungry now. This is why I don't find the concept of long-term versus short-term fuel supply very helpful when it comes to the question of hunger.

Anyway, even though I am not yet quite on 100% zero carbs (I only think insulin may kill me, but I
know my wife will kill me over this "crazy" diet! - Only kidding 😊, I can already sustain much longer periods without hunger, so it must be going in the right direction.

Speaking from experience, this is true for low calorie diets. However, eating a high fat, low carb diet, I feel sharp both mentally and physically, I have no cravings for carbs (and when I was eating a standard diet, I had uncontrollable cravings that caused severe binging), and increase in libido, and a much more stable mood.

thanks Bill

Bill..........do you evah notice getting blurry vision after so much caffeine? It sounds like you are getting very low blood sugah after spiking it with caffeine.
I am insulin resistant and that much caffeine causes heart palpitations and nausea in me. AND THATS JUST MORE THAN 2 CUPS
Anyhow bless your heart that's sure not good you going through that. If you cant just stop limit yourself to one cup then taper off and see if that changes things. If it doesn't go to your doctor.

I'm using 200 mg caffeine pills to taper off. Went cold-turkey sometime back and the headache was excruciating for 3 days. Did it then but like a fool went back to it. I'm going to make it this time!!!

RE: Zero Carb / Meat and Water - con - 09-19-2008 09:16 AM

con Wrote:
Hey everyone,
Just wanted to update my husband's progress. He started doing sorta low carb(SLC) approximately 2 weeks ago to rid himself of 'extreme gas production' in his stomach for which he was taking Alka Seltzer every night. After 2 days of SLC WOE he doesn't take Alka Seltzer any more. YEAH FOR ALL CONCERNED!

Now the next problem----he kinda complained to ME (me who has only lost 30 lbs. in 6 months) that he lost another 10 pounds!!!!!!!!!!!!!!!!!!!! (btw : this is a 70 yr. old man who has NEVER in his life dieted.) That makes -22 lbs. in TWO WEEKS!#@$&%

Sort'a LC=because he still insists on eating corn tortillas, bread, apples, and small amts. potato and isn't crazy about nice fatty meat...
Worst thing about it all is that I now feel responsible for his success or failure with this WOE. Maybe I should have let him keep burping?

I just wanted to update the info in case any of you were holding your breath,

The Old Man has now lost 35----yes that's 35 lbs. in the 3 months he's been Sort'a Low Carbing!!!!!!!!!!!!!!!!!!!!!

Sample of his daily menus:
b: Large bagel with butter or cream cheese at the Deli
L: chef's salad or burrito (with flour tortilla, beans, and rice) at restaurant
D: canned black beans made into soup or cottage cheese or hotdogs with avocados and cheese followed by lots of LC desserts like ice cream or SF jello with HWC(which I cook to be a SUPPORTIVE ☺wife but don't eat cuz I'm ZC😊)

snacks: nuts/occasional bananas/wheat grass juice at Jamba Juice

OTOH......TAKE myself....LC since January -ZC since Febr.-meat/water since end of May with almost no cheats have ONLY lost 37 lbs.

I don't know----it just doesn't seem fair to me---I've done the usual starvation diets all my life-this is his first diet and he's SO not suffering ENOUGH---actually not suffering at all. He's done NO research/studying/thinking--I've done it all!!!!!!!!!! He, of course, is losing more quickly, is loving his
food, and is regaining his health and energy.

It's not that I'm whining--------JUST SAYIN' ..... it's just SO NOT RIGHT!!!
con Wrote:
It's not that I'm whining--------JUST SAYIN' ..... it's just SO NOT RIGHT!!!

I feel your pain Con. My husband has lost about 25 pounds on SLC which for him, includes a bit of chocolate every night, nuts, LC wraps and even an occasional splurge.

I've credited this to the fact that he's never been on a low fat diet before and his weight has never yo-yo'd, so while he was overweight, his system just never got that screwed up. Even though he eats some carbs now, it is so much less than when he was mainlining candy every night from right after dinner until he went to bed.

Some people are just lucky!

Daveo Wrote:
Heh.. that's awesome that he is losing weight, but looking at his sample menu, I don't see where his diet could be considered even remotely low carb

I would like to see his before menu. My guess is his sugar intake, either glucose/fructose from sugar (soft drinks, coffee with sugar), or glucose from flour (via bread products, etc), rice, potatoes, etc. was sky high.

Montmorency Wrote:
that would not quite tie in with my reading of GCBC. From the way I read it, all of the fat used as fuel is in the form of FFAs, some of which has come from circulating triglycerides, which have to be broken up, some of which has come from freely circulating FFAs. There certainly seem to be plenty of references to freely circulating FFAs in GCBC, and given that triglycerides are apparently too big to cross cell membranes, and have to be split up in order to enter, I can't quite see why they'd have to be esterified again in order to be burned as fuel; for storage yes.

That discussion was about the source of glucose in a zero carb person not where do triglycerides (free fatty acids) come from in a zero carb eater.

I realise that of course. Nevertheless, you said:
MAC on 09-09-2008 08:20 PM Wrote:
"We do not consume free fatty acids that are not part of triglycerides."

and I took it you meant in the general case, not only in the case of sourcing glucose in a zero-carb person.
This got me worried, because up to that point, I had been fondly imagining (from Taubes) that the main source of energy in the body was **free** fatty acids circulating in the bloodstream. Looking back at Taubes, I saw that sometimes he referred to free fatty acids, and sometimes just to fatty acids in this context, and I suddenly realised I might have it all wrong, and that mostly our energy comes from triglycerides circulating in the bloodstream. (Especially after the quoted comment of Bear that triglycerides were our main fuel - I now think he was probably referring to triglycerides in adipose tissue BTW).

That's when I went back to GCBC, and satisfied myself (more or less) that the picture I'd had of circulating free fatty acids was more or less correct, although circulating triglycerides can also be used as fuel, in the manner I mentioned earlier (de-esterified by LPL activity).

I also found a paper which referred to muscles also having triglycerides in what I think were called intramuscular tissue. I presume that, depending on insulin levels and LPL activity, this too can be lipolysed and used for fuel; I presume that insulin resistance can also prevent it. (Sorry if this is old knowledge here; it was new to me I think).

MAC on 09-09-2008 08:20 PM Wrote:
In any case, all the fat you ingest is as triglycerides. One does not ingest free fatty acids.

Indeed, exactly as I mentioned in my post to which you are referring. I also said that I wasn't sure what happened to those triglycerides after that. I later found that the Wikipedia entry for "triglycerides" gives a good explanation (if it is accurate):

Wikipedia entry "triglycerides" Wrote:
"In the intestine, triglycerides are split into glycerol and fatty acids (this process is called lipolysis) (with the help of lipases and bile secretions), which are then moved into the cells lining the intestines (absorptive enterocytes). The triglycerides are rebuilt in the enterocytes from their fragments and packaged together with cholesterol and proteins to form chylomicrons. These are excreted from the cells and collected by the lymph system and transported to the large vessels near the heart before being mixed into the blood. Various tissues can capture the chylomicrons, releasing the triglycerides to be used as a source of energy"

(So what gets circulated at the end of ingestion is closer to triglyceride than a free fatty acid even though it's undergone some transformations since its initial ingestion).

I'd begun to have my doubts about circulating free fatty acids, since, if cholesterol is not soluble in blood/water and has to be packaged in lipoproteins(LDL/HDL), and triglycerides have to be packaged in lipoproteins(VLDL), then how could it be possible that free fatty acids were soluble in blood/water? I later found references to their being bound up in albumin - Wikipedia again:

Wikipedia, entry "Fatty Acid" Wrote:
"The uncombined fatty acids or free fatty acids may come from the breakdown of a triglyceride into its components (fatty acids and glycerol). However as fats are insoluble in water they must be bound to appropriate regions in the plasma protein albumin for transport around the body. The levels of "free fatty acid" in the blood are limited by the number of albumin binding sites available."

BTW, I am just trying to learn here. I was genuinely confused by what was said, and simply sought to clear it up.

dessert: loved baked bananas with sugar and cream/Hagen Daz ice cream every night

RE: Zero Carb / Meat and Water - Fully - 09-19-2008 10:50 AM

Hi! and Thanks!

No Soy *noted! 😊Gotta look for the mayo recipe.

I think I am going to do a huge meat bake-off Sunday for the week ahead. Anyone else do that? That
way I will have food ready for me at all times.

Today I had a hamburder patty w/drippings for breakfast, and 2 around 12:30 and water. No DEWS! But
I am missing my mayo or ranch dressing. I will get past it. I need a chicken thigh after all this ground
beef. LOL! Its kinda stuck in my hernia 😄

As good as Atkins is and as good as low carb is when it comes to lipid profiles, it is the products that cause the diseases of civilization - refined products such as flour, sugar, white rice, HFCS, refined corn and any and all products made from them (pastries, soda, tortillas, rice cakes, french fries, etc) that cause one's blood sugar to go sky high and cause hyperinsulinemia. Once you remove those, certain people have an easy time losing weight. Their insulin levels fall and the fat can come out of the adipose tissue. Even if one continues to eat carbs and they are mostly unprocessed (beans, lettuce, tomatoes, etc), i.e. Low GI/GL, one can still lose weight. It really is all about the insulin levels IMNSHO.

LOL! I can do it. I know I can. I quit smoking for goodness sakes. That was something I thought I would never do. I had tried many times and failed. You know what my goal was for quitting.....gastric bypass. I wanted gastric bypass, which in return was for a healthier, pain free and thinner body. So I will give up my Dews, carbs and Dukes Mayo 😍

My anniversary was 2 weeks ago and my husband and I were suppose to have gone out of town and
eaten at our favorite restaurant. But things came up and we were not able to go. But guess where we are going this weekend....yes to our fav restaurant. 😊 On the bright side, they have the best rib eyes I have ever eaten! 😋

And I am taking 2 ground beef patties with me for back-up 😊

RE: Zero Carb / Meat and Water - Fully - 09-19-2008 11:20 AM

Oh yes....when I wanted a cig really bad. I would go on youtube and watch video's of people who had gastric bypass and their before and after pics! So cool!

RE: Zero Carb / Meat and Water - suzannyea - 09-19-2008 11:35 AM

The problem with the surgery is that people do not deal with the problem and they usually just pick up another addiction. For me, I have a sugar-carb addiction and nothing was going to fix my weight and food problems until I dealt with the sugar and carb thing.

I always cook ground beef or burgers ahead of time. I can't do that with my steaks or ribs though, because I can't stand reheated steak. I don't know what it is. Plus, I like my steaks rare and it's hard to get that with reheating

There's a lady here at work that had WLS (lap band) in July. I walked by her cube the other day and heard crunching. She had this whole container of cookies. They looked kinda like wafer-thin almond cookies, but still... I was thinking, UM, isn't that what got you where you are in the first place???

I've heard thru the grapevine that her weight loss has kind of stalled out. I wish her well, but I'm racing her to goal. Not officially, but I need to prove to myself that I can and will do this without resorting to surgery. As Suz said, finding the cure to my carb addiction is more important, because that is what will keep me healthy for LIFE!

My ribeye addiction, however, is another story! Yum!!! 😋
Right... i didn't think about my rare meat. Bacon and burgers for sure.

I love rare steaks, and I can reheat them in the microwave just fine. That said, I don't nuke more than 30 seconds, maybe a 45 if it's a huge cut. Just enough to take off the chill.

Hamburgers I can't do ahead of time, though. I like those rare, and they are just yucky to me when reheated.

I can eat any meat in a pinch, but cold chicken is always my first cold choice, also I will cook my steak (I do 30 seconds on each side max, I like it basically raw) and eat cold steak, if it is the right cut, totally yummy! Cold flank steak is sooo good. I will do my ground beef cold, but never my first choice. I usually buy a trio of veal, pork, and beef, so I kinda got to cook that all the way unless I want to spend the night in the ER.

jeepifer Wrote:
I wish her well, but I'm racing her to goal. Not officially, but I need to prove to myself that I can and will do this without resorting to surgery.

That's great! That is definitely motivation! At least this way, you can maintain yourself when you do get to your goal. So many people that have the bypass or band just go back to those bad habits.

jeepifer Wrote:

I'll try that next time!

Charles on 09-12-2008 03:15 PM page 308 Wrote:
"No, this doesn't answer my query. This quote that you've taken from page 388 is from the description of Sir Randle's triglyceride/fatty acid cycle that we've discussed. This whole sequence begins after a meal containing carbohydrates as it states on Page 386 when the sequence begins:
"

With all due respect Charles, I disagree with your emphasis here. While it's true that Taubes introduced us to the triglyceride/fatty acid cycle in the context of a carbohydrate meal, I see no suggestion that it
does not also happen in the absence of carbs. It's a continuous cycle after all, and the fat cells are not aware of the dietary origins of the triglycerides or free fatty acids.

Of course, in the absence of carbs, the liver won't have any to turn into triglycerides to ship off to the fat cells; no question about that, and it is well accepted (by us lot, anyway) that low-carbers tend to have lower blood triglycerides. But it's also not unreasonable to picture free fatty acids which are released into the bloodstream, if they happen not to be taken up for use as fuel before they hit the liver, being converted into triglycerides by the liver and shipped back (ostensibly to the fat cells); the other end of the cycle if you like. Sure it will likely be a lower level of blood triglycerides than in a carb diet, but it won't be zero level. That's all I was saying, and it doesn't seem all that contentious to me, especially as I am quoting from GCBC page 388 in support, not just conjuring it up from somewhere. You are implying that I'm quoting out of context, but I don't believe that I am. Or are you saying that this process (conversion by the liver of circulating free fatty acids into triglycerides) does not take place in the absence of dietary carbs?

I am not arguing purely to be argumentative, but in a hopefully constructive way in order that we all get closer to the truth.

See here for example, which is talking about fasted (so no carbs involved) rats (not identical to humans, I know):

[http://www.jbc.org/cgi/content/full/278/33/30413](http://www.jbc.org/cgi/content/full/278/33/30413)

Quote:
"The recycling of FFA also occurs in the liver as part of a triglyceride/fatty acid cycle that accounts for a considerable quantity of fatty acid recycling."

Charles Wrote:
The Handbook of Physiology was attempting to counteract the widely-held notion that carbohydrates were the body's main fuel source. It was recently discovered (by most people) in 1956 that fat was the body's primary fuel even though many knew it at the turn of the century. The Handbook came out in 1965 and it presented what was considered the latest research on adipose tissue metabolism.

As zero-carbers, we're not too concerned about this, except for the few triglycerides that are present in muscle meat which we eat. MAC is quite correct in that we don't consume any free fatty acids.

No argument here of course, and it's pretty obvious really; we store our fats as triglycerides in the adipose tissue, and so do the animals that we eat store theirs; only the composition of the fats varies.

Charles Wrote:
Those triglycerides are broken down in the gut and the fatty acids and glycerol molecules go to adipose tissue initially, according to the Handbook.

Well, not quite directly if Wikipedia is to believed, but the end effect is the same, I would agree:

Wikipedia entry "Fatty Acids" Wrote:
The triglycerides are rebuilt in the enterocytes from their fragments and packaged together with cholesterol and proteins to form chylomicrons. These are excreted from the cells and collected by the lymph system and transported to the large vessels near the heart before being mixed into the blood. Various tissues can capture the chylomicrons, releasing the triglycerides to be used as a source of energy.
Thus after the end of ingestion, the fatty acids are now in the form of packaged triglycerides; whether these count in the normal triglyceride blood count, I have no idea; I'm guessing not.

Charles Wrote:
The glycerol molecules are esterified upon entering and upon exiting adipose tissue. They do not just sit there as something does in a repository. Because they are part of the stream, they must be esterified upon entering and exiting fat tissue during each pass they make. This slows down the stream (the metabolism) by a very small percentage, yet it is this percentage that is responsible for obesity. That's why Taubes presenting the triglyceride/fatty acid cycle. The Bear correctly observes that in keto-adapted individuals, there is no slow-down of fatty acids. They remain freely circulating. Based on this, he opined that free fatty acids do not enter adipose tissue. However, we learned that they actually do enter adipose tissue, they just don't get "trapped" which is the name for the phenomena that describes the 001% slow down that occurs in obesity.

No disagreement here, except that although Taubes may have presented the triglyceride/fatty acid cycle here, it also applies in other situations. It doesn't stop working when carbs are removed from the diet; at least, I'd be pretty surprised if it did.

Charles Wrote:
The Bear is not saying that triglycerides are the standard fuel.

Well, let's not fall out over what the Bear may or may not have said 😳 but for the record, the bit I was thinking about was from here:
http://activenocarber.myfreeforum.org/Bear_s_Words_Of_Wisdom_about22.html

Bear Wrote:
When glucose is required beyond that from glycogen, or to replenish glycogen, it is produced by GLYCEROL CONVERSION (ketones and glycerol are derived from triglycerides, the standard 'fuel' of the body- they have nothing to do with gluconeogenesis).

Yes, this is all in the context of glucose etc, but "standard 'fuel' of the body" is fairly unambiguous in whatever context you care to frame it. However, I'm not worried about this now, as I am pretty sure he meant the triglycerides in the adipose tissue, and of course, that is all potential fuel for the body, when insulin is normal, subject to lipolysis taking place.

Charles Wrote:
However, Gary Taubes himself e-mailed me his notes on the subject the other day and he has a reference to Baltzan, et al 1962, where they found that glucose actually plays a very minor role in oxidative metabolism (burning) by muscle [...]

Thanks very much for that. Yes, radical stuff, and I have little difficulty in accepting that we don't need carbs at all.

Charles Wrote:
This is groundbreaking! This means that a much greater percentage of glucose is stored than previously thought and the muscles and every organ take up lactic acid and pyruvate for cleanup which supports my theory that if glucose is taken up by tissues and organs in our bodies, it must be for elimination. Indeed, this seems to be the case. There is no adaptation for carbohydrates and therefore we should not consume them.
So it would seem. I wonder though, if glucose is not as important a fuel as everyone used to think, why the body goes to such lengths to maintain blood glucose at a pretty constant level?

Charles Wrote:
Hormones play a major part and this is why I maintain that a person will only be as lean as their hormones allow.

OK, many thanks Charles; many good points here, as always.

It has helped so much to read about other people in the same boat!

Nice one! Well done. You are going to have to change your forum name before too long!

RE: Zero Carb / Meat and Water - SLD - 09-20-2008 04:57 AM

Charles, do you think that there is a certain body fat percentage that the body wants to be at a.k.a. set
point (I know Taubes somewhat denied this) that you'll gain even on zero-carbing if you're under that body fat percentage? If someone with very low body fat, although eating adequate amount of protein and quite plenty of fat, is still somewhat hungry and have the feeling of being deprived and that something is quite missing even if not exactly hungry, what do you think is going on? I have unbelievable sugar cravings all the time almost as if the body is trying to get me to eat carbs in order to fatten up!

I think I am going to do a huge meat bake-off Sunday for the week ahead. Anyone else do that? That way I will have food ready for me at all times.

My husband actually does a huge grill - off every 2 weeks. I know many on this forum say "don't grill, you lose all the fat", but my husband is our cook and that's the way he likes to cook, so grilling it is. We split the meat into 2 even piles and freeze one container and put the other in the fridge. He usually grills up chicken thighs, chuck eye steaks and 73/27 burgers - en mass. Occasionally salmon or pork chops (which I don't like, but he does) He also fries up 4 packages of low sodium bacon in the electric skillet and I save all the grease from this in a container in the fridge. I request extra trimmed beef fat from the butcher and broil batches of it (when hubby isn't home because the smell makes him ill). Then, we reheat the meat and fat throughout the week for all our meals. He grills the burgers and steaks only to rare, but the thighs are more like medium. When we reheat the stuff, I nuke it about a minute, maybe slightly longer, but heat a little glass dish of the fat so it's hot. Then, I dunk each bite in that yummy, hot grease and it's delicious!! Barely cooked 73/27 burgers are my absolute favorite though - even reheated. The fat is marbled throughout with ground beef and it just tastes like smooth, rich, buttery deliciousness to me. Fortunately, the burgers are also the cheapest of the lot, so he sometimes makes another batch of those mid-week. The kids love them too and they just seem to get eaten the quickest!!!

Anyways, that's our routine.

montmorency Wrote:

Well, I think I'd be a good subject for this - however, I'm not sure I can bring myself to cut the calories yet. I am still relatively new to this WOE and I still enjoy the fact that I can eat all the meat I want. I eat nearly zero carb - still drinking 1/2 caf coffee in the morning and enjoying my merlot a few times a week, but no other carbs. My weight loss is going VERY slowly at this point and by all reasonable measures, I am probably at a normal percentage of body fat. I guess I truly don't want to be at a "normal weight" though. I want to be more cut up and the only way I can probably do that is by cutting calories, ie, eating less.

However, I look at Charles and he should be the perfect example of your theory and the fact that it works. He is 5'11' tall, I think, and now he weighs 146. Nothing personal, but to me, that is under "normal weight" for a man. Or at least under the normal percentage of body fat. (Now, I understand that "normal" is determined by comparison to other people in our carb eating society, so that is a relative
term, but for the sake of the theory, let's assume he's underweight.) He has cut back to only 2 meals and says he can eat very little at those meals even. He is eating to hunger, but certainly not overeating. The point is, he is pushing his time between meals to the absolute maximum, which results in less calories.

I'm not sure I can do that. I don't push it. I eat my 3 meals whenever I get to the point that the thought of eating my meat sounds good rather than sickening or even neutral, even though I know my body could certainly go much longer without food. So, I might not be ready to move to the testing phase of this theory. It's only been 8 weeks for me with this WOE. Maybe after another month or so, and a true stall, I'll be ready to crack down and really drop some more weight, but right now I'm still okay with the little losses I'm seeing. Unfortunately, I still love to eat.

I strive to be like Dana and Charles and any of the rest of you who truly have gotten to the point of not really caring about eating. It's a roller coaster for me. I'll go a few days where eating is boring and I forget about it - kinda - but then, I'll go a few more where I think about the meat I'm gonna eat all day from the time I get up. Sigh....

---

**RE: Zero Carb / Meat and Water** - MAC - 09-20-2008 05:25 AM

Cbnebraska Wrote:
He (Charles) is 5'11' tall, I think

Believe Charles is 5' 8" not 5' 11". So 146 is most likely a normal weight at that height. Depends on his frame size.

Rule of thumb is something like 105 lbs for first five feet then 5 lbs for every inch over 5 feet. Larger frames would I think deviate a bit from this rule of thumb.

---

I'm 5'9"... so.... 150 would be my ideal weight? I think I'd be anorexic-looking. I'm medium boned.

I think if your middle finger and thumb touch / slightly overlap at your wrists determines your bone width - but please correct me if I'm wrong because I cannot remember where I learned that. (It might actually be the index finger...)

That rule of thumb is for a man. Don't remember the rule of thumb for a woman.

There are some rules for frame size based on wrist size. Mine is like 7 1/2" around which puts me in the large frame size for someone who is 5' 9" (I used to be 5' 10" but I have shrunk with age). Mine don't touch when I use my middle finger and thumb.

RE: Zero Carb / Meat and Water - Wendyoh - 09-20-2008 06:09 AM

I think the rule of thumb for women is similar. I've seen 100# for 5', and add 5# for each additional inch. I'm 5'7", and that would put me at 135# as goal weight, which I would be very happy with. I was 145.5# this morning, and 10 more pounds of fat loss sounds about right.

I don't put a lot of stock in the wrist thing. I have very thin wrists and very long fingers so I can almost wrap my fingers around my wrist twice, LOL. I do think that I have a very small frame though.

I'm also 5'7" tall but 135 would be much too heavy on my small frame. My ideal weight is closer to 120.

RE: Zero Carb / Meat and Water - Wendyoh - 09-20-2008 08:33 AM

Weight would also depend on how much muscle you have too.

RE: Zero Carb / Meat and Water - cbnebraska - 09-20-2008 09:00 AM

Yep, I think you're all right. I guess I was thinking that 5'11 (but I guess he's 5'8' anyways) and 146 on a man as cut up muscular, fit and athletic as Charles is seemed really light. I am 5'5.5" and currently weigh 140 - down from 148 about 8 weeks ago. I am extremely broad shouldered, lift heavy weights twice a week and do cardio 4 times a week. I wear a size 4 or 6 pant, but must wear a M or L or even XL shirt because of the broad shoulders and thick ribcage. I do not carry my weight up top at all, I carry it in my thighs - which are huge from biking. So, I guess weight, once again, is not the issue, it's percentage of body fat.

nyteez Wrote:
I know this is a long thread, but if you read through it you will understand why calories don't matter on no carb and why you need to eat more fat. No chicken breasts, not enough fat, eat thighs w/ skin on wrapped in bacon & cooked in butter. 😐

I found it interesting that Bear said that although you don't have reduce calories to get down to your "normal" weight, if you want to get down below this (really low bodyfat), then you do have to reduce calories a bit. This doesn't seem unreasonable actually. If anyone is currently in a position to test this, please let us know. I'm still a good way off anywhere near that point! 😜

One thing I have noticed, is the more fat I eat, the less calories I eat. All calories are not equal. I can easily eat 4000 calories of carbs, it is impossible for me to eat 4000 calories of fat.

So, in eating more fat, your appetite is supressed, you don't snack and are only eating (in my case) twice a day. I am reducing my calories by eating more fat. I only eat about 1500 calories a day now.

Absolutely! I do also believe that this is the reaction that the perpetuates the myth that calories count though. Naysayers of Atkins and such will say that the only reason it works is because you're taking in less calories, and any diet where you take in less calories will work equally well. It's such a Catch 22. Which came first the chicken or the egg? My thoughts are that, hunger is the factor that is ignored. On which type of diet will hunger truly be managed? Apparently for some, they can do it by while reducing calories, for me, not so much.

**RE: Zero Carb / Meat and Water - nyteez - 09-21-2008 09:46 AM**

Quote:
I'm not sure I can do that. I don't push it. I eat my 3 meals whenever I get to the point that the thought of eating my meat sounds good rather than sickening or even neutral, even though I know my body could certainly go much longer without food. So, I might not be ready to move to the testing phase of this theory. It's only been 8 weeks for me with this WOE. Maybe after another month or so, and a true stall, I'll be ready to crack down and really drop some more weight, but right now I'm still okay with the little losses I'm seeing. Unfortunately, I still love to eat.

I strive to be like Dana and Charles and any of the rest of you who truly have gotten to the point of not really caring about eating. It's a roller coaster for me. I'll go a few days where eating is boring and I
forget about it - kinda - but then, I'll go a few more where I think about the meat I'm gonna eat all day from the time I get up. Sigh....

Thanks Cynthia! This diet does "evolve" with time. I never thought I would get to this point, it just happened. I thought I would miss the foods I gave up, but I don't. Eating now, is like putting fuel in my car, not something I look forward to or enjoy, just something I have to do. I enjoy the meat I eat, it tastes great, but I don't look forward to eating like I used to.

I know exactly what you mean about the naysayers. BUT, how many people try typical calorie restricted diets and fail? All of them. I could not live on the typical low calorie diet, I was tired, hungry, crabby and all I could think about is food 27/7.

Knowing the science behind zero carb and knowing it is 100% healthy I believe I can live on this diet forever. It is not all about losing weight anymore, the other side effects (great skin, great hair, no puffyness, clearer thinking, more relaxed moods, more energy, looking 10 years younger) is what convinces me that this is how I am supposed to eat to be healthy.

The calorie issue is hard to debate. All I know is I would much rather eat 1500 calories of ribeye steaks and feel satisfied, than 1500 calories of rice cakes, tuna & alfalfa sprouts and feel deprived!

I am still a big eater, my appetite never really got smaller, like Charles and the others. However, I love how eating in no longer one of my hobbies...

RE: Zero Carb / Meat and Water - mrw549 - 09-21-2008 01:38 PM

I would like to thank whoever it was that mentioned bacon mayo. I apologize for being to lazy to look back through the thread to find out who it was. I have been trying to make my own mayo because I don't
want to eat the soybean oil and my morning burgers are a little on the bleh side. Putting mayo and mustard on them helps a good bit.

I've tried olive oil mayo and the taste was just too strong for me. Likewise the macadamia nut oil mayo just tasted a little bit off. The bacon mayo doesn't really taste like mayo, but who the heck cares? It is really good on my morning burgers. 😊

---

**RE: starting meat and eggs today - ksdeb - 09-21-2008 04:02 PM**

Well here I am. I have been getting closer to this for some time. This last week I was eating meat, eggs, cheese (limited) and egg cream for breakfast. No movement and not losing inches btw. I have only lost inches in my thighs which are now 16 1/2" mid thigh. Seems the only place I am losing. How long should I expect to see the scale move with meat, eggs and water. I am going to quit all dairy to see if that helps. Was only having cream in my coffee this last week.
Edit: Cream in the coffee and egg creams. Probably 3 oz. cream a day maybe 4.

Hi Lynnhopes - I am in Denmark. The only meds available to us are Eltroxin. I have tried when in the US to get the local Dr to prescribe thyroid meds to me there but he said since he can't follow me on a timely basis he won't do it (also he doesn't want to give me 6 months worth of meds at a time or more).

I've been OK with what I am taking but I don't dare miss it for more than a day or two. 200 mcg a day! But, alas, it never did help the weight problem... Hopefully keeping with the meat, water, few eggs, and 1 cup of coffee a day will do it! I haven't started feeling 'great' yet like some of the people on here but I'm willing to admit that my body might be more screwed up than others to start off with! Last night I slept for 13 HOURS! And I still feel absolutely wrecked. I did this a few times last week also. While doing the liquid diet I was a strict 7 hour a night person - could not sleep longer even if I tried. So I'm not sure what's going on here... but I'm soldiering on!

Thanks for your input, I'm going to give the site to my mom too!

suzanneyea Wrote:
I have one "cooler" that looks just like a purse, they sell really nice tote bags too, that can act as a cooler.

Hi Suzanne - Where could I find a purse like that? I wonder if security in the airports would have a problem with it?

I'm desperate to find some 'take along' foods so I don't get into a bind while I'm traveling. I know I'm not the only one traveling like I do - or there would be WAY more room on the plane! 😊

Example day: Leave for airport at 5 a.m. Can't take water, etc thru security. By the time I've arrived in Dublin, it is 11 am (Danish time), 10 a.m. their time. By 1 pm their time, I'm STARVING. They order in sandwiches. About 4 pm they bring in cakes and coffee. About 9 pm, we stop work, go to dinner (if I'm lucky) or someone just drops us off at the hotel - where the restaurant CLOSES at 9 or 10. So we have to go out on the streets looking for food, 99.5% of which during a week night is fried fish, and french fries (fried in the same oil - it is DISGUSTING! - sorry Lynnhopes!). Or pizza. Or some other equally inappropriate thing. By the next morning, breakfast is lots of bread, cheese, etc if its a cheap hotel. If we are lucky there are boiled eggs.

Anyway - you get the idea.

I'm going to have my mom send me one of those beef jerky guns and make my own beef jerky. That will help! I've also taken fried 'meatballs' or fried bacon in a zip loc but that usually keeps only for a day - unrefrigerated.

As for eating at restaurants - well, I'm American. I absolutely MORTIFY my danish husband, or Irish or Dutch colleagues by ordering food exactly how I want it. My husband has known me for 13 years now and is STILL deeply ashamed that I would RUIN the chefs preparations by ordering it the way I like it - and not the way he prepared it! Viva la difference!

Any other ideas would be great to help me with this traveling situation! Also because we have to be in the hospital with our son for another skin graft in 2 weeks. This will be a week long 'isolation' - more or
less. I'll have a little easier time getting some food in there (or into a refridg there) but I need to plan ahead.

Lastly - after all this chat - I WILL say that though I don't feel 100% better I have noticed that I am really, really not interested in other foods much these days. I had 20 people here this weekend for my daughter's 18 birthday. All the usual fare. I had a few glasses of wine but kept to my meat. For breakfast the next day, they all had pancakes and bacon (typical American breakfast for my daughter). I had steak and bacon! I'm sort of amazed as I wasn't trying particularly NOT to cheat - I just didn't WANT to...

Kind of amazing since if you ask anyone (based on looking at my weight) I must have a really, really serious eating disorder! 😊

All my best!
Kacey

**RE: starting meat and eggs today - lynnhopes - 09-22-2008 04:03 AM**

Hi Kacey

It seems strange to me that you cannot get a traditional Irish breakfast somewhere no? Our traditional breakfast is sold everywhere and is eggs, bacon and sausage. If you spend a lot of time in Dublin I can tell you specific places that will do LC friendly food. I even know of a good diner that is open till the early hours of the morning and has several branches around the city centre.

As for other meds if you get a doctor or pharmacist to listen to you you can actually get meds imported to Denmark to a pharmacy [http://www.internationalpharmacy.com/en/products/details/387084](http://www.internationalpharmacy.com/en/products/details/387084).

I would bet your adrenals are pretty weak though so you will need to get salivatory cortisol levels tested first as you might need to use supplements or Cortef to strengthen the adrenals before adding Armour.

---

**RE: starting meat and eggs today - lynnhopes - 09-22-2008 04:05 AM**

Oh and I am always allowed to bring my own food through security around Europe; just no liquids. Also since we have rubbish weather here a cooler bag will actually keep food for two days anyway. I brought one on my recent trip.

FYI there are a lot of celiacs in Ireland so restaurants will be more than willing to accommodate a grain free menu for you. If necessary just say you are a celiac.

---

**RE: starting meat and eggs today - suzanneyea - 09-22-2008 04:41 AM**

I bought my cooler purse and cooler tote bag at Wal mart, they sell them everywhere up here. I bring it everywhere and have never been stopped. I have even gotten into several sporting events that had a purse check! My husband is always floored that they went through my purse or tote and do not find my food, lol. It is all about packing things in a crafty manner. He also gets uncomfortable when I order my food so specifically. However, once he started visiting NYC with me, he realized that everyone in the city is very specific when they order and no one orders straight off the menu. He was like "OMG! They are a toal pain in the a$$ like you!"
How to eat meat - Nicola - 09-22-2008 04:53 AM

I have been eating raw meat for over a year now; I have always chewed my meat because I thought/think it will digest better.

I asked about this on a different forum and was told:

I just cut up sizes which will fit into my mouth just about and bolt them down with almost no chewing (perhaps a quick chomp of the jaws once or twice, that's it, no more). I always find they digest well, with them being better absorbed by the body than, say, minced raw meat.

I used to eat quite a bit of minced, raw meat and it didn't digest well, I would feel a bit uncomfortable and it would sit in my stomach for some time (though without the severe stomach-pains I had after eating cooked-animal-food)

I did find suet in my stools for a while. Only with one source of suet, or if I ate too much of it at one meal.

I may chew hardly at all, but I do get the full benefit of the taste and texture. However, my main interest is to just bolt down the meats so that I can devote my time to more important things; this saves me SO much time each day that would otherwise be wasted on eating food.

After this I thought of asking "the bear":

Not a problem if you like the taste of raw meat, I personally like my meat seared a bit on the outside. Since I have all my teeth, a bit of a chew brings out all those delightful flavours food has, of course meat is only digested after it reaches the stomach.

Nice to see that some people besides myself actually do not expect their food to provide entertainment. "I could never eat only meat - I'd be bored to death" is a common response to my way of eating.

Cheers.

Bear

http://www.thebear.org

So how do you like your meat and how does digestion work for you?

Nicola

Good idea about the celiac allergy! - We always stay in the 'cheaper' hotels because we are over so much. So, getting a 'real' breakfast isn't always an option. And these sausage roll things they bring in the office are ... well, questionable! 😅

**RE: starting meat and eggs today - kacey - 09-22-2008 05:05 AM**

This is such 'American' behavior... No offense, since I'm American - and I'm all into the 'I bought it, it should be made the way I want it'. When I take colleagues to the US they are OVERWHELMED by the choices they are given just to order a burger. They actually get quite annoyed, saying, "Can't they just give me a burger already!" When Americans come to Denmark to visit (or Amsterdam where I also work very often), the things that are being said about them in the 'local' language are quite funny because everyone is wondering why they are changing the menu all around when it's clear what is going to be served just by reading the menu card.

Also, in the Scandinavian languages 'Is' (pronounced 'ice') is ice cream. Many, many Americans come here and say they want a coke and 'ice'. They get a coke (no ice) and a scoop of ice cream! 😋

It is fun to travel - you really get to experience different kinds of ideas and cultures - that is for sure!

Kacey

OK, I really need to do this. I've asked my doctor for other options before but she said we can't get them
in Denmark. She is used to me going to the US and coming back with stuff and saying "Here - I want this." But normally you can find it here. I'll have to ask about the importing because they are total freaks about that kind of thing in Denmark. I wonder if she can do the cortisol saliva test? I wish we could just order these tests like they do in the US. I'm going to ask for it next time I go for my blood work (which is in like 4 weeks). It'll be interesting to see how my other blood work is too after meat, water, little eggs, for 2 months! Thank you very much for the info!

Kacey

RE: starting meat and eggs today - lynnopes - 09-22-2008 05:28 AM

Yes, pm me, tell me where your apartment is and I can give you lots of info. There are lots of supermarkets that stay open late around Dublin also.

Your doctor or pharmacist can definitely order from that website. The meds just have to be delivered to a pharmacy though. I am glad I have my doctor as they won't deliver to Ireland without a prescription.

You will need to get salivatory cortisol levels done over a 24 hour or 48 hour period. A blood cortisol level is useless. Your doc sounds quite open and willing so tell her to have a read of the stopthethyroidmadness website.

RE: How to eat meat - LindaSue - 09-22-2008 06:47 AM

That's interesting because Stefansson says in "Not By Bread Alone" that the Eskimos hardly chew their meat. I've never noticed any digestion problems from eating meat whether cooked, rare or ground up. I do occasionally get a little nauseated after eating chicken breast, probably because it is too lean. Only vegetables and fiber cause digestion problems for me but that doesn't happen in the stomach. Your meat shouldn't be in your stomach for more than about an hour or two after you eat it.

question re: meat, eggs and water - ksdeb - 09-22-2008 06:50 AM

I started meat, eggs and water today and wondered if Kraft real mayonnaise would be ok. I know it is made with vegetable oil and has a bit of sugar in it, but would it be enough to impact the result of meat and eggs. If I do the mayo it would be only 1 tblsp.

RE: question re: meat, eggs and water - LindaSue - 09-22-2008 06:53 AM

I use a little mayo to make sauces to top my burgers. Many people shy away from mayo because of the soy in it but I don't worry about the little bit that I'm using. It boils down to whether or not it causes problems for you. Try it and see what happens. If you aren't losing, or are gaining, drop it and see if it makes a difference. I use Kroger brand mayo but it's pretty much the same as Kraft's and Hellmann's, just a lot cheaper.

RE: How to eat meat - Jeff - 09-22-2008 06:53 AM

For beef, pork, and lamb, I usually just sear the outside, leaving the inside raw. I don't think about it much, but I suppose I don't chew my food much. I usually take fairly large bite, so I chew it just enough
so that I can swallow it.

I find that raw meat digests much easier. If I eat a fully cooked steak, it seems to sit in my stomach for hours. Raw meat seems to digest very quickly.

---

**RE: How to eat meat - kansaskyle - 09-22-2008 06:58 AM**

I wasn't sure if this was a legit post or just a way to get some clicks to "The Bear's" Website.

I personally cannot imagine eating raw meat. I saw it a lot when I was in Dresden, Germany and Barcelona Spain within the last year; however, it isn't something that I want to do.

---

**RE: question re: meat, eggs and water - ksdeb - 09-22-2008 07:10 AM**

Thanks Linda, I haven't been loosing, bouncing around the same 5 pounds or so for a while. Dropped down under 130 one morning but that has been 3 weeks ago. I haven't cheated with anything carby at all. Actually been keeping carbs under 10 as it has been mostly from cheese, eggs and cream, and a sugar free pickle twice. This week I am dropping cheese and cream. I am really afraid it is the dairy that is holding up the weight loss. That figures since I really love cream, yogurt, butter and cream cheese.

---

**RE: question re: meat, eggs and water - LindaSue - 09-22-2008 07:28 AM**

It could very well be the dairy. Hopefully you'll see an improvement once you drop it.

I hope to try that bacon mayo recipe that everyone's talking about. I can make homemade mayo but I can't afford any fancy oils so I might as well buy Kroger mayo. Actually, I may try making it with pork fat since I rarely buy bacon and I'm not so sure that the junk in bacon is any better than the soy in store bought mayo.

---

**RE: How to eat meat - jeepifer - 09-22-2008 07:40 AM**

Since I don't have a gall bladder, I have digestion issues with fatty meats, which causes me problems with zero carb (meat only). So far (two weeks now) I've taken a digestive enzyme supplement to help. Hopefully my body will adapt and I won't be on a lifetime supply of Imodium!

But I eat my beef *rare* and always have. Love it! I tend to chew it but then again I take small bites anyway. Maybe I should experiment and see if I didn't chew so well, maybe it wouldn't hoof through my system so fast.

---

**RE: How to eat meat - nyteez - 09-22-2008 07:55 AM**

I like my meat rare. I cannot eat well done meat, except for ground beef and chicken. I like pork chops medium, I only like it well done if it is real fatty like carnitas or ribs. I do chew my food, but mostly to get the flavor out.

I tried bolting down some leg of mutton and that ended up stuck and I thought this was the end of my life!

Some how I "need" to chew for flavor and satisfaction - I don't know if I am missing "the better digestion" by doing this?

I wasn't sure if this was a legit post or just a way to get some clicks to "The Bear's" Website.

I personally cannot imagine eating raw meat. I saw it a lot when I was in Dresden, Germany and Barcelona Spain within the last year; however, it isn't something that I want to do.

No intention to get some clicks to "the bear's" website!!! I just like to mention his thoughts with his name - in respect to his reply!

We should eat the meat so that it works; if you feel grate with the way you eat then thats worth the trouble of cooking...I seem to do better with raw meat (I think).

Nicola

RE: How to eat meat - Noturningback - 09-22-2008 08:36 AM

Interesting thread.

I eat my meat rare with exception to ground beef. I had a very rare burger once and I paid the price for that! Personally, I don't like ground beef fatty but, that is just a taste preference. When I cook ground beef, I add a good dose of EVOO.

I never tried raw meat or swallowing pieces.

~Danielle

RE: How to eat meat - Charles - 09-22-2008 08:58 AM

The longer I am on zero-carb, the less I cook my meat as well, which is something the Bear predicted would happen. Beef seems to be just the best meat as well. I feel the best and get the most energy after medium rare beef and I'm practically moving towards it exclusively.
montmorency Wrote:
This is perhaps only semantics, but I still question slightly the use of "long-term" in the context of fuel supply. For example, if the fatty acids in the blood stream are the long-term fuel supply, and the stomach/gut is the short-term, what then is the adipose tissue? Even longer-term?

Well Mike:

You have to leave these terms in context. They don't mean much when you take them out of the context in which they were used.

For instance, when they use the term "long-term" they are making a comparison between us and insects. There is not much difference in terms of humans and insects in that each living organism is concerned about having a long-term fuel supply. All organisms need to go for periods of time between meals in order to survive.

The insects have a single fuel supply and we have two. To differentiate the two, we use "long-term" and "short-term". Calling them main and secondary in this context wouldn't make sense.

In terms of the "adipose tissue" the point is that adipose tissue is a direct participant in our energy supply. Heretofore, it was thought that fat tissue was just a big trash can full of fat. When you consider that it has blood vessels and nerves running through it and it instantly responds to energy requests, then that shows you that it is not inert at all. It is dynamic and an active player. Fatty acids never sit still in adipose tissue. Excessive triglycerides only cause a slow down, not a stand-still.

The stream runs through the fat tissue at all times so it is very much the main component of the main fuel supply. However, adipose tissue is supposed to be something that you don't notice when everything is working properly. If you look at my body today, you'll have a hard time finding where my body stores fat; however we know that it does. The fatty acids move freely through my adipose tissue and there is no reason for my body to inflate those stores to increase the rate of energy through them and therefore I appear lean.

As with everything in the body, you cannot explain a part of the metabolism without consideration of it's role within the entire context of the organism, which is what homeostasis is all about.

Regards,

Charles

I am a raw meat eater too. I always have been , even asa child. I usually melt some fat in the pan, turn the heat up and drop my steak in for a few seconds on each side. But, I have been known to eat it totally raw too.
I'm sorry, I don't have a reference, but I seem to remember reading that (at least some) Eskimo or Inuit ate seal meat, and this might have been a source.

Some Inuit did, but there were many others that didn't. In other words, you can't point to the Inuit and say "they ate this or that" because each time you say that, you can find other Inuit that did not. The point is, they were all healthy and they all had no deficiencies regardless of whether they ate seal meat or not.

The "experts" always want to attribute their vitamin D or whatever to some peculiar thing that one group of Inuit did. Some chewed on bones, so therefore they all must have got their calcium in this way. So then how do you explain the ones who only ate seal or whale and never ate caribou? Etc, etc.

I just ate the strip loin part of a T-Bone steak for breakfast. To experiment I cut away the strip loin from the bone and started chewing on the raw fat and muscle that was left on the bone. I would have to say based on this that I am not a big fan of cold raw meat as this was basically right out of the fridge. I like my meat medium rare but at least heated so that the temp through out the meat is something above room temperature.

As for chewing, I chew it enough to get it down my throat. Never been a slow eater.

I am so excited! I have lost 3 lbs since Friday! 😊 I am cooking chicken thighs and ground beef patties wrapped in bacon. Yummy! And I have my bacon greese now for my bacon mayo.

One question about soy...what is the evil in soy?

And what to you guys is a big appetite? Like right now I am eating when I am hungry only which is still 2 or 3 times a day and I may eat 2 patties or 2 chicken thighs at one time.

Just the thought of raw meat makes me want to blow chunks.... the pink color even makes me sick! That's another reason I don't eat ham.. the pink color! Not to mention.. the taste is totally different when even a tad bit undercooked! As far as not chewing it... OMG!! There are times when I don't chew my food enough and it gets stuck in my throat.... PAINFUL experience that brings tears to my face! 😢

Hats off to you Raw Meat Eaters.. I'm sure it's much easier-- less time to cook and fewer dishes to clean too!😊

Fully, congrats! I have chicken thighs waiting to be put in the oven for dinner when I get home.

I average 2 patties or 2 thighs or 1 short rib or 1 moderate steak per meal. I still eat 3 times a day, but I don't eat that much in the morning, maybe 1/2 what I do later on. I try to make lunch my biggest meal of
the day, and then dinner is about 6-7 hours later.

I suppose I could have a larger breakfast and only eat twice a day, but usually time is a factor and it's been working for me.

**RE: Zero Carb / Meat and Water - Charles - 09-22-2008 10:46 AM**

montmorency Wrote:
With all due respect Charles, I disagree with your emphasis here. While it's true that Taubes introduced us to the triglyceride/fatty acid cycle in the context of a carbohydrate meal, I see no suggestion that it does not also happen in the absence of carbs. It's a continuous cycle after all, and the fat cells are not aware of the dietary origins of the triglycerides or free fatty acids.

You seem to have a serious problem with context and I'm noticing that with most things that you quote. You can only take things out of context if you are sure of what they mean in the original.

The Randle cycle was only proffered to provide guidance on what happens after a meal containing carbohydrates. If you want to know what happens after a meal without carbohydrates, then you have to look at the Krebs cycle. There is no need to extrapolate from this to get to a zero-carb situation because that was explained as well.

I think it's quite obvious (maybe it's not) that even in muscle meat, there are triglycerides and even Taubes said as much. If you read through *Not By Bread Alone*, you'll even see that Stefansson addresses this at Bellevue. There are some carbohydrates in meat but an exclusive meat diet will only provide less than 5 per day. These are broken down in the gut and the components go immediately to fat tissue before being taken up by the stream. Once they're in the stream then the liver, heart, lymphs or anything else is free to take them up.

Mike Wrote:
But it's also not unreasonable to picture free fatty acids which are released into the bloodstream, if they happen not to be taken up for use as fuel before they hit the liver, being converted into triglycerides by the liver and shipped back (ostensibly to the fat cells); the other end of the cycle if you like.

But we don't need the Randle cycle to tell us this because in another part of this same chapter we learn that the largest part of the fatty acids we consume immediately go to fat tissue. The other part gets taken up by the stream directly. Since we were already told that this happens, why the need to extrapolate from the Randle cycle when we know what happens?

The few that are taken up by the stream and don't go initially to adipose tissue would only do so because of the demand which was placed on the stream by muscle activity. There is no other reason for them not to go initially to fat tissue. That's the point.

Quote:
"The recycling of FFA also occurs in the liver as part of a triglyceride/fatty acid cycle that accounts for a considerable quantity of fatty acid recycling."

What's the point of this? I don't think anyone is arguing that free fatty acids don't get re-used? This is not talking about triglycerides that are eaten in meat. Those would be broken down in the gut and separated. The glycerol molecules only become packaged when they leave the gut and enter the stream. There are no triglycerides that are used for fuel, only fatty acids. That is what the Bear was trying to communicate.
It's also obvious that the same FFA's involved in esterification don't get re-used on either side of tissue sites where triglycerides are unable to pass. On each side, different fatty acids are used. This would happen at any site that wanted to use the glucose packaged in a triglyceride. The longer one excludes dietary carbohydrate, the less frequently this occurs. The drop in triglycerides on a zero-carb diet is well-documented. That's not to say we don't use any because obviously we do.

Mike Wrote:
Well, not quite directly if Wikipedia is to believed, but the end effect is the same, I would agree:

Wikipedia entry "Fatty Acids"
The triglycerides are rebuilt in the enterocytes from their fragments and packaged together with cholesterol and proteins to form chylomicrons. These are excreted from the cells and collected by the lymph system and transported to the large vessels near the heart before being mixed into the blood. Various tissues can capture the chylomicrons, releasing the triglycerides to be used as a source of energy.

Now, you're arguing from Wikipedia? Are you serious? This entry is not at all talking about fatty acids that come from the gut when a person eats. This is a general process that occurs when triglycerides hit this particular site. Taubes is only talking about digestion. This entry has no relation to what he is discussing in GCBC.

There is no reason to dispute this Wiki entry, but again, you've totally misconstrued the context here. Those triglycerides are not the ones that we're talking about with regard to food initially being digested as the Randle cycle is. It is only concerned with digestion.

Fatty acids are only part of triglyceride packaging according to the level of glycerol phosphate in your body. As zero-carbers, we do have some glycerol phosphate, but not very much. We all maintain the ability to store fat, regardless of how lean we are. Nothing I've written should be construed as saying that we don't store fat at all.

Mike Wrote:
So it would seem. I wonder though, if glucose is not as important a fuel as everyone used to think, why the body goes to such lengths to maintain blood glucose at a pretty constant level?

There is a difference between dietary glucose and the glucose synthesized by the body in accordance with its need. The Bear was addressing people who wanted to argue that glucose is used to fuel muscles. The Bear quite correctly refuted those notions. Blood sugar is an entirely different animal that they were discussing.

The body will always keep a constant blood sugar. It becomes important when we overload our bodies with dietary glucose and therefore our bodies have to work much harder to stabilize it. However, when dietary carbohydrates are minimal, stabilizing blood sugar is an effortless exercise.

There's not much to argue here.

Regards,

Charles

montmorency Wrote:
I found it interesting that Bear said that although you don't have reduce calories to get down to your "normal" weight, if you want to get down below this (really low bodyfat), then you do have to reduce calories a bit. This doesn't seem unreasonable actually. If anyone is currently in a position to test this, please let us know. I'm still a good way off anywhere near that point! 😊

Even he acknowledges that this type of weight loss is difficult, if not impossible to sustain because it's based on semi-starvation and we all know how that goes. One should always eat to hunger regardless of weight and let the body control weight.

Weight on the scale is the most meaningless of numbers, in my opinion.

RE: Zero Carb / Meat and Water - Charles - 09-22-2008 10:59 AM

SLD Wrote:
Charles, do you think that there is a certain body fat percentage that the body wants to be at a.k.a. set point (I know Taubes somewhat denied this) that you'll gain even on zero-carbing if you're under that body fat percentage?

Welcome to the forum, SLD.

You have hyperinsulinemia. A zero-carb diet will not automatically reverse hyperinsulinemia. Taubes is quite right about the "set point" and it has nothing to do with body fat percentages. You are still hypersecreting and it will just take some time until this comes under control. You must remain consistent with your zero-carb diet and drink water. Don't allow yourself to go hungry.

Eat only when hungry and do not eat if you're not. Drink only to thirst and everything will be fine. Cravings are a sign of low-blood sugar, which is a sign of hypersecretion of insulin. It can take six months to fully adapt to the zero-carb lifestyle and it all depends on how severe hyperinsulinemia was to begin with.

You have to be especially careful with sauces and sweeteners because even though they are "zero-carb" they cause insulin secretion in anticipation of them which will lower your blood sugar and thus induce
cravings.

This vicious cycle has been compared with an addiction and the effects are remarkably similar. It takes some time to rehab from this addiction and it will be difficult. However, we know that with a determined effort, you can do it!

Regards,

Charles

Good Job Fully!!! I think every persons appetite will be different, depending on how active you are during the day, for example. I eat twice...around 8am I will have about 1 lb. of 73/27 ground beef and then around 4 or 5pm I usually have a big ribeye. I'm probably eating between 2000-2500 calories, not that it really matters, but as long as you eat when you are hungry and don't eat when you aren't you'll be fine! 😊

Ditto!
Veggies make me feel terrible. I never liked fruit and grains make me fat & puffy.

RE: question re: meat, eggs and water - LindaSue - 09-22-2008 12:49 PM

I think that I'd probably like the bacon mayo because of the smoky flavor. Rather than buy unsmoked/uncured bacon, I might as well use plain pork fat which I can get pretty cheaply.

RE: For the meat and water eaters another? - suzannevea - 09-22-2008 12:58 PM

never, no way, no how. Unless, I suddenly want to have digestion problem, gain weight, feel bloated, and feel like crap.

RE: question re: meat, eggs and water - suzannevea - 09-22-2008 01:01 PM

I use mayo every so often. I used to have a tablespoon daily in my tuna before I went zero carb and it never hurt me, but never more than a tablespoon a day, max.

RE: How to eat meat - LCMama - 09-22-2008 01:20 PM

I used to enjoy my steaks well done. When I was pregnant with my 2nd child, I had intense cravings for rare steak! I'm talking blood dripping. Part of me was repulsed, though other part was telling the first part to shut up as it scarffed down the steak!

I prefer it medium now. I don't think I could eat raw.

RE: For the meat and water eaters another? - Charles - 09-22-2008 01:26 PM

lynnhopes Wrote:
I'm not a zero carber but I guess the main thing a person would get is variety and different taste sensations. Along with making social life easier in terms of eating out. And although there are many healthy tribes all around the world who eat meat only I don't know if I am 110% convinced that veggies don't give us some benefit.
Well, the question was posed to meat and water eaters so you're talking a bit "out of school" as they say. The issues about social life and benefit of veggies is without foundation.

The social aspects largely have to do with the person, not others. There is a tendency in many of us to think that what we eat or don't eat matters so much that people will be offended by our choices when the truth is that most people really don't care. When I go to parties there is usually so much food, no one is standing by with a clipboard jotting down what I eat or don't eat.

When the cravings for carbohydrates are eliminated, you become very aware of the fact that there is much more to parties and get-togethers than food. You can actually get into celebrating the event that called you together without being distracted by what's to eat.

The real issue is someone feeling that perhaps they will "stand out" from the crowd because they don't blindly follow the other lemmings. It takes imagination to be a zero-carber and it's much easier to exercise that imagination when your mind is not fogged over with carbohydrates.

By the same token, although zero-carb works for anyone, not everyone will be able to benefit from it because they won't be able to overcome their acculturation and their upbringing to actually heal themselves.

I embrace change and I embrace my differences and they are nothing to hide or run from. At my office we have people who are gluten intolerant, pregnant, diabetic, and carbohydrate-restricted, low-fat, vegetarians and diabetics; white, black, Puerto-Rican, Northern, Southern, etc. We all eat different foods. Some eat cake and candy whereas others do not. Some eat their food in a box and some bring their lunch every day. Some go out and buy various things, yet we all eat in the same lunchroom. So what if I bring a steak. The majority of people walk by my office and remark how good my food always smells. Yet, they could never eat such a "boring" diet.

The onus should be on those who pitch vegetables to prove that there is a benefit rather than arguing over the lack of benefit. Everyone assumes them to be healthy but no one can say they really do, much like the dietary fat controversy over the past 60 years. We believe fat is bad even though we've never proven it. In every study where the theory was tested, specifically Nurses I and II, vegetables showed no benefit. How many more studies do we need?

In much better observations, we have colonial physicians who lived among the people they studied and directly treated their ailments. They say through eye-witness testimony that the diseases of civilization were simply not present in those people. They were directly aware of what they ate and what they did not. If they are healthy and disease-free shouldn't they be considered the model of a "healthy diet" since they are in fact, healthy?

Shouldn't the veggie pushers need to answer this question?

Regards,

Charles

**RE: For the meat and water eaters another ?** - lynn hopes - 09-22-2008 01:40 PM

I have deleted my post since I neglected to see that it was for zero carbers only.
However in social life I was referring to restaurants. I have visited America and you have much bigger portions so a meat only entree there is filling. Here portions are much smaller so when I eat out I go hungry often. Hence, I avoid it. Thats what I meant by social situations as sometimes one is FORCED to only have access to restaurants for a certain time period like I was last week. I did my best but my best involved going hungry.

**RE: For the meat and water eaters another ?** - ksdeb - 09-22-2008 01:44 PM

Charles, you certainly bring up valid points. I am still trying to wrap my mind around meat and water for the nest 30 or 40 years. Veggies and fruits usually give me some kind of digestive problem. I am beginning to think dairy products do to.

Thanks for the input everybody.

**RE: For the meat and water eaters another ?** - suzanneveya - 09-22-2008 01:53 PM

The potions are not that big in North America and that is one reason I do not eat out a lot, I usually have to order two steaks and it is too expensive more me to eat out, unless I go to an all you can eat place. I never find myself forced to eat anywhere because of very careful planning and I am very direct in getting what I want.

**RE: How to eat meat** - suzanneveya - 09-22-2008 01:59 PM

I still will not say I eat my food raw, even when I eat cold steak that has never touched a flame, lol. I still call it rare, it does not sound as gross.

**RE: For the meat and water eaters another ?** - Charles - 09-22-2008 02:01 PM

lynnhopes Wrote:

I wish this were true! Our meat portions are really not big at all. They will give you a small piece of meat and whole bunch of bread, veggies and grains which make for a big meal. However, if you just get the meat, you will leave hungry.

However, after being on zero-carb for a year, I can tell you that over time it doesn't take as much meat to fill me up especially if there is a lot of fat.

People always assume that there is not enough meat for everyone, but the truth is, if we were all ketoadapted and doing zero-carb, it wouldn't take such big portions to fill us.

Regards,

Charles

If you keep listening to your body, you'll come to the correct conclusion.

Don't think in terms of 30 or 40 years. Just try to think in terms of one or two weeks. As your insulin gets under control you're going to find that you feel quite differently about many things. Insulin creates a firestorm in your body that is hard to detect. Most of these things we call "emotional" are really physiological. When you get insulin calmed down, you'll find that the emotion link you used to have to variety will be severed.

You won't have to deny yourself vegetables. You will simply not want them or anything else. I have a passion for beef and fat and only beef and fat. There is no will power necessary.

All I can say is that the longer you're on it, the more your experience will change. You can't look into the future and say, how can I, because you're unable to see that far down the road due to hyperinsulinemia. It's more than physical, it's physiological.

Regards,
Charles

I'm with Kathy, I can't do it but more power to those of you who can.

RE: For the meat and water eaters another ? - Marius - 09-22-2008 02:54 PM

Hi everyone. First time poster here. Not a native English speaker but I hope my English isn't too awful.

I agree completely that the health benefits of vegetables are hugely overstated and that this modern Cult of the Vegetable has little scientific support. It goes hand in hand with the demonization of animal fat. This is sort of a pet peeve of mine, hence the reply 😊

I think there are deep cultural reasons for these beliefs, perhaps it has to do with our ideas of what is "natural". Certainly the lack of scientific support doesn't seem to matter much. As you said, Charles, when the hypothesis that lots of fruits and veggies is good for us is tested scientifically, the result is usually zero effect. WHEL is a good example:

http://high-fat-
"CONCLUSION: Among survivors of early stage breast cancer, adoption of a diet that was very high in vegetables, fruit, and fiber and low in fat did not reduce additional breast cancer events or mortality during a 7.3-year follow-up period."

This doesn't seem to make anyone any less convinced that it's true... If you hear the word "healthy" in connection with foods and eating, what's the first thing that pops up in your mind? I'm willing to bet that for most people, it's a carrot. At least here in Scandinavia. The archetype of a "health nut" is someone who eats carrots all day long. There is zero justification for this association. Of course it's healthier than eating pastries and snickers bars, which is probably why vegetable consumption is often weakly associated with health in epidemiological studies. But I see no reason to believe that eating a wide variety of vegetables add anything of great value to a carnivorous diet.

Even hunter-gatherer societies that have a higher carbohydrate consumption tend to rely on a few staples, generally some form of tuber being the main one. This despite living in environments where there are lots more potentially edible plants.

I'm also not convinced that vegetables are necessarily harmless or benign. All the different "phytochemicals" they contain, most of which are usually unknown, could just as easily be harmful as beneficial. Salicylates being one example, not good for the salicylate(aspirin)-intolerant.

Even vitamins aren't necessarily good for us, even in moderate doses. This recent study is a mouse-model, but if it also holds in humans, it would indicate that one of the reasons asthma incidence has increased is the folate supplements taken by pregnant mothers, perhaps combined with our increased consumption of broccoli, nuts, and other folate-containing foods:

I've also read enough studies on Vitamin C to convince me to stop taking my Vit C pills (and eating oranges - did you know that citrus fruits are more neolithic than grains? First eaten by humans several thousand years after the invention of agriculture).

---

RE: Zero Carb / Meat and Water - Fully - 09-22-2008 03:10 PM

Thank you Jeepifer and Chiara! That sounds like me. I don't think that's a lot but I love not having to eat every 3 hours. That's a pain! And I eat until full and no more.

Wow Charles and to think of all those soy bars and protein shakes I have drank in the past.

And those sugar substitutes.....are evil. They do make you hungry! That was the way I was with certain fruits also. Especially apples. If I wanted to eat but really wasn't hungry, I use to grab fruit until I noticed that an hour after eating an apple i would be starved to death!

Charles, you certainly bring up valid points. I am still trying to wrap my mind around meat and water for
the nest 30 or 40 years. Veggies and fruits usually give me some kind of digestive problem. I am beginning to think dairy products do to.

Charles is right, once you have been on zero carb for a while, you won't want carbs anymore. I don't think any of us meat eaters ever thought we were going to give up carbs forever. I know I didn't. I figured when I lost all my weight I would add a few carbs in. Now, I can't think of any reason why I would.

Welcome to the forum Marius! Your English is great and so was your post, I completely agree with everything you said.

**RE: For the meat and water eaters another ?** - montmorency - 09-22-2008 04:24 PM

Advocates of "healthy" fruit and veg continually harp on about the vitamins, minerals, and general nutrients in them, without stopping to think of the bioavailability of those nutrients. In some cases a lot of cooking is required to obtain some of them, which destroys others. The case is for the veg fans to make, not the other way around, but their case is always taken for granted, it seems, in the mainstream, while those on what is the more natural diet, have to apologise for it.

I still will not say I eat my food raw, even when I eat cold steak that has never touched a flame, lol. I still call it rare, it does not sound as gross.

A good friend of mine orders her steaks - MOO. Heat the grill, drop it on, count to five, flip count to five and serve!

I'm with Kathy, I can't do it but more power to those of you who can.

Personally, I love the lean extremely rare to raw. However, I don't like the taste of cold, raw beef fat. For this reason alone I usually cook my steaks rare to medium rare, where it is at least warm in the middle.

As far as hamburger goes, I eat that pretty rare too. I don't worry much about foodbourne illness either. I have faith in my immune system.

**RE: How to eat meat - Ladysilverpatch - 09-22-2008 06:31 PM**

There are health dangers to eating raw/uncooked/undercooked meats. I just don't get this at all, just way too extreme and not sure why?

And swallowing meat in chunks, not chewing is a good way to die. More people choke to death on meat than on anything else.

Another study, regarding those "wonderful antioxidants" which is the latest justification for the 5 a day:

"African-Americans had ... lower self-reported intake of most antioxidants (than whites). Levels of oxidative DNA damage, measured using the alkaline comet assay, were lower in African-Americans than Whites"

So how do we increase our antioxidant defences? Easy, by dumping the carbs:

"The 3 days of the L-CHO diet, which had been preceded by glycogen-depleting exercise, resulted in a
stimulation of the blood antioxidant defence system in young eumenorrhoeic women both at rest and during the graded cycling exercise to maximal oxygen uptake."

...or even just by dumping the fruits and vegs:

"The overall effect of the 10-week period without dietary fruits and vegetables was a **decrease in oxidative damage** to DNA, blood proteins, and plasma lipids, concomitantly with marked changes in antioxidative defence."

Note that the subjects in the last study weren't low-carbing, their diet included things like bread and cakes and so on. They just cut out all fruits and vegs, which markedly improved their antioxidant defence. Hmm, maybe carrots aren't healthier than pastries and snickers bars after all?

This is false. I am sorry you do not understand, but please be careful calling my diet dangerous, it makes me feel very defensive. I eat raw meat because I like the flavor. I am sure you cook your food the way you enjoy it as well.

Quote:
Is A Raw DIET Dangerous?
A compilation of relevant literature by Dr. R.L. Wysong

The following are some considerations from Dr. Wysong’s writings:
Humans are the only creatures on earth who cook food – does this not cause suspicion?
In the wild, carnivores eat raw, often filthy, putrid, decomposing prey with no adverse effects.
The attrition rate in the wild world is due to the inherent dangers there: predation, injury, drought, food diminishment, etc., not to the raw diet.
If raw foods were unhealthy, then no creature should exist today, since from the beginning of time it has been the only food choice. Raw food, not cooked, puffed, dehydrated, pressurized, retorted, sheared, baked, and steam cleaned, is the very incubator from which life has emerged.
It is a fallacy that humans and pets enjoy better health and live longer today. Modern medicine and technology self-servingly market these fallacious notions. Longevity (the potential to live longer) has not increased but degenerative diseases have, creating a huge class of humans and companion animals that now “enjoy” a unique new existence: medicated survival. Average life span has increased, but this is only because of improved hygiene (public works), better food distribution and decreased infant mortality. None of which have anything to do with the ability to extract starch and oil from grains and then create sterile, synthetic, chocolate-covered, melt-in-your-mouth food. (Also see Controversy #16 - Are We Living Longer?)
Degenerative diseases do not abound in carnivores that age in the wild as they do in pets fed “100% complete” super bow-wow cutlets.
What is the most perfect food that humans and animals will ever eat? Breast milk. It’s raw and serves as
the source of probiotic microbes that inoculate the gastrointestinal tract against pathogens, stimulate immunity, secrete digestive enzymes, and produce vitamins. Processors have tried to market new, improved milk formulas and the results have been disastrous. The literature now proves beyond doubt that breast milk (raw unprocessed food) is best.

The primary danger in feeding is the serious degenerative diseases (cancer, obesity, arthritis, diabetes, autoimmunities, dental disease, cardiovascular disease, etc.) that can result from imbalances caused by exclusively feeding fraction-based processed foods, not a rare bout of diarrhea from food-borne bacteria. Microbe-phobia is a fear based upon the mistaken notion that disease is caused by microbes. In fact, microbes will never be eliminated and cannot infect a creature properly fed and with a healthy immune system. In even the most virulent plagues, some in a population always escape disease, not because of lack of exposure but because of the parapet of immunity.

In an effort to decrease Salmonella infection in chickens (the same Salmonella that causes food borne illness) baby chicks were removed from the mother into a sterile environment. The result? Increased infection and greater mortality. Lack of exposure to probiotic organisms from the mother resulted in a totally vulnerable digestive tract. A minor exposure resulted in severe unchecked (by probiotics) infection. The solution was to feed the droppings from the mother to the chicks (known as autochthonous inoculation). Infections and mortality dropped.

Sterile, processed, 100% complete pet foods have maimed and killed thousands, but no like documentation proves animals die from eating raw foods.

Many people routinely eat raw foods including meat and eggs, and feed likewise to pets, yet no “epidemic” of disease results – particularly if probiotic supplements are consumed, such as those produced by Wysong.

That's the most that I use too.

RE: Zero Carb / Meat and Water - chris m. - 09-23-2008 05:55 AM

I do have a question:
One of the most important points I have learned on this thread that was new to me is the fact that there is an insulin responce to the taste of sweet whether it has any carbs or not [maybe even the thought of it!]. My question is - is there any way to quantify the effect?
In other words we know how many carbs in various foods and that is easy to total on a daily basis but just how much insulin effect do things like a diet coke or toothpaste, mouthwash, or other sweet tastes have?
Can this effect be enough to derail many dieters when they think they are doing the right thing with no calorie sweeteners, etc?
I forgot about the sweet taste setting off cravings! Another reason to avoid all sweet tasting things.

RE: Zero Carb / Meat and Water - Richard - 09-23-2008 06:07 AM
Something I have noticed...

I have an old elbow and knee injury along with 2 herniated disk in my back.

For the past 5 years I have been limited to 20 lbs lift restriction. When ever I would lift something over 10 lbs I would get a numbness in my leg and foot along with a sciatic pain from the back to the bottom of my foot. I was in medical purgatory (Dr's word not mine. Too injured to be called healthy but not injured enough for insurance and surgery).

This last weekend I had to lift and move my 30lbs dog due to an injury he had received. I did not think about the restriction I just picked him up and took him inside to take care of things. Afterwards I started thinking about what I did. In the past I would be in pain and probably have to pull out the cane and used it for a day or to as well on the hydrocodone pills for a week. What happened was a mild numbness and discomfort but nothing I needed to resort to the pills over.

After more thinking, the knees which did make grinding sounds every time I went up stairs and elbow which also had some issues seem to be quiet.

I must believe that 4 weeks of increased fat and protein have 'lubricated' things more that 5 years of GS/MSM.

An interesting benefit I would say.

RE: How to eat meat - Kristi31 - 09-23-2008 07:21 AM

I agree with Suzanne and the doctor. I ate raw meats, including organ meats, seafood for more than a year without any problem. I also ate raw ground beef many times. The only time I got food poisoning is when I ate cooked food at a restaurant.

Whether one chews or not doesn't really matter either.

RE: For the meat and water eaters another ? - Kristi31 - 09-23-2008 07:29 AM

Just to get back to size portion, I actually find them pretty generous with their meat. One prime rib steak and I'm full.

RE: How to eat meat - nyteez - 09-23-2008 07:36 AM

I don't beleive the dangers are in the raw meat, it is the handling of the meat. How many cases of E coli have come from the home? Most of them are from resturants where the meat has been handled improperly and exposed to bacteria. In California we recently had e coli or samanella (I forget) outbreaks from tomatoes and then Jalapenos! Does this mean we shouldn't eat raw vegies?

Thank you suzanne for that very informative artical!

RE: How to eat meat - Charles - 09-23-2008 07:50 AM

From my hero Stefansson back in 1946:

Quote:
To sum up: Any people who eat vegetables, even the softest, anyone who eats bread or leafy vegetables, is bound to chew a good deal more than the average for a carnivorous people. Yet the Eskimos, or meat eaters comparable to the Eskimos, and pastoral people like the medieval Icelanders, all of them mastication slackers, are the only ones ever found in present or former times who can show 100 percent freedom from caries. There is, accordingly, in the study of such diets and habits of life no aid or comfort for those who believe that the decadent teeth of our civilization are a result of decreased chewing

As far as raw versus cooked, I honestly don't believe there is any real health benefit between cold raw and medium-well. The Inuit always preferred to cook their food somewhat when there was time and
many other cultures enjoyed freedom from chronic diseases while cooking. Anyone who eats their food at any point between these two states will get the maximum benefit from their food, in my opinion.

Regards,

Charles

I had tendinitis in one of my elbows that never seemed to want to clear up. It went on for about 3-4 months. I wasn't working out because I didn't want to aggravate it and make things worse. Eventually it got to the point where I just worked out anyway. I was careful of the movement to not put a strain directly on the elbow but still work the biceps and triceps pretty hard. My tendinitis went away in about two weeks of starting back with my workouts.

For me, it wasn't despite lifting heavier weights, but because of it that my elbow got better.

Kristelle:

This can be true at a steakhouse or some other place that specializes in meat, so to speak, but you usually have to pay considerably more for a good portion of meat than you would at more common restaurants in the U.S.

Most of us can't afford to do the "steakhouse" on a regular basis due to the cost. There are some high-medium steakhouse chains like Outback, Texas, and Texas Roadhouse, which offer good steaks at a somewhat reasonable price but this pales in comparison to going to a supermarket and just buying your own.

The more-affordable and popular medium-tier restaurants like Chili's, Applebee's, Johnny Carrino's, TGI
Friday's, Ruby Tuesday's, etc, all serve steak but the portions are small compared to the amount of vegetables and grains they serve with their entree. To get full, you would have to order off the menu or maybe order two. The cost then becomes exhorbitant in relation to what you're getting.

Charles

**RE: How to eat meat** - Jeff - 09-23-2008 08:09 AM

I eat my beef nearly raw...I just sear the outside for a few seconds. Pork I usually eat slightly more cooked, but not much. Medium rare, I'd say. Chicken I will cook fully.

I have been under the impression that heat destroys some nutrients. Does anybody have any thoughts on this?

---

**RE: How to eat meat** - suzanneyea - 09-23-2008 08:57 AM

We have had several "debates" on the nutritional benefits of cooked vs. raw. An we all had good points and decided to eat it the way we prefer, lol.

---

**RE: How to eat meat** - entwyf - 09-23-2008 09:03 AM

I like my meat done. Not burned to a crisp, not bloody. Just nicely done. I'm sure a lot of it has to do with what I'm used to.

Since the human digestive tract is not made the way a carnivore's is, I have to assume that it is possible to have "issues" if I eat meat raw. Not necessarily likely but possible.

In other words we know how many carbs in various foods and that is easy to total on a daily basis but just how much insulin effect do things like a diet coke or toothpaste, mouthwash, or other sweet tastes have?

Chris, I don't know of a way to quantify it, but I do know that all of the systems in our bodies tend to overcompensate by secreting more than what is actually necessary to do the job. I don't know if I saw this in GCBC or some other journal, but it's well-settled amongst physiologists.
Powley and Rodin's research in 1985 suggested that this "feedback" loop would be more severe amongst the obese depending on the level of hyperinsulinemia. They figured that the hyperinsulinemia would lead to increased consumption of food, which likely supported the dogma that eating more means gaining weight. If they were familiar with low-carb science, then they would have noticed that hyperinsulinemia may not necessarily lead a person to eat more, but it will certainly keep them from mobilizing fatty acids at a level that they should.

The point is that your body will never be unprepared for what you're about to introduce to it. Insulin comes in waves with the first one lasting up to twenty minutes. This is well before any glucose actually enters the bloodstream. The second wave lasts for several hours. The experts typically measure insulin on laboratory animals about 30 minutes or an hour or two after the meal. They pay little attention to the details in between which is why they miss the first wave.

We know that when insulin is circulating, then nothing else is and that's why we feel such an acute hunger. This is why people like that doctor Jimmy interviewed, refer to hyperinsulinemia as hypoglycemia. The effect is the same.

Chris Wrote:
Can this effect be enough to derail many dieters when they think they are doing the right thing with no calorie sweeteners, etc?

Oh, most definitely. This also keeps people from succeeding on zero-carb. They feel absolutely miserable and then when they eat a few carbs, they feel better. They are unable to complete ketoadaptation because they can't get past the hyperinsulinemia which can only be controlled with time.

The craving for sweet things is simply an addiction. There is no nicer way to say it. We have to battle it similarly. Maybe I should open a carb-rehab facility that only serves zero-carb. I could put people on induction and keep them on the grounds for the first month until they are ketoadapted. Once they are, then they can have visitors and get day passes!

Charles

Stefansson noticed the same thing as he got older. He had some arthritis set in and couldn't walk up his stairs very well. One day, he just sprinted up the stairs after returning to the all-meat diet.

Regards,
Charles
A lot of people read one person's diet and see that they drink cream with their coffee, so they think "oh, I can have a little cream." Then they read someone else's and see they have splenda, so they think "ok, a little splenda won't hurt." Next thing you know you have a ton of sweet things in your diet plan and then you start having cravings.

suzannyea Wrote:
We have had several "debates" on the nutritional benefits of cooked vs. raw. An we all had good points and decided to eat it the way we prefer, lol.
Ok, fair enough. LOL

I agree that if you eat at someplace that isn't a "steak" place, your meats are generally pretty skimpy. We are drastically cutting down on eating out, and usually it's just DH and the kids that order.

Of course, if we go to a Brazilian steakhouse, all bets are off. 😐

I also used to wonder about 'quantifying' insulin release upon smelling or seeing especially tempting sugary, carb-laden foods. Then one day, the thought just came to me that if just the smell or sight alone was enough to trigger the salivary glands to start the saliva flowing, the first level in preparation for incoming food, then it would only be in the natural progression of things that the brain also sends a message to the pancreas to start the insulin flowing! The brain also starts the stomach acid flowing in anticipation of incoming protein, so if you throw super-carbs at it, there's going to be more than needed to break them down, so the extra acid has nowhere to go but up, aka Acid Reflux! The body is very much a Pre-Emptive Machine!

This is why you will get hungry just as you are about to begin eating. At least this is true for me. Just the thought of eating or the smell of the food cooking will trigger insulin release. This will lower BG levels......then BOOM!, you're hungry.

I have been "off the wagon"
not the low carb wagon, but the ZC wagon.
I am trying to crawl back on it...because I know it works...
so far so good today...although I still drink Diet Soda...I had eggs cooked in butter...for breakfast ...and prepared some hamburger patties for lunch....looking forward to those....
I felt so guilty about posting in this thread without being brutally honest...and Meat and Water only is hard for me...it works...and I want to stick to it..but, so far..I have not been all that successful staying M&W....

I was thinking the same thing last night while brushing my teeth. If I'm reading Charles' reply correctly then the best test is how you feel after using the product. If you start to feel hungry even though you just finished a good meal, then your insulin may have spiked. I'm considering simple baking soda for brushing and hydrogen peroxide as a mouth wash. I'm also weaning myself from supplements (I noticed that I was sucking on my B12 like it was candy).

Please don't ever feel like that, man. We all acknowledge that this is a tough row to hoe, as the saying goes. We're not at all looking for perfection or anything like that. As I've said many times, "falling off the wagon" is actually being on the wagon. You and your body know what works and when you add carbohydrates to your diet, your body also lets you know and that's why you come back.

It may take many more times of episodes like this before you one day decide that you're not going back. All I can say is that it does get easier over time, but I assure you, it does indeed take time. I didn't get strict overnight. I got that way through much trial and error.

Stay in touch and don't ever feel guilty or anything. This is about life and that's the most important thing. Who cares what I or anyone else thinks. I don't get any bonus points for how many people successfully implement this lifestyle. If no one else does, I'll be here relating how positive it was for me.

Hell, even Stefansson couldn't last more than 10 years. He had a big "off the wagon" period before his
body began to break down and he came running back. You came back much faster than he did so in my mind, that makes you pretty smart!

Best regards,

Charles

RE: Zero Carb / Meat and Water - jeepifer - 09-23-2008 11:11 AM

Well, Charles said it better than I ever could (as usual, 😊) but don't beat yourself up. I've been on/off/on so much the last three months it makes my head spin. But 17 days and counting, and it's getting easier.

Remember, we're all at different stages of the journey, and we all had to take that first step!

RE: Zero Carb / Meat and Water - Fully - 09-23-2008 11:12 AM

Unless someone can share some secrets with me....I don't think I could stay on water and meat 24/7 365 days. It definitely works. I am losing now when I have not in the past. But the meat is kinda sticking in my chest and seems like it takes forever for it to go down much less digest. I do have a small hernia and meat is what bothers it....ground beef to be exact and at times it really hurts. But I am going to stick with it for as long as possible because I have a lot of weight to lose. Like 90 lbs by the chart. 70lbs says me. I miss the light coolness of food. Meat is just so heavy. I am guessing this is why a lot of you are eating rare meat? Is that right? I like my steaks medium rare but there is no way I can afford to eat steak all the time.

RE: Zero Carb / Meat and Water - Charles - 09-23-2008 11:23 AM

ANOVA Wrote:

Not only when you've finished a meal, but even before you eat a meal. If I were to eat a good piece of chocolate, I used to think about the next time I was going to have it. I was that way with sweetened water. I don't drink nearly as much regular water as I did sweetened water. I'm that way with cheese as well. If you put cheese and seasoning on a burger, I can eat twice as much than if the burger is plain.

Some will say, well, that's because it "tastes better." Or, perhaps it's because I respond to sweetened things by secreting more and more insulin which continues to remove nutrients from my bloodstream in expectation of the arrival of more. This keeps me hungry; meaning, that it blocks any feeling of satiation. This is why Taubes says, "it's not so much that fat fills us up. It's moreso that carbohydrates prevent satiety and so we remain hungry."

When you eat a purely fat meal, there is no re-enforcement of the impetus to secrete more insulin because there are no sweet sensations. Try eating barbecue with and without the sauce and you can easily tell the difference. If someone puts sauce on it, they can eat twice as much and they usually have an "overfed" feeling at the end of the meal. Whereas, if you just eat the meat plain, you'll stop when you're full and you'll feel as if you can go running afterwards.
I found the same thing to be true with mustard and salt. If I put mustard on plain ground beef, I can eat two or three quarter-pound burgers. If I eat the ground beef plain, I can eat 1 and a half and I'm full.

It has nothing to do with the amount of calories or carbohydrates present. It's all in your response to the food you anticipate and the foods you eat.

Regards,

Charles

**RE: Zero Carb / Meat and Water - jeepifer - 09-23-2008 11:31 AM**

Charles, do you notice a difference in how much you eat if you eat slowly vs. quickly? I eat at my desk at work most days, breakfast and lunch, and I tend to eat a few bites, work, eat a few bites, etc. I notice when I do this, I eat far less overall than I do when I sit down to dinner and just eat all at once. Maybe that's why even though I season and still use condiments/sauces, I don't tend to eat large amounts?

---

**RE: For the meat and water eaters another? - Kristi31 - 09-23-2008 11:38 AM**

I usually got to this bar/restaurant where they sell a 12 ounce prime rib steak for CAN$13. Delicious and filling.

It takes time for your body to adjust to the digestion and a little longer for your mind to adjust. When your insulin is running rampant with nothing to do, you will keep getting small urges that you have to ignore. This is very much like fighting an addiction. Some days will be easier than others and there will be a time where the thought of eating just makes you ill.

Most of us don't equate boredom and feelings of deprivation with cravings, but they are all caused by physiological reactions to oversecretion of insulin.

It's impossible to look down the road and say what you can or can't endure. When I began my journey, I hated beef medium-rare and I thought it was the grossest thing in the world. Fat on beef? It was okay, but nothing I ever thought I would look forward to, or go out of my way to find at a local meat department.

When eating becomes boring and almost repulsive, that's a sign that you are doing this properly. All of those emotional ties have to be severed because they were only there due to chronically-high insulin which created the cravings to begin with. It takes time for this to die down, but with a determined effort, they will vanish one day. You'll be able to look at all foods and not feel the slightest inclination towards them.

Hunger very truly means that your blood sugar is low. If you get hungry, you have secreted insulin. It is
not at all emotional, it is physiological and it takes time to reverse. Cravings are your body's way of getting you to help it balance the blood sugar. You have to ignore these and let your body do it on its own. It gets more and more efficient at stabilizing your blood sugar every single meal.

Fully Wrote:
I do have a small hernia and meat is what bothers it...ground beef to be exact and at times it really hurts. But I am going to stick with it for as long as possible because I have a lot of weight to lose. Like 90 lbs by the chart. 70lbs says me.

Homeostasis tell us that the entire organism has to be considered when we talk about nutrition. If ground beef bothers a hernia, you may need to get the hernia fixed in order to be successful.

Fully Wrote:
I miss the light coolness of food. Meat is just so heavy. I am guessing this is why a lot of you are eating rare meat? Is that right? I like my steaks medium rare but there is no way I can afford to eat steak all the time.

This is your upbringing (acculturation) talking. We don't eat it this way because it's light, it's more flavorful and there are more nutrients available the less you cook it. There are many people who can't imagine a hot, greasy food on a hot day. They think that on those days, they should have a light salad and a cool glass of iced tea. These associations are all physiological manifestations of out of control insulin and acculturation. In Latin American countries and the southern United States, the people have no problem eating fatty, greasy foods on the hottest of days and drinking cool water.

This is a learned behavior that you can also pick up for yourself as long as you stick with it. After a while, you'll find that you come to prefer that which you previously despised. As my Dad used to say, if you're hungry enough, you'll eat.

jeepifer Wrote:
Charles, do you notice a difference in how much you eat if you eat slowly vs. quickly? I eat at my desk at work most days, breakfast and lunch, and I tend to eat a few bites, work, eat a few bites, etc. I notice when I do this, I eat far less overall than I do when I sit down to dinner and just eat all at once. Maybe that's why even though I season and still use condiments/sauces, I don't tend to eat large amounts?

Not really, Jenn. Nowadays, I just don't eat that much so it doesn't really matter at what speed I eat it. I just fill up the tank and then I stop eating. I've been known to eat three-quarters of my meat at dinner and give the rest to my dog. When I'm full, it's over. I think he's very similar to me because he will leave food in his bowl when he's finished eating as well.

Comparison of man's digestive tract

http://paleodiet.com/comparison.html

The actual book, The Stone Age Diet, from which this excerpt is, can be found in certain libraries. A fascinating read and I'm sure we could have a whole discussion chapter-by chapter like GCBC and NBBA...Charles would have a blast dissecting it.

The author, Walter L. Voegtlin, is in favor of an all-meat diet but says if we are to eat fruits and veggies, to cook them to increase nutrient availability. Or something along these lines.

Charles Wrote:
Maybe I should open a carb-rehab fascility that only serves zero-carb. I could put people on induction and keep them on the grounds for the first month until they are ketoadapted.

You read my mind. 😊

RE: For the meat and water eaters another ? - Charles - 09-23-2008 11:55 AM

I've attached a typical menu from the Texas Roadhouse here in North Carolina, United States. This is what I call a "middle of the road" steakhouse. If I were eating here by myself, the price is not bad. When you consider that I need to get what I eat times 5 to feed my family, then you can see that this adds up quickly and it's not uncommon for my bill to be $80 and all we ate was meat. We can't visit this place very often.

I ate at this restaurant when I was in Norfolk, Virginia, recently. This is a more upscale steakhouse. The meat portions are enough to fill anyone up, but the price is beyond the "splurge" of most people.

Charles

RE: How to eat meat - Charles - 09-23-2008 11:58 AM

I've read enough Loren Cordain in my lifetime. His views on fat in the paleo diet are way off. He later
acknowledged it, but he still has trouble with the idea that paleo man would have did whatever he could to secure as much fat as possible. I say, leave him to his delusions.

RE: Zero Carb / Meat and Water - Charles - 09-23-2008 12:05 PM

chiara Wrote:
I don't crave them and they are not a temptation, but I do smell them. Is that going to ruin my progress?

No. The issue is hyperinsulinemia. If you get your insulin under control (which you obviously are accomplishing since the carbs in your house don't bother you) then the mere presence of food or even smells won't throw you off much.

It's normal to smell things, see things, talk about things, hear food cooking, and get a little rush of insulin which causes a slight hunger pang. This should only keep fatty acids out of circulation for about 20 minutes. However, if you hypersecrete, then you'll not only secrete that time, but you'll secrete insulin even when there is no reason to. This keeps fatty acids in storage for longer than they should and makes it harder to lose weight.

This isn't something to worry about, it's just something that some people will have to deal with more than others. It gets easier each and every day.

Just keep to the basics and all will be well.

1. Eat when you're hungry and don't eat when you are not.
2. Drink water when you are thirsty and don't drink when you are not.
3. Eat plenty of fat to the point of nausea and eat lean to finish the meal off. The ratio is about 1 to 4. One part fat, and three parts lean. The amount is based on your hunger.
4. Eat anywhere from raw to medium well, just don't overcook.
5. Avoid supplementation.

Regards,

Charles

You should have seen the post I did on him regarding ketosis on Dr. Eades blog.

Here is some more BS from a paleo diet update for his newsletter. I too have had enough of Cordain. Hello Cordain? Have you never heard of ketones and keto-adaption?
"Why Low Carb Diets make some people feel weak

People who go on a low-carb diet will sometimes report feeling weak or light headed during the first few days on their new eating pattern.

Whether this happens depends on two main factors: 1) the total carbohydrate restriction and, 2) the total caloric restriction.

Popular low carb diets typically restrict carb calories to 50 grams (~200 kcal) or 100 grams (~400 kcal). If the diet is low in calories and carbs are restricted to less than 100 grams, many people will feel weakness because their muscle and liver glycogen stores will become depleted and they must rely upon beta oxidation (the metabolism of triglyceride) as their primary substrate source.

Additionally, the brain can only use glucose as an energy source, hence hepatic gluconeogenesis (the synthesis of glucose from either protein or fat in the liver) represents the primary glucose source. However, gluconeogenesis is inefficient and can only supply small quantities of glucose.

All of these metabolic adaptations - beta oxidation, hepatic gluconeogenesis and ketosis (a by product of carbohydrate restriction and beta oxidation) - upset homeostatic mechanisms shaped by a lifetime of high carb intakes for the average Westerner.

With the Paleo Diet, we advise people to get all of their carbohydrates from fruits and vegetables and to restrict grains, sugars, legumes and processed foods. Carbohydrates are not restricted on the Paleo Diet, but because fruits and vegetables contain so much fiber and water, it is difficult to consume more than about 30 percent of the daily energy from these foods.

Most people don't experience weakness or lethargy upon adoption of the Paleo Diet, but rather the opposite. Their energy levels remain stable over the course of the day."

RE: Zero Carb / Meat and Water - cbnebraska - 09-23-2008 12:37 PM

As a woman, I think we have it tougher when it comes to emotional eating. I know that insulin surges are what make us hungry, and by getting our blood sugar under control we can avoid those rushes as much as possible. But, there is more to it than just plain and simple hunger, for me at least. I would dare guess that there will be other women out there who will agree, and even some men. I still wander into the kitchen when I'm looking for something to soothe myself, or for something to do, or for something that will break the monotony of everyday life - even if I'm not hungry. I wander around looking at the food, but can't bring myself to eat meat, so I wander out. I don't even know what I'm looking for, I'm just hoping to find it. It's probably not food, but it's something, and I can't fulfill the need. This truly is willpower - to walk away. I've heard it said that willpower doesn't come into play if you're eating to satiety, but let me assure you, I have had to use shear willpower plenty of times. I have been zero carb for 8 weeks now and have only taken a very few bites off plan. My last vice is coffee with cream twice a day and I am working on that, trying to determine if it's holding me up. I've moved to 1/2 caf and am only drinking 1/2 cup twice a day. I am dealing with being a bit groggy and unmotivated in response to this. However, I hope to get off of it soon. I feel like my last 8 weeks has been one big "give up". Granted, I know I'm gaining health and I'm even losing a little weight, but it's been quite tough at times. I wish it were more weight, but I know it's the right thing to do regardless...

RE: Zero Carb / Meat and Water - chris m. - 09-23-2008 12:52 PM
The last few pages have been EXTRA special. Sometimes, we need to back up and clarify a few points that seem a little harder to understand. Still I find it so much more meaningful to hear each person's experiences rather than just read the research. [I'll leave that to others much more qualified to interpret]

Thanks to all for your comments, advise, help, etc.

I bake bread and the smell fills the house, no problem for me. I also bake a lot of cookies and stuff, no issues. I would not worry about it.

cbnebraska,

Now, I do not want this to sound harsh, but you have not been zero carbing for 8 weeks. You have said that your husband does the cooking and puts sauces and seasonings in the meat. Plus, you have posted several times about recent social situations when you have eaten dessert and other high sugar and carb filled foods. If you eat off plan, even one bite, you cannot expect the amazing results of zero carb. The amazing results being the freedom from the emotional eating you are struggling with. If I ate the same as you, although your carb level is low, I would still be struggling with the urge to snack and munch too. I was one of the worst binge eaters and emotional eaters out there, food was my life and it was all I thought about 24-7, so I understand the emotions you guys are feeling, been there. However, on zero carb, it is all gone, like magic.

---

RE: How to eat meat - Charles - 09-23-2008 12:57 PM

As I said, leave him to his delusions!

People should not be surprised that zero-carb diets don't get studied. If all the people feel weak for a few days, it seems inhumane to keep them there. Fortunately, we're out here and doing just fine. Hopefully, enough people will notice. We can't wait for the scientists to test and figure this out. Someone has to look at the epidemiology and just go for it. That's me!

Regards,

Charles

I know you may not believe it, but sister, I can tell you, I had those days as well. I know very well of what you're speaking of but I also know that I no longer have those days. It's not about blood sugar at all, it's about insulin. Insulin is the key to the whole shooting match. If you are hungry then you are eating too many carbohydrates, period. I didn't believe that was true when the Bear first said it, but he's right on the money.

Coffee and things like that all affect people different ways depending on their hyperinsulinemia. There is no getting around it. The reproductive cycle and other hormones all will come to a grinding halt if insulin is out of control. If that's true, which it is, then why wouldn't insulin fluctuation cause the types of things you're describing?

Walking into the kitchen and wondering about -- those are cravings! I had those on my low-fat diet and on my low-carb diet. I know exactly what you're talking about.

Eight weeks is commendable but it is only a drop in the bucket. As Stefansson said, it takes six months to determine whether a person will be able to adapt to a zero-carb lifestyle for any appreciable amount of time. Just because you eat zero-carb does not automatically mean that your body is not still expecting them, and yours obviously is.

I've been eating zero-carb for 11 months and I feel like I am just now beginning to secrete the proper amount of insulin because I only get hungry twice a day. You get hungry far too often to think that your insulin is under control. I hate to break it down like that, but it's true.

Richard Wrote:
...4. Eat anywhere from raw to medium well, just don't overcook. ...
I remember this being mentioned (raw to medium)before but why not 'well'?

I think you just lose too much in the cooking process. "Well" may actually work, but I haven't read of anyone who ate their meat this way and did well. I've heard of medium-well but not well.

When people report being tired and things like that, it's usually due to not enough fat and eating too lean meat. I find that when I overcook my meat, I get this sensation.

I would not stress over this. Get yourself to true zero-carb and water and you will likely find that you come to prefer your meat a little less done. I'm not into raw, but I do prefer medium-rare whereas a year ago, I would have not said the same thing. The Bear was very astute when he said that over time it changes, and I have to agree.

Don't use that grill so much. Use the oven or a pan and keep the drippings, especially if you eat your
meat well-done. Most of the best parts are lost in the fire.

Regards,

Charles

Just something 'comfortable' about it.

RE: Zero Carb / Meat and Water - chiara - 09-23-2008 01:43 PM

I found myself "panicking" again today...I bought beef short ribs from Walmart that looked really fatty. I didn't even think to look at the nutritional info. When I got them home, they said 1 gram of carbs for a 4 ounce serving size. How can that be?

RE: Zero Carb / Meat and Water - abnormalslc - 09-23-2008 01:45 PM

thanks for the kind encouragement...

Question regarding sweet taste, even if artificial, triggering insulin release/hunger.

So..if one does not experience hunger after a sweet taste...diet soda for example...does that mean the insulin response does not exist for me? or am I simply good at ignoring this trigger?

RE: Zero Carb / Meat and Water - cbnebraska - 09-23-2008 01:56 PM

Okay, I guess I did cheat this past Friday, I split a piece of cheesecake with my husband at the Cheesecake Factory. He used to put bits of green peppers and onions in our burgers, and I'm sure he's used sauces that were low carb, but not no carb. I have about 3 glasses of wine a week and my coffee. The cheesecake is the only one I considered a full out "cheat", but I guess I should consider anything but plain meat without seasoning and water to be cheats. Just typing this brings me down though, so I need to re-group. Tough love sucks.

That's why we're here, big guy! 😊

Quote:
So..if one does not experience hunger after a sweet taste...diet soda for example...does that mean the insulin response does not exist for me? or am I simply good at ignoring this trigger?

The insulin response occurred when you contemplated drinking the diet soda. What prompted you to reach for it? The thought of it, sight of it? smell? cold feel? Any of these cause you to secrete insulin in anticipation of the drink. The idea here is to condition your pancreas and your body to not react to food in this way. This allows fatty acids to flow for longer periods of time which causes you to lose weight. Each experience of that diet soda by your 5 senses causes at least an anticipatory insulin response which keeps fatty acids out of circulation for 20 minutes at a time. The 20 minutes is in a normal person. Someone with hyperinsulinemia? ...........

If you were good at "ignoring the trigger" you wouldn't drink the diet soda in the first place.

Regards,

Charles

Call me crazy, but they probably do it to add weight to the meat, since they charge by the pound 😊

Very good point. I bet that's it exactly. Make it weigh more... just like adding fillers to ground beef.

One of the MANY reasons I NEVER shop at Wal-Mart.

I love BBQing outside! We only use briquettes & wood, no gas grill here. I really like a ribeye or some fatty beef ribs where the fat is crispy, smokey, charred on the outside and the meat is rare on the inside. My meat is not on the grill long enough for the fat to drip off.😊

Are you my long-lost twin???. 😐

nyteez Wrote:
My second choice is the nuwave oven, I'm getting pretty good at cooking meat in that thing.
I have *got* to get one of those Nuwave ovens! I shoulde bought that instead of a camera for my birthday!

I saw an infomercial for the Nuwave oven the other day. All they kept talking about is how it cooks out all the fat and makes the food so 'healthy'. I could imagine the look of disgust they would have on their faces if I poured those grease dripping they were so proud to dispose of over my food 😛
The thing looks pretty cool. I'll have to get me one some day.

Thanks! At least someone does. I'm not too keene on me right now! I need to just buckle down and "get 'er done"!

RE: Zero Carb / Meat and Water - Charles - 09-23-2008 03:14 PM

nyteez Wrote:
Normal seasonings (herbs & stuff) are really not a problem or shouldn't be. Even The Bear uses seasonings. The amount you use is so small the carb count is negligible.

You have an excellent point. However, I don't think we can be so general about it. Some people can eat things that others can't. When I used to look through the store for seasonings, it was very, very difficult to find seasonings here that did not have MSG or dextrose, or corn syrup or any other type of crappy additive. I don't know how it is there, but it's ridiculous here. BBQ sauces are really bad news. They almost always have sugar or corn syrup in them. Maybe it's just the U.S.

The point is that the carb count is irrelevant. If your body reacts to the sweetness in these ingredients, then that is enough. There is nothing special or hideous about carbs. It's our reaction to them. This is why someone can eat high carbs and another cannot. If a person only has nominal insulin resistance, they will appear to tolerate much more than someone who has it bad.

Regards,

Charles

RE: Zero Carb / Meat and Water - Charles - 09-23-2008 03:24 PM

Fully Wrote:
Charles, how did you learn about all this and who is the "Bear" you mention?

It's okay. Others know much more about Owen "the Bear" Stanley than I do so perhaps they'll chime in. I just recently read his thread that used to be on a forum before the people there just drove him away by constantly attacking everything he said. He didn't have much patience for those who disagreed.
I came to this from my readings of Stefansson (similar to the Bear) and other texts like GCBC. I haven't lived a zero-carb lifestyle as long as the Bear, but I've lost 75 pounds and I've learned a thing or two about insulin which no one seems to talk about. My only goal is to share what worked for me and hopefully a few others can find success with it and I will feel as if I have "given back" if you will.

I don't agree with everything that the Bear says, although I find him very fascinating and quite astute. I have had the benefit of Gary Taubes as a friend and e-mail partner and I think I've been exposed to some incredible science by Nobel-winning scientists that knew what they were talking about.

I think that all of these plans have to be adapted to the individual as we all come to this from very different places in our lives. Some have been obese for a long time and others haven't. That seems to make a big difference as to how easy or difficult this path will be. It's been shown in ALL the animal models that those who are the most obese have the highest levels of circulating insulin. This means that the central problem in common obesity is control of insulin.

The one thing I know is that people that eat meat and drink water do not suffer from the chronic diseases of civilization. Sure, it's possible to eat many things and have success, but I don't know anything about those methods so I leave it to those who do.

I realize that in many ways I am more strict than the Bear, but that's just the way I see it for folks with out of control insulin. I would encourage anyone to try it as the Bear does and if you have success, so be it. I feel the same way about Atkins Induction.

If you don't have success and you can't get your insulin under control, then there's always, something else.

Regards,

Charles

hmmm...never thought of it that way...I understood that AFTER having a sweet taste that you become hungry....not simply thinking sweet thoughts...

RE: Zero Carb / Meat and Water - nyteez - 09-23-2008 03:30 PM

LOL! I should have been clearer. When I say seasonings, I mean "real" food seasonings like herbs, garlic, pepper, chilies. I forgot that you can buy premade "seasonings". I don't buy anything premade because they have so much garbage in them. You never really know what is in them and I can't pronounce half the ingredients.

The only thing I buy premade is hot sauce. But now that I have some good Hot sauce recipes I don't have to buy it anymore.

RE: Zero Carb / Meat and Water - Charles - 09-23-2008 03:38 PM

abnormalslc Wrote:

That's why it's so hard for the obese to lose significant amounts of weight. They always have more of a "taste for the sweet" than others do. By "sweet" I don't mean just for donuts. It's always about the breads, pastas, and diet cokes. They always seem to be dieting and eating less but the weight does not go away. LeMagnen found that it was due to hyperinsulinemia which makes it very difficult for them to escape the vicious cyle.

Obviously, some tolerate diet coke and things better than others. It just seems to me that if you have a lot of weight to lose, why not just keep it clean, scale it back and lose all the weight you need to lose. When you get to where you want to be, then you can make decisions about what you want to eat and what you want to exclude.

When you get to that point, I'm pretty sure I know what you'll do, but we'll talk about it when you get there!

Regards,

Charles

Must be nice! 😃

RE: Zero Carb / Meat and Water - Charles - 09-23-2008 03:56 PM

Like I said before, I think people should be able to eat all sorts of things but depending on the individual situation, it just isn't possible for everyone. I should be able to enjoy eggs and I'm sure I could if I chose to have them. I found better success without them. I never acquired the taste for coffee despite being in the Navy where everyone drinks it. I found the taste to be bitter and I feel the same about dark chocolate. All of these things are learned behaviors. If I drank or ate enough of them, perhaps I would feel differently.

My thing is, keep it clean and get to where you want to go, if possible. Once you get there, you have the freedom and the ability to do anything you want. I don't feel deprived at all. I feel like I could have anything and I would be just fine. I don't because I choose not to. That's real power in my mind. Having the ability to just say no without any compulsion.

True Freedom!

True Freedom!

It really is true freedom, and I think that is what I like most about this WOE. I am finally free! I was always a prisoner of food, when was I gonna eat, what was I gonna eat, what am I allowed to eat, how often should I eat, what kind of food is there going to be at the party or the wedding. My life revolved around food. Now, I don't even think about it. I know I can eat whatever I want and just return to zero carb the next day, I just don't have the desire to.

I am just afraid after doing kimmers . I am afraid to explain how I feel because I am afraid someone will be angry with me.

Oh honey, we'd never get angry with you! Or pretend to be a Russian bride, or anything like that.

I'm not zero-carb yet, working my way there, but I am getting bored with my food and really don't care to eat. 😊A good sign! For me it's a matter of getting off the condiments. I love ketchup and HP sauce. Oh, and the diet soda. I don't drink a lot of it, but I average about one a day. Not a huge deal IMO, but I'd prefer not to want one at all.

I am going back to the gym this week too, finally, and I ordered a body fat analyzer thingy that I think should be fun. I'm slim, but I'm fat/slim, if you know what I mean.

cbnebraska,
Do not get down on yourself! I worried when I wrote that to you, it would be too harsh. I know you struggle a lot with how to make the necessary lifestyle changes. You have a lot more to deal with than just yourself, you have to keep your marriage working too. I know your husband is not ready for all the changes you want to make and that is certainly not a fun place to be. I know, I am married and totally understand the fine balance of making changes in our lives that our husbands do not agree with. Making the change to VLC can be tough enough, but you have someone trying to block your path at the same time.
You are the one who knows what is best for your life, not me or anyone else on this board. I can only offer my opinion and my advice and I only know what works for me. In reality, we do not know much about other people on the board and their lives and private struggles. You are a strong woman, you compete in athletic events that blow my mind. Give yourself credit for the amazing things you do in life instead of focusing on the little things you do not like.

Thanks, Suzanne. You weren't too harsh, it's the truth. I see it that I've been zero carb for 8 weeks, but really, I've had two sugar slip ups and then the coffee and the wine, plus whatever little bits I've gotten in seasonings. My weight hasn't budged a bit besides normal fluctuations since the first 2 weeks. That's frustrating to me. I have always been a perfectionist in many areas of my life and it is a struggle when I can't meet my own expectations. However, I do need to lighten up on myself. I'm sure many people who post here are hard on themselves as well. The line between success and failure seems so clear cut, so black and white with this WOE. No gray areas.... That's rough on a perfectionist. Ha ha! On the flip side, my job is a bit boring right now, I'm not real motivated in the gym and I'm not feeling really challenged intellectually in any aspect either. That makes success on the eating front more a focus for some reason. Hmmm.... Just typing this is a bit of a catharsis.

Good morning to all, BTW.

HI. Couldn't find an INtro or Newbie Introductions thread, sorry.

I'm not being humorous. Health is serious business!

RE: Zero Carb / Meat and Water - chris m. - 09-24-2008 06:07 AM

The responce to some of these issues has been great!!
It is starting to come down to a will-power thing.
You KNOW what you should do but doing it is another thing.
I think for so many years we have conditioned ourselves to "food is a party" Birthdays, anniversaries, weddings, funerals for goodness sakes! Let's go out to eat!! commercials on t.v. !

Now we know that food is just fuel for the body [no more - no less]
Just like breath air - drink water.
Air doesn't have to smell a certain way or water HAVE to be flavored a certain way!!

I think this is the best revelation I have from this thread [not only the science behind it which is "legion" here] but the psychology of why we do what we do - the cravings and feelings of hunger -
what sets these things off and how to over-come it!!

The anecdotal comments are priceless [ Cynthia wandering thru the kitchen - not hungry just want something] This is real life FOLKS and we all struggle with these things. How you all help each other is what is priceless!!
Chris m

RE: Zero Carb / Meat and Water - cbnebraska - 09-24-2008 06:07 AM

Well, that's an interesting perspective. I haven't swam since my last triathlon, so maybe I should try jumping in and cleansing off a little! Certainly can't hurt. Thanks for the support!

RE: For the meat and water eaters another ? - suzannevea - 09-24-2008 06:23 AM

So, introduce yourself here. I just cannot get a read on you and your intentions. But, so far I am leaning towards you being rude. Hope you can clarify my impression.

RE: For the meat and water eaters another ? - Ogg - 09-24-2008 06:25 AM

Wow, no intention of being rude. Just trying to participate like everybody else. What sort of introduction is required? Are there some samples somewhere on this board? Like I said, I couldn't find the Newbie or Introductions thread. Just point me in the right direction and I'll head on over there in a jiff.

RE: For the meat and water eaters another ? - suzannevea - 09-24-2008 06:29 AM

So, introduce yourself here.
I believe I did point you in the right direction, very clearly. This is pretty much your last chance with me. Stop playing games or move on. This is childish.

RE: For the meat and water eaters another ? - Ogg - 09-24-2008 06:36 AM

You have got to be kidding. I'm asking where is the place where new members post their Intros. In case you didn't notice, this board doesn't have a SEARCH feature. So where is YOUR intro? That will give me some idea of what sort of thing I'm supposed to post. If you aren't going to help then why the hassle? You want me to post an Intro HERE in a forum that's not an intro forum, it's a meat and water diet forum? Fine. Here ya go. I'm a recovering fatty, into bodybuilding, as is my lovely wife and our kids. We travel extensively, mostly in Siberia, Tibet, Eastern Europe, Scotland, and Texas, which is our home base. I am a published author on the subjects of ancient history, world cultures, and exotic cuisine, and my wife teaches English wherever we travel. After reading about the Yak Diet, I have cut all carbs and vegetation from my way of eating, resulting in tremendous vibrant healthiness as well as loss of two hundred and forty seven pounds. Which I have KEPT off for going on four months now. Now, who are you and why are you being so rude.

Chris m

Chris, I totally agree that LLVLC is a great learning and support tool, and this ZC/Meat&Water thread
has tons of life changing info. I've followed it from the beginning and it has helped me tremendously.

You mentioned that "it comes down to the will power thing". That used to be my way of thinking as well. But once I went VLC willpower doesn't seem to be a real issue anymore. For me, the willpower was what I thought I needed to control the cravings, but that wasn't necessarily true. The cravings are practically non-existent on VLC and those who are ZC will tell you they are completely gone!

In addition, another valuable bit of info that really helped me on LC was from Dr. Stephen Gullo, author of "The Thin Commandments Diet". The First Commandment is, "Strategy is Stronger Than Willpower". "The winners at weight control do not have more willpower than those who fail - they have more strategies." And then the next nine commandments are the strategies. Some of us did a discussion/summary of his book on the old board and Linda Sue reposted the thread here if you'd like to look at it.

But like I've said other places on this board, once I eliminated most of the so called 'allowable' LC foods from my diet and went VLC it seemed that willpower, which never worked for me anyway, was no longer a real issue. I never dreamed I'd see a day that cravings weren't a part of my personal food battle. But those days have become a reality with VLC.

**RE: How to eat meat - cbmarie - 09-24-2008 07:26 AM**

As I said before, raw is not for me - I do cook all of my meat to medium and pork to well done. Even though most pork in this country is safe, trichinosis is not something I ever want to deal with, or any intestinal parasite. My one bout with pinworms as a young child - probably eating mudpies - was enough for me.

My brother is married to a lady from Japan who is a fantastic cook. He eats raw fish - sushi- quite often and loves it. Much of the problem as was mentioned earlier is in the handling of the meat or fish.

**RE: How to eat meat - Ogg - 09-24-2008 07:32 AM**

cbmarie Wrote:

Not to argue but exotic cuisine is one of the topics upon which I have lectured professionally and have studied in many areas of the world through travel with my wife and kids.

The raw fish is actually termed sashimi, while sushi refers to the rice or more accurately the soured rice. Most of the time however when people say sushi they are speaking of the end result which is served -- i.e., the sour rice wrapped around various food items and then finished for presentation with sea vegetable.

Which reminds me -- I am hungry! 😊

I can't even begin to tell you how much I relate to that. For my birthday, every year, part of my gift was my parents would take me out to eat wherever I wanted to go. Even when I got too old for that, going out to eat became such an important part of my birthday.

Someone once told me, "eat to live, don't live to eat".

---

**RE: Zero Carb / Meat and Water - cbnebraska - 09-24-2008 08:08 AM**

I have a bit of a different opinion. I can wander into the kitchen **not the least bit hungry** and be tempted to put something into my mouth just for sensory input. Honestly, I can be staring at something carby and think "that won't even taste good", but have the desire to **feel or taste** something, anything at that moment other than the boredom or bluness that I'm feeling. Deciding not to put it in my mouth is pure and simple willpower - or good decision making - or strategy -or whatever you want to call it. But it is not hunger or a craving for food. It's a craving for something other than whatever is going on right at that moment in time. It took me years to figure out a strategy that works, and sometimes it does and sometimes it doesn't -if time constraints are an issue. My "strategy" is to go up to my bedroom and read. I LOVE to read. I love to learn and it takes my mind off of the laundry I should be doing, the lack of motivation to move on to the next task or whatever needs to happen next in the day to day process of life. It provides me some sort of input and breaks my thought patterns.

Now, this makes me sound like I'm in some sort of a depression, but really, I'm not. I simply have short periods of time where life isn't throwing enough at me to keep me hoppin'. I need to be kept busy, but I am not a great initiator in a lot of ways. I'm the type that will come up with great ideas, but I want someone to do them with me. Just like everyone else, my motivation waxes and wanes, so getting through those periods of low motivation or low creativity, whatever you want to call it, can be rough. So, call it a strategy or willpower, or whatever you will, but it is not the same as an actual food craving.

---

**RE: Zero Carb / Meat and Water - caroline - 09-24-2008 09:11 AM**

CBNebraska,

Thanks for your post. I don't think you sound "depressed" at all. Yes, there is the insulin component. But I am much more interested in the emotional component. What makes us want to eat in the first place? What makes us want a little "boost?" While changing our diets improves health in every way, you are not freed from the basic problems of human nature. Maybe you don't eat, but then you shop, or you watch t.v., etc.

So I think you are dealing with a much larger issue. I agree that removing all these foods that were my "go-to guys" when I was bored, mad, sad, etc., has made life easier in that I don't binge eat. Now my feelings come out loud and clear--a little too loud and clear for my comfort sometimes. I think you are really smart to investigate what's behind the food thoughts, apart from insulin.

p.s About your "cheesecake" slip, if you can use these opportunities (as you obviously do) to further your insight, then you have gained something essential.

Thanks for being so candid about your struggles that I am certain, many others, relate to.

Charles

FormerDonutJunkie Wrote:
You mentioned that "it comes down to the will power thing". That used to be my way of thinking as well. But once I went VLC willpower doesn't seem to be a real issue anymore. For me, the willpower was what I thought I needed to control the cravings, but that wasn't necessarily true. The cravings are practically non-existent on VLC and those who are ZC will tell you they are completely gone!

Thanks for posting this and I can totally agree with it. I certainly do not have willpower. My wife does. She can eat two pieces from a chocolate bar and put the rest in the refrigerator for a month and it not bother her. I have to eat the entire thing right now. Not only that, but I'm thinking of when I'll go and get the next one.

For me, I had to eliminate them, but it was more about strategy than willpower. If I eat a big beefsteak with extra fat, you cannot tempt me with any other food under the sun, plain and simple. There is no willpower there, it's just that I am not at all hungry.

It helps me to think about the physiology involved sometimes. Insulin is so powerful that it recruits your central nervous system, your hypothalmus, your blood pressure, and many other systems to make you hungry. It removes all nutrients from your bloodstream which instantly makes you have more room for food that you otherwise would not eat. That should inform us that the problem is more related to physiology than it is to our mental state. There are people who make enormous sums of money based on the belief that those who overeat are only being led by their gluttony and sloth. They have people
feelling guilty and scared to eat. They think that if they eat or don't work out, they'll automatically become fat.

This is a major travesty and it's surprising that all of us aren't fat if that's all it takes to get there. You must remind yourself often that you did not become overweight because you ate too much and didn't run a marathon. That's complete and utter garbage. You simply ate the wrong foods which caused your insulin to rise and remain elevated for inordinate periods of time. This is the cause of all the chronic diseases of civilization and obesity is just one of many symptoms.

You have an opportunity to make a few hard choices and reverse the damage that you inflicted upon your body. Your mind is perfectly fine and healthy. There is nothing deficient in you or your mental state. Develop a strategy and overcome the obstacles. You can do it!

Regards,

Charles

RE: Zero Carb / Meat and Water - jeepifer - 09-24-2008 12:34 PM

I find a lot of what I crave is kind of like remembered actions. For example, eating popcorn during a movie.

Or, like today I met DH at a Mexican restaurant. I walked in and told him to keep me away from the chips. I didn't *really* want them, but from numerous times in history I remembered munching on them with salsa before the meal. I ordered the beef fajitas, sans beans/rice, and ate the beef. I was fine without those chips. But at first it felt odd not to have them, you know?

It's something like reprogramming habits. I saw a great quote once that said:

"Habits are first cobwebs, then become cables."

RE: Zero Carb / Meat and Water - Charles - 09-24-2008 12:57 PM

cbnebraska Wrote:
I have a bit of a different opinion. I can wander into the kitchen **not the least bit hungry** and be tempted to put something into my mouth just for sensory input. Honestly, I can be staring at something carby and think "that won't even taste good", but have the desire to **feel or taste** something, anything at that moment other than the boredom or blahness that I'm feeling.

Okay, when I say "craving" I'm not at all just talking about the issue of wanting something to eat. I really get it. **I have done this very thing myself.** I'm telling you that this is not natural. The mental reason why we put something in our mouth is very irrelevant. There is a reason why boredom and blahness can be ameliorated by putting something in your mouth, no matter what it is.

If we'll all remember back to the high-carb days, when you ate a restaurant and finished your entree, that waiter would come by and offer you desert. If you thought about it, you were stuffed and you generally said, no, thanks. Then, you would see desert walking by on a tray and you then decided to have some. Even though you were stuffed, you found a way to get a piece of pie or cake down.

Oh sure, you could develop strategies and willpower to overcome this situation, but this is not the same
as having your insulin under control. You shouldn't have to contemplate reading or some activity to keep from putting something in your mouth. It's not about strategies or willpower. When you get it together, you won't need either. You just will have no inclination to eat unless you are hungry.

If you understood what I've written about insulin then you understand why the situation becomes mental. Your pancreas already knows that you're not going to be adding any sugar; but the insulin is already out there and has cleared your bloodstream and initiated the eating process at a time when you should be satiated. At this point, it is trying to balance your blood sugar not your stomach. It could care less about your stomach. This issue affects your nervous system on so many levels.

There are many on this forum who have zero-carbed for a period of time and they can attest to the fact that you will not do this anymore when your insulin is under control. These folks who are just getting started for a few weeks or even a couple of months really have no idea of how calming insulin control really is.

I've been doing this for close to a year now and only recently have I begun to feel completely in control. I used to go to Golden Corral and feel powerless before the cheesecake. After a while, I was okay with the deserts, but I couldn't resist some of the saucy meat and things. I would be nervous if someone in my family wanted to go there because I knew I would have to overcome my desire for desert or something.

Now, I can go there and only eat the steak and drink water. Not only that, but it's the only thing there that I remotely want. There is no more willpower or strategies to avoid certain things. The other things simply don't exist even though everyone else around me is enjoying them.

It took almost a year of zero-carb to get to this stage. Trust me, I understand what many of you are saying, but you have to know that it really does take time to reverse this. It's all going to feel emotional until it isn't anymore.

When that day comes, you'll come on here to tell me how you finally understand. You'll finally understand what true freedom feels like.

Regards,

Charles

I agree 100% with you Charles. The truth is, eating this way isn't boring OR entertaining to me. It's just eating. Someone once said "eat to love, don't love to eat". I know what they were talking about now. I watched my wife eat a big slice of what was my favorite pie in the world last night and I wasn't remotely interested. There is nothing that tempts me anymore, even if it tastes good it isn't at all worth sacrificing the well-being I have found.
Interesting topic,

I had eaten a LOT of my beef completely RAW for about 20 years (yep, I was about 5 or 6 when I started eating it like this), I LOVED raw beef, I also learned to LOVE raw salmon (wild, of course) and I would also eat undercooked duck and chicken, but NEVER pork.

Interestingly enough I never got food poisoning or blatantly unpleasant symptoms.

However....

last month I was doing my first attempt at a cleansing of my system and I... came across a rather UNpleasant surprise while flushing my system out....

a tapeworm piece...

about 4 inches long and oh, yes, I know that's what it was for sure. It was the head end with the segments clearly defined as well.

Needless to say, I do not eat raw meat any longer and any plant's I DO eat I clean with H2O2 to destroy any baddies if I plan to eat the plant raw.

I am thoroughly disgusted and since then I have gotten rid of many of what my husband calls "The Foreign Legion" (what a peach he is, huh?). My metabolism runs far more smoothly now, and my allergies are also disappearing along with my cravings and mood swings.

I cook my beef to 140 now (even though I miss the taste of raw beef) and cook my other meats as well.

RE: Zero Carb / Meat and Water - cbnebraska - 09-24-2008 02:03 PM

I guess I'll just have to hope you are right. Hopefully, the boredom or desire for a change of pace or need for sensory input that brings me to contemplate food I'm not really hungry for and doesn't even look good to me will go away over time.

Another question. If the anticipation of food causes an insulin surge, does this same thing happen with the big juicy steak I'm contemplating as it's cooking? My mouth begins to water and my desire to eat it gets incredibly strong. Now this feeling is one I'd call more a craving. Right now, I am hungry. I am not at home and will not be getting to eat for another few hours. I know that I won't die, but I'm still hungry and I'm still thinking about my dinner and hoping the 2 hours pass quickly.

Does the surge only come with the anticipation of something sweet or carby? Why not with the meat?

In my pre-LC days I ate everything I eat now on VLC, meat, eggs, cheese, water and coffee. But on top of that I ate donuts, pies, cakes, pastries, ice cream, cornbread, biscuits, french fries, etc, etc. I've lost 53 pounds and I haven't exercised at all. My activity level has remained the same; primarily work related as a plumber. The only difference is the foods I ate prior to LC caused insulin to rise and stay high most of the time. I can truthfully say that my weight loss is not due to exercise, but trashing the carbs!

RE: Zero Carb / Meat and Water - Charles - 09-24-2008 02:12 PM

cbnebraska Wrote:

This is about the only time you get hungry when your insulin is under control. The Bear mentions this as well. There is an old saying that says "the appetite comes while eating" which means that the hunger is felt most acutely at the beginning of the meal. After a few bites, the hunger goes way down. Thus, food is never as good as the contemplation of it is.

By this logic, palatability is a learned response to the pattern of insulin secretion and the availability of fatty acids and/or glucose in the circulation.

Cynthia Wrote:

It does come with meat. Insulin is perfectly natural and normal. What is abnormal is to secrete between meals (or at a time you should be sated) and for insulin to stay in circulation so long as it does in those with hyperinsulinemia. It's normal to see a decadent piece of food and have a craving, but this should go away pretty quickly and you should go back to business as usual. Some people can't get back to business so quickly and this affects their ability to lose weight.

Charles

This is the Phase I insulin response to smelling or tasting or thinking about or anticipating food. The insulin released during Phase I clears the bloodstream, so you get hungry as soon as you start eating. Hence the phrase which Charles quoted, "The appetite comes while eating". They just didn't know specifically that it was an effect of Phase I insulin release but they knew how it affected them.

I found this out for myself this past week. I have been doing very low to zero carbs - low carbs including eggs and cheese only. Not much of either one, except for 2 days last week - overdid the cheese and eggs. Anyway - I made a small pot of coffee (yes I also do coffee- black) and decided to make a french vanilla and added ground all spice, nutmeg and cinnamon (first time for flavored coffee since I started). While it tasted really good - my body's response to having that large cup was to want food all day!! I craved food all day and was really hard pressed to stay within my LC - but did. By the next morning I was no longer feeling that. It did not go away quickly for me, so needless to say, that's the last time I put myself through that!! I did not like having that feeling. It was so out of control.

RE: Zero Carb / Meat and Water - PatTee - 09-24-2008 04:25 PM

Since I have been on VLC and most days zero, I have felt sooo much better than I've felt in a really, really long time.
I'm learning to listen to my system and can actually see myself eating like this for the rest of my life. Which is quite a statement for me. At this point, I don't know if I can pick one meat and stay with it as Charles says. For right now, I like to include fish with a variety of meat. Maybe that will come with time.
As a KK survivor, I found this way of eating lots easier and more satisfying than allowing myself more carbs and choices on other W'sOE. I was also very strict for 4 months while there. Anyway - I found that I gain with veggies. The cravings are hard to stem also. I have no cravings now, only when I had the flavored coffee, LOL!
I've lost 5" or more and one size down, since doing the VLC/Zero, the weight however, comes off very slowly. I'm sticking with it and I have faith that it will eventually come down too.

RE: Zero Carb / Meat and Water - Charles - 09-24-2008 05:39 PM

For clarity's sake, I really don't have a problem with a wide variety of meat. My advice to find one meat and eat it was more for those who have a lot of weight to lose and they want the quickest path. Very difficult? Absolutely, but you'll be surprised what people will endure when they want something bad enough. Some people spend thousands of dollars to lose weight and others only have to eat meat and drink water.

I would much rather eat meat over having some kind of surgery! 😊

RE: Zero Carb / Meat and Water - nyteez - 09-24-2008 05:58 PM

Cynthia - I am so glad you were candid enough to bring your experiences and thoughts here. 8 weeks seems like a long time, but it really isn't with zero carb. It took me 2 months of VLC and about 4 months of zero carb to get to the point of not wandering into the kitchen for "something". Yes, I did it too.

The Bear mentions if people can make it to 6 months on zero carb, they are more likely to stay with it. 6 months is a long time to stay with a diet when you may not be seeing significant weight loss. But after 6 months you really do begin to see things more clearly.

I am so glad Suzanna is here to verify women can do this too. Before Suzanna showed up there were no women who were successful or there were women who were struggling with this WOE and blaming it on female hormones. Suzanna is proof this can and does work for women too.😊

RE: Zero Carb / Meat and Water - caroline - 09-24-2008 06:07 PM

Not to be devils advocate, but our Suzanne is not over 40. It can change things a bit when you hit 40 and up. Now I realize this is a broad generalization, but hormones can certainly give people the run-around, so I think we need to take each person as an individual. Perhaps others can follow in their path, but alternatively, there may be other things coming to pass besides "cravings" brought on by emotion.

RE: Zero Carb / Meat and Water - caroline - 09-24-2008 06:10 PM

Suzanne,

I am by no means lessening your triumph--and it is a triumph to be able to have the freedom that Charles speaks of. I have found this too, having a very similar background to you with the bingeing.

But I think that we are all so different that there is no way for even the best science to guarantee that one size will fit all. Even if it is something as beneficial as zero carb.

My mistake Charles. I know that it is doable, I am not surprised - when on KK I ate nothing but chix cutlets then 1 type of fresh fish for 4 months straight. No added fats whatsoever. I adhered to the plan - 300- 500 cals. a day, I'm ashamed now to say. Yes I lost very quickly ( not the best way) - and also the hair on my head, muscle mass and kidney, gallbladder problems, palpitations - all of which I am trying like the dickens to not repeat. That- life long / long time desperation has left me - lose at any cost - that's where I was! I make sure now, that I have enough fats in or added to my meats. So if it is slower, it is slower - I also want to be alive to enjoy a thinner me. That's why I am here.
I have cousins that have had bariatric surgery - one successfully over time although she still eats next to nothing - the other gained back more than before the surgery.
I looked into it seriously and after my DH's office coworker ( at 35 yrs. of age) died after the surgery from sepsis from a surgically nicked colon, I absolutely chickened out.
So all this has lead me here. At 57 yrs. of age - still trying to figure out just what is right for me - sad that I was never able to get it before - but I'm close very close to knowing just what IS right for me. 😞

RE: Zero Carb / Meat and Water - nyteez - 09-24-2008 06:32 PM

Well, I am almost 42 and have had no issues with hormones or changes in my body or mood since I can remember. I honestly think female hormones are overrated and definitely to quick to blame for weight issues.

Quote:

You will know when it happens, trust me. I was on the pill the majority of my reproductive life and it handles a lot of the hormonal issues in and of itself. When I started having trouble with it, I had to go off and boy did the s__ hit the fan then! I would have gladly stayed on it until I hit menopause, but it was messing with my cycles. I've read it helps to handle the symptoms quite nicely.

You very well may be one of the lucky ones that doesn't get hit with it, but believe me, it is real for many of us. The age that it kicks in can vary from late 30's to early 50's, so you may not have gotten there yet either. I am only 40 but I am already suffering sporadic cyles, hormonal breakouts, heart palpitations, extreme fatigue and moodiness. I have NEVER suffered so much as a PMS symptom - besides cramping - until now. I would much rather NOT have something to "blame" it on, because I would feel much more in control, but I have gone so far as to track all the things I stated above on my calendar and there are definite patterns.
Just my experiences.

RE: starting meat and eggs today - kacey - 09-25-2008 02:08 AM

Hi there - How is everyone doing? I am hanging in there. It is almost 2 weeks now. I've managed to lose ONE POUND - which is depressing, but I'm not depressed about it (does that make sense?). I've skipped the eggs now all week which doesn't seem to hurt or help much (in terms of cravings or being full). I seem to have some residual, 'small stomach', problems left from liquid dieting. I cannot seem to get down more than 3 ounces of meat at a time. I want more a few hours later but my body just can't take more than that at any one time. Weirdest of all - I have, for the last 5 days, been sleeping like 12 - 14 hours a day!! What is with that? I'm a 7 hr a night person. Anyway - I'm just giving my body some time to adapt.

No real cravings but I've yet to experience the burst of energy that everyone talks about. I'm keen to get there!

So basically, I'm on around 65 - 70% fat, 1- 2% carbs (from the eggs or the cheese or a cup of tea), and rest protein. I'm putting some coconut oil in my tea (1 tsp one or two times a day). Not much else. Primarily either beef or fatty pork.

Just wanted to see if everyone else is hanging in there. I'll say this - it is easy NOT to cheat! 😊 So - I'm going for week 3 now!

Kacey

RE: For the meat and water eaters another ? - kacey - 09-25-2008 02:38 AM

Hi - I posted some questions about traveling in another thread (primarily about what do you take along) - but I think that it relates here also. I travel frequently. Last year, I had to take a sudden trip to China for 2 weeks. I had, at that point, been doing Atkins Induction (20 carbs or less) for 6 months. In China, well, let's say you can order whatever you'd like - but you are going to get mainly noodles, noodles, or rice. Teeny little pieces of meat (very fatty though) and not much veg either (all boiled).

I was deathly ill for a week. I thought it was the 'Chinese' food. It was the noodles.

How do I know? I had a planned trip to Mexico for holiday. Remote areas. I had some choices of bread, beans, rice, and some meat. Same reaction. I thought I would die from the stomach problems.

I agree totally that eating this way (very low or no carbs) is the best!!! But I am NOT looking forward to another one of these trips. I actually think I have to start 'carbing up' before the trip - if there is sufficient notice - so that I'm not sick for a week during the trip.

I'd prefer NOT to do that. I would appreciate other suggestions from people who've been in a similar situation.

Thanks for all the great input!

Kacey

Like Suzanneyea I am a moderator on this forum as are Charles, Jimmy, LindaSue and a few others. Again, welcome to the forum Ogg.

RE: How to eat meat - montmorency - 09-25-2008 05:07 AM

Uncomfortable reading! For what it's worth "The Bear" says he does not eat pork for this reason, since he likes his meat very rare, and he says pork is more prone to this sort of problem. He cooks the outside of his meats quickly to kill surface pathogens, leaving the inside rare.

Regards,
Mike

RE: Zero Carb / Meat and Water - chris m. - 09-25-2008 06:24 AM

Thanks for the excellent explanations on cravings, true hunger, insulin response, etc.
Now I get the diet coke, Splenda or stevia, et. al. thing!!
Yesterday was my first day on true 0 carb. Not one thing of a sweet nature entered my mouth. I was down 2.5# on the scale.
I even used - GET THIS - baking soda to brush my teeth.
And frankly my mouth has never tasted cleaner!!
As a bonus this morning was the FIRST time I have not felt "hunger" or wanting something to eat during my Y workout.
Complete calm - until I finally ate a hamburger patty about 8.
EXCELLENT!!

Way to go!!!
Hi Casey, what method were you using to flush?

Too much protein - Mackay - 09-25-2008 07:22 AM

Mike was kind enough to post this review of low carb and physical performance.

http://www.nutritionandmetabolism.com/co...75-1-2.pdf

At the end, the author mentions an Inuit condition called rabbit malaise that is related to eating too much lean spring rabbit meat. Essentially the Inuiuts were suffering from fat deprivation.

Any comments and/or experience with too much protein and not enough fat?

Ogg Wrote:

cbmarie Wrote:
My brother is married to a lady from Japan who is a fantastic cook. He eats raw fish - sushi- quite often and loves it. Much of the problem as was mentioned earlier is in the handling of the meat or fish.

Not to argue but exotic cuisine is one of the topics upon which I have lectured professionally and have studied in many areas of the world through travel with my wife and kids.

The raw fish is actually termed sashimi, while sushi refers to the rice or more accurately the soured rice. Most of the time however when people say sushi they are speaking of the end result which is served -- i.e., the sour rice wrapped around various food items and then finished for presentation with sea vegetable.

Which reminds me -- I am hungry! 😋

Thanks, Ogg for the semantics lesson. I will have to ask SIL about that the next I see her. I was raised in the old days with mandatory fish on Fridays and absolutely hate fish of any kind no matter how it is
prepared. I have cans of tuna in my cupboard that have been there for 5 years at least. They are cat food as far as I am concerned 😊

*Just the thought of raw meat makes me want to blow chunks.... the pink color even makes me sick! That's another reason I don't eat ham.. the pink color! Not to mention.. the taste is totally different when even a tad bit undercooked! As far as not chewing it... OMG!! There are times when I don't chew my food enough and it gets stuck in my throat.... PAINFUL experience that brings tears to my face! 😓*

Hats off to you Raw Meat Eaters.. I'm sure it's much easier-- less time to cook and fewer dishes to clean too! 😊
I am with you on this. LOL Just looking at rare or raw meat makes me puke. I heard that charcoal was good for the soul!! I like my meat cooked thru and its been 7 months at zero carb!

I'm with the both of you !! Gotta have it well done !!!

RE: Too much protein - Jimmy Moore - 09-25-2008 08:03 AM

I addressed this in a recent YouTube video, Mackay:

http://livinlavidalowcarb.com/blog/?p=2428

When you eat protein, the liver can create carbs with it. That's why eating adequate fat is essential to a healthy low-carb lifestyle. That's why people like Charles are always promoting eating the "fattiest" cuts of meat...they are indeed better for you despite being more calorie-dense. Hope this helps!

RE: Too much protein - montmorency - 09-25-2008 08:27 AM

I had a bad experience a week or so ago, when I bought what looked like some beautiful Aberdeen Angus "top rump" (not sure if that is UK-specific terminology). Although there was some fat on the outside at one end, when you cut it through, there did not appear to be a trace of fat in it. I did not worry too much, because I always cook with plenty of added beef tallow, but after a couple of days, I began to feel distinctly low, and headache-y. I'd been eating that stuff (cooked with added fat) exclusively, so I then began to make sure I was also eating fatty ground beef as well. Those symptoms seemed to disappear soon afterwards. It could have been something else perhaps, but since then, I have tried to avoid meat that doesn't actually have fat running through it.

Regards,
Mike

Not to be devils advocate, but our Suzanne is not over 40. It can change things a bit when you hit 40 and up. Now I realize this is a broad generalization, but hormones can certainly give people the run-around,
so I think we need to take each person as an individual. Perhaps others can follow in their path, but alternatively, there may be other things coming to pass besides "cravings" brought on by emotion.

I know that my mother, a trim high-carber all her life, started putting on abdominal fat when she hit menopause. She was fine at 40, but at 50-on, boy did she think her body was out of control.

Ironically, she can't get the tummy to go away--and it's probably because she's really started to eat more starchy carbs than she ever used to pre-menopause.

I try to get her to eat more meat and less carbs, but sometimes the thinking of a lifetime and multiple generations of eating-styles are very hard to change.

As others have said before, you also have to give the meat-water way time to work, and it can take from a month to a year.

BTW, as female hormones (estrogen and progesterone) drop with age and menopause, testosterone affects females more, so women who add muscle mass or at least maintain muscle mass will help keep back tummy-creep, imo. Low or zero carb and the weightlifting will probably work really well for 40+ women who don't have to deal with monthly fluctuations in their hormones. (I intend to give this theory a try when I hit that age!)

**RE: Too much protein - Charles - 09-25-2008 09:31 AM**

We've discussed this article many times on the forum already. A good search should find most of the comments, but make sure you click the "show posts" button as it generally shows the thread which isn't very helpful. Most of the people here consume a high fat diet to ensure they don't run into rabbit starvation and the issue is well-known.

Dr. Phinney's conclusions are very interesting but they don't necessarily dovetail with everyone's experience. His experiment does show that we need to use more intelligence in our training methods. We can't necessarily reproduce the same training results as our high-carb friends; however, we can equal their performance. After all, the purpose of training is to race, not more training.

Cynthia - I am so glad you were candid enough to bring your experiences and thoughts here. 8 weeks seems like a long time, but it really isn't with zero carb. It took me 2 months of VLC and about 4 months of zero carb to get to the point of not wandering into the kitchen for "something". Yes, I did it too.

The Bear mentions if people can make it to 6 months on zero carb, they are more likely to stay with it. 6 months is a long time to stay with a diet when you may not be seeing significant weight loss. But after 6 months you really do begin to see things more clearly.

I am so glad Suzanna is here to verify women can do this too. Before Suzanna showed up there were no
women who were successful or there were women who were struggling with this WOE and blaming it on female hormones. Suzanna is proof this can and does work for women too.😊

There are others who have been around a while who have been successful. ME!!!

Well I will be 51 next month and I have been LC for about 2 years and VLC/ZC now for about 6 months. My waist dropped a total of 7 inches so this WOE does help. Not to mention my skin and hair look much healthier. I see women 10-15 years younger and they look so much older. I really believe that carbs/sugar age you as well. I do not have any issues with menopause, but then everyone is different.
RE: Zero Carb / Meat and Water - Charles - 09-25-2008 10:41 AM

caroline Wrote:
But I think that we are all so different that there is no way for even the best science to guarantee that one size will fit all. Even if it is something as beneficial as zero carb.

I read this a lot but I'm still waiting for someone to identify the other "sizes" that supposedly work for others. Zero-carb does indeed "work" for anyone. Just because a person is unable to overcome their upbringing and acculturation to succeed at it does not change the fact that it works.

Zero-carb is not an "entity" or some mysterious being that one has hope in or puts faith in. Zero-carb is a reflection of you. It's who you are at your essence. Go fast for 9 months and I guarantee you that you will be on a zero-carb diet and it will work. During these nine-months, your body will only be consuming fat and protein, period! This is proof positive that this is what your body is designed to run on and what it prefers to run on. After the first seven days, you will no longer experience hunger. Your senses will be heightened and your brain will work better than it ever has. This has been well-established since 1915.

When we cloud things up with sweeteners, plants (coffees), dairy, etc, then we introduce a variable that our body would not be dealing with on a fast. Zero-carb, meat and water is very much a fast. Over time, your body will quit using other substrates and it will adapt to the bare essentials. On a fast, this takes about 13 days. On zero-carb, it takes about six months. I'm talking about six months of fatty meat and water, nothing else.

If you can make it this far, then you will have a different opinion. If one cannot make it this far, then they will doubt the veracity of zero-carb. It really is that simple.

Regards,

Charles

RE: Too much protein - Mackay - 09-25-2008 10:44 AM

Thanks Charles. I didn't "search" this topic. just scanned recent threads.

Bottom line is that your body creates too many carbs out of the protein?

RE: Too much protein - Ogg - 09-25-2008 10:55 AM

Because too much protein converts to CARBS then whoever follows an all meat path is NOT following a zero CARB path.

THEREFORE in light of this new information I hereby effective today have cut YAK and all other MEAT from my diet.

The REAL ZERO CARB PATH consists of FAT AND WATER ONLY.

My FAT of choices is YAK LARD.

Do NOT make fun of my DIET I will become very defensive.

As Mr. MOORE HIMSELF THE OWNER OF THIS BOARD has stated, "We are all different". Some are more different than others.

RE: Zero Carb / Meat and Water - Charles - 09-25-2008 11:01 AM

A lot of people get into this "it works for some and not for others" business and I think this is the wrong way to look at it. We've had many successful women on this forum and I'm glad Angela spoke up. Con has also been very successful. I'm not going to start naming names because I'll forget and they'll be mad at me. If they want to come on and tell you, then that's up to them.

You have to understand also that not everyone who reads this thread decides to post on it. I get e-mails daily from people who vividly share their stories and seek advice. I won't reveal their names but you'll see them every now and then popping in just to say hello. One person was at 250 and they are now at 208 at 6" tall. They reversed Type 2 Diabetes and they have cut their blood pressure meds to 50% as they've lost. They have only been at zero-carb for 2 months.

Another has their entire family doing zero-carb and they have been doing so for 8 months. The mother lost 40 pounds and the father lost 60. Another is going through pregnancy on zero-carb and doing just fine.

Others have not been as "successful" but they know what to do and how to get there.

These are real people who occupy a great deal of my time but it's worth it when I get an e-mail in the morning and they detail how they implemented what I've asked of them and they report success.

Far too many people look to others for self-justification and things like that. This is a dangerous practice. You really can't look at another person, especially on a forum when you really don't know what's actually going on.

If I had a dollar for every person who told me that they've been "strict" zero carb for a "long time" yet it doesn't work. Upon closer examination it is invariably revealed that there were many "cheats" and they don't do meat and water as I have described it.
I don't generally "go BEAR" on people but sometimes his words need to be repeated. If you are hungry and having cravings, you are eating carbohydrates. There is no other option, no other "size" that will fit. We were not designed to eat carbohydrates so I cannot be convinced that there is any healthy diet that includes them.

I am not now nor have I ever been constipated on this way of eating. As I have shared many times, when I have to go, I have to go. Get the hell out of the way! 😝You won't go every single day and that's okay because there is nothing in there to gum up the pipes. There is no need to sit in the restroom for hours because if you don't have to go, you're not going! Some people get into this "cleansing" business so much that they feel if they don't go at regular intervals, something is wrong. If you drink excessive amounts of water, this will likely come out some place and things will be loose. That does not mean, however, that you have dysentery.

It may be that one can "tolerate" 20 grams of carbs per day, but that doesn't make for something I would consider "healthy." Zero-carb "works" for everyone. I do admit that it's difficult and for some people it will be impossible, but you must know that it is a reflection of you and only you can determine whether you will implement it or not.

As Yoda said,

Quote:
Do or Do Not. There is no Try!

Mackay Wrote:
Bottom line is that your body creates too many carbs out of the protein?

That's the theory but there is no truth to this. Gluconeogenesis only happens during starvation and even then it is a rare occurrence. Moreover, we know that all-meat populations do not have the symptom of obesity or any of the other diseases of civilization. This is a common rumor generally propagated by
people who have not found success on their low-carb diet, but there is no truth to it.

We have posted the entire benchmark starvation study which was performed by Francis Benedict in 1915. It is still regarded as THE study on starvation. There, they found that after 7 days on a total fast, our bodies use zero-carbohydrates and protein drops off to very little. In fact, our bodies conserve protein and it doesn't need very much.

As the fast continues, notice how the protein use decreases and the fat use increases exponentially. If gluconeogenesis was being performed, then clearly there would be more use of glucose after 13 days. However, there is none. No research has actually shown this gluconeogenesis that everyone wants to blame. The key is to eliminate the carbohydrates and eat plenty of fatty protein.

Using protein for glucose would weaken us, as Dr. Groves explains:

Quote:
While the body can use protein as an energy source in an emergency, it is not at all healthy to use this method in the long term. All carbs are made up of just three elements: carbon, hydrogen and oxygen. All fats are also made of the same three elements. Proteins, however, also contain nitrogen and other elements. When proteins are used to provide energy, these must be got rid of in some way. This is not only wasteful, it can put a strain on the body, particularly on the liver and kidneys.

Too much lean protein is a problem, not because of conversion to carbohydrates, but because of ammonia (hyperammonaemia) build-up in the body. This is toxic and this can kill you in short order. Therefore, regardless of the amount of protein, there should be plenty of fat. This is why all low-carb diets, even zero-carb, are high-fat diets. There are no high-protein plans promulgated on this forum.

Protein is self-limiting as is fat. You would be hard pressed to eat too much of either. It is possible to eat too much lean protein, but your energy levels clearly let you know when this occurs. Some added fat generally fixes the problem very quickly, as some of the Inuit discovered in the spring.

Regards,

Charles

**RE: Zero Carb / Meat and Water - Tana - 09-25-2008 11:51 AM**

I am a firm believer in zero carb, it took long enough for me to finally wrap my brain around eating good fats. I am 63 in two months, and I feel so much better without the carbs and sugar. Not to say that I don't have times when I eat something I shouldn't, but the after effects of carbs and sugar remind me why I don't eat them.

I noticed my metabolism changing when I got close to 50, even trying to eat Atkins style, I kept gaining. Finally, as I got close to 60, I got closer to eating induction level Atkins style. A short time of kimkins style eating proved to be too low in fat, causing dry skin and dry eyes, besides not being a satisfying lifestyle. After increasing fats, and keeping carbs low, I did lose over 100 pounds in about ten months.

I attempted to go back to eating less than 20 carbs, but was finding my weight creep up and cravings return. I was fortunate to find this thread, and I now do zero carb eating. It would be unrealistic to think that a person can eat the same amount of food at age 60+ as when they are in their 30's and 60's, which I think some of us had been doing. I am working on losing 10-15 pounds to get back to my goal, but at
least I can eat all the meat I want and feel great getting there.

My skin is in great condition and I no longer have to use drops for dry eyes. My triglycerides are 58, and my HDL is 86!

Thanks to all you zero carbers for posting, I appreciate the time everyone takes to share their experience for us newbies to this WOE.

Eggs give me horrible acid, which is why I don't eat them. Maybe that's what is going on with you. The other possibility is since you only started Monday, your stomach is still producing enzymes in anticipation of foods it isn't getting.

FROM THE CONCISE BEAR:
A zero-carb all meat, 80/20 (by calories: fat/protein) diet delivers the necessary small amounts of glucose from glycerol- while most of the daily glucose requirement (as seen in a mixed diet) is replaced by ketones, which- like glycerol- are by-products of fat metabolism. If you are properly using the ketones in your body as food (glucose replacement) - you will not see them spilling in your urine. Dietary protein is never used to make glucose in a fat-sufficient dietary situation.

kacey Wrote:
Hi - I posted some questions about traveling in another thread (primarily about what do you take along) - but I think that it relates here also. I travel frequently. Last year, I had to take a sudden trip to China for 2 weeks. I had, at that point, been doing Atkins Induction (20 carbs or less) for 6 months. In China, well, let's say you can order whatever you'd like - but you are going to get mainly noodles, noodles, or rice. Teeny little pieces of meat (very fatty though) and not much veg either (all boiled).

I was deathly ill for a week. I thought it was the 'Chinese' food. It was the noodles.

How do I know? I had a planned trip to Mexico for holiday. Remote areas. I had some choices of bread, beans, rice, and some meat. Same reaction. I thought I would die from the stomach problems.

I agree totally that eating this way (very low or no carbs) is the best!!! But I am NOT looking forward to another one of these trips. I actually think I have to start 'carbing up' before the trip - if there is sufficient notice - so that I'm not sick for a week during the trip.
I'd prefer NOT to do that. I would appreciate other suggestions from people who've been in a similar situation.

Thanks for all the great input!

Kacey

I am sorry I do not know the answer to your dilemma, as I have not had that same experience nor for my wife and family anything aside from occasional intestinal problems especially due to microbes in untreated water. So I don't know if the noodles, rice, beans, fiber, and other carbs would be the culprit or if it was the water in the broth, the spices used, the possible lack of sanitary food handling, lack of sanitized serving dishes and utensils, allergic reaction to some ingredients, or some other as yet undiscovered factor.

You might consider seeking medical specialist for testing for parasites as I have heard some real horror stories.

All ingested fat comes in the form of triglycerides (TG or TAG). TGs are comprised of three fatty acid molecules and one molecule of glycerol. So you get the glycerol which is converted to glucose from the fat you eat on a zero carb diet. Else your brain gets what it needs from ketones.

RE: Too much protein - con - 09-25-2008 01:38 PM
Mackay Wrote:
how come your blood sugar can rise even on zero carbs?

We secrete hormones like cortisol, epinephrine and norepinephrin early in the morning to give us the energy to get up. These hormones raise our blood sugar levels by using glucose stored in the liver. Otherwise, on ZC from what I've read, BG is very stable.

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 01:38 PM
We don't know everything. People can be wrong. I never said that people on zero carb (myself included) doing well, weren't having that success. My only point, was that it is POSSIBLE that it doesn't work for everyone. I didn't say it is CERTAIN.

"Working" for everyone may mean something like people not being able to handle the fact that they don't move their bowels for months and months. I am on this forum b/c I believe in low carb.

RE: Too much protein - Charles - 09-25-2008 01:58 PM
Mackay Wrote:
OK. So help me out here. If your brain indeed can only use glucose, where does this come from and how come your blood sugar can rise even on zero carbs?

The idea that "the brain can only use glucose" is the part that has never been demonstrated. This is very similar to the idea that muscles burn glucose for fuel and that the heart and nervous system take up glucose, which they also do not. When the tests are performed the expected glucose uptake does not occur.

The brain uses glucose when it's available but it does not require it. Many studies have shown glucose-use by the brain when available but "the transport mechanism has been poorly defined due to difficulties in determining intracellular glucose concentrations." Unlike adipose tissue and muscle, brain tissue is not accelerated by insulin although there have been a few reports to the contrary in 1958, and 1965.

Many of these theories are only true in certain "states" that the body finds itself in. What the body
"requires" can only be determined when there is an absence of all nutrients. In that case, the body uses fat at an astonishing rate as the chart shows and conserves protein. If the body was making glucose from protein, then there would be evidence of it.

The 2002 Institute of Medicine (IOM) Report has a discussion of this and it acknowledges that the brain will be fine without carbohydrates because it runs perfectly well on ketone bodies and glycerol. It talks about protein-derived glucose, but I agree with the Bear that this does not happen and the fasting data bears this out.

Regards,

Charles

"Working" for everyone may mean something like people not being able to handle the fact that they don't move their bowels for months and months. I am on this forum b/c I believe in low carb.

FROM THE CONCISE BEAR:
The carnivorous diet has no left-over rubbish and masses of dead bacteria to void and even if you wind up only going every other day or even less, it is of no consequence. Eating veggies like lettuce while attempting a meat diet will REALLY upset your gut. Strict meat eaters are never constipated.

Through personal experience I found out a person can't experience freedom from constipational woes(hee hee😁) until ALL previously ingested plant matter has been eliminated. A wild guess might be 3 days without carbs to get rid of them all from one's intestine? If one is having horrible pain in the 1st week of transition a suppository(Dulcolax is painless)works extraordinarily well!!!!

---

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 02:11 PM

Well, you may be right, Patti. Perhaps it would have taken him a year to remove all previous plant matter. But he's not willing to not "you know what" for a year.

---

RE: Zero Carb / Meat and Water - Charles - 09-25-2008 02:21 PM

I just don't know that one can attribute this "not going for months" to zero-carb. There may be another factor at work here. I won't speculate because I don't know what he eats, but it's impossible to know what else is going on in his intestines that might have existed before his attempt at zero-carb. I have not heard of anyone else not going to the bathroom for that long on any diet.

My experience completely dovetails the Bear's, and from the sound of it, most of you are the same.
RE: Zero Carb / Meat and Water - nyteez - 09-25-2008 02:23 PM

Somebody who can't "you know what" for months or a year, has a very serious problem. Don't you think you are being a little extreme?

Any change in our diets is going to cause a change in our BM's. Constipation has nothing to do with zero carb.

RE: Zero Carb / Meat and Water - Charles - 09-25-2008 02:24 PM

cbnebraska Wrote:
It's not that it works better for some than for others, it's that some have an easier time with the strictness and all or nothing commitment that this WOE requires.

That's my only point. I do know it's tough and I even acknowledge that not everyone will be able to do it. I appreciate the difficulty, I really do.

PatTee, I didn't start out this way, but one of my e-mail partners did start at zero-carb from the beginning and his weight loss has been astonishingly fast. I feel like I would have been the same way if I knew back then what I know today. That's the reason I provide such strict guidelines because I think if someone can deal with the initial discomfort, they will get there quickly.

I feel bad for people until I hear what former Kimkin's people went through. I figure that if they can go through that, then this is pretty easy!

Regards,

Charles

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 02:28 PM

My husband did not have this problem before going zero carb. I am not getting what you mean by "don't you think you are being a little extreme." If you mean am I exaggerating, no I am not. He didn't have to go--he used enemas instead. Perhaps that clarifies things.

RE: Zero Carb / Meat and Water - Charles - 09-25-2008 02:30 PM
caroline Wrote:

Hopefully, she'll clarify what she meant. I don't know if that was for me or you...

Did he have stomach cramps and pain or did he just never have to go? What prompted the enema? Just sitting around and saying, you know, I haven't gone in a week, I need to make myself go, or was he doubling over with stomach cramps and had to take an enema to relieve the pain?

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 02:32 PM

Nyteez,

Your incredulity (I assume that is what it was) around the fact that dh never had to go mirrored my feelings exactly. That's why it was such a quandry, in spite of the fact that he was eating without "cheats."

RE: Zero Carb / Meat and Water - nyteez - 09-25-2008 02:32 PM

cynthia Wrote:
Have any of you ever fasted? For how long and what does it feel like? What did you go through in the way of energy, brain power, light headedness, etc...

I fasted for 5 days. It is not easy! The first 2 days are the hardest. Headaches, hungry & tired. The last 3 days I wasn't hungry, but I just had no energy and no brain power. I would have stayed on it longer, but I had to work.

PatTee Wrote:
Just curious - has anyone here started with ZERO carbs without ever doing the LC's, whatever plan, first?

I started with atkins induction but I kept the carbs at less than 10 for 3 weeks, then around 5 for a few weeks then went zero.

I thought she was making a generalization that people who go zero carb have problems going for months.
RE: Zero Carb / Meat and Water - Ogg - 09-25-2008 02:36 PM

All joking aside. Getting serious here for a minute.

It's always interesting when people report problems and are then accused of either lying or doing it wrong or whatever. Caroline is concerned about her husband. She has explained why she's concerned. There are obvious established medical reasons for that concern. But never mind all that, because according to self appointed experts she must be lying, or her husband is lying, or he didn't follow the "right path".

Very sad state of affairs indeed.

nyteez Wrote:
I thought she was making a generalization that people who go zero carb have problems going for months.

Oh....I'm sorry, I didn't understand.

I, too, think that there is something else going on in his insides that zero-carb only manifested. Adding veggies may mask it further even though he can go, but that's something I would get checked out. I don't like the sound of colonoscopy, but if I were him, I would check it out.

I'm leaving work, so I'll check in later.

Regards all,

Charles

I don't think anyone has said that. The issue is whether what he is going through is related to the diet or not. She seems to be suggesting that perhaps the diet doesn't work for everyone because of his troubles which may not have anything to do with zero-carb. That's the issue.

There is no need to cloud the issue further.

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 02:41 PM

Nyteez,
I said "my husband" in all of the reference to low carb. I did not reply "all zero carb people are constipated." Hopefully, that clears it up. You did not read correctly.

Actually you didn't. This says "people" not my husband. You didn't mention that your DH is really having a problem for few posts later.

**RE: Zero Carb / Meat and Water - Richard - 09-25-2008 02:45 PM**

As someone diagnosed with IBS many years ago I can also verify the ZC has straighten this out too.

I had a problem with excessive mucus production in colon. After about 2 weeks on ZC this went away although it got worse after the first week of ZC.

I still eat some cheese (a slice or 2 every 4-5 days) and still on the heavy cream in 1 cup of coffee in the morning. This was about the same amount of dairy I was having before ZC. So the mucus production does not appear to be from the dairy.

But all my previous issues have gone away.

If someone is have constipation issues they are not eating enough fat. Fat does several things but one of the best is 'greasing the wheels'(my limited experience talking there!).

**RE: Zero Carb / Meat and Water - caroline - 09-25-2008 02:47 PM**

If someone said they were unhappy b/c they were overweight, would you say, "aren't you being a little extreme"? If something concerns me, as things concern you, Nyteez, then it is not "extreme." I think it's impolite to grade or judge someone's concerns. I don't appreciate it.

You are taking this all wrong.

Your statement
Quote:
"Working" for everyone may mean something like people not being able to handle the fact that they don't move their bowels for months and months. I am on this forum b/c I believe in low carb.

sounds like a generalization, that zero carb will not work for some people because they will not be able to handle not "going" for months and months.

As a general statement "people not being able to handle the fact that they don't move their bowels for months and months" IS extreme, because this is not the case with most people.

That is all I ment. You did not indicate that this was a real problem with your DH.

**RE: Zero Carb / Meat and Water - Ogg - 09-25-2008 03:00 PM**

Quote:
**Strict** meat eaters are **never** constipated.

So let me guess ... the author of that statement has personally interviewed **every** "strict meat eater" throughout human history and has verified that **not a single one of them ever** experienced constipation.

**RE: Zero Carb / Meat and Water - Ogg - 09-25-2008 03:09 PM**

nyteez Wrote:
they don't move their bowels for months and months" IS extreme, because this is not the case **with most people**.

This is not the case with most people? For that claim to make even the slightest bit of sense, all people, or at least all people who had been living on nothing but supermarket beef/beef fat and water for a certain period of time, were tracked, studied, interviewed and tested, and that all the data from that tracking, studyies, interviews and medical tests have been correctly tabulated and calculated and THEN all the numbers proved that "most" (whatever that percentage was) had not experienced lack of bowel
movement for "months and months."

It's so easy to make these blanket statements like "this is not the case with most people" without having to back it up with factual data -- and in so many instances, including this one, there is no factual data about "most people" because "all people" have not been tracked, studied, interviewed and tested.

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 03:13 PM

Look, I'm sorry if I was testy, Nyteez. It sounds like we had a miscommunication. I value your input on this forum. Maybe my husband is 1 in one million. Maybe not. The main thing is that I want him to feel relaxed and happy.

I didn't and haven't had a problem with this WOE. My husband did. I never referred to anyone else being constipated but him. I wouldn't know that information.

RE: Zero Carb / Meat and Water - Ogg - 09-25-2008 03:25 PM

In that case I misunderstood the content and tone of some of the posts directed at Caroline.

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 03:25 PM

Glad we got that settled. I hate conflict! That makes ME constipated! LOL

Now he is doing some vegetables. He even has bananas now, which made me raise my eyebrows, so to speak. But I can't argue with him. Trust me, I tried and tried. What else would you do if you love someone. He was pretty gung-ho b/c I kept reading him all this great stuff, and I showed him before and after pictures of Charles. (Even though weight wasn't an issue for dh.)

I am determined to stay my course, and it's not affecting my food decisions. And it may be that his system is particularly sluggish, and maybe he would have had to do enemas for the next few months even. But there is no convincing someone when they are anxious and determined about something and set to do as they will.

Thanks for being understanding. I appreciate your input, Dana.

Sincerely,

Caroline

This comment is not directed at this constipation issue but is a broader comment.

When someone fails to achieve one's goals even when they say they are following things to the letter and not succeeding, there is always someone who comments however subtly that they have deviated somehow, someway. Now this doesn't happen all that often here in this forum but it does happen. They don't accuse the person of lying (probably too strong a word) but they sure do express doubt about if they are doing things correctly. Just my 2 cents. I think it is human nature to doubt others.

THAT'S CORRECT!!!!!!!!!!
RE: Zero Carb / Meat and Water - daveo - 09-25-2008 03:53 PM

To paraphrase The Bear, it is amazing how obsessed and neurotic people are about their bowel movements.

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 04:00 PM

Maybe it's no different than the same socialization we talked about that makes people think they need salt...or vegees. The idea about what is "normal" causes anxiety when the result is something other than the idea.

But in dh's case, I'm going to give him a break and not characterize his upset over constipation as "neurotic" b/c I don't know what it feels like to be in his shoes. And until I or someone else goes months without needing to go, there's no way to no what one would personally feel like.

I'm just grateful that my experience has been different, and compassionate for his struggle.

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 04:02 PM

Dana,

Lucky for you, you trained him properly. Get 'em started on the casseroles, force em to take away the steaks, and put them back on, and you have a plan!

Have a great day--time for some more work.

RE: Zero Carb / Meat and Water - Charles - 09-25-2008 05:19 PM

Carolina, I'm sorry, but I still don't understand your dh's constipation. Was he in pain or did he have severe stomach cramping or something? Did he just feel uncomfortable because he is used to going frequently or what? If someone else knows the answer to this, please let me know....

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 05:23 PM

No, Charles. None of that. He just felt "crappy" (ha ha) not ever having to go. The enema thing worked but he was freaked that the whole peristalsis thing never happened for him. really, I don't understand it myself. Unlike me, he is pretty methodical. He's not obsessed with food, has never been a sweets eater, and stuck to the diet.

I got him eating LOADS of fat, b/c I told him he must not be eating enough--but it never made anything "happen" so to speak. He's not doing loads of carbs now, but he is (although bananas hopefully wont become a regular item) adding some until he gets regular again. Oh well.

RE: Zero Carb / Meat and Water - Charles - 09-25-2008 05:25 PM

Ogg Wrote:
Perhaps she's right. Have you considered that as a very real possibility? Human physiology is complex enough that no one way of eating is going to work for everybody.

You have no foundation for this comment. You can't enter a thread 348 pages into it and take a comment out of context and attempt to assign meaning. Everyone here knows that I don't force my views on anyone. I only reply to what is asked of me. I am here sharing what worked very successfully for me and what I've found through study. I don't get any reward or benefit from what people eat or don't eat. Frankly, I don't care what you eat or don't eat. This thread is filled with people who are convinced of a certain way of eating, along with others who are trying it for themselves. We certainly do not need anyone instigating turmoil where none exists.

There is a major difference in my mind between a plan that works and a plan that works for a particular person. I readily admit that most people can not follow such an extreme diet due to many factors and that's quite okay. Everyone here already knows that. You're not adding anything that has not been covered ad nauseum. How about reading through this thread and find out what you've missed prior to sharing your views.

I'm beginning to understand very well why the Bear ended his participation in these forums.

Regards,

Charles

That makes a ton of sense, now. He's just bothered that he doesn't have to go. That makes a lot of sense. I think "eat more fat" works when thinks are actually blocked up and there are issues. In this case, his body seems to have been very efficiently handling what he threw at it. I've also always been regular even on my high-carb diet until I did low-fat. Then, all the fiber made me bleed.

Zero-carb intially did give me some mental hangups in the beginning because I was like clockwork, every morning. It took some getting used to when it only happens every other day or even every third day. I also felt strange when things were "loose" but I noticed that it wasn't really diarrhea because I didn't have the dehydration or the cramping. After a while, I adapted and now I can eat meat pretty rare and be just fine. That wasn't always the case.

As we said, there are going to be many, many reasons why people will not implement zero-carb and you've identified a good one. All of these reasons are good reasons and that's fine. I know many people who have their colon cleansed and things like that. They feel absolutely icky unless they get their "clean-out." I think that's unfortunate if they then resort to carbs, but hey, many people have done very well on a small amount of carbs so perhaps he's one.

Thanks for letting me understand.
Regards,

Charles

---

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 05:36 PM

Thanks for your concern and thoughts, Charles. I appreciate it.

You know, I asked him, after everyone made their comments, if it felt painful. His answer was that it was "unnatural," not healthy, and there must be something wrong with a diet that would keep you from "going." So at this point, I'm just going to be grateful that, like you said, he is doing low carb. He is a total believer in it--he can't NOT be--i have read him so much info and shared so much with him. And he's seen the changes in me. But he's not willing to wait it out, and I don't have the powers of persuasion to convince him otherwise.

Thanks for all your help and time--

I'm just grateful that my experience has been different, and compassionate for his struggle.

I think you may be right about the socialization. Some people can't bring themselves to eat fat (or whatever). They just can't accept that it is ok. The stress of trying to eat something you are not sure is good for you can be a real problem. That very well can be part of what's going on with him.

---

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 05:54 PM

He has never been fat phobic, and he doesn't object to the idea of fat. But in his mind, since he was regular before, and the change of diet was what brought on the change, there is a "problem." Now if there were studies telling people that it could be "normal" for people to be blocked for a while, or not have the urge, I don't know if even that would allow him to get over it.

---

RE: Zero Carb / Meat and Water - nyteez - 09-25-2008 05:54 PM

Quote:

That really makes sense. My mother "goes" 3 times a day. She would freak out if she only went once every other day or so. She would say the same thing, it's not normal. She would think food was rotting in her intestines releasing toxins into her body. She is a vegetarian.

RE: Zero Carb / Meat and Water - caroline - 09-25-2008 06:02 PM

You can always tell the vegetarians b/c when you go into the health food store here, (health food), they are OFTEN confused about very basic things such as price, or answering simple questions. The ones in their 20's often look pretty good, but then you see the others who are 30's and up, and they (at least the ones in the store here) look anemic, pale, and with very greyish looking skin. Have some more tofu!

RE: Zero Carb / Meat and Water - nyteez - 09-25-2008 06:17 PM

I know what you mean! My mother goes back & forth on her diet. She will eat meat for awhile, then go back to no meat. She has been off meat for about 9 months and she is getting nutty and looks terrible! I am trying to get her to eat some meat so she can get a few brain cells functioning again and some color in her skin. I can always tell when she hasn't eaten meat!

RE: Zero Carb / Meat and Water - jeepifer - 09-25-2008 06:42 PM

Question for those of you that do weight/strength training...

You've said that ZC means you don't have to work as hard or as much? How does that come into play? I am planning on two days a week (not 3 or 4) but do I lower the number of reps or sets too? What about weight, heavier or lighter?

Also, can someone give me the lactic acid primer again? We don't have any or as much because it's a by-product of glucose being burned in the muscle or something like that?

RE: Zero Carb / Meat and Water - daveo - 09-25-2008 07:23 PM

caroline Wrote:

So really, the problem wasn't physical, it was mental. That's cool, some people aren't cut out for it. Like The Bear says, acculturation and belief systems are pretty strong. Me, I won't worry about the last time I went to the bathroom, whether it was this morning or 2 weeks ago, unless I start feeling some physical symptoms.

Angela, I've noticed the same thing more recently on the fat loss/pant size phenomenon. It seems the farther I go along the less pounds lost it takes to get into a smaller size! Wow! I'm cool with that!

Dr. Eades says it's common to gain some muscle mass on this kind of diet, even if you don't go to the gym. So that could explain it. Muscle weighs more than fat!

The net effect of my loss was 6 lbs, which was fat. I may have gained muscle as well. I do go to the gym 3-4 days a week. I run 30 minutes and lift weights 1-2 days!

Not at all! I love it in so many ways. And there's always plenty of other plumbing problems to work on.
RE: How to eat meat - BlackPhase - 09-26-2008 05:26 AM

Mackay: I am actually using several things. The worm had been dead awhile (falling apart instead of breaking).

I am killing them now (I don't see them too much now like I did before) by using food grade hydrogen peroxide (diluted of course), and wormwood/clove/black walnut/oregano oil tea, then flushing the garbage out with a celtic sea salt laxative.
Got rid of a lot of impacted stuff and candida along with the rest. My tongue stays pink now, too, so now I can stick my tongue out at someone without worrying if it looks gross. 😊

RE: How to eat meat - BlackPhase - 09-26-2008 05:30 AM

cbmarie: a meat thermometer is a beautiful thing if you have one. You can then comfortably get it as rare as possible (if you like it that way) and KNOW that your at a safe temp.

Charles Wrote:
I just don't know that one can attribute this "not going for months" to zero-carb. There may be another factor at work here. I won't speculate because I don't know what he eats, but it's impossible to know what else is going on in his intestines that might have existed before his attempt at zero-carb. I have not heard of anyone else not going to the bathroom for that long on any diet.

My experience completely dovetails the Bear's, and from the sound of it, most of you are the same.

Charles

I know some who didn't and even had to remove bowel matter from their intestines with twigs they became so impacted.
That was the soccer team that crashed in the Andes and weren't found for months. There was a documentary and a book on the ordeal.
They resorted to cannibalism and of course their "meat diet" was very lean with no appreciable fat for the entire time.
You look at someone who has trouble with constipation and you can almost bet it's not enough fat. That was a revelation for me as I just knew I was going to "stop up" immediately BUT never did.
Again that "Fiber Menace" website has excellent info on the entire subject.

jeepifer Wrote:
You've said that ZC means you don't have to work as hard or as much? How does that come into play? I am planning on two days a week (not 3 or 4) but do I lower the number of reps or sets too? What about weight, heavier or lighter?

Try to get Fred Hahn's book, *Slow Burn* which is a very good read. It's not a big book but it explains so much. It doesn't have all that I'm about to explain, but there are good concepts there.
The key to weight lifting and any training for that matter is that you work the muscles to exhaustion which causes small injuries to the muscle, and then the body takes two or three days to repair itself and build up the muscle to be stronger in anticipation of the next workout.

If you understand this paragraph then you understand that the "growth" happens during the rest interval, not so much in the workout period. Most of us moderns don't tend to properly grasp this point. We're more concerned with speeding our recovery, masking the soreness and pain in order to get back at it faster, which has health consequences. It's natural to get tired and to rest before repeating.

True gains in strength and performance happen over a period of time. We accomplish very little from workout to workout. The best runners know that it takes six or seven years of steady development to reach your best state. Therefore, there is no need to attempt to rush the process and those who do invariably find themselves injured and they undermine their efforts.

Jenn Wrote:
Also, can someone give me the lactic acid primer again? We don't have any or as much because it's a by-product of glucose being burned in the muscle or something like that?

Lactic acid burn happens when mammalian erythrocytes (cells that lose their mitochondria) carry lactic acid instead of oxygen for elimination and it's these cells that end up in muscle which makes them burn during conditions of oxygen debt. Under all conditions, our muscles run on fatty acids. Glucose is not taken up by muscles. Erythrocytes in muscle transport glucose molecules across the muscle.

In the case of a zero-carb athlete, when we reach oxygen debt (during a 400 meter sprint or overexertion) our erythrocytes are not mammalian, in that they don't carry lactic acid. Instead, they carry oxygen. Because of this, we do not get the lactic burn that others get. We also don't hit "the wall" as fast.

It's a common finding that high-fat diets allow "time to exhaustion" to increase at an exponential rate. When high-fat populations add carbohydrates, one of the first signs besides bad teeth is that the people become sluggish and lose their endurance. There is a basic physiological reason for this.

It should not surprise us that so many in our Western societies are lethargic and don't exercise. It's not because they don't want to. They are subsisting on fuel which doesn't allow it without pain. When you fix your diet, you'll find that there is more oxygen available for your muscles and you'll be able to perform more tasks without fatigue.

Regards,

Charles

Thanks, Cynthia. As I understand things better, I tend to write it a little simpler. This is why no one should be afraid to ask a question again that we've already covered. It's possible I can answer it better after some time has elapsed.

Regards,

Charles

RE: Zero Carb / Meat and Water - Charles - 09-26-2008 06:48 AM

Fascinating!

Along the lines of what we've been discussing this morning, I just saw this article praising the Alaskan Husky as the best dog in terms of endurance.

Quote:
Davis believes the dogs possess very thin cell membranes within their muscle fibers that enable the canines to absorb nutrients from the bloodstream while exercising.

"The muscle has two choices for the source of energy — use what is abundant in the bloodstream, or use what is stored in muscles," he explained. "The latter is limited, and the more the muscle taps into those limited stores, the faster it fatigues."

He suspects sled dogs can consume a commercially-produced racing diet, supplemented with everything from salmon to congealed lard balls, and quickly convert it to usable energy.

Anyone who knows anything about sled dogs know that their primary diet is fatty meat. The dogs of Eskimos can make the same claim. They sit half the year in kennels eating fatty meat and when the time comes they go immediately to pulling large sleds over frozen tundra without any warmup.

If humans are fed right, there is no reason why they can't also have super endurance. Feed your children high fat diets from the womb and you can expect durable children as well!

RE: Zero Carb / Meat and Water - cbnebraska - 09-26-2008 06:50 AM

Just pondering the "impacted" issue. I too am like many of you in that I now only go maybe once every 3 days and when I have to go it's NOW. Like Charles said, it's not diarrhea because there are no cramps and even no excess water, it's just that I eliminate in a few seconds flat and I'm done. wow, this is a wonderful thing for me because I suffered constantly from constipation before all this. I tried EVERYTHING, including "eat more fiber", "drink more water". I tried psyllium husk capsules, flaxseed, all of it. No luck on any regular basis. I need to keep reminding myself that even though I'm not dropping weight left and right, this benefit alone is enough to keep me here.

Also, how does this type of "elimination" - meaning not so frequent but swift - compare to the animal world? I see dogs squatting and pushing hard to do their business at times, but they aren't fed their natural diet, so I now assume they are constipated when they are having to work so hard. Charles, how is your meat only dog doing in that arena? I can think about horses, who drop piles rather than rolls (is this a good term to use?). I wonder if "piles" is the natural way?

And actually, which animals are truly omnivores in that they NEED a mixed diet, not just can tolerate one for a short time? Somewhere at sometime I heard or read it stated "have you ever seen a fat carnivore?" That right there was one of the thoughts that got me headed in the zero carb direction. Although I don't know how that transfers over to the body styles of herbivores and omnivores, but I do know that when I think of wild cats I think "muscle"!! And also - eat for the body you want, not the body you have. Gotta love it....

Now if there were studies telling people that it could be "normal" for people to be blocked for a while, or not have the urge, I don't know if even that would allow him to get over it. That's the thing. Not going for several days while eating zero carbs doesn't necessarily mean that things are "blocked up". It just means that there isn't enough in there to need to come out very often. When I was eating a lot of veggies on my low carb diet, I almost always had a "full" feeling in my gut even when I wasn't bloated and gassy. I only felt good after I'd finally had a good BM. Now that I rarely eat veggies, I feel that sort of empty, relieved feeling all the time. Sometimes I don't even know that I'm going to have a BM until it happens. For me it was fiber that made me feel constantly plugged up.

By the way, I do sometimes go more than once a day but other times I may only go a couple times a week. It doesn't bother me one way or the other. I don't see why my body should be like clockwork in this regard.

I'm glad you asked that. My 16-year-old son has been impacted the most by Sawyer's new habits. It used to be that when he cut the grass, my 12-year old (it's technically his dog) has to go out and pick up the poop in the yard.

Now that Sawyer has been on his 73/27 diet for the last two months, we don't see any of his poop anymore. It decomposes very rapidly and my son never calls for my other son to pick up poop before cutting the grass. I didn't even notice it until Cynthia asked the question and I thought about it.

Other improvements are that he doesn't shed so much hair anymore. It used to be that you could pet him and hair would be everywhere. This doesn't happen anymore.

He sleeps in his crate in the house at night so that he doesn't bother the neighbors with his loud "hound" bark. It used to be that if he passed gas in the house, it would stink to high heaven. One day a few weeks ago, he pooped in his crate, which is a rare thing. Well, we went half the day and didn't know that he did it. No one smelled it. My son had to see it. That's major improvement!

He can now run and jump for longer periods without getting tired. I walk him and he's much more energetic than he used to be on his dogfood. Oh, and he's lean and muscular!

**RE: Zero Carb / Meat and Water - Richard - 09-26-2008 07:19 AM**

Charles question...

Raw, cooked, frozen then thawed...how do you give it.

I have an older dog that has developed join issues. He eat 50% 'pouch meat dog food' and 50% dry. I'd like to change him if it would help but in the past you hear so much 'bad stuff' about raw hamburger meat.

---

**RE: Zero Carb / Meat and Water - Charles - 09-26-2008 07:27 AM**

Richard Wrote:
Raw, cooked, frozen then thawed...how do you give it.

I give it just like you see it. By trial and error, I've learned that he likes it thawed and at room temperature. I buy it fresh at the store and put it in the refrigerator. I take it out and let it sit a while before I dish it for him. He eats it right away (once he sees that I'm gone -- won't eat if I'm standing there -- he must think I'm the alpha dog or something...)

I've given it to him cold and he didn't like it, and I've given him cooked food on occasion.

In the beginning, his stomach had to adjust some so I noticed that he would sometimes take the meat and put dirt and grass over it before he ate it. This meant that his stomach was upset. After a week or so, he stopped doing this and just ate the meat. I suppose once he became ketoadapted....
I no longer get his teeth brushed or take him to the groomers for baths. He just doesn't seem to need it. He smells like a dog, but it's much better than it used to be, that's for sure, and his teeth are perfect!

Regards,

Charles

Richard - I've been giving my dog raw hamburger for over a year with no problems. Dogs have a shorter gut and process food much more quickly than humans. They aren't prone to the same issues we are. If you're interested, you might check out this website for more information on feeding a raw diet using a "base" that can be added to meat Sojos. They have both a regular base and a grain free base...all made with human grade ingredients.

Having owned a Sibe for years and now a new pup, Salmon is also a primary dietary component. Although I do not race them, the breeder I've purchased from does in smaller races. Having had other breeds - it is really amazing to see the absolute differences in the dietary needs. Sibes generally do not overeat. Keeping to the bulk up late summer and fall for winter and way less consumed in spring and early summer. I was told that during a race whole frozen salmon was one food of choice for some racers.

Our 1st Sibe was an avid swimmer. Every day out into the pool in summer. This new pup of ours - has spurts of unbridled energy - just running and running - shocker!!

I cooked for our 1st Sibe and will do so with this one.

Some of the best dietary recipes call for salmon of course, chicken, fresh fish and animals like otter and mink which have a very high fat content.
Foods to avoid are beef, horsemeat, soy avocado, yellow corn, beet pulp, no bones whatsoever.

😊

RE: Zero Carb / Meat and Water - Charles - 09-26-2008 07:52 AM

I would probably want to add that obviously, racing was not in the mind of the Eskimo. Their dogs just needed to have endurance and they exhibited this greatly. Just like humans, a diet that is great for athletic performance may not in fact be healthy for life.

RE: Zero Carb / Meat and Water - jeepifer - 09-26-2008 07:57 AM

Charles Wrote:
The key to weight lifting and any training for that matter is that you work the muscles to exhaustion which causes small injuries to the muscle, and then the body takes two or three days to repair itself and build up the muscle to be stronger in anticipation of the next workout.

So the principle of doing the heaviest weight you can manage, at 15 reps for a couple of sets still holds. This will break down the muscle tissues, and after a couple/three days of rest to let them repair, rinse and repeat.

Charles Wrote:

I don't even go that far. I'm thinking 7 (min) -10 (max) reps of the heaviest and then move on to the next exercise. Your arms should be shaking at number 7. That's a good sign that you're doing it right. If you can manage 15 reps, the weight is too light.

You will experience great growth and you'll only get stronger as you lose weight. If you are eating carbohydrates, then you could puff up with this, although I don't think so with so little carbohydrates. If you do, then you know what the culprit is.

RE: Too much protein - Loops - 09-26-2008 08:30 AM

Hi -

nobody has brought up the issue of insulin and protein on this thread yet - I'm quite surprised.

It's true 'excessive' protein consumption doesn't usually have any effect on bg levels, but what about insulin? I seem to remember Barry Groves writing about this in his book - that protein does cause quite a bit of insulin release - and fat has no effect.
So far everyone keeps going on about gluconogenesis - but is that really the issue here?

Also, ketones are a form of sugar - fructose I believe - is that correct? So however you look at it, the brain is still using sugar - just a different form.

Loops

I'm not sure why this post has suddenly appeared in this thread! The other 'protein' thread seems to have gone missing as well. what is going on???

---

RE: Too much protein - Mackay  09-26-2008 08:39 AM

Even better! The more I build and tone now, the better I will look as the weight comes off! I don't want to be "muscular" but I've read that it's hard for a woman to get that way unless they *really* work at it, almost at a professional level.

Also wanted to mention that I'm at almost 3 weeks <5g carbs/day (most days zero or 1), and except for mid-morning today, my energy's been fine. Not brimming, but I can keep going (walking, staying up later) more now than I could a month ago.

I was about to fall out of my chair exhausted this morning -- not sure if it was the workout last night or I need more fat or what. I woke up and got to work, but about mid morning I crashed. I had just eaten some pork roast. I didn't have any extra food with me so I resorted to caffiene. I need to find a very fatty lunch!

Ditto for me, I guess. It's hard to see the scale not drop dramatically, but I have lost nearly 2 pant sizes, which was only 7-8 lbs. I'm 5'5.5" tall, so that seems to follow suite. I definitely have more muscle definition, although not as much as I'd like to eventually end up with.

Quote:

Definitely!! Low reps, heavy weights. 3 sets of 12 is the standard "recommendation", but I disagree. Like Charles, I like what's called lifting "to failure" which means, so you can't finish your last few repetitions. I like 2 sets to failure, usually no more than 8 reps, with a 60 second rest in between sets. The other advantage is -- it's MUCH quicker this way. Get in, get it done, get out!

Not always true. It's genetic to a certain extent. I lift side by side with friends whose bodies don't look anything like mine. Even when I was just low carb. I lift twice a week and am muscular, especially in my arms because I am leaner there. I'm working on removing the layer of fat that covers the muscles in my legs.

Hi -

nobody has brought up the issue of insulin and protein on this thread yet - I'm quite surprised.

It's true 'excessive' protein consumption doesn't usually have any effect on bg levels, but what about insulin? I seem to remember Barry Groves writing about this in his book - that protein does cause quite a
bit of insulin release - and fat has no effect.

So far everyone keeps going on about gluconogenesis - but is that really the issue here?

Also, ketones are a form of sugar - fructose I believe - is that correct? So however you look at it, the brain is still using sugar - just a different form.

Loops

If I remember correctly, Bear did say that ketones were actually a special kind of carb. And I know that Mary at the Yahoo Sat Fat group says ketones are a form of fructose.

Aw, nuts. I'll have to break out the Callenetics videos to lengthen those muscles out, then. Ack.

I agree that genetics has a lot to do with how muscular you can look. My muscles are very strong from doing Callanetics twice a week but you'd never know it by looking at me. Someone with my body type (tall, thin and small boned) won't ever look very muscular no matter how much they work out. Plus, most of the muscle that I have built up is covered with fat so you can't see it much. The Callanetics have improved the general shape of my body though despite the fat.

Hi cbnebraska: Hope you don't mind my asking but could you tell me specifically what is your circuit when you lift twice a week? I would like to start lifting (I probably should have started long ago). I'm 53 y/o and unfortunately have those lovely arms that continue to wave even after I've actually stopped! LOL I should add tho that I would like to have a complete body routine.

I would also love to hear from Charles as to what I might incorporate into a resistance training routine.

As always, I appreciate any and all suggestions and comments!

This is not true at all. You have to qualify what you mean by "protein". Dr. Groves has the best article on his site that explains why a diet should be high fat and not high protein. It has nothing to do with the effect on insulin levels. It is just as I quoted above, from his article. If you have the passage in the book, you should quote the entire thing so we can see what he's talking about.

Loops Wrote:
So far everyone keeps going on about gluconogenesis - but is that really the issue here?

The only reason this ever comes up is because someone claims that they can't lose weight doing zero-carb and they want to blame excessive protein and some theory that it converts to glucose. If protein were to effect insulin, then it must do so by being converted to glucose which would increase insulin.
This has never been shown and does not happen. If you have evidence that it does, then you should post it so we can read it.

Loops Wrote:
Also, ketones are a form of sugar - fructose I believe - is that correct? So however you look at it, the brain is still using sugar - just a different form.

That's not true either. Ketones are made from fat. They are not a form of sugar nor are they glycerol. Even the ubiquitous Wiki gets this one right:

Quote:
Ketone bodies are three water-soluble compounds that are produced as by-products when fatty acids are broken down for energy in the liver and kidney. They are used as a source of energy in the heart and brain. In the brain, they are a vital source of energy during fasting.

If protein was broken down to be converted to glucose, then there would be excess nitrogen which would lead to an ammonia buildup. That's the part you seem to miss.

Wouldn't you agree that during fasting, this is the perfect time we would need protein to be converted to glucose to fuel our brains? Yet it does not occur. That theory has to be discarded.

Even if protein were converted to glucose, what difference would this really make? What's the point you want to make?

Everyone acknowledges that zero-carb is very difficult and we all understand everyone is not going to be able to overcome their upbringing and acculturation to implement it successfully. There is no reason to invent reasons such as "too much protein" or things like that which have never been shown clinically.

Again, if there is evidence of gluconeogenesis in a ketoadapted individual, then produce it so we can have a look at it.

Regards,

Charles

RE: Zero Carb / Meat and Water - cbnebraska - 09-26-2008 11:34 AM

Well, I hate to say that I don't have a regular circuit. I go to the gym, decide what muscle group I need to work based on my previous days' workouts and do them. Sad, isn't it? My husband bought a set of posters from Amazon.com that hang in our basement weight area, so if you were going to workout at home, a set of those would be helpful. It's for dumbbells/handweights rather than a bar.

Here's the link to the posters. They are a great start.: http://www.amazon.com/Dumbbell-Training-Poster-Michael-Jespersen/dp/0969677332/ref=pd_bbs_2?ie=UTF8&s=books&qid=1222453797&sr=8-2

Also, a good magazine to get with great lifting routines is called Oxygen. I subscribe to that, but it's on most magazine racks. I avoid fluffy magazines like Self and Shape, etc... So much of it is dieting advice, which I obviously disagree with. So, I go for the more serious muscle one instead. I am NOT a body builder, and never want to be, but the workouts in Oxygen work for regular gals too!
I usually do only arms in the weight room and I do tricep kickbacks, overhead extensions, bicep curls, lateral raises, chest flies, chest presses, deltoid pull backs and probably others I'm not thinking of. If I do legs, it's usually just squats, hamstring extensions and calf raises. I often times take a class called "Body Pump" as an option. It is not a "to failure" type circuit, as we usually do one or two muscles for the entire length of a song, with just a few breaks in there. I still load my bar super heavy so that by the end I can barely make the last one, but a song is a long time to keep at it!

Hope some of this helps!

RE: Too much protein - Loops - 09-26-2008 11:38 AM

Charles -

I didn't say AT ALL that gluconogenesis happens. Please don't misquote me. It's happened before and I'm not happy about it. Where exactly did I say that? I do not agree that for insulin to be released bg has to rise, or gluconogenesis has to happen - if it does anyway. What about artificial sweeteners? Cheese? These things don't usually cause a fluctuation in blood glucose, yet the theory is too much insulin gets released anyway. Anyway, enough of what I think - here is the passage from Groves's book:

p78

Protein reduces glucose - but increases insulin

Over the years, there has been considerable uncertainty about the effects of protein intake on blood glucose levels. Recently a well-conducted study of people with type-2 diabetes showed clearly that protein improves overall glucose control. In this study, protein intake was doubled while carbs were reduced proportionally. It produced impressive results by reducing twenty-four hour blood glucose by a massive forty percent. There were also significant decreases in glycosylated haemoglobin and triglycerides after just five weeks. This was all to the good. However, the addition of 50 grams of beef had one drawback: it caused a prompt three-fold rise in blood insulin levels. Insulin was at a maximum after two-and-a-half hours, and it did not return to a fasting value until more than six hours after the meal.

Also, I've heard people report ammonia-smelling sweat when they eat too much protein. And when they eat lots of fat and reduced protein - the smell goes away. Why would that happen if it wasn't happening?

Loops

RE: Too much protein - Loops - 09-26-2008 11:39 AM

Sorry - that quote was from Natural Health and Weight Loss by Barry Groves 2007

RE: Zero Carb / Meat and Water - Charles - 09-26-2008 11:51 AM

I can't recommend it enough, but you really want to go and pick up Slow Burn It contains a full-body workout that anyone can use to begin. You work each muscle group and then you go home. I talking about 7 reps and then go to the next exercise. It has pictures and explanations.

Those of you women who are concerned about muscle should have watched some part of the Olympic
weightlifters. These women were awesome. The best and most revealing part is that they did not look the part. These ladies did not have muscles bulging all over the place but boy, they could move some iron. That's how it's supposed to be.

These people that you see in magazines with ripping muscles and veins popping all over the place are doing steroids and carbohydrates, plain and simple. Weight lifting does not equal bulk. Just because your muscles don't look big does not mean that they are not strong. One should lift weights to gain strength, not to look muscular. The muscularity and leanness comes from the correct diet.

Most of you have abs already but you can't see them because your diet is incorrect. Once you get on the correct one and lose, you'll find that you'll automatically look muscular as you become lean, if you have that type of build to begin with. If you don't have a muscular build, you likely won't have one, but you will be lean and you'll look fantastic.

By the way: Big muscles doesn't mean big strength either. I lift more weight than many people at my gym who look much bigger than I do.

Regards,

Charles

**RE: Zero Carb / Meat and Water - jeepifer - 09-26-2008 12:06 PM**

I'm going to share my meat joy here, where I know others will appreciate it...

I found vacuum-packed "whole" ribeye, about 14-17 lbs. on average per package, for $5.39/lb. (Costco, of course!) Okay, it's still 80-90 bucks for the whole shebang, but that's better than coming up with $400 for the 80-lb. case! If I plan on one 1-lb. steak each day, that would last me two weeks at least, and I'm still saving $1.50/lb over their regular price. That's what, a 30 dollar savings on a 20-lb. hunk o' beef? Cool! And Yum!

Spoke to DH and he figured we could fire up the grill, slice it all up, and maybe grill half of it at a time, then freeze the steaks individually. Then I could just pull one out, let it thaw, and reheat *slightly* for my daily meals. Happy camper! 😊
RE: Too much protein - Charles - 09-26-2008 12:18 PM

You said:

Loops Wrote:

This is why I asked you to provide the article because I interpreted your comment along that line. There is no other way for protein to effect insulin except through gluconeogenesis.

There is another way to explain Dr. Groves' observations in the short study:

Dr. Groves Wrote:
In this study, protein intake was doubled while carbs were reduced proportionally. It produced impressive results by reducing twenty-four hour blood glucose by a massive forty percent. There were also significant decreases in glycosylated haemoglobin and triglycerides after just five weeks. This was all to the good. However, the addition of 50 grams of beef had one drawback: it caused a prompt three-fold rise in blood insulin levels. Insulin was at a maximum after two-and-a-half hours, and it did not return to a fasting value until more than six hours after the meal.

This is common to many people on this forum, including Jimmy. This is classic hyperinsulinemia which all diabetics would have. This also happens when a person initially goes to a zero-carb diet. When you start dropping the carbs, your insulin is going to be higher in circulation.

Why? Your body will still continue to secrete the same insulin prior to and during meals even though you drop your carbohydrates down. Insulin is secreted based on your history, not what you're doing right now. This is why it takes six months for a zero-carb diet to work!

There are less carbohydrates in the system for the insulin to process so quite naturally, there will be higher insulin levels. If they would have kept the study going longer they would have found that the levels would have gone down as time passed and the body was conditioned to secrete less insulin.

This is why we do zero-carb! The goal is to condition the body to secrete less insulin over time. This is why you cannot just try zero-carb for a couple of weeks and think that you've done something. Your body will continue secreting too much insulin during the entire two weeks. This means that you will likely not lose weight and you may even gain weight because too much insulin in circulation means that more fatty acids are being stored. The weight loss will likely not start until the insulin levels get under control.

Loops Wrote:
Also, I've heard people report ammonia-smelling sweat when they eat too much protein. And when they eat lots of fat and reduced protein - the smell goes away. Why would that happen if it wasn't happening?

This is because when you eat too much lean protein, the body breaks it down and you get excess nitrogen. This is what leads to the ammonia in the bloodstream which is excreted through sweat. It doesn't have anything to do with insulin.

Dr. Groves Wrote:
Excess intake of nitrogen leads in a short space of time to hyperammonaemia, which is a build up of ammonia in the bloodstream. This is toxic to the brain. Many human cultures survive on a purely animal
product diet, but only if it is high in fat. A lean meat diet, on the other hand cannot be tolerated; it leads to nausea in as little as three days, symptoms of starvation and ketosis in a week to ten days, severe debilitation in twelve days and possibly death in just a few weeks. A high-fat diet, however, is completely healthy for a lifetime.

Charles

**RE: Too much protein** - Loops - 09-26-2008 12:47 PM

Hi -

again, I hope you don't think I came here, tried zero carb for a couple of weeks and gave up - I did it for a very long time (about a year) after two years of high fat low carb (20-30g carb) - I went down to <10g for a year. Most days were less than 5g.

Anyway that is beside the point. Are there any more studies linking protein intake to insulin production I wonder?

Also, are you then saying that Groves and also Kwasniewski are completely wrong about limiting protein intake? Because a lot of people who have trouble losing weight on low carb have success once they limit their protein. So what about that?

This is also beside the point, but I can actually lose bodyfat on slightly higher carbs (30g) as long as fat consumption is high. The slightly higher carb intake usually means my protein is a little lower than usual. I don't lose a damned thing on zero carbs. I'm not alone either.
RE: Zero Carb / Meat and Water - jeepifer - 09-26-2008 12:48 PM

Well yes, you are right, primarily we use a charcoal outdoor grill. But not much drips -- at least, I highly doubt it. All the fat is still waaaaaaaay intact around the edges and beautifully marbled inside. I wasn't kidding when I say we eat it rare.

RE: Too much protein - Loops - 09-26-2008 12:51 PM

Hi Mac -

I can't see it stated anywhere which study it was - sorry.

RE: Too much protein - MAC - 09-26-2008 01:01 PM

Loops Wrote:
Hi Mac -

I can't see it stated anywhere which study it was - sorry.

Thanks. 50 g of beef is not a lot of beef. That is 1/9 of lb or less than two ounces of protein. Dr. Eades says that on a scale of 5 protein is a two and carbs are a five in terms of raising insulin. The other thing no one talks about with the insulin rise via protein is that glucagon (insulin's counter regulatory hormone) also increases. There is no rise in glucagon with carbs.

RE: Too much protein - Loops - 09-26-2008 01:44 PM

Hi -

YES I keep forgetting about glucagon.

RE: Too much protein - Charles - 09-26-2008 02:30 PM

Loops Wrote:
again, I hope you don't think I came here, tried zero carb for a couple of weeks and gave up - I did it for a very long time (about a year) after two years of high fat low carb (20-30g carb) - I went down to <10g for a year. Most days were less than 5g.

This is still not zero-carb. It is very low carb and I appreciate that, but it's not true zero-carb and I think you know that.

It's immaterial. The fact is that you have never been able to get your insulin levels under control and that's the point of zero-carb to begin with. I don't care if it was 1 g of carbs for two years, the fact is, you were unable to get your insulin under control

This is not shocking to me. Most people will not be able to implement zero-carb as it is very difficult. I commend you for trying. You are unable to do it so move on to something else. I am not trying to persuade you or anyone else to do it. We do it, it works for us and that's that.
Loops Wrote:
Anyway that is beside the point. Are there any more studies linking protein intake to insulin production I wonder?

MAC just provided a very good one and it suggests the very opposite of what these doctors are saying. Personally, I'm not interested in any other studies because I know what has happened with me and many others. There is no reason for me to "prove" zero-carb. It speaks for itself.

Loops Wrote:
Also, are you then saying that Groves and also Kwasniewski are completely wrong about limiting protein intake? Because a lot of people who have trouble losing weight on low carb have success once they limit their protein. So what about that?

What they said means nothing to me. I would have to examine the individual case to see what happened. We've had people around here try to limit their protein and I don't recall it really working for very long. Just because someone eats a half a pound less of beef for a week or two and loses another two pounds, don't tell us much.

If you drop your calories, you will lose weight. There is no doubt about it. The question is, does this satisfy a person's hunger and do they have energy and no muscle loss? If those answers are true then perhaps they were eating when they were not hungry and this goes against what we believe for zero-carb.

If you dropped your protein and now you have achieved your weight loss goals, then great. It is what it is!

Loops Wrote:
This is also beside the point, but I can actually lose bodyfat on slightly higher carbs (30g) as long as fat consumption is high. The slightly higher carb intake usually means my protein is a little lower than usual. I don't lose a damned thing on zero carbs. I'm not alone either.

So why are you bothering me with questions concerning zero-carb?

Do your plan and enjoy it. I really don't care. I'm glad that you found something that works for you. We're all after health and if you find it in some way other than zero-carb, than that's fantastic.

Regards,

Charles

Also, ketones are a form of sugar - fructose I believe - is that correct? So however you look at it, the brain is still using sugar - just a different form.

I thought this must be wrong when I first read it, but I went back to see what The Bear had said:

The Bear at http://activenocarber.myfreeforum.org/Bear_s_Words_Of_Wisdom_about22.html Wrote:
At this point I would like to point out that a zero carb diet does NOT cause ketosis. The body rapidly adapts within a few weeks and begins consuming the ketones from fat metabolism. A fully keto-adapted body excretes no ketones in the urine. A metabolic by product, 'ketone bodies' are actually a special kind of carb, and they substitute for glucose at the structures which use it. They have the added advantage of making you feel good- and well fed.

and if you look at the Wikipedia entry for "carbohydrates" it says:
wikipedia entry "carbohydrates" Wrote:
Chemically, carbohydrates are simple organic compounds that are aldehydes or ketones with many hydroxyl groups added, usually one on each carbon atom that is not part of the aldehyde or ketone functional group.

so it is true that ketones and carbs are chemically related. However, this does not mean necessarily that they behave similarly in the body.
(There is not much difference between the structure of a fatty acid with a trans bond and one with a cis bond, but the biological difference seems to be considerable).
I'd be be little bit surprised if they had any effect on insulin, but that is just surmise. A quick google found this:
which is about rats. They only seemed to cause insulin secretion in the presence of glucose in that situation, FWIW.

Regards,
Mike

RE: Zero Carb / Meat and Water - cbnebraska - 09-26-2008 05:15 PM

Yep, you look exactly like my 3 closest friends! You look great, no worries!!

I guess I'm not quite as all or nothing as you. I probably would be though if I could shake the coffee ritual I share with my co-worker and wine time with DH. For me, it's still about those relationships right now. I have gone decaf, but I know that's not quite good enough, it's got to go. I just don't know how to break the tradition that my aide and I share of making our pot in the morning, popping it in the fridge and sharing a mid afternoon iced coffee over conversation. I got her hooked on them and now I'm trying to figure out a way to un-do it. We work pretty much isolated from the rest of the faculty, so it's
something we share. Well, and you know the hubby story.

I'll figure it out though.

Have a great weekend all. I've got somewhere to be!!

RE: Zero Carb / Meat and Water - suzanneeya - 09-26-2008 05:26 PM

I have coffee with cream and equal everyday, no desire to give it up.

A metabolic by product, 'ketone bodies' are actually a special kind of carb, and they substitute for glucose at the structures which use it. They have the added advantage of making you feel good- and well fed.

He's clearly just trying to explain the function of the ketone body at this point. That's very different than saying that a ketone is a sugar. Even on the Wiki you can see that the components are not at all similar.

Studies that try to demonstrate anything regarding ketones with dietary glucose present are just irrelevant.

All of the brain studies that purportedly show that the brain does not use ketones all had plenty of glucose on hand. However, when we completely remove all exogenous food, then it's quite clear that the brain does indeed use ketones and there is no glucose made.

Regards,

Charles

RE: Too much protein - montmorency - 09-26-2008 06:12 PM

con Wrote:

OK. So help me out here. If your brain indeed can only use glucose, where does this come from and how come your blood sugar can rise even on zero carbs?

FROM THE CONCISE BEAR:
A zero-carb all meat, 80/20 (by calories: fat/protein) diet delivers the necessary small amounts of glucose from glycerol- while most of the daily glucose requirement (as seen in a mixed diet) is replaced by ketones, which- like glycerol- are by-products of fat metabolism. If you are properly using the ketones in your body as food (glucose replacement) - you will not see them spilling in your urine. Dietary protein is never used to make glucose in a fat-sufficient dietary situation.

This book (Exercise Physiology) has a nice little diagram & explanation on page 161 which shows the
synthesis of glucose from glycerol. It notes that this pathway is limited, and repeats the usual stuff about consuming carbs, but clearly, this glucose would be enough for survival in a starvation/fasting situation. (BTW, triacylglycerol is a more specific name for triglycerides; they change the names to fool the layman...:}):

http://books.google.co.uk/books?id=btesVutdJ2EC&pg=PA162&lpg=PA162&dq=glucose+synthesis+from+glycerol&source=web&ots=XrZQupOrEA&sig=a-FwJffgkzIHkBz88odc--NhXhY&hl=en&sa=X&oi=book_result&resnum=5&ct=result#PPA162,M1

Sorry, I don't know how to copy and paste from google books.

Regards,
Mike

Mike, you really have to pay closer attention. The Bear correctly says that glycerol is made from fat. Your article is talking about glycerol made from glucose and the Bear is in no way agreeing with that.

You wrote:

If you want to know about a fasting situation you need to go and read the fasting study we posted in the zero-carb thread. It is THE authoritative study in this area. The chart posted above in this thread comes from that study and it clearly demonstrates that no glucose is used at all in a fasting situation beyond 7 days. The glycerol and ketone bodies needed are synthesized by our bodies from fat as the Bear explained. You can even see in the chart how the use of fat increases exponentially and the use of protein decreases to very little as the body conserves it.

The whole book you referenced is complete and utter BS.

This garbage has been around since the 1920's and it is no more true today than it was back then. Fat burns in the flame of carbohydrate? Seriously?

Of particular importance is the 31st day of the fast. Look at the values there. There is a slight protein
catabolism but the fat catabolism is off the charts. This is because fat provides fuel, ketones and glycerol as needed. Protein provides very little structural support. This is only after one month and scientists agree that we can go 9 months or longer if necessary fasting and we'll be fine.

If there is some glucose being made from protein, it would happen after 9 months of total starvation at the bitter end because the nitrogen would likely kill us since there is nothing left to buffer it. I still doubt it would occur because the cost would be too high.

Regards,

Charles

**RE: How to eat meat - Jimmy Moore - 09-27-2008 07:10 AM**

Ogg, THANK YOU for sharing your concerns, but Dr. Carlson is not the only medical doctor who believes eat a healthy low-carb, high-fat diet during pregnancy is perfectly fine. I just completed an interview with Dr. Barry Groves yesterday and he said virtually the same thing based on his DECADES of experience studying the subject.

While I appreciate your comments, Ogg, I must say that your method for going about it is not conducive to the tone of my forum. Everyone has a right to make the case for their particular topic of interest and EVERYONE knows that the information provided here is "at your own risk" and taken "as is." Please read this disclaimer associated with ALL of my web sites.

Most of us here are simple laypeople who are sharing what works for us. You can choose to heed the advice provided or simply ignore it. In the end, it is YOUR choice about what to do. Together we can learn a lot from each other. If you don't like what you hear and would rather pitch a hissy fit instead, then perhaps you should move on to other forums where they'll tolerate you. Because this is unacceptable at my forum. THANK YOU, Ogg!

I would agree that a HEALTHY low carb, high fat diet might be fine during pregnancy but are you even aware that you have a moderator here on your forum who is advising women that ZERO CARB/MEAT AND WATER ONLY is perfectly healthy during pregnancy? I think that's what Ogg took exception to.

RE: How to eat meat - nyteez - 09-27-2008 07:38 AM

Quote:

Why wouldn't it be?! As somebody who eats this way and is in better health now than I have ever been in, I see nothing wrong with continuing this diet during pregnancy. If it is healthy for me it would also be healthy for my baby.

RE: Zero Carb / Meat and Water - cbnebraska - 09-27-2008 07:42 AM

Auntiee- you are an awesome 53!! And Angela, same goes for you. I'm going to get Slow Burn as well and we'll try it out together. I am all for anything that shortens my routine. I enjoy my Body Pump Class, but I could easily give up a full hour workout for an abbreviated version and give my body more time to rest. Let me know how it goes once you get it!

RE: How to eat meat - Jimmy Moore - 09-27-2008 07:42 AM

Hey everyone, Ogg is gone now, so THANK YOU for tolerating his nonsense the past few days. As I stated in this thread on Friday, this is not a zero carb forum, but rather it is open to a variety of voices who want to discuss their chosen method for livin' la vida low-carb. Some people say they are intimidated by the authoritative tone that many people who advocate zero carb take and my response is don't be. We're all just laypeople sharing from our experiences so that hopefully others can learn something about their own situation. The purpose of my forum is for meaningful discussions to happen so you can make better decisions for the sake of your weight and health. THANKS again for continuing the conversation.

RE: How to eat meat - Charles - 09-27-2008 08:07 AM

As the moderator in question, I have to repond to this issue. I find it highly insulting to the thinking members of this forum to suggest that my opinion is so sacred that people just all do as I say. The conversation in question went like this:

Karishma Wrote:
It seems like I highjacked this thread into a discussion of LCing during pregnancy, but in my defense, I have to point out that I did not ask advice on what my diet should be, nor suggest that I would change how I was eating depending on suggestions made in this thread.

This women did not come looking for advice. She's an adult who independently researched and evaluated opinions including mine as she says here:

Karishma Wrote:
I've read everything I can find about lowcarbing during pregnancy, including the standard medical advice (eat according to the food pyramid). Practically all the studies that found negative effects of ketosis were done either in diabetics (in ketoacidosis), or women who were burning ketones due to starvation. Obviously, neither of those is equivalent to a woman on a LC diet.

The general opinion is there isn't enough research done to know if ketones are safe for the baby so it's best to avoid them. Which is all well and good unless you are one of the many women who needs to stay at a very low carb level to avoid gestational diabetes and the sugar high/crash rollercoaster. Given a choice between the known negative consequences of gestational diabetes (on mother and baby), and the theoretical consequences of ketones on the baby (since ketones obviously don't harm the mom), I would take my chances with the latter.

As you can see, she independantly accepts whatever supposed risk there is with ketones and her baby. In fact, she's had other very low-carb pregnancies and hopes the next one will be zero-carb. There are ketones used by the body at 30 grams and there are ketones used at 0 grams. What difference does this make?

The alternative hypothesis of obesity clearly supports hers and my view and Wade and Schneider's research since the 1980's very clearly implies that the availability of metabolic fuels is the important variable, not body fat.

What did our poor poster think of my opinion?:

Karishma Wrote:
In general I agree with you here, and if I'd been eating zero-carb for a longer period of time like you had and was well-adjusted to it, I would probably have continued eating that way.

The way I'm eating now is still VLC; it's still very much based on fatty meat. I just let myself have some veggies, cheese, cream and the occasional berry or small piece of fruit on the side.

It's not because I think zero-carb is unhealthy; it's because i think this is a carb level I can sustain throughout the pregnancy. I think if I ate zero-carb for a few months during my pregnancy but was unable to stick with it (because I couldn't tolerate red meat, say, which happened for a while during my last pregnancy), the consequences would be worse than just starting off at a slightly higher carb level to begin with.

I do hope to go back to zero-carb after this baby is born and hopefully get adjusted enough to it that my next one can be a zero-carb baby, but I just think it's too drastic a change to implement in the middle of a pregnancy.

As you can see, this was an adult who is capable of objective analysis and she made up her own mind. How I did I react to someone rejecting my sacred opinion?:

Charles Wrote:
And I respect your decision greatly. Please don't ever think for a second that I don't.

People on the zero-carb path routinely post their lipid profiles and they all show weight loss, improved HDL and triglyceride numbers and many other markers that dramatically improve on zero-carb.

The Cleveland Clinic states that:
An estimated 20.8 million Americans now have diabetes, increasing their risk of heart disease, blindness, limb amputation and other serious health problems. An additional 41 million are estimated to have "pre-diabetes," meaning that they can expect to develop type 2 diabetes within 10 years unless they change unhealthy habits or receive medical treatment.

People are reversing pre-diabetes and diabetes by eliminating carbohydrates from their diets and eating meat from the supermarket. Myself and many others are healthy by every objective medical standard.

The risk for gestational diabetes is 1 in 100 which clearly indicates that despite unhealthy eating habbits, babies have the capacity to survive unhealthy high-carb diets. By the same token, why wouldn't they be expected to survive a healthy high-fat, carbohydrate restricted diet?

If the mother is healthy, why would her baby not be healthy? Even crack mothers have been known to deliver crack-free babies at times.

If Dr. Groves believes that his low-carb diet is healthy for pregnancy, which ranges from 50 to 30 grams of carbohydrate per day, what is in it about those 30 grams of carbs that are so much healthier than 0 grams?

Since all-meat populations such as the Inuit and Masai have healthy babies regularly, shouldn't the onus be on those who advocate vegetables and fruit to prove that they are healthy for expectant mothers?

Regards,
Charles

RE: Zero Carb / Meat and Water - jeepifer - 09-27-2008 08:25 AM

Hey gang, I had to laugh. I broiled a ribeye for breakfast this morning, and my littlest daughter decided she'd rather have some of my steak than her sausage! 😊

RE: Zero Carb / Meat and Water - cbnebraska - 09-27-2008 08:34 AM

Woo hoo DD!! Gettin' her properly acculturated at a young age!

RE: How to eat meat - VernsWifeVickie - 09-27-2008 08:39 AM

I have absolutely no intention of debating with you but I must point out that to compare the Inuit and Masai people groups and what they eat to what a zero carb dieter in America who is eating mainly beef and beef fat is like comparing apples and oranges. Last time I was at the supermarket they didn't have whale blubber and harbor seals in the meat department. For example, the Inuit people get vitamin C from whale skin. They also eat a few root vegetables when they are available.

As to your question about what would be contained in 30 to 50 gms of carbs that would make the diet healthier for pregnant women, I would say that if you're eating 30-50 gms of healthy low glycemic vegetables and fruits then there would be essential nutrients and vitamins that are not found in meat.

As I said, I have no desire to debate with you and this will be my last post on the subject. But whether
you want to accept it or not, that little title under your avatar that says "moderator" gives you a certain amount of credibility to some people and some responsibility to watch the kind of advice you're dishing out.

I have watched this sort of cult mentality and disordered eating play out before. The last time I saw this kind of "go lower and lower" mentality it was at Kimkins. In my opinion the extreme diet mentality that says go lower and lower is disordered whether you are talking about calories or carbohydrates.

Having said what I have to say, I will now now out of your discussion and leave you all to your extreme dieting.

---

**RE: How to eat meat - Jimmy Moore - 09-27-2008 08:56 AM**

And this is a fine example of why I wrote what I did yesterday regarding keeping the discussion of ideas about specific plans in those specific threads. Otherwise, people get upset. Keep talking about what works for you, but let's refrain from pushing one point of view over another. THANKS everyone! Please go read this post I wrote about this issue:

---

**RE: How to eat meat - nyteez - 09-27-2008 09:05 AM**

Quote:
For example, the Inuit people get vitamin C from whale skin.

I am sorry but this is completely false, many Inuit never eat whale or whale skin or seals.

Quote:
I would say that if you're eating 30-50 gms of healthy low glycemic vegetables and fruits then there would be essential nutrients and vitamins that are not found in meat.

This is false too. Studies have shown that vegetables do not contain essential nutrients and vitamins that are not found in meat. Studies prove that all essential nutrients we need to survive are in meat.

Quote:
I have watched this sort of cult mentality and disordered eating play out before.

Now us Zero Carbers are a cult?! This is an insult to me. You have obviously not done the reading and research I (and others) have done on this subject. As a college educated owner of 2 successful businesses, I think I know how to make educated decisions for myself.

---

**RE: For the meat and water eaters another ? - waywardsister - 09-27-2008 09:31 AM**

Just wanted to say great posts, Marius. I've read that fruit/veg one before and it really opened my eyes.

---

**RE: How to eat meat - Jimmy Moore - 09-27-2008 09:47 AM**

Easy guys, easy. Nobody believes people who are on "zero carb" is in a cult. I think Vickie's concern is
that some people may be taking their passion for that way of eating too far by pushing it like what happened at Kimkins. You can't blame her for thinking that way since she saw it happening there. Let's just all breathe and realize that we have some differences of opinion about how to live our low-carb lifestyle. THANKS!

RE: Too much protein - montmorency - 09-27-2008 10:14 AM

Charles,

I don't deny anything you say here. I was merely offering an explanation of the mechanics of how glucose can be synthesised from glycerol (wherever it comes from). Actually I thought I was supporting the point that you and Bear were making!

Admittedly, I didn't look at much else in the book, although I did see some things I thought might be wrong. It may well be BS for all I know.

OK, I'll go to the back of the class and try much harder.

Regards,
Mike

VernsWifeVickie Wrote:

See, Jimmy. This is the reason why we NEED to debate. People should not just get away with posting their beliefs and little snippets and then just move on. No one learns anything that way.

People without any science to back up their dogma never want to debate. They just want to post inflammatory comments and then just walk away with the last word. A little bit of education goes a long way.

Just like the great and powerful Ogg, she made these statements without any proof, nor any backing of any kind. She has no idea of what the Inuit or Masai eat, nor does she seem to know much about the very successful zero-carb dieters on this forum.

If she really wanted to educate herself, then she would join our book discussion and perhaps she would learn that low-carb did not originate with Dr. Atkins. The first low-carb physician was Dr. Blake Donaldson, who read Stefansson's book *The Friendly Eskimo* and made zero-carb more "acceptable" for dieters. She could also learn first-hand about what the Inuit ate and what they didn't eat. She would also see how it's not even important what they ate or didn't eat. The Bellevue experiment proved all these claims were false.

Vickie Wrote:
Last time I was at the supermarket they didn't have whale blubber and harbor seals in the meat department. For example, the Inuit people get vitamin C from whale skin. They also eat a few root vegetables when they are available.
If Vickie participated in our book discussion of the Inuit, she would realize that there were many Inuit groups and they didn't typically eat the same way. There were some who ate seal and whale the entire year and there were some who never ate fish. There were those who subsisted on caribou. Both of these groups did not eat any vegetable matter prior to the times that Europeans came and afterwards, some groups ate some vegetables to their detriment. Even in this case:

Stefansson Wrote:
While there were in pre-white times many Eskimos who used no vegetables, there were some, especially in Labrador and Alaska, who got as many calories from vegetables as the Holiday Diet does; so, even with a few things like lettuce and potato, we may well name this regimen for the Eskimos. The same diet is described in my 1921 book Friendly Arctic, was used and enjoyed by whites who, like the Eskimos, found it nonfattening, and thus a good reducing menu. Then Dr. Blake Donaldson, successful New York physician, read the book, and concluded that with a few things to make the regimen more "acceptable," such as salad, fruit, and token potato, it would be a good reducing diet, and so it proved.

Of course, not being a participant in our discussion means she wouldn't know about the Holiday diet or the origins of the low-carb movement. This is why zero-carb seems so far-fetched in the mind of the modern-day low-carber. They don't realize that low-carb started out as zero-carb, not the other way around!

Vickie Wrote:
As to your question about what would be contained in 30 to 50 gms of carbs that would make the diet healthier for pregnant women, I would say that if you're eating 30-50 gms of healthy low glycemic vegetables and fruits then there would be essential nutrients and vitamins that are not found in meat.

Again, this is the your opinion. You can't provide any science to prove that low-glycemic vegetables and fruits provide essential nutrients not found in meat. Nor can you prove that an all-meat diet is deficient in nutrients. No one has ever had a deficiency disease while on an all-meat diet. However, we have first-hand testimony from ship captains that fresh meat ALWAYS cured deficiency diseases and fruits and vegetables rarely worked. Our thread is full of science on this very issue and our book discussion lays out much of it.

Nutritionists have known since the 1930s that carbohydrates cause nutrient deficiencies and Theodore Van Itallie even testified to this fact at the 1973 McGovern hearings. He is not a friend of the alternative hypothesis by any stretch.

Vickie Wrote:
As I said, I have no desire to debate with you and this will be my last post on the subject. But whether you want to accept it ot not, that little title under your avatar that says "moderator" gives you a certain amount of credibility to some people and some responsibility to watch the kind of advice you're dishing out.

Oh don't think for a minute that I am Charles Barkley claiming not to be a role model. On the contrary, I stand by everything I say and that's why I am so accessible. You can come to North Carolina and have dinner with me at our low-carb meetup every first Sunday of the month and you can see for yourself that
I am 100 percent real.

I stand by all of my opinions and advice and I offer science to demonstrate all of my opinions unlike you who make these claims with no backing or source for what you say. You've merely spouted your beliefs in an attempt to scare people just as you seem to be.

Vickie Wrote:
I have watched this sort of cult mentality and disordered eating play out before. The last time I saw this kind of "go lower and lower" mentality it was at Kimkins. In my opinion the extreme diet mentality that says go lower and lower is disordered whether you are talking about calories or carbohydrates.

The proof is in the result. Are our people losing their hair, complaining about lethargia? I think if you read our thread you'll find the complete opposite. Do we take money for this advice and not return messages and calls from disgruntled dieters? To compare me to Heidi Diaz is irresponsible and highly inflammatory. It's no wonder you don't want to debate because there is no basis for your claims.

Vickie Wrote:
Having said what I have to say, I will now now out of your discussion and leave you all to your extreme dieting.

Of course, that's what they always do. It must be nice to be able to write things and not have anyone challenge them.

Regards,

Charles

Who "pushed" zero-carb on Vickie? When did I tell Vickie that she needs to go on a zero-carb diet? We don't even think of zero-carb as "dieting." Nothing in our thread ever calls zero-carb a diet.

Did Kimkins push you all to pay her money and do what she says? If I remember correctly, one had to sign up for this program and pick the plan they wanted to do. Comparing zero-carb to anything like that is highly offensive and we have every right to be offended by that.

Just like anything, everyone has a right to choose what plan they want to follow and they are encouraged to educate themselves about their choice. If one finds an argument for zero-carb compelling, that doesn't mean they are being duped or brain washed. We're all adults here capable of taking charge of our own health.

---

RE: Too much protein - Charles - 09-27-2008 10:48 AM

montmorency Wrote:
I don't deny anything you say here. I was merely offering an explanation of the mechanics of how glucose can be synthesised from glycerol (wherever it comes from). Actually I thought I was supporting the point that you and Bear were making!

I understand, but don't take it as argument. I want you and everyone else to understand the process. It can indeed be confusing but it's not really rocket science. My wish is that everyone will understand these things for themselves so they can properly discern fact from fiction. When you see things written up looking really scientific, it's easy to look casually and then conclude that they have it right.

This is why our book discussion is so important and I encourage everyone to join in. These beliefs all go back very far. The notion that "fat burns in the flame of carbohydrate" has been with us since the late 1800s and most people do not realize that we've come a long way since people had that notion.

Most of us don't realize that zero-carb actually came before low-carb and they know nothing of Donaldson, the first "low-carb doctor."

It took another 50 years for people to realize that fat was the primary fuel for the body. You would think that when new science comes out, the old stuff would be uprooted but sadly, that's not the case. These things continue to persist because people don't want to learn new things.

There is no use for glucose in our bodies at all. Our bodies can make ketones and glycerol from fat and neither of these things cause insulin to rise at all. Many studies try to make claims along this line but they invariably fail to account for the glucose present in the dietary which will skew the results. Our brain will use glucose when it's available, but not in the manner that everyone thinks. The muscles and organs merely transport these mammalian erythrocytes through muscle which gives the appearance that they are being "used." When they actually try to test how much glucose is being "used" they always find two things:

First, that there is not enough glucose to supply any real energy since our bodies cannot store very much outside of adipose tissue; and

Second, that the organs and tissues only take up very little after you account for that present in erythrocytes.

Those erythrocytes trade their oxygen for lactic acid and this results in trauma to the organ or tissue.

Don't be afraid to share the information you find. It's very good, but it's more important to really parse it and find out what point they're making with the research.

Regards,

Charles

RE: How to eat meat - Jimmy Moore - 09-27-2008 11:56 AM

Okay, fair enough Charles. You've made your counterpoint and we appreciate where you are coming from. The bottom line to me is if you choose to do zero-carb, then do it with all of your might and never let anyone sway you otherwise. But if you rather do another form of low-carb, then nobody is gonna keep you from doing that. We are all adults here and make our own decisions about what is best for us. I'll assume everyone realizes this and acts accordingly. THANK YOU again! 😊
I'm making pemmican this weekend! The meat is noisily drying in my office. I found a dehydrator at Walmart for $35.00. It is a new model by Nesco. It has clear trays and fits a lot of beef! It's kinda noisy, so I put it in my office. I sliced the meat, pounded it out thin, then pounded it with the tenderizer side of the ponder thinking it would dry faster. We'll see. It should take 5-10 hours. I am thinking about 5 because I got the meat pretty thin.

Well I went crazy and binged on cookies one day this past week. Needless to say it staled my weight loss 😞 I am not sure what happened. I really think it was emotional eating. My son had his heart broke for the first time. He cried and I cried. Then I ate cookies and cried cause I ate cookies. I am back on meat and water and hopefully I will be losing again.

Nyteez I am coming shopping when I shed some of this weight 😏 That's a promise 😏

Falling off the wagon, is not so bad as long as you can get back on! 😏

Then I ate cookies and cried cause I ate cookies. I am back on meat and water and hopefully I will be losing again.

Falling off the wagon, is not so bad as long as you can get back on! 😏

Nyteez I am coming shopping when I shed some of this weight That's a promise

Thanks Fully! 😊

I am so sorry about his foot! Poor kid, I hope it heals fast. Stressful situations, like that, are really the hardest for many of us. It happened and now it is in the past. Today is a new day.

((((HUGS))))))

LOL Suzanne it was his heart

Yeah Yes I am back on track. Changing 41 years is not gonna happen so easily.

But hey I went back and found y'all's (cbn & suz) pictures! WOW!!!!!!! Wooooooootttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttttt
WANNA LOOK LIKE CHARLES 😊

Honestly, I really do. Because my husband owns a gym and I would love to look good enough to compete. Hence.....I didn't say compete. I would like to look good enough to though. I am going to have to have some skin removed when I reach goal. But thats alright....I am no spring chicken....nor am I dead 😊

Richard Wrote:
Raw, cooked, frozen then thawed...how do you give it.

I give it just like you see it. By trial and error, I've learned that he likes it thawed and at room temperature. I buy it fresh at the store and put it in the refrigerator. I take it out and let it sit a while before I dish it for him. He eats it right away (once he sees that I'm gone -- won't eat if I'm standing there -- he must think I'm the alpha dog or something...)

I've given it to him cold and he didn't like it, and I've given him cooked food on occasion.

In the beginning, his stomach had to adjust some so I noticed that he would sometimes take the meat and put dirt and grass over it before he ate it. This meant that his stomach was upset. After a week or so, he stopped doing this and just ate the meat. I suppose once he became ketoadapted....

I no longer get his teeth brushed or take him to the groomers for baths. He just doesn't seem to need it. He smells like a dog, but it's much better than it used to be, that's for sure, and his teeth are perfect!

Regards,

Charles

There is a great deal of info on BARF Biologically Appropriate Raw Food for dogs on line http://www.njboxers.com/faqs.htm

My niece has Samoyeds and has recently acquired a Border Collie who is actively herding - Can they be anything but ACTIVE! 😊 She firmly believes in the benefits of RAW for dogs. Anyway there is research all over about it. Google BARF and it will give you all the info both pro and con that you will ever want 😊

RE: Zero Carb / Meat and Water - Charles - 09-27-2008 02:19 PM

Good afternoon, everyone!

I'm sure it's obvious to all of you who read this thread, but in case it isn't, zero-carb is the largest and most popular thread on the forum. It's for good reason, but facts are facts.

The forum is still a "low-carb" forum despite appearances to the contrary. To keep our forum as accommodating as possible, I'm going to ask all of you to try and keep our matters within our thread.

If you decide to drink coffee or eat eggs and cream as the Bear, there is no need to start a new thread for that. You won't be judged! Even if you eat 10 to 20 grams of vegetables because you can't do without them, you can still post in our zero-carb thread.

Please don't go out to the "General Discussion" area and start a new post asking about a question that we can address here. These kinds of things give the appearance that every thread is related to zero-carb.

There is no difference between us and the meat/eggs and coffee forum so please don't start threads like that.

When the moderators see that someone has started a new thread that is clearly within the parameters of this one, we will move that thread and merge it into this one, so please be advised.

I know our thread is huge and probably deserves a bigger place on the forum, but that argument is for another time. Please just keep it in the family, if you would!

You can certainly journal all that you want to talk about there. You can post your menus and any ideas that you have.

You can ask questions here that we've already gone over if you can't seem to find the answer with the
search feature. I don't think I ever refuse to answer a question because we've covered it before. I may tell you that as I'm answering, but I'll let you know.

Thanks to everyone for being here and I'm sure we can all work together to make sure we get the coverage we need while at the same time allowing those other plans to find their way.

Regards,

Charles

---

**RE: Zero-Carb/Meat and Water - Charles - 09-27-2008 03:13 PM**

This thread is bigger because I merged many of the related threads into this one. Now the thread is larger, I would encourage all users to use the search feature to navigate it if necessary. When you go to the search window, be sure to select "posts" as opposed to "threads" in the lower-right corner and it is very user-friendly.

If you're more comfortable with Google, you can use it to search for stuff here as well. I don't think there are many other zero-carb threads on the Net with as much traffic, but who knows.

Again, if you have a question or comment regarding any aspect of zero-carb, even the meat and eggs, cheese and cream crowd, just post here.

Regards,

Charles

---

**RE: Zero-Carb/Meat and Water - suzanneyea - 09-27-2008 03:13 PM**

Fully, lol, I have no idea why I thought it said foot! How weird! A broken heart! That is much worse! Anyone who has zero carb questions can also post them in my journal, as I always say- I do not have the technical information like Charles, but I can chat about my experience. Angela, it is nice to see you posting more, we need more success stories.

---

**RE: Zero-Carb/Meat and Water - Fully - 09-27-2008 04:04 PM**

Marie..... I had gas so bad that night LOL! I know.....TMI. I have IBS Irritable Bowel Syndrome and low carb works wonders for my digestion. If I eat low/no carb I do not have nearly the problems. Only I am also lactose intolerant and dairy products bother me as well. So I have to be really careful what I eat on low carb. Like regular cheese does not bother me but some of the different creams do. Although cheese is really bad for yeast. That was one of the reasons I decided to try the no carb and see how I did.

My son is 15 and this was his first heartbreak and it hit him really hard. And I was so hurt by it all because I loved her and I was really disappointed in her. Just all that parent stuff. I think I ate like 3 or 4 white chocolate macadamia cookies. I had a bad feeling when I bought them. I should have listened to my inner self. 😞

RE: Zero-Carb/Meat and Water - aim in Fla*working - 09-27-2008 04:48 PM

is this thread still going strong? I think my allergies are back because i have been off plan. I went shopping and got ground beef, lamb, and pork chops and I am starting clean again. I have GOT to quit coffee because I think it causes serious cravings for me and the cream I can drink out of a bottle..no lie...like a sfruit drink!
So here I am hoping to do it again...My rosacia is out of hand. Red from shame and allergens...I am ready to try again.

RE: Zero-Carb/Meat and Water - cbnebraska - 09-28-2008 05:18 AM

OH my gosh! I was busy for a half a day and this thread and look what happens! Posts appeared out of nowhere in between ones I know I've read! Somehow along the way I missed the whole deal with this Ogg person. Did that discussion start in another thread? Which one?

I do take offense to being considered part of a cult though! Geesh.
Quote:
Marie..... I had gas so bad that night LOL!

This thing right here is reason enough for me to stay away from vegetables - although I know you were talking about cookies!! I just can't say enough about how my entire digestive system has done a 180 since I cut them out. I also watch many people drown their beloved salads and vegetables in animal fat in order to be able to choke them down. My husband says he likes having his veggies, but he really can't eat a raw one without ranch dip or a cooked one without butter. I don't miss veggies at all!!!!!!
I'm really enjoying hearing all the new voices here. Did this thread just explode with people "coming home"? So many of you seem to have been here before...

**RE: Zero-Carb/Meat and Water** - MAC - 09-28-2008 05:21 AM

cbnebraska Wrote:
I'm really enjoying hearing all the new voices here. Did this thread just explode with people "coming home"? So many of you seem to have been here before...

Believe Charles merged some other threads into this one so as not to have the whole forum be about zero carb and water. Which is why you have seen some posts merged in between others.

**RE: Zero-Carb/Meat and Water** - jeepifer - 09-28-2008 05:26 AM

A lot of posts from other threads are getting moved here so we are all contained in one area and don't dominate Jimmy's forum.

I think the system arranges them by time, so they will be interspersed between other posts. A little confusing, eh?

**RE: Zero-Carb/Meat and Water** - cbnebraska - 09-28-2008 06:24 AM

Gotcha! I did pick that up from Charles' posting, but I didn't know about the time issue.

Can someone help me yet again with the link to the Bear's condensed version of his forum? I saved a copy of the link in an e-mail, but when I use it, it sends me to a log in screen to some other forum. I'd rather not make an account. Did any of you .pdf this? If so, I'd love to have it. I could print it off and read it when I'm stuck at soccer practice or reading in bed. I often read from my iphone, but at boring meetings it is much more acceptable to be reading something on paper than from my phone!!

**RE: Zero-Carb/Meat and Water** - aim in Fla*working - 09-28-2008 06:25 AM

I know this may sound weird but I had to set a goal to lose to 127 by a month or I am going to start smoking again. I have very expensive clothes and they are all 4's and 2's and I am not able to fit in them. I quit smoking in November and I have gained a bit and my belly is like a round ball. I used to love my body naked and not I HATE IT...and really I would rather smoke and be thin. I hate feeling the bloat and water retention etc., pain in my joints (fibromyalgia) and exhaustion (Chronic fatigue) and I know the additional 10 pounds has done it. I am terrified to weigh.

I don't want to be intimate with bf because I feel fat and because I am NOT FAT but not myself...no one understands this. They say, but bigger clothes you look fine..But I remember what what felt like 10 years ago...buying bigger and bigger...

I already hate that I look bad in photos. I am very small boned and 10 pounds on my fram is debilitating to my health. I look at pills ALLIE, dexitrim what ever it take...bottom line is the lack of willpower.

I am making a pork chop for breakfast and then later I will eat more meat. No veggies. nothing else. attempting 2 weeks. I will not weigh now as I am afraid it will make me so depressed that I wont function. So on October 30th...I hope to be 127. I am pretty sure I am about 140. thanks for letting me vent...sorry to be a sunday bummer

see this post for Concise Bear: http://activenocarber.myfreeforum.org/Concise_Bear_about1646.html

You don't have to be a member to get to this forum as far as I know. I am not a member of this forum.

Here is the longer Bear version from the same forum:
http://activenocarber.myfreeforum.org/Bear_s_Words_Of_Wisdom_about22.html

Search for 'papa bear' on this forum. I had a post with all three versions and called them baby bear, momma bear, and papa bear links. Be sure to use the 'Posts' option in the lower part of the search page to find them.

cbnebraska Wrote:
Thank you! That worked like a charm. Not sure what was wrong with mine, but I copied yours.

BTW, do a google for 'PRIMOPDF'. It is free shareware you have to install and will turn anything and I mean anything you can print on your PC into a PDF. It would be perfect for turning Concise Bear (as it is all on one HTML page) into a PDF. I am not going to print each page for the longer ones. Wonder if there is software that would do the page turning and printing for you?

Nothing here sounds weird!! We actually are considered the epitome of weird by some people, so you've come to the right place. I will start off with just a few things and then the other, more experienced ZC support folk can do their thing. First, I am not way overweight either and never have been. I too am unhappy with a body that everyone else says is just fine. It's a very hard thing to share with anyone because a lot of people will roll their eyes and say "whatever", because so many people truly are overweight and unhealthy. I, for one, would never do that!!

First CONGRATULATIONS on quitting smoking. It's obviously a VERY hard thing to do, and you've done it!! You have to keep this first and foremost in your mind because you've only conquered half the battle right now. Someone out there will tell you why nicotine was keeping you thin, I just know that scientifically, it was. BUT, it also ruins your health and WILL kill you. I watched both my mother-in-law and grandmother die from a life time of smoking. They both suffered from a host of other miserable symptoms because of it. Neither of them ended up with cancer, but their lungs are what killed them in the end and osteoporosis limited their lifestyles beginning in their 50s and 60s!! That's YOUNG!!

You CAN make this change and lose the weight (assuming you aren't trying to be underweight, which I'm not sure your body will allow you to be with this WOE). However, PLEASE don't put a time limit on it! Your body is about to go through some changes and it will fight you at first until it realizes it won't have to deal anymore with the crap you used to put in it - in the form of food or nicotine.

Jumping right to the meat. The most important thing about this WOE is that you must eat FATTY meat! NOT chicken breasts, lean hamburger, fish, tenderloins and filets (unless you are adding animal fat to them in great amounts). You will do great damage to your body if you try eating lean meat only. Your diet should be 70-80% of the CALORIES from fat. I'll let our scientists take it from here, but please head the fat warning! You will have to experiment with your eating over the first few weeks until you find a balance of lean to fat that keeps you energized and full!! You can't plan it out every day since it varies so much based on your energy usage, time of the month and muscle ratio, so be sure you have TONS of meat and fat available and be ready to EAT, EAT, EAT.

Okay, I'm done, but welcome to our forum and please visit frequently because there are some great people here to support you!!

Charles Wrote:
montmorency Wrote:
I don't deny anything you say here. I was merely offering an explanation of the mechanics of how glucose can be synthesised from glycerol (wherever it comes from). Actually I thought I was supporting the point that you and Bear were making!

The muscles and organs merely transport these mammalian erythrocytes through muscle which gives the appearance that they are being "used." When they actually try to test how much glucose is being "used" they always find two things:

First, that there is not enough glucose to supply any real energy since our bodies cannot store very much outside of adipose tissue; and
Second, that the organs and tissues only take up very little after you account for that present in erythrocytes.

Yes, on average, the amount of glucose in the blood at any given time is about 5 grams. How much energy does anybody think that would supply?

**RE: Zero-Carb/Meat and Water** - Beth - 09-28-2008 10:33 AM

I know a lot of you pump up your fat % with added fats or coconut oil. I was wondering if there is anything wrong with butter? Sometimes I can only get 80/20 hamburger or the chicken or steak just doesn't seem fatty enough. I've tried the bacon fat and I literally have to choke it down. I haven't tried the beef trimmings from the butcher yet. That might not bother me since I like that taste on a steak. But in a pinch is it OK to add a tablespoon or two of butter? Does it cause stalls? Is it not considered an "animal fat" because it's really a by-product?

Thank you
Beth

**RE: Zero-Carb/Meat and Water** - Jeff - 09-28-2008 12:09 PM

I think butter is fine. I use a lot of butter myself.

**RE: Zero-Carb/Meat and Water** - suzannevea - 09-28-2008 12:54 PM

If I find myself without fatback I use butter. But, I do not like the taste as much.

**RE: Zero-Carb/Meat and Water** - FormerDonutJunkie - 09-28-2008 01:05 PM

I've been using butter on my 73/27's some of the time. I'm one of those who just happens to like the taste of butter. I can't say for sure whether it slows my weight loss, but at this point it doesn't seem to.

**RE: Zero-Carb/Meat and Water** - Kristi31 - 09-28-2008 02:39 PM

Just as The Bear said, I have no appetite, none at all... on zero-carb, of course. This really started about 1 day ago and if I eat, I just eat out of boredom or habit. My last meal was yesterday late at night. And before that, it was early morning. It's almost 6pm right now and I'm really not that hungry. We are going to the restaurant and we'll see if I get hungry there. Even smelling mom's cooking or going to Costco and seeing/smelling so many of the foods there didn't do anything to my hunger. This is sooooo weird but sooooo great!

Every other aspect of my health is improving also, since dropping estrogen. I feel very energetic and happy.

thank you so much. I cannot tell you how much better I feel from reading this post. I have been so conditioned to feel shame about feeling uncomfortable in my 10lb over body. I usually eat fatty meat/ I love fat. ALOT. I just went to the Buc's game and went all day after eating 2 pork chops for breakfast. Honestly, I was not hungry. Could be the DISGUST from not being able to fit into anything. I appreciate any advice you guys can offer.

Is lamb a good fatty meat?

---

**RE: Zero-Carb/Meat and Water - suzanneyea - 09-28-2008 04:19 PM**

I love lamb. Now, you are just having a bad day. You are not going to start smoking again, that is not an option, so take it off the table. I 100% understand how you feel. You think there is one woman on this board who has not put on a pair of pants and then fallen on the floor in tears when they do not fit? HA! We have all completely lost it when getting dressed. Please, I had a period in my life when I saw bulimia as the solution to my weight problem, so I understand bad and crazy choices. Now, keep eating on plan, the weight will come off in time. Focus on health for today.

**RE: Zero-Carb/Meat and Water - caroline - 09-28-2008 04:52 PM**

Hi Aimee,

I second what Suzanne says. She's a wise woman and so is Cynthia.

I looked in the mirror today and instead of seeing a person who is making attempts at improving herself from inside and out, I saw ugly hair, a stomach that should be "skinnier" (and I don't need to lose weight--so there's the insanity), and a career that should be "further." I had to take a walk outside and be in nature and race up a lot of hills and steps to blow it out of me.

You are completely entitled to feel this way, and if you can stick with the feelings, then you don't have to take actions, such as smoking, to change it. You don't need to apologize or be ashamed. Like Cynthia said, we ALL have our moments.

Good for you for working through this struggle. And if you falter a few steps, just get back in step. You are a good person and worthwhile no matter WHAT you are thinking.

Sincerely,

Caroline

**RE: Zero-Carb/Meat and Water - hpseids - 09-28-2008 05:17 PM**

Hi everyone!
I just posted a question in the main forum and then Suzanne kindly informed me to post here (I think!) as to keep all the ZC talk streamlined. Sorry 'bout that!

Anyway, I'm Emily! I'm a medical student and low carber, but new to zero carbing. Actually it's a work in progress. After emailing with Charles and Suzanne (thanks, guys!) and learning and reading, I'm trying it to see if it can take care of my chronic heartburn, fatigue and get these last 20 pounds off! For good!

My question was, in case it gets lost (sorry if it's here, I'm trying to catch up on this thread but it's HUGE as you all know!)...why exactly are veggies (and fruit) bad? Is it just the carbs? The fiber? The phytochemicals (harmful)? I'm certainly not arguing b/c dropping all plant material has already helped - 5 pounds in 6 days and already more energy and NO heartburn whoo hoo!! I just really want to understand the why. I want to become a well-informed doctor one day and help my patients with low carb living!

TIA!

Emily 😊

---

RE: Zero-Carb/Meat and Water - hpseids - 09-28-2008 05:20 PM

BTW sorry for the weird pic-- I tried a few others but they were too big. So that's me with 2 of my best friends...I'm the one in the middle I guess, with the shorter hair. We were probably TPUI...(taking pictures under the influence) 😄

Carry on...

Carbohydrates deplete the body of vitamins and minerals. Meat is sufficient to provide the necessary vitamins and minerals and macronutrients. There was a year long study in the 1920's where the anthropologist Stefansson and a companion were monitored and lived on only meat & water for a year. They were supposed to contract scurvy but of course never did. There are many cultures who in the past lived quite successfully on basically meat only diets like the Inuit and the Masai. These cultures did not suffer from any of the modern diseases of civilization like cancer, diabetes, etc. If you get the time, read Good Calories Bad Calories by Gary Taubes (now out in paperback) and you will discover how bad the science of nutrition has been. Welcome to the forum.

**RE: Zero-Carb/Meat and Water** - [waywardsister](#) - 09-28-2008 07:56 PM

Hi Emily! You should check out the thread about Not By Bread Alone/Fat of the Land (we're having a book discussion) in the Ode to Gary Taubes forum. Actually that whole forum, bc Charles did a fantastic job of summarizing Good Calories Bad Calories, chapter by chapter. Anyway, we just were talking about the veggie thing in the NBBA.FotL thread. Fiber, the plant's own defense chemicals...lots of interesting reasons why veggies aren't all they're cracked up to be.

It's nice to see a future doctor here!

So...I am very happy bc I finally got myself 3lbs of beef fat to render. My farmers market beef ppl kept trimmings for me, so now I am "The heart and fat lady", bc I always buy up all of their beef hearts as well (for my cats and for myself sometimes). I'm going to render a pound at a time. I've discovered that I love trimming some of the fat from my steaks, chopping it up, and rendering it before I slide my steak in the pan. Tastes better than butter, and the fatty chunks become cracklin' - omg, good stuff. I could live on cracklins. So with the quantity, I'll render it out and save the cracklins in the fridge as a dinner side dish.

Nyteez, how'd your pemmican turn out? I am dying to make some, hunting for a cheap-but-good dehydrator. Are you going to cut it into bars, or chunks, or keep it in a dish...how do you store it? I know it'll keep forever, just wondering what the best option would be for portability.

I've been awaiting the results as well. Did you use any seasoning?
RE: Zero-Carb/Meat and Water - aim in Fla*working - 09-29-2008 06:01 AM

thanks you guys! I appreciate the words of encouragement. I am eating zero carbs again today. I felt better when i woke up this morning after keeping them under 5. I did have eggs this morning and a few slices of bacon. I think eggs cause me to get a rash on my face like rosacia...I KNOW corn does this although I have been dtested for allergies to grain i have not been tested for corn. When i told my doc he said, "don't eat corn'....
duh, i guess.
Lunch is 2 pork chops and then lamb broiled with butter and a little garlic.
AGAIN, THANK YOU SO MUCH FOR THE ENCOURAGEMENT!

RE: Zero-Carb/Meat and Water - nyteez - 09-29-2008 07:45 AM

So far I made one small batch of pemmican. The hardest part is grinding up the beef jerky. I put it in my food processor. This first batch is plain. It is not bad, not delicious, but not bad at all. I still have enough jerky to make a few more batches. So I am going to try a salt & pepper one and an herb one. I have an herb garden, so I am going to saute a sprig of oregano ( or rosemary) and maybe a garlic clove in the tallow, then take out the oregano & garlic & use the flavored tallow for the pemmican.

I mixed up the pemmican and pressed it into a small gladware container then put it in the fridge. I took it out of the fridge about an hour ago. I cut a small piece off to try it.

I think I will keep it in the fridge and cut off pieces as I need them. I am going to take a piece to work w/me today, so I'll let you know if it melts or gets gooey.

I researched dehydrators and decided the Nesco brand is better because the heating element & fan are in the top of the unit. People liked this mostly because if anything drips it doesn't go into the element and it is easier to clean. Walmart has a new Nesco model FD-39. It is only 34.88! It is kinda noisy, but it only took 4 hours to completely dry the meat. (I did slice it thin and pounded it w/meat hammer) It is not so hot that it cooks the meat, it dries it raw, which is what I wanted.

I am looking forward to making the herb pemmican tonight, I think it will be much better than the plain.

RE: Zero-Carb/Meat and Water - jeepifer - 09-29-2008 07:49 AM

What type of meat did you use? Do you think a meat grinder would work for grinding the jerkey?

Can't wait to hear the herb results!

RE: Zero-Carb/Meat and Water - jeepifer - 09-29-2008 07:53 AM

Do you think ribeye is a fatty enough meat on it's own, or should I supplement with additional beef fat? I
haven't been eating strictly ribeye but it's been a breakfast staple and I'm feeling a bit tired. I'm wondering if I should get some beef fat and eat that along with it?

We didn't get the whole ribeye grilled this weekend, but hopefully will tonight. DH is going to put it in the freezer when he gets home from work, then fire up the grill and slice the chilled meat (for firmness). I am really looking forward to dinner!

Based on your comments about rib eye at Costco I was in there yesterday for another reason and looked at the meat. They also had beef short ribs that were boneless and packaged in cryovac. They were about $3.00 lb. The fact that this was boneless caught my attention plus the fact that beef short ribs are pretty fatty. There is only a .20 cents difference I noticed between the 14-17 lb rib eye package and the case price. Not too bad. 14-17 lbs of rib eye would be a lot of rib eye. Take me a week to eat if I ate it for every meal.

Rib eye is pretty fatty by itself from my viewpoint.

RE: Zero-Carb/Meat and Water - Charles - 09-29-2008 08:08 AM

jeepifer Wrote:

Only you can really answer that. All ribeyes are different. I get some that have big pieces of fat in the middle and some that are fairly lean after the trimming. I pretty much brown some fat every time I eat regardless of the content of the meat. Sometimes, I get to the edge of nausea and can't eat all the fat, so I just finish the lean and toss the remainder to my dog, who loves it.

Too much is nausea, too little is no energy.

Regards,

Charles

RE: Zero-Carb/Meat and Water - suzanneyea - 09-29-2008 08:16 AM

Listen to your body, I can tell exactly what I need. When my body needs fat I find I cannot touch my
chicken breasts, I only want my fatty pork chops and rib eyes. Other days, my chicken is very yummy to me. Some days I crave the fat I cook with, other days I just give it to my dogs, no desire.

I get the boneless beef short ribs often. I put them in the crock pot and they come out tender and well marbled.

Beth Wrote:
I know a lot of you pump up your fat % with added fats or coconut oil. I was wondering if there is anything wrong with butter? Sometimes I can only get 80/20 hamburger or the chicken or steak just doesn't seem fatty enough. I've tried the bacon fat and I literally have to choke it down. I haven't tried the beef trimmings from the butcher yet. That might not bother me since I like that taste on a steak. But in a pinch is it OK to add a tablespoon or two of butter? Does it cause stalls? Is it not considered an "animal fat" because it's really a by-product?

Thank you
Beth
Actually - real butter - is a good source of Butyrate a free fatty acid mentioned in "Life Without Bread" Lutz
Butyrate de-differentiates cancer cells rendering them harmless.
Don't hold me to the actual quote and my terminology may be off as I don't have the book with me but I wanted to get the info out as it seems to be important. Still we didn't use butter prior to milking cows. Coconut oil is also supposed to be real good for you as well.
Chris m

RE: Zero-Carb/Meat and Water - nyteez - 09-29-2008 09:06 AM

I got one of those costo ribeye roasts (18.5lbs!) last week. I have been cutting my own ribeyes from the roasts for years, because it is cheaper. I found a great inexpensive meat cleaver on ebay. It goes right through raw meat like a butter knife! I cut them, then put 1 or 2 to a pack in a quart size zip lock bag & freeze them.
Thanks for the dehydrator info. I'll see if I can find a Nesco one.

Has anyone else found that they've totally gone off certain things? I cannot stand the idea of pork other than bacon, ribs or sausage (ground pork I've made into patties), and I haven't had the urge for eggs in weeks. When I have eaten them, I'm like "meh". Not appealing to me at all. I mainly want beef, lamb, and the odd time some chicken. I have pork chops in my freezer that seriously sick me out when I look at them. I've only ever liked pork with lots of seasoning, or apple sauce and tons of salt.

I've decided to really make a go at the zero carb thing. Reading Stef made me realize that keeping certain things in my diet, even if they are low carb, are leading to junk food urges later on. Might as well just go all out. I'm keeping tea/coffee for now but limiting it and ditching sweetener (I take it in coffee). I can ditch most condiments, like ketchup, bc I only eat it with eggs really and I don't want eggs. I'll use herbs/spices, hot sauces, and a little lemon juice on my steak. I will be eating some sheep cheeses too and some coconut milk, so I won't be zero...more like <10.

I'm totally understanding the acculturation thing - I haven't craved a vegetable/fruit in forever, but I do get urges for junk food like chips, or popcorn, or peanut butter cups. Non-food. I really want to break this.

I'm going to satisfy occasional urges for something 'special' by finding wonderful meat recipes. I just got an old Julia Child cookbook from Ebay, so I am seeing some amazing roast chicken and duck in my future. Maybe even some rabbit and more seafood. I could hunker down to watch a movie with a nice lobster and not miss my Ruffles one bit 😊(A cooked lobster, that is. Not me and a lobster cuddling and watching chick flicks.)

Sorry, guys, but I just can't help but laugh at all of this. When I enter the forum, I look down at the "last posts" and yes, they are not in the General Discussion area any more, but all the journals and other threads still have a Zero-Carb notation in front of them. I tried!

Zero-carb just rules!

It's ironic, since zero carb is so simple. You would think there would be a lot less to say 😊

RE: Zero-Carb/Meat and Water - Fully - 09-29-2008 10:38 AM

LOL! I was thinking the same thing.

I hate the smell of fried fat in my house. I have always hated it. But now I am frying fat all the time. I clean and clean but its just a sticky stinky mess. I guess I could grill but that gets expensive since i only have a charcoal grill. I started cooking a bunch at one time but I hated the taste of warmed up beef. Yuck! I can handle my chicken thighs but that's about it.

I am spending a load on ribeye's. I guess I need to go to Costco's or somewhere. There is another cut of steak called chuck eye. Its pretty fatty looking to me. Have you guys tried that?

Chuck Eye's rock!!! They are tender and fatty, and usually half the cost of ribeyes, or even less. I think they may go by other names in certain parts of the US or other countries.

The one's I have had were awesome! I am from NC/SC. But they have raised the prices here on them. I think I need to see what I can get a big slab of them for. The thicker the better in my opinion 😊

RE: Zero-Carb/Meat and Water - Fully - 09-29-2008 10:52 AM

Here we go.... and yes, cooked medium, thick sliced is the best i think. Pan fry and pour any juice over it. Yummy! And I bet this would be good to make jerky.

Definition: The Chuck Eye Steak is cut from the chuck eye roast (Chuck Primal), lower down from the rib primal. This means that this steak is a similar cousin to a Rib-Eye Steak, but isn't as tender or flavorful. A good lower cost alternative but will dry out quickly.

The Chuck Eye Steak is best braised to keep it moist, but is also good grilled or broiled, provided care is taken not to over cook it. This steak is best served Medium Rare.

Me too. I am getting sick of pork, unless it is cooked in the crockpot & shredded with lots of fat, I gave up bacon weeks ago...too salty, I make my own sausage so it is ok. I still like chicken thighs once a week. I have a bunch of bonless skinless chicken breasts that I don't know what do with, I'm not eating them LOL! Maybe I'll just feed them to the dogs.

**RE: Zero-Carb/Meat and Water**

jeepifer Wrote:
Speaking of which, I should change my journal title. 😊

No, please don't do that!

There are some who will continue to perceive this as a zero-carb forum only and we can't do anything about that. All we can do it contain our enthusiasm for each other and the new members who seek us out.

I cleared the "page views" for this thread which were over 130,000. It's now quickly climbing once again.

Before there was low-carb, there was zero-carb and people don't know that. Anyone having trouble on Atkins or whatever plan will come here and attempt to give it a shot.

One of these days people will recognize that it's all about insulin and not about carb counts. Just creating "low carb versions" of your favorite high-carb foods is only going to backfire and lead to despair. Only here can you totally ditch that "urge for the sweet." When you do, then you finally get the true benefit and promise of "low-carb."

I'm not the Kimmer. Anyone can e-mail me for free, see my photos --heck, you can even come and run a race with me or eat dinner with me this Sunday at the low-carb meet-up at Golden Corral in Apex, NC. I'll be there at 6:30. Better yet, go on the low-carb cruise which I am about 99% going to participate (as long as I get my money in time). I'll be there and you can see for yourselves that I definitely practice what I preach!

Regards,

Charles

Count me in the only pork products I will eat these days are bacon, ribs or sausage but then saying that I haven't had pork in weeks. But then I have always preferred beef to pork or chicken. Go Beef Council.

Just finished lunch and had Beef Loin Flap Meat. This stuff is great. You can see the fat streaks in the meat about every 1/8 of an inch. This is one of the cuts they make fajitas with in addition to flank and skirt steak.

RE: Zero-Carb/Meat and Water - suzanneyea - 09-29-2008 11:12 AM

Hmm, I super into pork chops these days, but maybe because they are like 80% fat, lol. I am like Charles, most of my food is beef.

RE: Zero-Carb/Meat and Water - nyteez - 09-29-2008 11:14 AM

I got my meat cleaver a few years ago on ebay, that seller is still selling them if anybody is interested. It really is a great quality knife for the price.

Here is a link to the auction. Meat Cleaver

If you ever see T-Bones suck those up as well. A T-Bone is just cut from a different end location than the Porterhouse. The T-Bone has a smaller tenderloin section than the Porterhouse which is why it is less expensive than a Porterhouse.

I can't say at this point that I'm totally ZC but I'm slowly gravitating that direction. I've never had a love of veggies and I have nearly eliminated them altogether now. Charles, eliminating LC Versions has been one of the most positive moves I've made; that together with eliminating veggies has practically eliminated carb cravings, something I never believed possible.

I'm thankful for Atkins and Protein Power as they both made seriously positive impacts on low-carb initiation and first year of weight loss. And it would continue to work, but when I found this thread I just spent time reading and thinking about it for a while. I never once felt compelled by anyone to jump into it, nor did I feel condemned for still doing Atkins/PP. But the more I thought about it, the more I realized it just made sense.

I didn't jump right into it. I'm just eliminating things a little at a time as I feel comfortable with it. I'm glad that folks like me can come here and find that ZC indeed existed eons before "low-carb" was ever "discovered". It seems like ZCer's are always happy to entertain our questions even though we're not strict ZCer's ourselves...yet! Thanks for all you do for this forum and for all the friendly, helpful members who have contributed so much to the success of this way of life.

Someone here purchased some beef ribs or something similar, and when they got home, realized the package had carbs listed! The ingredients were beef and beef broth. Obviously, filler or sugar or preservatives etc. were added. Why? To make it weigh more for less actual beef. Improve their profit margin.

So it wouldn't surprise me that the same thing is happening to the ground beef.

Those of you that shop Sam's Club, beware. They're owned by Wal-Mart, so their beef (and I'm assuming other meats) will be suspect as well.

RE: Zero-Carb/Meat and Water - hpseids - 09-29-2008 01:08 PM

Oh no!

I buy those ground beef...uh, logs?...from Walmart often, the 73/27 ones Charles recommended. I just ran to my fridge and checked...they say 0g carbs but there's no ingredient list. Should I assume that's bc they're 100% beef?

I also really like Bubba burgers when I'm lazy...do any of you guys eat those?

I think I'm finally getting into ZC after a week like this...I officially went 6 hours today before I was like, oh yeah I'm kinda getting hungry. I'm about to eat a burger now and it's been 7 hours. So cool! On high carb it'd probably be like 2 hours, max lol. Guess that was the problem...!

You guys RAWK.

RE: Zero-Carb/Meat and Water - ANOVA - 09-29-2008 01:10 PM

I'm still mixing it up. Ground beef for breakfast. lean beef strip for lunch and pork, chicken or beef for supper. Still zero carb, plus, I'm starting training for a sprint Triathlon in June.

Yep, if it doesn't list ingredients, then anything other than beef has to be in negligble amounts.

Nope, on the bubba burgers. I'll have to look at them the next time I'm at Wally World.

You're welcome, Ron. I don't get much press when I tell people that going off plan is actually part of the process of being "on plan." Your body will tell you what it prefers by responding with energy and vitality. Sometimes people have to eat badly and go through periods of feeling terrible before they finally decide that it's just not worth it. I worked my way here as well.

It's really not 'us against them' but I don't imagine too many of us zero-carbers like to be compared to a cult or to Kimkins. We're all trying to find our way just like anyone else. On the other hand, zero-carb is not something that requires belief.

We don't force anyone either. It's simply, try it or don't try it. It's that simple really. We know it works but we understand that it takes quite an effort for many people and we're okay with that.

Regards,

Charles

I think I'm finally getting into ZC after a week like this...I officially went 6 hours today before I was like, oh yeah I'm kinda getting hungry. I'm about to eat a burger now and it's been 7 hours. So cool! On high carb it'd probably be like 2 hours, max lol. Guess that was the problem...!

Congrats, Emily! I wouldn't worry too much about any injected solution in the ground beef. You certainly can't taste it and the cooking process may eliminate it. I've never eaten it raw, so maybe you can taste it that way; I just know I don't taste anything sweet in their ground beef and it's fatty and quite bland(which I like).
The test always comes down to cravings and how you feel after eating it. If any food sparks cravings, don't eat it. If not, it's all good.

Regards,

Charles

Charles Wrote:

I'm not the Kimmer. Anyone can e-mail me for free, see my photos --heck, you can even come and run a race with me or eat dinner with me this Sunday at the low-carb meet-up at Golden Corral in Apex, NC. I'll be there at 6:30. Better yet, go on the low-carb cruise which I am about 99% going to participate (as long as I get my money in time). I'll be there and you can see for yourselves that I definitely practice what I preach!

Regards,

Charles

I don't think anyone here has even suggested any similarity. The naysayers view this as a "radical" diet and therefore, its proponents as radicals. But the proof will be in the pudding. I go for a CAT next November and that along with the bloodwork can be compared to a few of my baselines over the last 2 years. I'll report back what changes, there are.

I'll just say that this has been the easiest way for me to lose weight.

FormerDonutJunkie Wrote:

I didn't jump right into it. I'm just eliminating things a little at a time as I feel comfortable with it. I'm glad that folks like me can come here and find that ZC indeed existed eons before "low-carb" was ever "discovered". It seems like ZCer's are always happy to entertain our questions even though we're not strict ZCer's ourselves...yet! Thanks for all you do for this forum and for all the friendly, helpful members who have contributed so much to the success of this way of life.

FDJ, this is exactly what I'm doing. I was already LC but still craving and thinking about food nonstop which caused me to binge. Fortunately I always got back on plan, but I would beat myself up over my
failings. I joined this forum on July 26th of this year after lurking for a few days. I was intrigued and eeked towards zero carb for about a week and then finally went after it the second week in August.

The first week or so I felt just great, couldn't understand people who were talking about being lethargic or having stomach issues and then, BAM, they hit me. I've been doing tweeks ever since and can REALLY tell when I haven't had enough fat. I keep a good journal of what I ate and how I felt - what I weighed, if it was a hungry day or a lethargic day or a great energy day, where I am with the hormone cycle, etc... which has really helped me to figure out what works for me. Pretty soon I hope to be done with the journaling and be able to listen totally to my body. For now though, I still need to dissect it to feel like I'm in control and making progress.

So, for anyone new to this WOE, don't give up if you have a bad week - or two. In all honesty, I almost needed a period to grieve after the honeymoon was over- meaning - have my little pity party and pout about not being able to eat more variety, etc... I'm still trying to figure out how it all fits into the life I live - social settings, family life, holidays, etc... Thank God for all the support here!!

**RE: Zero-Carb/Meat and Water - suzannevea - 09-29-2008 02:25 PM**

I get very defensive about low carb, only because I would NEVER belittle another person's low carb plan, but a lot of people think it is ok to tell me I am going to die eating this way. Sometimes if you have nothing nice to say it is better to not say anything. Also, it hurts me. Atkins, low carb, very low carb and now zero carb have all been amazing diet programs in my life. It hurts me to see people suffer from binge eating or get down on themselves and their bodies when I really believe their is a solution. I know the emotional pain of being unhappy with food and your body and it can been horrible. So, when people compare zero carb to some weight loss scam like kimkims, I get upset.

hpseids Wrote:
Oh no!

I buy those ground beef...uh, logs?...from Walmart often, the 73/27 ones Charles recommended. I just ran to my fridge and checked...they say 0g carbs but there's no ingredient list. Should I assume that's bc they're 100% beef?

I also really like Bubba burgers when I'm lazy...do any of you guys eat those?

I think I'm finally getting into ZC after a week like this...I officially went 6 hours today before I was like, oh yeah I'm kinda getting hungry. I'm about to eat a burger now and it's been 7 hours. So cool! On high carb it'd probably be like 2 hours, max lol. Guess that was the problem...!

You guys RAWK.

Hi Emily: Just wanted to let you know that as we speak, I'm cooking up four 1/3 pound Bubba Burger's, two for dinner and two for tomorrow's lunch (if I eat now, I won't eat again until at least 12 or so tomorrow) and they are the most delicious burgers I've ever eaten. I buy them by the box at BJ's for $11.99. I highly recommend them.

I would also like to add that eating this way, meat, some eggs, small quantity of cheese on occassion and cream for my decaf coffee, is the best thing that's ever happened to me. My grandmother always cooked
the best "beef patties". I'm sure she used nice fatty chuck and because she touched them with her blessed hands, and cooked them nice and rare, they were the best thing I ever tasted. She also cooked skirt steak, nice and fatty and always rare. She used butter and chicken fat to cook things and everything she made was fabulous. She gave me my love for fatty meat cooked nice and rare. And then something happened...my grandmother passed away. I was 19 and everything changed. Doctors and "experts" were telling us fat is bad. Eat more carbs, eat low fat and you'll loose weight. You know what? My grandmother was right. Fat isn't the enemy and it's taken me all these years to find that out and I would like to thank (as I've done before) Charles and Suzanne for bringing me back into the light. I would also like to thank Jimmy for putting the forum out there for all of us to live and learn together on this low carb journey. Whether it's low carb, very low carb or zero carb.

The good Lord made us all different for a reason. I'm pretty sure he knows exactly what he's doing!

Marsha

jeepifer Wrote:
Someone here purchased some beef ribs or something similar, and when they got home, realized the package had carbs listed! The ingredients were beef and beef broth. Obviously, filler or sugar or preservatives etc. were added. Why? To make it weigh more for less actual beef. Improve their profit margin.

That was me!! I haven't gone back since...I've been buying ribeyes at BJ's almost exclusively. They're not too expensive and they are nice and fatty 😊

RE: Zero-Carb/Meat and Water - hpseids - 09-29-2008 03:15 PM

AuntieM-- I love the Bubba burgers too! They're so tender and greasy (in a good way) and deelish! I love ur name, by the way...lots of people call me Em and I'm still waiting for one of my brothers to have a baby so I can be Auntie Em! 😊

Suzanne-- I totally know what you mean...and even tho you didn't mention this, what you said made me think of the idea of being ashamed of this WOE...does anyone ever feel this way? (or at least at first did maybe?) Maybe ashamed is too strong, but I'm invited to a friend's parents' house tonight for Rosh Hashanah dinner (Jewish New Year)...and food is a central part of Jewish culture haha...so I want to go and probably will because it's meaningful and important to me, but I'm definitely nervous. Like I feel like I need a good excuse or something why I'm not eating the apples and honey, challah (bread), etc....KWIM?

Probably sounds goofy but I'm even thinking of saying I'm trying an elimination diet because I might have Celiac disease or something, but it seems ridiculous not to just be up front and proud of my WOE...I dunno...people all of a sudden think you're not as fun or something just because you don't want to binge on fries and beer and cookies 😊

The thing is this: on one hand, as a med student and someone really interested in health and nutrition of our society, I reeeeally want to spread the word and educate and inform others...that's the ideal...but then I get embarassed or something and, like Suzanne said, don't like feeling like I have to explain myself. Everyone assumes it's just a vanity thing like ohhhh...you're following some fad LC diet to lose 10 pounds (not that there's anything wrong with that, if you ask me!), instead of realizing that's it's a a
whole mind-body-spirit thing...health, well-being, emotional peace...everything! People don't get that straight off and it would take a LOT of explaining several times a day if I really wanted them to.

Ugh...sorry for the rambling! Y'all might think I'm insane but I thought I'd share in case anyone else felt the same and/or had some insight.

No doubt! I'm going to sit down for Rosh Hashana dinner myself in about an hour. There are about 83 food items that I won't eat. In an effort to not be rude I am going to do my best to scrape the gravy off the brisket rather than cook my own beef, but my grandmothers are in town, so I know I'm gonna get interrogated about why I'm not eating the traditional Jewish carb-fest side dishes (my parents are used to my food choices now). I don't really care anymore though. To me, answering some stupid questions and dealing with disapproving looks is outweighed by the promise of being thin and healthy. Besides, these same people criticized me before for being fat, so I cant win anyway 😒

I know what you mean about feeling like you need an excuse - or an arsenal of scientific information. I try to stick to the point that I'm working to manage my insulin levels. I always say that I have Diabetes and obesity in my family (which I do) and that I'm determined to avoid the same fate.

Quote:
The thing is this: on one hand, as a med student and someone really interested in health and nutrition of our society, I really want to spread the word and educate and inform others...that's the ideal...

You actually are in a unique position as a med student to inform people that you've done some research
in the area of nutrition, health and fitness and you feel that you're making an informed decision for yourself. People are more likely to give you credit than someone like myself who simply says - "well, I've been reading up on it". Most people know that you can find something to read about any point of view or opinion on anything that will support your view. My friends are all quick to ask me where the studies are, why the AMA doesn't support it, why Atkins died of heart failure, etc... Then, I'm left with my mouth hanging open, feeling like a detriment to the cause.

Hence, I often times serve myself and push things around on my plate! I used to admire women who could leave a plate half full because I always licked mine clean. Now, I'm sometimes one of them!! Strange as it sounds, this in and of itself is a MAJOR accomplishment for me, so I delight in doing it! It's like the "willpower" I never had on LC.

Well, if the Jews in your area are anything like Jews from NYC, you will be fine as 99% of them probably have some kind of secret eating disorder themselves and are just as fearful of this meal. Social situations can be tough. I play each one differently. Sometimes I say I am not hungry, other times I go with food allergies, stomach bug. I have a list of "white lies." I do not want to draw attention to my eating, nor do I want to offend the host. Somehow, it always draws attention and I usually just continue to change the subject. But, no matter how I play my cards, I never have eaten a single bite off plan in any social situation.

---

RE: Zero-Carb/Meat and Water - sean - 09-29-2008 04:35 PM

Nyteez,

Just a heads up for what its worth. I read a few posts back about your cutting up the ribeye and then freezing it. You and I have almost identical methods (even the cutting board picture) however if you can avoid freezing the meat it may make a difference.

Months ago BEAR emailed me a response to this very question and the subject line read, "Freezing F** Me up Permanently". Quite obvious what he thinks. He sort of beat around the bush on his now famous forum, but one on one he told me directly that freezing the meat will absolutley damage it and who knows over the long haul what could happen. Just a heads up.

He suggests setting the fridge at about 33-35 degrees and the meat will keep almost indefinitely. I find that when I do more and more things exactly as he suggests (50 years of experience) things seem to go very very well.

I buy the ribeye logs just as you do, from a butcher in Baltimore who I think may be the best in the country. He leaves the "rim" of fat on and anything else I request. He cryovacs it and I usually buy 35-45 pounds a pop. Thats it, my shopping is done for the month. It really is that easy. Ive never frozen one piece, and on day 30 it is just as good as day 1.
I don't know the science behind it or anything else, but I've noticed a difference since I stopped eating frozen meats that I had shipped from the Amish up in PA. BEAR really stressed this aspect about fresh meat....

______________________

I've noticed a lot of talk about social situations and the like and I can only say you should all go on the offensive.

There is no shame in truth......

I have many co-workers who seem to know "everything", (just the way the job is), and when we go to lunch (rare occasions) I order rare to raw ribeye with a side of fat. Thats it. My coworkers are nibbling on some appetizer garbage and offer it to me while cracking jokes about meat fat. I simply say, Why would I eat that shit? They then become embarrassed and what's funny is they then start explaining why they're eating some corn rolled spinach something or other. I don't even ask, answer or engage them, yet they feel the need to do what I think many of you are saying you feel the need to do. Put it on them, you have no explaining to do.

I also told them once lets all strip down to our underwear and walk around and see how our "diets" are treating us. Since then I've had about 8 of them very clandestine like come to my area and start asking meat questions just low enough so no one can else can hear....

That sounds exactly like me! I always thought people who left food on their plate or ate "half" of anything just couldn't be trusted. LOL! Cause in all reality, I ate all mine and could have eaten their leftovers as well.

And yes, it is a major accomplishment to be one of the "weird ones" who now leaves food on their plate, especially if I'm at a gathering where carbs are the primary food being served. I like to put some on the plate and pick over 'em, then leave 'em just so they'll think I eat veggies, especially. It's really not willpower, but what the heck, they don't know the difference!

My membership in the "Clean Plate Club" is now expired and I don't plan on renewing it!

RE: Zero-Carb/Meat and Water - caroline - 09-29-2008 05:12 PM

I'm finding that b/c people are so biased about "thin," that no one criticizes me for the way I eat. They see how I look at 40 years old and that shuts them up. My family is Jewish, obsessed with food, obsessed with thinness, but thinness wins over.

What I get from people is usually, "don't you eat...such and such?" I say no, don't defend it, and that's that. And people leave it alone and then begin asking me details about my "diet."
RE: Zero-Carb/Meat and Water - nyteez - 09-29-2008 05:30 PM

Sean,
Yes, I remember Bear mentioning the freezing thing. I only froze half of it. I am looking into making an "aging box" where the meat will naturally age and actually get better. I saw an episode of Alton Brown where he poked holes in a plastic box or something, I have to find it.

I guess now that there is nothing in my fridge except meat I can turn it down. I no longer have to worry about the veggies being frozen! LOL!

Thanks for the heads up!

Probably sounds goofy but I'm even thinking of saying I'm trying an elimination diet because I might have Celiac disease or something, but it seems ridiculous not to just be up front and proud of my WOE...I dunno...people all of a sudden think you're not as fun or something just because you don't want to binge on fries and beer and cookies 😞

I've only ever caught flak from one person, ironically a very thin friend of mine who went on to develop gestational diabetes. The only time I feel awkward is when people who know I'm celiac bring a bunch of gluten-free brownies, cookies and other carbage especially for me -- I hate refusing it, even though I didn't ask them to bring anything for me (or even flat out told them not to, because it isn't necessary). I have gotten over it now, pretty much. I still feel a bit oogy about it sometimes, but it's rarely an issue anymore. You can always say that x, y or z doesn't agree with you, which is true after all.

sean Wrote:

Really? Interesting. So you find that meat will keep for a month in the fridge at this temp? I have to try this out. I'd really rather not freeze everything. I remember him saying how he'd keep his meat in the fridge and just hack off a piece - sounds very easy and convenient. Would this method be alright for poultry as well? Also - my fridge just has 'cold - colder - coldest' settings...I'm assuming 33 degrees would be 'coldest'?

Nyeteez, I am now googling 'aging box'.

I bought some enormous scallops today, and am going to wrap them liberally in bacon...mmmm. Another 'watch a movie' food.

RE: Zero-Carb/Meat and Water - hpseids - 09-29-2008 08:29 PM

Oh my gosh, so much ZC action since I left! Awesome advice frm Sean, Caroline..everyone. I'm learning SO MUCH!

Just got back from Rosh Hashanah dinner...people definitely asked questions, but I just said I'd been not feeling well (true) and am cutting out all common food allergens to see what it could be (pretty true). They asked what I was eating, I said pretty much meat...and I feel 100% better! They all looked at me like I had 3 heads but whatever.

Several of them, med students with strong science backgrounds, mind you, said "well what do you do
for carbs?...you NEED carbs, you know." 😊 I just said, actually, you don't. You need fat, you need protein, don't need carbs. I eat plenty of fat and protein and feel amazing!

It's not their fault because it's what everyone's acculturated (I won't say taught) to believe, but it's still sad...future doctors who are clueless and don't even get me started on the kind of sh*t some of my profs spew...SCARY. A lot of it isn't even just bad opinion, it's straight up, downright FALSE. I don't get it! How could a biochem professor, who has mastered all of these chemical and enzymatic reactions not make the connection?! GRRR!!!

Anyway, even with allll the questions and annoying comments I stayed positive and moved on...ate some brisket and some salmon and took some zucchini and salad, to be polite. I had a bite of zucchini, just for the hell of it...and it wasn't even good! It tasted kinda bitter and weird to me. I was totally happy with my meat! WEEE!!!

Exam tomorrow, wish me luck!

...I also really like Bubba burgers when I'm lazy...do any of you guys eat those?...

The Walmart brand special burgers (1/3 and cheese w/bacon etc.) show between 1 and 4 gr carbs but they are goos. I also mix some sage into my own version of 1/3 burgers. Gives it kind of a pork sausage spice taste. These and the Bubba Burgers are good.

I eat 70 - 80% fat. Some days I eat only 2 meals. I'm just hanging in there....I sure can't drop any carbs because there are none to drop. Any suggestions? Or just don't worry about it?

Charles Wrote:
What is your energy like?

GREAT!
Charles Wrote:
Are you hungry at regular intervals or do the times vary?

Vary

Charles Wrote:
How long do you average between meals?

Varies. Six hours usually.

Charles Wrote:
Is everything else in your body working right; meaning, are there any other issues going on like irregular menstruation or fibroids or anything like that? (You don't have to answer these questions, but you should consider them because they all can have an impact.)

I stopped my cycle in January. It returned 2 weeks ago and was the easiest and normal ever. No pain. No problems with fibroids, which were a problem.

Charles Wrote:
Weight is a body regulated thing when you eat a proper diet but weight is only one part of the entire homeostasis. Many things can interfere with your weight regulation. All you can do it eat when you're hungry and don't eat when you're not. Don't drink too much, just drink to thirst.

I say all this to say that it's okay to have some long periods where nothing happens. Look for other positive changes in terms of mood, energy, optimism, sex drive, etc. These are all important markers as well. Just keep living!

Mood is good. Would be better, if my weight would cooperate. Sex drive has greatly improved. I love how I feel, but I'm human and I want to look good, too. I want to get rid of this excess fat.

Thanks, Charles!

suzanneyea Wrote:
I get very defensive about low carb, only because I would NEVER belittle another person's low carb plan, but a lot of people thinkit is ok to tell me I am going to die eating this way. Sometimes if you have nothing nice to say it is better to not say anything. Also, it hurts me. Atkins, low carb, very low carb and now zero carb have all been amazing diet programs in my life. It hurts me to see people suffer from binge eating or get down on themselves and their bodies when I really believe their is a solution. I know the emotional pain of being unhappy with food and your body and it can been horrible. So, when people compare zero carb to some weight loss scam like kimkims, I get upset.
Suzanne.......Kimmer's plan, allowed NO FATS......that's what made people sick. That and the 400-500 calories that was encouraged.

hpseids Wrote:
Maybe ashamed is too strong, but I'm invited to a friend's parents' house tonight for Rosh Hashanah dinner (Jewish New Year)...and food is a central part of Jewish culture haha...so I want to go and probably will because it's meaningful and important to me, but I'm definitely nervous. Like I feel like I need a good excuse or something why I'm not eating the apples and honey, challah (bread), etc....KWIM?

Probably sounds goofy but I'm even thinking of saying I'm trying an elimination diet because I might have Celiac disease or something, but it seems ridiculous not to just be up front and proud of my WOE...I dunno...people all of a sudden think you're not as fun or something just because you don't want to binge on fries and beer and cookies 😁

Ugh...sorry for the rambling! Y'all might think I'm insane but I thought I'd share in case anyone else felt the same and/or had some insight.

I am Jewish and went to my aunt's house yesterday night for Rosh Hashanah. The whole family was there, about fifteen people. Everyone ate their typical apple and honey, bread, etc and I stuck to my rare chicken thigh, refusing everything on the table. My cousin was even a little mad when I refused the apple and honey thing because it was like I went against tradition but I stood my ground. He was sitting next to me and even told me how seeing me eat my chicken rare was sort of disgusting. So I fought back and said that what he was doing was not right and that I wasn't commenting on his food so he shouldn't either unless he has anything good to say. We should all respect each other's ways. Then, his mother in-law jumped in and told us that they used to eat the chicken like that in Israël back in the day. I had a big smile on my face. Then he mentioned the dangers of salmonella and bacteria in raw food and I explained that I had actually eaten raw for more than a year with no problems. He even told me the night before that the brain needed glucose to survive and when I asked him how it is that I survived on no carbs since about 2 months, he didn't know what to say. 😳

It's truly amazing how in the face of contradicting facts, people still persist in their beliefs. Even very logical, educated people. I really did not expect this from my cousin. I thought he was more open-minded than that. He insists that moderation is best and yet he gives his children 1% milk. LOL.

It was very interesting to watch the kids eat. My cousin's 6 yr old son ate the meat and fries first, then the broccoli that his dad insisted he ate if he wanted to have more french fries. I asked his oldest daughter, almost 10 years old, what her favorite dish was and she said that it was pasta followed by meat. Nothing I could do but watch and listen! So frustrating!!!

Everyone in the family knows how I eat and I'm not ashamed. No matter what the occasion, I stick to my guns. Coming back home, we met our neighbors and I told them about my diet. I'm in no way ashamed of my diet, I'm a better person for it.

RE: Zero-Carb/Meat and Water - chris m. - 09-30-2008 07:17 AM

Here's what I'm thinking:
In order to effectively introduce this WOE to anyone TRULY interested - we need to be able to direct them to this website and then to our "zero carb reccomended reading list" - Once they have spent enough time digesting all of the facts they WILL be left with enough info to make an informed choice of their own. The list should include Stefanson, the Bear, GCBC, and others especially our thread where I have learned MORE than any other source during my low carb journey.
I checked with my butcher and his ground chuck comes to him in tubes and he did not know whether it was injected with solution or not. He does grind his own 80/20 so knows it does NOT have anything added.

"Moderation is best", in my opinion, is one of the worst cliches in the book. In almost every case, something is either good for you or bad for you. If something is bad for you, moderation may make it less harmful, but it still isn't as good as 0. I can only think of a couple things that the evidence shows is best in moderation. Exercise comes to mind for example.

I've been following this thread for months now and appreciate all that's been shared by everyone. Just reading here every day has become the daily 'pep talk' that keeps me strong.

I just wanted to chime in to say I pretty much agree with Angela on this one. Coming to ZC has been such an epiphany for me on so many levels and I'm just not going to debate with someone who wants to drag me down. I've finally found what works for me and if someone else doesn't like it, tough! There's just no room for that in my life these days.

Kristi

RE: Zero-Carb/Meat and Water - **Fully** - 09-30-2008 08:35 AM

I have not eaten outside my immediate family as of yet but when I do and someone says something to me about not eating certain things, I am going to tell them "I am getting my insulin in order." That way it gets away from the word "diet" and becomes more medical. "Low Carb and/or Protein diets seem to get such bad raps. Really irritates me. I get so tired of hearing....you know when you start eating bread again you will gain all that weight back! 🙄

And when people ask how did you lose all that weight, pending on the person......I will just nicely say, "You know once I got my insulin in line the weight just fell off." 😊

RE: Zero-Carb/Meat and Water - **jeepifer** - 09-30-2008 08:42 AM

I wish my weight would fall off. *sigh* I know, I know, these things take time, etc. yadda. 😞

I've decided to give myself an October challenge of eating NOTHING but meat and water. Get back to zero and see how it works out. Goodbye wine and coffee! Not looking forward to tomorrow's headache 😞

RE: Zero-Carb/Meat and Water - con - 09-30-2008 09:55 AM

LATEST UPDATE!!!!!!!!!!

I can't believe it! My newly "sorta" LC DH announced this morning that he has lost another 5 lbs. and had to punch another hole in his belt to keep his pants from falling off! He's still wearing the same clothes, yes he is, and yes, he does look slightly "baggy". 😊

That makes 40 lbs. he's lost in just over 3 months. He said in all bewilderment, "I didn't do anything and I lost 5 more lbs."(don't know which smily to use 😊or 😊)

There is a SUGGESTION of hope here for many. Because ALL he cut from his WOE was sodas, Jamba Juices, pastries, candy---the most obvious sugary treats. He still has bagels and beans and strangely enough doesn't eat lots of meat OR fat.

Anyway, just wanted to share how dh has in less than 1/3 of the time eating LC than me, whilst endulging in bagels, lost more than me.

Too much 😞 I've been drinking wine at about 3-4 glasses a night, and about 3-4 cups of coffee in the morning. I think it is too much, and I'm curious what a month without them will do for me.

RE: Zero-Carb/Meat and Water - Charles - 09-30-2008 12:35 PM

Congrats, Daveo! Nothing like a good challenge to rev the senses!

Alcohol is generally handled like a carbohydrate. That body has to dispose of it before it can go back to burning fatty acids so although it doesn't raise insulin pre se, it still has to be dealt with by the liver and this can slow you down. Any time you burden the liver with alcohol or fructose, you cause problems. This one is more insidious than sugar.

Regards,

Charles

I cut down on my wine to 1 day a week, friday or saturday. I started that last week. I figure since I cut back, now I can afford to drink really GOOD wine! 😄LOL! I mostly drank wine to mellow me out in the evenings, but since going ZC I don't feel so stressed out anymore. I also am not drinking anymore coffee, but I didn't really drink much before, so that's not a big deal.

The only think I have noticed so far is I need to eat more, 3 times a day instead of 2, but I have hit my lowest weight in 3 years today.

I have been drinking 1-2 cups of coffee every morning for more than 10 years, probably more like 12 or 15 really. I worked myself back to 1/2 caf in the last 2 weeks and I will tell you, I am completely frustrated with it. I understand that I won't lose weight until I've cut it out completely since it's the coffee, not the caffeine, but I am completely not myself without my full caffeine. My morning workouts without my caffeine jolt have become pathetic, at best, my normal bubbly, chatty personality is nowhere to be found and I'm exhausted by mid afternoon. I guess this speaks true to the addiction, but I'm just not sure I want to wait this one out.

Have any of you given up caffeine and felt this way? I mean, really, my brain just doesn't seem to be
hitting on all cylinders and I am as blah as they come. I wish I had the luxury of stopping for a nap to relieve the sudden onset fatigue I'm experiencing, but it ain't happening. I've been trying to eat whenever I feel this way, hoping the fat will rejuvenate me, but at work I just don't have the ability to stop, drop and eat fatty meat at any given time!!

Should I go with the No Doz? What's a good dosage on those? Any other ideas? Or, how long will this go on? Will I EVER be the same again without caffeine?

RE: Zero-Carb/Meat and Water - nyteez - 09-30-2008 01:54 PM

Quote:

I use the walmart brand "stayawake". It's probably worth a try since you feel so sluggish. They are 200mg each. Since you have had problems with it before, maybe you should take 1/2 of one & see how it goes.

BUT!... It also might be a good idea to beat the addiction. I think it takes 2 weeks to a month to get over the withdraw symptoms.

RE: Zero-Carb/Meat and Water - cbnebraska - 09-30-2008 02:05 PM

2 weeks to a month, huh? Maybe I'll wait until after my last race on the 18th and then give it a whirl. Then, I won't hurt my race performance any and by next season I'll be fully recovered. I think I'll go lay down.....yawn........

I used to drink a lot of diet sodas back in the day (sometimes two 2L bottles a day) plus coffee and tea for extra perking up. I went cold turkey when I started Atkins induction, and I felt terrible for a long time--two weeks at least. Headaches, low energy, sleepiness, brain-dead, you name it, I was it. The headaches eventually went away, but I still crave that sweet fizzy every now and then. I still don't feel as quick as I did when I was on caffeine, but I'm not crazy-high either.

I hope to be more energetic when I'm keto-adapted to ZC. I'm just trying to get enough sleep at night and drink plenty of water, and get up and move every once in a while to get the blood going.
My stomach feels a lot better now that I'm not forcing so much acid and fake sweetener in it, though! Coffee made my stomach hurt the worst.

What's really scary is to dream you were eating Cotton Candy....and wake up the next morning and your pillow is gone! 😐

LOL 😐

Thank you PLAY!!!! And welcome to Livin' La Vida! I am still a newbie. I joined a couple weeks ago and still look to everyone here for information. This is a really great place to be and everyone really cares for the members.

Well, I haven't celebrated yet. Not sure how I will or if I will. I may have my nails done or something. I don't know. Its funny though cause it does not bother me to be around smokers. Actually I love to smell a cigarette, cigar or pipe while its smoking. The smell doesn't even make me crave one. The only thing I hate is the smell on someone's hands. I am hoping the smell of fresh baked brownies will be the same way. Love the smell but not bother me.

OMG what a nightmare that would be! LOL! I bet I wouldn't be hungry then would I! 😐

Charles Wrote:
Congrats, Daveo! Nothing like a good challenge to rev the senses!

Alcohol is generally handled like a carbohydrate. That body has to dispose of it before it can go back to burning fatty acids so although it doesn't raise insulin pre se, it still has to be dealt with by the liver and
this can slow you down. Any time you burden the liver with alcohol or fructose, you cause problems. This one is more insidious than sugar.

Regards,

Charles

I wonder then why does alcohol make me STARVING hungry? And crave carbs for days after drinking it. I don't drink it at all for this reason but I sure would love to know why this happens.

Anyone?

RE: Zero-Carb/Meat and Water - jeepifer - 09-30-2008 04:34 PM

Hmm, Daveo, sounds like an awesome challenge!

The only think I have noticed so far is I need to eat more, 3 times a day instead of 2, but I have hit my lowest weight in 3 years today.

Interesting. I was hoping it would have the opposite effect on hunger, since I have suspected that the wine might be affecting my blood sugar a bit. But if you are eating more and still losing weight, I'll take that 😊

Congrats!! That's so wonderful! I'm sure it's motivating as well.
daveo Wrote:
I'll let you know what happens! Zero Carbing has been great for me, and I no longer miss ANY of the foods I stopped eating. I am hoping history repeats itself and I won't miss the caffeine and wine either. I know I'll be better off without them.

I have been drinking 1-2 cups of coffee every morning for more than 10 years, probably more like 12 or 15 really. I worked myself back to 1/2 caf in the last 2 weeks and I will tell you, I am completely frustrated with it. I understand that I won't lose weight until I've cut it out completely since it's the coffee, not the caffeine, but I am completely not myself without my full caffeine. My morning workouts without my caffeine jolt have become pathetic, at best, my normal bubbly, chatty personality is nowhere to be found and I'm exhausted by mid afternoon. I guess this speaks true to the addiction, but I'm just not sure I want to wait this one out.

Have any of you given up caffeine and felt this way? I mean, really, my brain just doesn't seem to be hitting on all cylinders and I am as blah as they come. I wish I had the luxury of stopping for a nap to relieve the sudden onset fatigue I'm experiencing, but it ain't happening. I've been trying to eat whenever I feel this way, hoping the fat will rejuvenate me, but at work I just don't have the ability to stop, drop and eat fatty meat at any given time!!

Should I go with the No Doz? What's a good dosage on those? Any other ideas? Or, how long will this go on? Will I EVER be the same again without caffeine?

I'm a little concerned about that. Worst case, if I'm dragging badly tomorrow while I'm working, is I'll wait till the weekend to drop the coffee. Experience tells me the worst of the withdrawal will be over by Monday 🙁.

RE: Zero-Carb/Meat and Water - Angela2 - 09-30-2008 06:02 PM

Coffee just doesn't seem to cause me any problems. I do not drink sodas but I do have about 16 ounces of coffee every morning. Granted mine is not very stong and has quite a bit of HW cream.

RE: Zero-Carb/Meat and Water - jeepifer - 09-30-2008 07:00 PM

I don't envy you the coffee addiction. I'm having a hard enough time giving up the diet sodas. Was doing pretty well this week but gave in and had one with a lunch meeting since they were set out right there. That seems to be the only sweet thing I want now, but I wonder if it's the caffiene and fizz I'm after? 😞

I am addicted to the fizz. I can do without the sweet and caffeine so I drink seltzer water or carbonated mineral water.

**RE: Zero-Carb/Meat and Water - suzannevea - 10-01-2008 02:02 AM**

Daveo, Good job on the alcohol. I am not a big fan of drinking, so I will always support someone slowing down on alcohol. I honestly cannot remember the last alcoholic drink I had. Now, cutting out two big things like coffee and alcohol at the same time? I could not do it. I always take things one at a time. I used to drink a ton of coffee and reduced it one cup at a time. Now I am down to one cup each morning and it causes me no problems. I love my morning coffee, it gets me going each day. But, I never have a second cup cause I know it will be a matter of weeks before I can justify three cups... Tomorrow I will celebrate my full 2 months of being smoke-free.

" And last night I dreamed I was smoking a cigarette! Freaked me out! I was scared to death when I woke up!!!!! So has anyone ever dreamed they were eating cake or something? "

Once I had a dream I was eating jellybeans, I felt so bad when I woke up. Then, just ba few nights ago I dreamed I had a bite of spagetti with sauce. Weird, I do not even like spagetti, lol. I woke up in a state of panic!

**RE: Zero-Carb/Meat and Water - AuntieeM - 10-01-2008 04:05 AM**

Good morning Suzanne: Congratulations on being two months smoke free! When I stopped smoking 24 years ago I smoked 4 packs a day! I went "cold turkey" as I gave it up that year for Lent. I always used to say I wished it was that easy to give up chocolate but since I started VLC, I don't have that craving any more. I'll have to see when I get to PMS time what happens but I think I'm going to be okay. Have a great day cigarette free day!

Marsha

I like to drink seltzer water. I get the fizz and water. The natural flavored ones aren't sweet at all. I used to drink 4-8 cans of diet soda before. Now I have 3-4 seltzers a day.

Congratulations on the 2 months! Quitting smoking was the hardest thing I ever did, it took me 2 years of off and on trying to finally do it. The brain plays such crazy tricks on you. I remember when I had been quit for about 6 months, I went to the gas station. This was before the pay at the pump credit card reader, you had to go in to pay after you filled up. I came out heading for my truck packing down a pack of cigarettes that I had just bought without thinking about it. I couldn't believe it. I just sat the pack on top of the gas pump and drove away shaking my head.

Tomorrow I will celebrate my full 2 months of being smoke-free. And last night I dreamed I was smoking a cigarette! Freaked me out! I was scared to death when I woke up!!!!! So has anyone ever dreamed they were eating cake or something?

Yep: had cigarette based dreams. And this weekend I dreamt I was eating twinkies by the handful. Started to think to myself, "I ruined my diet!!" Woke up, smiled and knew this was a sign of psychological addiction. Not nearly as vivid as my cigarette dreams.

RE: Zero-Carb/Meat and Water - Charles - 10-01-2008 11:03 AM

Wow, you guys really take this stuff to bed with you....😊 ...And I thought I was a zero-carb maniac!

By the way, I would encourage everyone to take a look at Jimmy's blog today where he mentions yours truly and my crazy notion that our version of zero-carb would even work for pregnant mothers. I'm about to add a comment that differs from Dr. Carlson, so if you're interested in that response, you'll have to check it out. I would love to see what others think of this as well.

To me, a healthy diet is a healthy diet. If you don't believe that zero-carb meat and water is a healthy diet, not just some reducing plan, then I don't think you should do it. I think it's just as healthy today as it was back in Bellevue in the 1920's when Stefansson and Anderson did the same thing. I know, they didn't buy their sirloin at Wal-Mart, but I don't think it would have made one iota of difference!

Regards,

Charles

RE: Zero-Carb/Meat and Water - suzanneya - 10-01-2008 11:16 AM

All I know is that Big Mac french fry diet I did when I was pregnant is not such a good idea.

RE: Zero-Carb/Meat and Water - Fully - 10-01-2008 11:17 AM

LOL Anova! How funny is that! Its not at the moment though. I remember one time when I was doing Atkins I had stopped by a convince store and I was about to starve so I bought a bag of pork skins and a
drink. The skins were a really hot BBQ. Well I got in my car and as I was driving, I was eating my skins and drinking my Dew just as fast as I could cause my mouth was on fire. Well, when I got home I noticed that I had bought a regular Mt. Dew and not a Diet Dew. I felt the blood drop from my face. I thought I was gonna throw up because I had drank a whole 20 oz sugary Dew. I was so mad LOL!

But I have been know to sleep walk and eat. I hope I don't do this now.

RE: Zero-Carb/Meat and Water - abnormalslc - 10-01-2008 11:29 AM

I have dreamed that I had gone off the low-carb wagon...I rarely remember dreams...but sometimes wake up thinking that I am such a failure and hypocrite...only to find out...I was dreaming! 😕

Nightmare....on Simpson Ave....

edited to add: Remember...dreamy-nightmare carbs...have a ZERO carb count....so....eat all those you would like. 😊

RE: Zero-Carb/Meat and Water - abnormalslc - 10-01-2008 11:32 AM

Charles....I tend to totally agree with you on the diet while pregnant issue...eat healthy....and to some of us...that is Zero Carb.

eventually...slowly....science will come to our side.....how can objective, correctly done studies not reveal that LLVLC is the answer?

at least it is still better than actually eating high carb foods!

RE: Zero-Carb/Meat and Water - chris m. - 10-01-2008 12:02 PM

Didn't want to really ask this - BUT -
I was reading where lack of BIOTIN could cause leg cramps which I still get at night. So I looked up the Biotin content of beef and it is zero. The requirement is 150 to 300 mcg. per day. Looking at a wide range of foods and it does look like it is hard to obtain that much from a mixed diet much less meat and water!
I still take a low dose multi-vit and it only has 10 mcg. in it.
I wonder if this could be contributing to the cramps?
chris m

RE: Zero-Carb/Meat and Water - Richard - 10-01-2008 12:14 PM

Now I've got to go microwave my pork rines and munch....BARK...BARK...

RE: Zero-Carb/Meat and Water - waywardsister - 10-01-2008 12:16 PM

Chris, liver and egg yolk both contain biotin. Not sure how much.

After I found out I was celiac and went gluten-free, I dreamt I was eating pizza and freaked out (in my dream). Before that, when I was waiting for my test results, I dreamt of the grim reaper, but instead of a scythe he was holding a sheaf of wheat, and the tips of the stalks were rattlesnake tails!

I am quitting smoking Friday, after an 8 month relapse -- hooray! Doing it cold turkey, like I did the previous time. Made it two years, started again for a very stupid reason. It will be nice to be a non-smoker again. Congrats on your 2 months Suzanne 😊

One of the things that attracted me to low carb; naturally healthy, self regulating (no counting calories or worrying about timing) and possibly slows/halts nuerodegenrative diseases and cancers. Hmmmm not a hard decision for me.

I had my doctor's appointment wrong; I'll be visiting him on the 9th of this month. I should get some blood results back from baselines. IT won't be comprehensive, but it should show trends.

I don't know much about the candy bars, but Ogg is someone named Mimi who already had a thing with Jimmy and she seized on the comments about zero-carb for pregnant women. They're all outraged but I haven't seen one shred of science that might suggest that what I've said is not true.

Regina Wilshire had interesting things to say about the need to supplement, but I told her that Dr. Price noted in the sub-Sahara that the meat-eaters did not supplement their diets; only the veggie eaters did.

Everyone has an opinion about the Inuit eating the whole animal or the contents of the stomachs. In our book discussion this week we've already seen how the internal vitamin-rich organs were given to the dogs and the people ate the stuff that you and I eat.

Again, all I've seen is vitriol but no one wants to discuss the case on the merits!

I think just "thinking about food" causes the pancreas to excrete insulin. Because when I think about something sweet...like the birthday cake I am gonna have to buy my son this weekend......makes my mouth waters 😏How long will it take for this to go away?

RE: Zero-Carb/Meat and Water - Hilary - 10-01-2008 03:37 PM

Hello Everyone!

I was on the old forum doing atkins. Got to goal and then got preg. Husband says it was my fault because I looked to good, but anyway....I started the preg. low carb and got sick of everyone giving me trouble about "dieting" while preg. and gave up. Now, I am feeling crappy and wanting to get back on. I shouldn't have given it up, I know, I know. I was looking over the atkins induction and saw Charles in
I started today. So far, my coffee (will give it up next week) and 1 lb of 80/20 hamburger fryed up. I poured it all in a bowl and ate it like cereal. You know, the fat is like the milk and the hamburger was like the cereal. It was so tasty! I am breastfeeding my 1 1/2 week old and will be doing it for quite awhile. I am really looking forward to some positive results.

BTW, Charles, I haven't run a 5K in a year and 1/2 and stopped running when I was 3 mo. preg. I am so missing it. I was looking at some of your pictures and really missing it. When I am up to in the the next month or so, I will be visiting you in the excercise forum.

**RE: Zero-Carb/Meat and Water** - cbnebraska - 10-01-2008 05:26 PM

Hi Hilary! Nice to see a new face. I've only been around since the start of August, so I'm still learning from everyone.

Okay everyone, I found a great, fatty pork steak packaged by Farmland!! Do any of you get these? They are $1.89 a lb here at our No Frills and each steak is a little over a lb. I see Farmland brand at lots of stores though, so you might be able to find them nationally. I'm guessing someone else has discovered them....? Wow, I just broiled one up for dinner and scarfed half of it down. It was delish and I am perfectly full!!! No added ingredients and no seasoning necessary it was so good. I LOVE the flavor crunchy/broiled fat gives to the meat. I love that I'm learning to cook my own meat rather than rely on my husband's grilling all the time!! He's playing tennis, so I made it while he was gone so I didn't hurt his feelings. He really has this thing about doing all the cooking for me. I am also broiling up some batches of my beef fat tonight since he hates the smell of it. I am learning that I really struggle to get enough fat just by dipping my beef and chicken in bacon fat (low sodium). I also really need the hunks of fat. Any one else this way?

I'll also share that I gave up on trying to quit coffee. I know, I'm lame, but I'm just not ready to battle this right now. I need the energy and can't afford to be sluggish. I've decided I will try it again when I have a
few weeks off, maybe over the holidays. I will go back to drinking 1/2 cup with cream first thing in the morning before my workout and 1 cup iced mid afternoon. I only put cream in it, but I do know it's the oils in the coffee that are the issue, so I'll give it a go at a better time.

My fat's a cracklin'

RE: Zero-Carb/Meat and Water - suzannevea - 10-02-2008 02:35 AM

Hi Hilary! How are you doing with the new baby? Is this your first? I lost my baby weight via Atkins and it was a great plan for me very simple cause you certainly do not have a lot of free time or hands to cook and eat with a baby. I used to put on my Ipod, put Andrew in his sling and walk and walk and walk! He was happiest with me walking and being so close to me. The stroller sat untouched. He would scream and cry in it. I got so good with that sling that I could walk and nurse him at the same time and seriously, no one would ever have known I was nursing. Many times I would be walking with my dh
and he would ask if we needed to stop and nurse Andrew and I was like "I am, right now!" This took some time, the pain of nursing put me in tears for the first few weeks, it was hell. You are so lucky to have all this information with your new baby, I wish I could turn back the hands of time with Andrew's diet. He hated all carbs as a baby and yet I continued to give them to him and now he likes them, so I am trying to undo what I have created. I know a few new mothers on another board who are starting their babies first food as meat. I so wish I could go back in time and do that. Live and learn. I am making the changes now, but it is much harder.

Thanks for the advise - I keep forgetting about salt as I think you have said that b4 . I also am VERY suspect about minimum daily requirements on everything. For instance how the cholesterol limit of 240 was set. That's a real "hoot" - also how "they" then adjusted that arbitrary figure down to 200 which coincidentally made most everyone NEED statins. sheesh!!!
I think it gets back to what makes your bodies run efficiently without problems etc.!!
Thx again for the reminder.

chris m

RE: Zero-Carb/Meat and Water - ANOVA - 10-02-2008 06:19 AM

For pork, Iv'e been buying pork loin roast and cutting it into steaks. I eat it on alternate days. Chicken left me feeling tired and worn out the day after had eatne it. "Beef, its whats for Dinner"

RE: Zero-Carb/Meat and Water - aim in Fla*working - 10-02-2008 08:13 AM

I have a friend that has parkinson's disease and he went to a clinic that movies stars (Michael J Fox
etc.,...) got to for treatment. The first thing they told Jack to do was get off all Vitamins and eliminate sugar and starches....I get the sugar and starches....but vitamins? Hmmm....what do you all think?

RE: Zero-Carb/Meat and Water - nyteez - 10-02-2008 08:18 AM

I think this goes back to what we have discussed before. If you are eating a proper diet you do not need supplements. The supplements may be doing more harm than good.

RE: Zero-Carb/Meat and Water - cbnebraska - 10-02-2008 08:53 AM

I have become a full believer that no animal eating its proper diet needs vitamins because it has no deficiencies. Look into nature and you see this. It IS possible for us to eat our proper diet - even in this day and age.

I have absolutely no fear that I'm missing something!

About the Parkinson's... I have a friend whose father had to have a triple bypass and now has Parkinson's. It's complicated by the fact that his father was very active up until the day he had the surgery and his mother was a "wholesome" cook his whole life, long before it was in fashion. This friend is terrified for his own health because he sees it as "all in the genes". He follows all the traditional advice and has lowered his salt intake, eats salmon whenever possible, avoid sat. fats, works out like a crazy man twice a day, basically lives in fear.

I have tried to gently suggest that there is research out there that is completely contrary to all the mainstream advice. I forwarded him a bit about sat. fats and mentioned that I eat LC (and now ZC) to avoid heart disease, diabetes, obesity, etc... But, he just doubts it and argues and won't read anything that doesn't have an official looking name behind it. He just can't step outside the box and see that what's being recommended isn't working. He's just assuming people aren't following the recommendations, so it's their own fault, not an error in the data. Ironically, he picks and chooses when to follow them too, but he does do better than some people in following them.

He is a good friend and I hate to see him doing this to himself, repeating the ways of his father and just blaming it on "genes". Ugh.

I would like to follow the research that comes out a little better. Do any of you have a favorite place to track LC related research? In the event that something comes out with a well known organization or research facility attached to it, I can try to relay the information in a positive way.

RE: Zero-Carb/Meat and Water - con - 10-02-2008 10:08 AM

Dr. Eades' blog always posts a lot of research and clarifies it for the rest of us. He also has archives to search.

After reading it all and the comments it seems to me, if your going to register, under false pretense just to be a sheet stirrer.
How can she/yak, expect anyone to believe she is genuinely concerned in the first place.

RE: Zero-Carb/Meat and Water - chris m. - 10-02-2008 10:59 AM

Even though he is constantly selling - Mercola seems to have a lot of current info as well.
chris

RE: Zero-Carb/Meat and Water - Hilary - 10-02-2008 11:05 AM

Yesterday was day one and I did pretty good. I had a really bad headache at bedtime because I am coming off the American SAD, high carb diet and it is bad. I ended up having a Flax seed One Minute Muffin at the end of the day to help that. My total carbs were 17.5. Here is what I ate.

1 lb. of Hamburger fryed ( I ate all the fat)
1 C. of dark Chicken
3 hamburger patties w/ fat poured over them
One minute muffin
string cheese

I am going to be a little leinent this week, but keep the carbs 20 or under and then next week go ZC.
Also, after reading some of Travis' posts, I am wondering if I can just give up the AS in my coffee and keep the coffee. I really like it. The only thing is I can't drink enough water. I am breastfeeding, but I am up to 80 or more oz when 60 or so used to be just fine. I also have to salt everything I eat. I try it without, but it just doesn't taste right.

RE: Zero-Carb/Meat and Water - Charles - 10-02-2008 11:18 AM

southern-dahlin Wrote:

She claims that the yak diet was a parody of me and that it was meant to be just as ridiculous as the store-meat and water diet. She can't envision any scenario where zero-carb can be healthy. It's almost implicit in her statements that this may be a good weight-reducing diet, but not healthy in the long run.
and certainly not good for a nursing mother who for some reason requires more nutrients.

Then we have Regina Wilshire who believes all of us are in a steady ketosis. She doesn't seem to understand that once we get keto-adapted, we no longer are "in ketosis" and we don't waste ketones.

The USDA may have its issues, but I think they happen to do a fantastic job regulating meats. The prices are reasonable and we haven't had too many issues over the years with bad germs. The problem, as I see it, is that this reliance on starches is damaging the digestive system and pretty soon meat will be blamed for many things that are not meat's fault.

Nowadays they want to blame red meat for colon cancer when fiber is clearly the culprit. They don't want to come out and blame these antibiotics and things because they have all passed their clinical trials. Therefore, red meat is the culprit by default. Then they want to say it's feedlot beef instead of grass-fed and somehow supermarket beef has been grain-fed from birth.

We all know that's not the case at all as it would be too expensive to do this. The little bit of grain that these cows eat for the last bit of their lives just has ZERO effect on anyone but the cow who is probably just as delighted eating grain as humans are eating donuts.

As you can tell, I stand firmly by my claims!

Regards,

Charles

---

**RE: Zero-Carb/Meat and Water - ANOVA - 10-02-2008 11:32 AM**

I actually found ogg's parody entertaining at first. I'm not taking this way of eating seriously, I'm enjoying it. If I drop dead tomorrow, the nay sayers will say it was my diet. If I live to be 150 they'll say it's my genetics. All I know, is its working so far.

---

**RE: Zero-Carb/Meat and Water - Charles - 10-02-2008 11:47 AM**

That's kind of the paradox; isn't it? On the one hand it's serious if it keeps a person from chronic disease, but on the other hand it's absurdly simple. I'm not claiming to have discovered the fountain of youth by any stretch, but it's more like the Latin mathematics formula, *reductio ad absurdum*, where we eliminate the absurd choices and end up with the obvious.

If one accepts that we likely started out with something this simple, then this is doing nothing more than returning to default. I don't think it's overly complicated to observe that those who do not eat refined and easily digestible carbohydrates do not suffer from chronic disease. I could really care less about the weight loss, although it is an obvious benefit.

If you are "ketoadapted" it means you're adapted to ketosis and utilizing fatty acids & ketone bodies for energy. Don't forget...ketone bodies are a product of the lipid metabolic pathway!

Whether or not you are spilling excess any longer isn't the issue - if you're using fatty acids for your primary energy source, you're making ketone bodies, thus you're in ketosis. How effectively you're utilizing the fatty acids and ketones determines your blood levels of beta-hydroxybutyrate ... and spillage of excess ketones - but you're still making ketones regardless of whether or not you're spilling any excess or not.

Here's an idea.....how's about you head to a lab and ask for a blood measure of your beta-hydroxybutyrate - perhaps then you'll understand that you are making ketones and they're in your bloodstream despite not spilling ketones in your urine, saliva or sweat?

That is true, we do use them. However, that's not usually how people describe the "state of ketosis." What studies do you have that show that a high-rate of circulating ketones are harmful in a healthy adult? That's really the issue. Since we have evidence of entire meat-eating populations such as the Mackenzie Eskimo who we are currently studying, how did these women successfully have children and propagate their species despite such high levels of ketone bodies and beta-hydroxybutyrate?

Regards,

Charles

Are you talking about the dietary changes that are found in various tribes and populations for women who are trying to get pregnant, are pregnant or are breastfeeding? Is that what you mean when you're saying "supplement"? I'm asking for clarification to be able to properly respond....I was thinking when you said "supplement" that you were talking supplements.....but yes, if you're talking instead about supplementing the diet with foods other than usually consumed, yes, various cultures do indeed have ritual changes they make to women's diets routinely around potential pregnancy and known pregnancy!

RE: Zero-Carb/Meat and Water - Regina - 10-02-2008 01:14 PM

Charles Wrote:

OK...how people usually describe ketosis doesn't matter much, it is what it is and that was why I responded to your post saying I don't understand "that once we get ketoadapted, we no longer are "in ketosis" and we don't waste ketones."

Those are two different issues - the wasting ketones is issue one, the presence of ketones, thus ketosis, another. I think I've replied to both in my previous post.
Charles Wrote:

That's right and I quoted [Dr. Price here](#):

Quote:
It is significant that the vegetarian groups practiced the feeding of special foods during gestation and lactation. Apparently carnivorous groups found no need to supplement the diet, as it was already rich in the factors needed for reproduction and optimum growth.

This is consistent with other groups we looked at such as the Mackenzen Geiimo and the Native American of the Great Plain who subsisted on mainly buffalo.

They obviously had high levels of circulating ketones and beta-hydroxybutyrate yet they were able to do it.

As I said initially, I'm speaking of a person who is keto adapted and obviously used to this condition and their bodies are healthy and making efficient use of the ketones. I argue that such a person, even one on a low-carb diet, would still not need to change their diet to facilitate pregnancy.

This eating regimen is not at all about weight loss as we recognize that obesity is merely a symptom of the metabolic disorder caused by excessive insulin. It's about health and if a person is on a healthy diet, then their ability to reproduce will not be compromised.

The pregnant mother will gain the required weight due to the decoupling of weight gain from food intake that is consistently seen across animal models as well and Gary Taubes covered this subject very well in his book. The critical variable is the availability of suitable metabolic fuel and this diet more than provides that.

Regards,

Charles

This whole matter arose when a pregnant member of our forum came here discussing her circumstance. She already delivered two babies on a very low-carb diet and she expressed a desire for her next baby to be born on a zero-carb diet. I agreed with her.

This sent Mimi (aka Ogg) on this tangent about our desire to kill babies and our blatant disregard for the health of pregnant mothers.

I argued then as I do now that if a person is healthy on a zero-carb and water diet then I believe their chance of a successful pregnancy is no different than someone on a very low carb diet just as our member demonstrated. This is consistent with the sources I just named.

Same webpage you're quoting:

Africa also afforded Dr. Price the opportunity to compare primitive groups composed largely of meat eaters, with those that were mostly vegetarian. The Masai of Tankanika, Chewya of Kenya, Muhima of Uganda, Watusi of Ruanda and the Neurs tribes on the western side of the Nile in the Sudan were all cattle-keeping people. Their diets consisted largely of milk, blood and meat [note: bolded items have carbohydrate], supplemented in some cases with fish and with small amounts of grains, fruits and vegetables. Rich in animal fats, these diets provided large amounts of the fat-soluble vitamins Price discovered to be so necessary for proper development of the physical body and freedom from disease. The Neurs especially valued the livers of animals, considered so sacred "that it may not be touched by human hands. . . It is eaten both raw and cooked."

------

The Masai do not eat a zero-carb diet Charles.
Charles Wrote:

Except that you're basing your opinion on an "n of 1" dataset when reams of data exist that leave that opinion in question. N's of 1 always exist and defy odds -- I'd like to see data that supports your position and not simply N of 1 anecdotes from a forum post.

Can you define a "zero carb diet" - basically how exactly do you reach "zero" carbs when even meat contains glycogen, which is stored energy, generally recognized as stored carbohydrate, readily converted into glucose? Add in organ meats, you have more carbohydrate.....add in dairy, there's more (I know you're not eating dairy though it seems you do occasionally have some cheese?)....add in eggs, there's more carb.....so, how do you really achieve zero carb? Or is it rather a way to describe as little carbohydrate as humanly possible?
Regarding Ogg/Mimi/whatever other aliases she has, she's a nutcase IMO.

I realize you're reading quick and you're excited, but this doesn't make your contention. Even meat has carbohydrates if you want to get technical because the fat contains triglycerides and these must be accounted for. Are you claiming that perhaps it's the meat and blood that make the difference? Perhaps the problem with a diet such as the one we're discussing has nutrient deficiencies? If that is your contention, please state it.

We're currently studying the Mackenzie Eskimo that Stefansson lived with during his ten years on an all-meat diet and he wrote of many types of Inuit with varying diets, but these people, among many others, were exclusive meat eaters (caribou) with the occasional fish although many never tasted fish. They had babies and did not suffer from chronic disease.

I have the book *Not by Bread Alone* and I can send you a PDF if you would like to read it. We're having a book discussion on [this topic here](#).

Regina Wrote:

Okay, this is getting ridiculous. Is your contention that there are no people on zero-carb diets that have babies? Let's get to the heart of the matter.

[quote=Regina]Not being snarky, but what fascilitates pregnancy? In reverse, what inhibits pregnancy?

That's for you to answer. My answer is the same as reproductive biologists, specifically George Wade and Jill Schneider in the 1960s that all animal models demonstrated that the availability of food is the most important environmental factor in fertility and reproduction. The critical variable is not body fat but the immediate availability of metabolic fuels.
High insulin will inhibit fertility in all of the tested animal species by redirecting circulating metabolic fuels away from oxidation and into storage in adipose tissue. The same is true in humans as well.

The clear implication of their research is that a woman struggling with fertility or amenorrhea will benefit more from a diet that lowers insulin but still provides considerable calories and thus repartitions fuel consumed so that more is available for oxidation and less is placed in storage.

This metabolic-fuel hypothesis of fertility has escaped the attention of clinicians as does most good science, unfortunately.

Since a diet of meat and water provides the necessary metabolic fuels there can be no doubt that a healthy mother already on such a regimen would have the necessarily conditions met for a successful pregnancy in my opinion.

Regards,

Charles

The opinion may indeed be in question. I only gave an opinion. I never claimed to have proved anything. Dr. Groves and I both offered an opinion that a healthy person already adapted to diet such as mine should not have to change things once they became pregnant. That's the issue, please focus. If you're saying that you don't believe our opinion because you don't have data, than we can end the conversation right there.

Regina Wrote:
Can you define a "zero carb diet" - basically how exactly do you reach "zero" carbs when even meat contains glycogen, which is stored energy, generally recognized as stored carbohydrate, readily converted into glucose?

I define it the same way that Stefansson defined it in the 1920s. It's about two pounds of sirloin per day with a half pound of fat. It's not technically "zero" but it surely is less than 5 grams per day. I do not eat dairy or organ meats. Even the Inuit that Stefansson lived with did not eat very many organ meats. They were typically given to the dogs and were believed to be harmful due to over-vitamin consumption.

Regina Wrote:
Regarding Ogg/Mimi/whatever other aliases she has, she's a nutcase IMO.

We both agree with that! 😊

RE: Zero-Carb/Meat and Water - Regina - 10-02-2008 02:09 PM
Africa also afforded Dr. Price the opportunity to compare primitive groups composed largely of meat eaters, with those that were mostly vegetarian. The Masai of Tankanika, Chewya of Kenya, Muhima of Uganda, Watusi of Ruanda and the Neurs tribes on the western side of the Nile in the Sudan were all cattle-keeping people. Are you claiming that perhaps it's the meat and blood that make the difference? Perhaps the problem with a diet such as the one we're discussing has nutrient deficiencies? If that is your contention, please state it.

My contention is and was that the Masai do not eat a zero carb diet.

They do include milk, which has appreciable carbohydrate, they do consume honey, which is rich with carbohydrate, and they drink the blood of their animals, also containing carbohydrate in the red blood cells as glucose. They also specifically have changes to diet in their women when they're pregnant, changes that substantially increase carbohydrate to the point where carbohydrate is the dominant macronutrient in the third trimester of pregnancy.

The diet you follow, as I understand it, is simply store-bought meats and water? No organ meats, no skins, no brain....just the flesh - is that correct?

If that accurately describes what you follow and recommend/suggest is okay in pregnancy, then we disagree, as I would contend that such a diet is not optimal, for a number of reasons, including nutrient adequacy, for a pregnant woman.

RE: Zero-Carb/Meat and Water - Charles - 10-02-2008 02:14 PM

Regina Wrote:

Their diets consisted largely of milk, blood and meat [note: bolded items have carbohydrate], supplemented in some cases with fish and with small amounts of grains, fruits and vegetables.

So in this case, you believe it was possibly milk that provided the supposedly necessary carbohydrate in the third trimester for these people who Dr. Price observed, do not supplement their diet during pregnancy? Surely he would have mentioned that perhaps the increase in their milk consumption during pregnancy or something. That wasn't the observation.

The Mackenzie Eskimo was not a cattle-herding people. They hunted and ate caribou. How would you explain their pregnancies? A bunch of glucose in the meat?

Regina Wrote:
It's ridiculous to ask for data rather than "n of 1" anecdotes?
A) a zero-carb diet is even possible?

I already described what we mean by the term. It's not "zero-carb" in that sense, but it's about 5 grams or less per day.

Regina Wrote:
B) a zero-carb diet can and will result in pregnancy?

I just provided evidence of cultures who were meat-eaters who obviously had babies. If you think they drank milk to compensate then you have trouble because the Mackenzie Eskimo did not eat milk or eggs yet had babies.

Regina Wrote:
C) a zero-carb diet can optimally support an ongoing pregnancy to deliver a healthy full-term baby?
My opinion is that it can and apparently Dr. Groves agreed as long as a person was already adapted to this before getting pregnant. If it's data you need, then perhaps we'll wait until one of our members becomes pregnant and we'll talk then. Suzanne, are you listening?

Regina Wrote:
I'm outta time right now....will continue later!

Perfect timing. I'm looking forward to it!

RE: Zero-Carb/Meat and Water - Charles - 10-02-2008 02:26 PM

Okay, other zero-carbers. It appears we've stopped so please chime in here. I'm going to the gym but I'll check in later this evening!

Regards,

Charles

RE: Zero-Carb/Meat and Water - nyteez - 10-02-2008 02:58 PM

What is with these people who come in here condemning my diet with no facts to back it up?!

Where is the data proving that zero carb....oh EXCUSE ME,.... very low carb, cannot support a healthy life or pregnancy?!

There isn't any, so what is your argument?

LATEST UPDATE!!!!!!!!

I can't believe it! My newly "sorta" LC DH announced this morning that he has lost another 5 lbs. and had to punch another hole in his belt to keep his pants from falling off! He's still wearing the same clothes, yes he is, and yes, he does look slightly "baggy".

That makes 40 lbs. he's lost in just over 3 months. He said in all bewilderment, "I didn't do anything and I lost 5 more lbs."(don't know which smiley to use 😛 or 😄)

There is a SUGGESTION of hope here for many. Because ALL he cut from his WOE was sodas, Jamba Juices, pastries, candy---the most obvious sugary treats. He still has bagels and beans and strangely enough doesn't eat lots of meat OR fat.
*sigh* frustrating I guess. Probably no consolation, but I remember when I was a bit younger, years before I was into LC, I managed to lose quite a bit simply by giving up biscuits (cookies). At other times I would lose for no apparent reason whatsoever. It also would come back for no apparent reason whatsoever. However, I'd be faced with the problem - what do I give up now? Biscuits had already gone, and gradually I'd be left with few more "obvious" foods to give up. I had no rhyme or reason to go on. It was only when LC came into the picture, and I began to understand some of the science behind it, that I finally felt somewhat in control. But the older you are when you start LC, the harder it is for it to work, IMO. I believe it's also a lot easier to lose by other methods as well (probably almost any method), when you are younger, provided your metabolism isn't too much out of kilter.

chiara Wrote:
Does anyone only eat once a day? The last few days my body has just not wanted food at all. I've been eating once to keep from falling over...it's really weird.

At the point I started ZC (or as near zero as I wanted to be at that point), I was eating 3 times a day, and was usually quite hungry before mealtimes (more than just the cephalic response...I felt this was real hunger, especially in the evening).

Gradually, I found I could go longer and longer, and this naturally developed into going to 2 meals a day, with little hunger in between. I'd get hungry as I cooked the food, but this time, it really was only the cephalic response. I'm pretty sure now I could manage on one meal a day, although I choose not to. I got to thinking that 2 meals might be preferable to 3, in order to reduce the number of occasions on which insulin is raised. I don't know if that's important or not, and I seem to remember The Bear doesn't think it's important how many meals one has.

It has the practical advantage of needing only 2/3 of the cooking time, and 2/3 of the washing up!
RE: Zero-Carb/Meat and Water - Charles - 10-02-2008 04:01 PM

So I can't wait until she returns. She is suggesting that the Masai basically adopt a high-carb diet during the last three months of pregnancy where carbohydrates are the primary nutrient. Did anyone else see that? I missed it during the discussion but you can best believe I'll be all over that one.

I also can't wait to see the list of nutrients that are missing from our diet. As I've written here many times, you cannot just analyze the food from a diet in order to determine what nutrients are missing from the consumers of that food. The Inuit did not eat enough calcium, yet were never calcium deficient. The list goes on but these arguments date back to the 1920s.

This one about carbohydrates is a new one. So now, ladies, you can't have babies unless you're on a high-carb diet at least at some point during your pregnancy. Where is Karishma when I need her.....

Regards,

Charles

**RE: Zero-Carb/Meat and Water - Riley - 10-02-2008 04:18 PM**

Hello Zero Carbers! I want to tell my story and get a bit of feedback.  

I have been on low/zero carb for a little over 3 months now and I feel amazing. I'm so glad this diet came into my life. I owe it all to my mother who has become very knowledgeable because of this forum and this thread (among other sources). She snoops so you don't know her but she is very grateful for all the contributors. 

Ok on to the meat... Here's what I eat -
- 85/15 ground beef patties with mustard and pepper. Sometimes I put a slice of swiss cheese.
- 6-8 oz of ribeye steak sauteed in butter and topped with Cholula (Vinegar, water, red peppers, piquin pepers, salt, spices, xanthan gum)

I eat either of these meals twice a day and I stop eating when I feel full

Those are my 2 main meals. Other foods that I jam down my gullet include-
- 5-10 slices of Gallo Salami. This has 1g of carbs per 5 slices - sometimes with swiss cheese.
- Coffee with heavy cream and splenda.
- in-n-out burger - 3x3 (three meat patties and three cheese slices) protein style (lettuce wrapped) with mustard only. I have this when I'm out and about.
- The occasional egg

My workouts are intense and I get rest between workout days. I mainly do crossfit ([http://www.crossfit.com](http://www.crossfit.com)) and interval sprint training. I go road cycling about once a week for about 1.5 hours really just for fun and to hang out with my riding buddies.

Vitals - 5'11', 32 years old, medium bone structure, no previous health issues

Results from this diet -

I went from 200lbs to 182lbs. The diameter of my belly fat went from 38 inches to 35 1/2 inches (I only started measuring about a month ago). My energy levels are very high. I get a great night of sleep. I don't wake up hungry. I don't crave anything except steak when I'm hungry. I get hungry about every 6-8 hours. I don't have zits. I don't need deodorant. I have a very soft stool every 3 days. I don't have that dirty teeth feeling. I have amazing power and energy when i workout. I'm starting to look good naked.😊

I have encountered a small plateau at 182lbs and I have made the decision to make some tweaks.
- No more coffee. This one stings but I know this will help free up some fatty acids.
- No cheese on my 3x3. That one will be easy.
- No more salami. It's mainly pork and beef is the way to go if weight loss is the goal.
- Skip the eggs.

Workouts will stay the same.

Thanks for all the information everyone has gathered and posted. It has helped me greatly!
RE: Zero-Carb/Meat and Water - montmorency - 10-02-2008 04:36 PM

daveo Wrote:
suzanneyea Wrote:
Also, the zero carb people seem to be more active on the boards, we are all big time posters.

It's ironic, since zero carb is so simple. You would think there would be a lot less to say 😊

Also, cooking and preparation is now laughably simple. I cut it up small, quick whizz round in the pan with beef tallow, and it's almost done. Remove meat from pan, leaving fat; add an egg or two; fry lightly; pour into bowl including fat; eat with spoon, including all the (runny) fat & juices. Leave bowl and pan to soak.

Pork - it was the Bear who put me off pork, and when I thought about it, the thing I liked most was the crackling; the meat I found pretty boring.
(needed apple sauce to make it interesting - obviously not now).
I still eat bacon once in a while. I'm mostly eating lamb at the moment, as we seem to be able to get some nice, cheap, really fatty stuff, either as stewing lamb or as a shoulder joint. It mostly goes the same way though; cut up small and "whizz-fried". The bones go into a bone-broth.

chris m. Wrote:
Beth Wrote:
I know a lot of you pump up your fat % with added fats or coconut oil. I was wondering if there is anything wrong with butter? Sometimes I can only get 80/20 hamburger or the chicken or steak just doesn't seen fatty enough. I've tried the bacon fat and I litterally have to choke it down. I haven't tried the beef trimmings from the butcher yet. That might not bother me since I like that taste on a steak. But in a pinch is it OK to add a tablespoon or two of butter? Does it cause stalls? Is it not considered an "animal fat" because it's really a by-product?

Thank you
Beth
Actually - real butter - is a good source of Butyrate a free fatty acid mentioned in "Life Without Bread" Lutz
Butyrate de-differentiates cancer cells rendering them harmless.
Don't hold me to the actual quote and my terminology may be off as I don't have the book with me but I wanted to get the info out as it seems to be important. Still we didn't use butter prior to milking cows. Coconut oil is also sposed to be real good for you as well.
Chris m

FWIW, Mary Enig and Sally Fallon are very big on butter (e.g. in "Eat Fat, Lose Fat", and also on the Weston A Price Foundation site, various articles). It seems to have so many things going for it, that it seemed a shame to let it go, which is why I have kept it. It would seem that animal husbandry has been going for longer than agriculture, so it's possible that humans (at least in some parts of the world) were consuming dairy regularly quite some time ago. It's possible that it stalls some people; the jury is still
out in my case.
ME and SF suggest that it may work synergistically with meat.

RE: Zero-Carb/Meat and Water - Kristi31 - 10-02-2008 05:05 PM

Hi Riley,

Welcome to the forum and this thread. Hope you enjoy your stay and happy to hear about your health, your improved physique and energy levels.

I'm also 32 and really enjoying zero-carb since making a few changes in my life. Take care. 😊

RE: Zero-Carb/Meat and Water - montmorency - 10-02-2008 05:10 PM

hpseids Wrote:

My question was, in case it gets lost (sorry if it's here, I'm trying to catch up on this thread but it's HUGE as you all know!)...why exactly are veggies (and fruit) bad? Is it just the carbs?

Emily 😊

Others have replied on vegetables, and why meat is a complete food. One point on fruit: apart from not really containing all that many nutrients, one thing it does contain is fructose. Maybe not much per piece of fruit (some more than others), but if you eat a lot (like I used to), it can mount up. Gary Taubes will tell you why the combination of glucose and fructose is bad. In addition, in "Natural Health and Weight Loss", by Barry Groves, on page 210, and in table 14.1, he explains about sugars lowering our immunity to infectious diseases; basically it weakens the leukocytes. And guess which sugar was "top" of the league table? That's right - fructose, causing a 45.1% decline, which did not return to normal for more than 5 hours.

It rather annoys me that the health authorities in my country (and I believe, in the USA) loudly proclaim that a diet including lots of fruit is healthy, whereas the diet that I now espouse is unhealthy, because of the saturated fats. In fact, the very opposite would seem to be the truth!

RE: Zero-Carb/Meat and Water - Mel - 10-02-2008 05:10 PM

Hi Riley, welcome!

I think your diet sounds good and especially your next move. I avoid all sweet tasting things even zc sweeteners because they trigger insulin surges and cause me hunger, so when you give up coffee that will be gone. I also gave up the salami slices because I wanted to be lower carb and they just quit tasting good. Others here have noted that the closer to zero we go the easier it is to "listen" to what the body wants. Fatty meat, mostly beef, is all that usually sounds good to me and I feel great on this diet. Weight loss is just a bonus, the inches off the waistline is the best, IMHO.

Keep us posted and "Hi" to your Mom. Melinda

I gave up splenda about a month ago and i had a small drop in my weight. Common sense told me that splenda might be tricking my body into thinking it was real sugar. I had one craving and it was back in my coffee every time. I'm not going to let that happen again.

I usually have the salami when i get a bit hungry. Next time that happens I'll just cook up some beef.

I agree about the waist fat. Really my main goal is to have a slim waistline.

Thanks for the warm welcome!

Charles Wrote:
I know our thread is huge and probably deserves a bigger place on the forum, but that argument is for another time. Please just keep it in the family, if you would!

On the subject of the thread being huge, would it be (a) technically possible? and (b) desirable? for there to be sub-threads of this thread?

I wasn't thinking so much of the old stuff, but for any new topics that come up, which might deserve a sub-thread of their own; things which may be of great interest and importance, but maybe not to everyone at the same time.

These (suggested) sub-threads would only be visible within the "Zero Carb / Meat and Water" "mother thread", so there would be no issue of ZCM&W taking over the forum, or whatever.

It might possibly make things somewhat easier to find, and (dare I say) add a little more structure to the overall thread (although not meaning to make it rigid or anything).

I understand, but don't take it as argument. I want you and everyone else to understand the process. It can indeed be confusing but it's not really rocket science. My wish is that everyone will understand these things for themselves so they can properly discern fact from fiction.

[...]

When you see things written up looking really scientific, it's easy to look casually and then conclude that they have it right.
Don't be afraid to share the information you find. It's very good, but it's more important to really parse it and find out what point they're making with the research.

Charles,

Thanks again for your considered replies. We seem to have had our disagreements, but I incline to think it is often more a difference of interpretation. I freely admit that I have not read as widely or as extensively (and perhaps not as carefully 😞) as you, and I look forward to learning more from, and with you. If we differ, it's on technicalities, and what unites us is a great deal bigger and stronger. Although I personally would love to further discuss some of the specifics that I previously quibbled over, on balance, I think it would be better to move on. There are plenty of more fruitful areas for discussion within the wider topic, not least, of course, "Not By Bread Alone".

Regards,
Mike

Try working amongst the health authorities. I do. I go against what I was taught in nursing school. Some days it gets rather tiresome to defend my position. I get a lot of ridicule for what I'm doing. I told them time will show them. They are getting sick with viruses that we come in contact with and I'm not. They can't see it.

RE: Zero-Carb/Meat and Water - hpseids - 10-02-2008 05:57 PM

Hi guys!!

I had no idea how dependent on internet I am until it stopped working! Sorry I've been MIA-- after 3 hours (and some crying) with Comcast I'm finally back online. Whoohoo! I definitely freaked out the
4th guy I talked to a little when I started whimpering...I was just SO frustrated!! Oh well, it worked lol 😃

Annyway, just caught up reading all the posts I've missed. Lots o' good stuff. Hi to Riley and any other new posters 😊. And thanks to everyone for the great advice and personal experience re: dealing with social situation and ZCing...well, vLCing. I'm working on it!

So, I'm eating fewer eggs, maybe 1-2 a day, some days none (I guess an average of 1 a day, which doesn't sound like nothing but is a lot less compared to my past LCing)...AND I realized the stomach aches I sometimes got were from too many eggs! That's another great thing about this WOE...it's so simplified that you can really tune into your body and exactly what food makes you feel great and not so great. It's like an elimination diet doctors recommend for food allergies...I think everyone is "allergic" to carbs.

The majority of my diet is ground beef but I still have a cup of coffee in the morning...doing ok with that and will stay unless it becomes a problem!...some cheese and bacon on weekends...and some lettuce, on stuff (not big salads). Pretty much it...oh except for that Jack and soda the night after my exam (blush...) but it was only one and I didn't really feel bad about it! lol...everyone else was chugging beer after beer so I'm pretty pleased with myself...and I had just as much fun! (Maybe more since I still woke up a little lighter and NOT hungover! 😄)

Still losing...not that quickly, maybe .2 lbs a day, but then one day it'll be down like a pound and a half...I should probably stop weighing every day so I can see the bigger picture. I've only gone up 2 days (out of about 2 weeks) and they were very small blips that went down the next day...salt, I'm sure.

OK, that's enough rambling for now...basically, I'm not ZC but vLC until I stop losing and/or don't feel great, then I'll tweak again.

Hope you're all great!

---

😊 Hi Riley, and welcome, by the way. You seem to be doing great!
By coincidence, we seem to have a similar weight and waist size just at the moment (although I am, ahem, about 4" shorter, so it doesn't look so good on me 😊). Like you, I want a slimmer waist ... used to be really proud of my relatively slim waist when I was twenty. Sadly, having been overweight for several decades, I fear I might never get down to that waist again, even if I get the weight down, but we'll see!

I also ride a bike, also for fun, touring-type stuff & as means of transport, but occasionally, when no one is looking, I'll get down on the drops and go into my "Tour de France" fantasy number :-)

We'll have to take it case by case. We did not need a meat, water and coffee thread. I love the 100-day challenge thread although it could have been here as well. One does not have to be different than me in order to post here. We recognize that people are on their own individual journeys and we all respect and appreciate that. Don't ever feel bad about posting.

However, people need to master the search function and as long you select "posts" instead of "threads" you can very easily find what you're looking for.

Anyone who has read this thread knows that we do regularly repeat questions that have been answered before because it's more important that people understand the science than it is to be rigid about rules.

I don't mean to be so rigid but if you have been reading closely on this board, Jimmy and many others are not zero-carb and they're not comfortable with the perception that the entire board is dominated by our way of eating. Therefore, as good citizens, we try to be accommodating.

Regards,

Charles

I would stop weighing every day and go to once or twice a week. It can play games with your mind when you all the sudden are up 2lbs. The extra weight could be anything irrelevant (salt, eating a bit too much, water retention from a hard workout) to your goals. Try adding a body measurement of a "problem area", you choose because I'm not going to list any. Your body may find a resting point as far as weight goes but you are still reaping the benefits of eating VLC/ZC.

Quote:
montmorency Wrote:
The more positive reports we can get of LC/VLC/ZC-ers successfully competing, the better :-)  

Well, most of you know that I have done 2 sprint triathlons (which take roughly 1.5 hours), both VLC and 5 Adventure Races, the last few being zero carb. Adventure Races take anywhere from 4-7 hours. At my last 5.5 hour race, I did not take in anything to eat the entire race after a very high fat ground beef breakfast. We rocked and we won our division!! (teams of 3 that is similar in nature to The Amazing Race - you don't know what you'll be doing, you're following a map, seeking out checkpoints, performing team challenges along the way, riding mountain bikes but also including running, kayaking, canoeing, climbing, and whatever else the crazy race directors can come up with!)

I have another AR this weekend, leaving Friday afternoon and competing first thing Sat. morning. Planning to repeat my large breakfast of all ground meat and tons o fat, about 1.5 hours before race start and taking in only sips of water along the way.

I'll let you know how it goes!! wish me luck....

**RE: Zero-Carb/Meat and Water - Charles - 10-02-2008 06:48 PM**

Readers of my posts probably think I tend to waffle on salt. I don't use it, but my position is that when you're losing weight, salt is something that can not only cause cramps but it can fool your hunger and cause you to eat more than you otherwise would. A person who is at a good BMI has a bit more latitude in terms of salt and seasonings because by then, I'm confident you have learned to listen to your body and you'll hear loud and clear whether it's good or not. Just as we'll learn in Stefansson, he craved salt at first and when he finally got some salt, he enjoyed it. Then, over the next few days he forgot about his salt and didn't miss it.

This is probably what will happen to most of you as well, but I think it's necessary to be a little stricter with things when you're losing. When you get to where you want to go then you can use the Atkins principles and add or subtract things based on what they do to you and how they make you feel. The
signals are much louder at this point.

Regards,

Charles

Still losing...not that quickly, maybe .2 lbs a day, but then one day it'll be down like a pound and a half...I should probably stop weighing every day so I can see the bigger picture. I've only gone up 2 days (out of about 2 weeks) and they were very small blips that went down the next day...salt, I'm sure.

I would stop weighing every day and go to once or twice a week. It can play games with your mind when you all the sudden are up 2lbs. The extra weight could be anything irrelevant (salt, eating a bit to much, water retention from a hard workout) to your goals. Try adding a body measurement of a "problem area", you choose because I'm not going to list any. Your body may find a resting point as far as weight goes but you are still reaping the benefits of eating VLC/ZC.

You're right. I should definitely weigh less often, once or twice a week, like you said. This will sound so weird, but when I wake up in the morning, it kinda feels like my birthday or something with presents waiting-- I'm so excited to run to the bathroom to weigh. Wow, I can't believe I just wrote that lol. I'm not obsessed, really! But it is exciting to see your body responding to something healthy and I like to see how it changes with my food changes.

As far as measuring, I haven't done it and really should. I'm pretty proportional so there isn't really a specific problem area per se, I'd just like to lose a little more all over...the usual suspects of areas haha. I hate noticed my tummy is flatter for sure, especially since dropping the tons of veggies I was eating before. And yesterday I put on my white coat to work in the hospital and I buttoned it and noticed it totally felt looser than last week.

Thanks for the good advice 😊
Welcome Riley! Great pic.

I've stopped looking to the scale, since I'm very close to "goal" weight. I got a handheld bodyfat monitor thingy and I'm using that instead. I'm more concerned at this point about body composition, bc weight changes aren't likely to tell me all that much. It's not 100% reliable, but gives a measure to go by.

I'm between 22-23% bodyfat, and IIRC for women 18-20% is pretty much the lowest you want to go? Anyone know?

I've been leaving it out on my coffee table, and everyone who's come over picks it up and measures, which has been giving me a pretty good idea of what real leanness looks like amongst different body types. My husband is 7% bodyfat - I almost broke up with him on the spot.

Interesting discussion going on re: VLC/zero carb and pregnancy. I can't comment really, other than to mention (and this is anecdotal, of course) that my mum had two babies with neural tube defects: my sister has occult spina bifida, and my late baby brother had anencephaly (he died soon after birth). Neural tube defects were a major reason behind folate supplementation of grocery-store foods. Anyway, my mum followed a "healthy" recommended diet during each of her four pregnancies (she lost the fourth in her first trimester) and took pre-nataals. Due to the link between gluten and folate deficiency/malabsorption, I can say with some authority that she would have been better off not eating grains. Would she have been better off zero carb? Who knows. Likely better off than she, and her babies, were, but that's just my biased opinion 😊

When were nutritional guidelines for pregnant women set? What were they based on? Who set them? How have they been field-tested, monitored etc? Have they changed over the years, and if so why?

Regina, glad you're here!

---

Hey Charles, I have a question for you:

I have always had to buy 75/25 grassfed ground meat online, because of the fact that all the meat in my area was too lean. Two days ago, a wal-mart supercenter opened down the street and now only have to pay 2.40 for a pound instead of 5 dollars. I also think grain fed meat is better for because there is a smaller amount of PUFAs and tastes better. However, when I went to check the store for 73/27 ground beef, I saw that there are natural flavors in the ingredients list. Doesn't this mean there is a chance there is free glutamic acid contained in the beef, and if so does this not bother you?

Thanks

---

K a bit of a vent and a message for people who may be visiting this thread as a result of the whole ZC pregnancy thing.

IMHO, the contributors to this thread (we're all contributors) do not consider Charles to be the ultimate authority on anything other than his own body. He is willing to share his experience, as we all are (and
there are others here who are all-meat and share just as much as he does). We remain the directors of our own bodies, health and MINDS. Charles could care less what you eat, and he has said as much - he shares what's worked for him, as do we all.

The whole pregnancy post has really got people on other sites on edge, and there's a lot of misinterpretation (Jimmy is telling women to go on a hamburger diet while pregnant, how dare he! And Charles is Kimmer!) and misquoting (Charles tells people not to drink water!) going on. Such is the internet, I suppose. It's one thing to disagree (and to back up your argument, ideally - here's my thesis, here's the info I used etc etc), but what's going on is pure reaction based on emotion, from what I've been reading.

Anyway, I have no dog in this fight so whatever - I just wanted to say that I enjoy this forum bc it's full of lively, intelligent discussion and debate, and of people who won't flip out when I say I don't often eat vegetables. And that I didn't decide to eat this way because of this forum or Charles, or any philosophy or dogma, or anyone other than my own body's response to it - and many other participants here arrived doing VLC/ZC already. Thanks Jimmy for putting yourself out there with your controversial post (which, from what I read, was just you putting a big question out there rather than making a statement or recommendation) and for giving us a comfy home. Thanks Charles for being yourself and offering advice to those who ASK, clearly based on your own experience. Thanks to everyone here for being open, friendly, questioning, and curious - and offering your experiences, arguments and knowledge.

RE: Zero-Carb/Meat and Water - suzanneyea - 10-03-2008 01:59 AM

First, hi to the new people! Second, like I have said in the past, Charles is not the pied pier! We will not all follow him off the edge of a cliff. I find it annoying that people think I am such a "follower" and cannot make my own choices. I can point out several parts of my diet and lifestyle that differ from Charles, I drink coffee, I work out every single day, no day of rest. I could go on, we are all different from eachother. I do not take any supliments, but some people do. I used to take like 10 a day. I used to love getting on the scale when I was losing weight too, well I was always nervous, but excited. However, I really limited it to once a week. Now, I hop on every so often at the gym, but I have stopped worrying about the number. A while ago I was getting upset cause I was too thin and people were giving me a hard time. Tough. I actually noticed that if I just bought my clothes in a size smaller and better fitting, all the negative comments stopped.
I also seem to have no desire to eat ground beef recently, only ground pork or veal. I started getting those cause they were always on the 50% off rack and now I like them better. I have also been eating a lot of pork fat recently. I usually throw a few slices in the pan for flavor with my steaks, but do not eat the actual fat. Suddenly, I am eating all the fat and putting in extra. It is yet another phase, I probably won't want to touch it next week.

RE: Zero-Carb/Meat and Water - cbnebraska - 10-03-2008 03:37 AM

If there is one thing this WOE has taught me, it is LISTEN TO YOUR BODY. The funny thing is, I didn't know what I was listening for because conventional signs are not always accurate with this WOE. First, I have lost and maintained only 5 lbs according to the scale, BUT I dropped an entire pant size! So, weight doesn't tell the whole story. I only drink when I'm thirsty so I only pee 2, maybe 3 times a day and it is bright yellow. When I take in too much water I pee so quickly there after it's nuts. What a waste, and extra work for the kidneys I would think. I only have a BM every 3 days and it is very loose. My stomach makes a lot of gurgling noises. Conventional medicine would tell me all these things are BAD. I now know they aren't at all.
I too wish I would have been ketoadapted when I was pregnant. I would have loved to have avoided
being a beached whale who gained 30 lbs., was constipated all the time, achy, swollen and tired. I
always admired those people who carried a little beach ball in front. Not me, you knew I was pregnant
from ALL angles!! Ugh....

I am reading Bear's concise posts from the active no carber site. I would love to read more of his stuff.
As I'm reading, I'm writing the main topic of the post in the left margin for easy access later. It's too bad
he's not actively chatting somewhere. He just fascinates me due to his age. He is scaring me with a few
things though--- pork, for one. Goodness. And hunger. He says a ketoadapted person doesn't get hungry.
I get hungry, well kinda - I definitely like to eat and seem to get headaches if I don't, so I'm worried I'm
not ketoadapted maybe? Lastly, fasting glucose level. He says his never wavers, all day. I tried testing
mine to see if it varied and it was up and down a bit. Many of you told me that testing it really wouldn't
tell me anything, and apparently my monitor doesn't work right anyways from what more experienced
folks have said, so I quit doing it.

Also, I am still waiting for a post on coffee by him, since he drank it. I'm 4 pages from the end and
nothing has been said. It's been said here that it's the oil in the coffee that's an issue because coffee beans
are obviously vegetables. But I want to know if it has carbs or what in it bumps a person out of
ketoadaptation? At what level and duration of carbs does that happen? I've tried using my keto- sticks
and it doesn't change colors at all, but I'm confused as to whether a) they are ruined strips b) I am not
even into ketosis because of my coffee and whole cream or because I had a glass of wine last weekend
or c) I truly am "ketoadapted". I really wish there was a way to know for sure because then I could listen
to my body even better. My energy is great right now and I have no cravings, although I do get hungry.

Well, I'm off to get ready for work. Have a great day everyone!

RE: Zero-Carb/Meat and Water - Regina - 10-03-2008 05:15 AM

nyteez Wrote:
What is with these people who come in here condemning my diet with no facts to back it up?!

Where is the data proving that zero carb....oh EXCUSE ME,.... very low carb, cannot support a healthy
life or pregnancy?!

There isn't any, so what is your argument?

First of all, I did not "condemn" your dietary approach, so don't take it personally. It's your body, it's
your experiment!

I do however believe strongly that individuals also should have a wide swath of information to base their
judgement on, and pregnancy is a subject that any woman should have information about when it comes
to their diet and how it can and does affect their ability to get pregnant and maintain an ongoing healthy
pregnancy.

I registered to reply because I was specifically named on this thread and what was said did not
accurately represent what I posted on Jimmy's blog comments. It was said that I did not "understand that
once we get ketoadapted, we no longer are "in ketosis" and we don't waste ketones."

My reply, which clarified how we do indeed continue to manufacture and use ketones was met with
"That is true, we do use them." acknowledging that indeed, perhaps due to my clarification, that Charles
understood my understanding of "ketosis" 

Also, long before this thread, I was invited to join this forum, so I've also had a standing invitation that I haven't had the time to take up.

That said, since the focus of this long thread isn't simply Charles contention that store-bought ground-beef and water is enough sustenance for a healthy pregnancy, I'll move the remainder of my replies to the appropriate thread here:

...that seems to be to discuss that issue. I'll just move quotes as I reply over there since this thread is a way too general discussion overall and I'd prefer not to lose focus on the issue that brought me into a discussion!

Good day folks - hope to see some of you over on the other thread!

mlcondiff Wrote:
Doesn't this mean there is a chance there is free glutamic acid contained in the beef, and if so does this not bother you?

It's possible that there may be but I've never had any problems with Wal-Mart's ground beef. In fact, I've never looked at the ingredients list on it. These days, since I don't eat breakfast, I'm only eating ribeyes, chuck steak or something like that with added fat. I wouldn't hesitate to eat the ground beef though.

I suppose if someone can easily get better quality meat and the price is not an object then that's fine, although the benefit is arguable. I haven't seen anything to suggest that there is anything wrong with the supermarket variety.

The grain-fed is only fed grain shortly before slaughtering. The completely grass-fed may have more nutrients but that doesn't mean that the grain-finished doesn't have sufficient nutrients.

I say all that to say that I would eat the Wal-Mart 73/27 without hesitation, but that's just me!

Regards,

Charles

If I understand the following link correctly, free glutamic acid is MSG.

http://www.nutrition4health.org/nohanews/NNSp00_MSG.htm

If you believe the symptoms in those sensitive to MSG then it may be better to avoid it. I have 73/27 hamburger from Cargill. Going to check the ingredient list. Don't believe it has anything in it but ground beef and fat.

I can't help much with the coffee, but I thought the Bear covered it pretty well. If I were a coffee drinker, I would try and drink it exactly as he does. If he has it plain, or uses cream or whatever, I would listen to him. I'm glad that I don't, however.

Some quotes:

Quote:
Our local cream has ~1 gm/100 ml, so 2 l contains 20 gms. There are not 10 gms of total solids in three cups of my expresso (I grow, roast, grind and brew coffee- I have Rancilio and Conti machines), and the sugars have been caramelised by roasting. My vanilla extract label says it is 0 carb- I don't buy the cheap stuff. Perhaps there may be ~30 gm total, but that is spread out over 3.5 litres of ice cream, or one gm per 125 ml. How close to
zero do you want to go?

I go much closer.

Quote:
I questioned only your contention that the level of dissolved solids in three 20 ml cups of coffee is 10 gm, and what portion of the total mix of extracted solids and oils would check out as sugars. By the way, the oils in fresh coffee seem to have an ability to stimulate insulin release. Not the caffeine, nor will defatted instant, only whole brewed coffee. I have had to stick to just one cuppa in the early morning, drat it.

Something to consider.

Quote:
I love my one morning cup of coffee- but not black. I found some time ago that a couple of tablespoons of heavy cream diluted with water will froth up like milk and makes a delicious cappuccino

Quote:
Ice cream is: egg yolks, cream, non-lactose milk protein in water, vanilla extract and a tiny pinch of aspartame.

For a 6 qt White Mt. churn: 16 yolks, 1.8 litres cream, 250 ml water with 2 heaping tablespoons of a mix of 3 parts calcium caseinate and one part ion exchange whey (not isolate) two tablespoons of high quality vanilla. You can spice it up by grinding up fresh vanilla bean. If you like coffee flavour, add three small cups of short-black espresso. Be careful not to run the machine too long or it will turn to butter.

The only potential problems I can spot with such an approach is with regards to insulin. You have to remember that the Bear has been on this regimen for a long period of time. I think the rules are much different for those who have achieved their healthy body-regulated weight than it is for someone who is losing and has hyperinsulinemia. Therefore, in my opinion, one should get to where they want to go before adding things like this. On the other hand, if you can enjoy these things and they don't slow you down, that's something to consider as well.

Again, these are all just my opinions. He also offers this caveat which addresses my concern:

Quote:
Simple solution: if you feel hungry, eat. Try not to constantly check the scales and so on, the reduction process is slow, and varies as your BF falls. Coffee? May be the culprit.

Again, it all depends on the state of your insulin. If it's out of control, you cannot eat like the Bear. If it's properly controlled, you can enjoy certain things. This is probably why Dr. Eades thinks that people who achieve their goal weight can eat more things than someone who is losing. This isn't a blank check, but I
believe you would be more attuned to your body and not to quick to overdo it. This is why I suggest you get to where you want to go and then experiment.

The ketostrips would not change colors if you were not wasting ketones. The fact that they are clear indicates that perhaps your body is efficiently using the ones you are producing so this is a good sign.

When the Bear talks about getting hungry, he means that he doesn't get hungry in the absence of food. He only gets hungry when he's preparing his food. The enjoys the smells and things like that.

Quote:
'Hunger' is due to blood-glucose variation. On a zero carb regime, the blood levels never vary thus you will never 'feel hungry' or have 'mood swings' whether you eat or not. This is normal. Appetite appears as soon as you smell the meat cooking... I try to remember to eat at least once a day, more is ok, perhaps better. If you don't mind the time spent in the kitchen, you can even eat as many times as 6 per day- which I consider a good format for adding muscle when bodybuilding

What he is communicating is that his insulin is under control and his blood sugar does not go too low, which means he does not hypersecrete insulin. This will be true for you as well the longer you stay on the regimen. It took me more than six months to achieve this. I am only hungry in the presence of my own food.

Regards,

Charles

Welcome, Regina.

Welcome to Riley, too. You're doing great on zero carb. I'm sure we'd all love to meet your mother. Is she doing zero carb or some other low carb plan?

waywardsister Wrote:
I'm between 22-23% bodyfat, and IIRC for women 18-20% is pretty much the lowest you want to go? Anyone know?

I don't put a lot of stock in body fat percentages since they don't take body shapes into account. I've probably only got about 17% body fat on the upper half of my body but my lower half is probably more like 25%. Even though I'm bottom-heavy, the body fat calculators put me in the nearly underweight category of about 18-19% even though I'm a bit overweight in my legs.

Charles Wrote:

Since I don't buy my 73/27 hamburger from Wal-mart, do the ingredients list free glutamic acid on the package or are you saying it lists 'natural flavorings'? The OP had me believing it listed free glutamic acid. Couldn't find the original post when I want looking. This thread moves too fast.

I posted on the 73/27 Wal Mart ground beef sometime back. It does have an injected water based solution with other stuff in it [salt sodium something, other "natural flavors"] I don't know if the 80/20 has it or not. My local butcher sells two types neither of which is pre-packaged. Their "ground round" is ground in the store and is not pre-packaged nor is it injected with any solutions. Their hamburger - however - is bought by them in tubes and they have no idea if it is injected with a solution. I have to use a lot of hamburger for budgetary reasons - so I have to keep exploring the subject to try to be sure what I am eating is as pure meat and fat as possible.

chris

OK. I buy 3 lb tubes of 73/27 from either Stater Brothers or Meadowland Farms brand which is processed by Cargill. Neither of these sources lists anything but 100% beef on the label.

So I guess I now understand Charles' question about natural flavorings as you say Walmart 73/27 had them and the link I posted said natural flavoring could contain MSG.

"These OFTEN contain MSG or create MSG during processing:

Flavor(s) & Flavoring(s), Natural flavor(s) & flavoring(s)"

So Walmart 73/27, since it contains natural flavoring may also contain MSG. We just don't know.

**RE: Zero-Carb/Meat and Water - [nvteez](mailto:nvteez) - 10-03-2008 08:12 AM**

Cynthia - Unfortunately thost strips don't work for everybody. Some people never show any color, some people (like me) always show color. It is not really a reliable test. The Bear also mentions this.

Also, the Bear has been eating this way for 50 years. When he says you should not be hungry when keto adapted he is right, but it may take many months for your body to unlearn wanting to eat every 5 hours. Every month I notice changes. Just keep doing what your doing and you will see results.

I have been off eggs for 2 months. Last week I started getting hungry around 2-3pm and started having 3 HB eggs w/ lots of butter. ( my office is where I also raise chickens so the only thing to eat there is eggs LOL!) Not every day, but 3-4 days for the past 2 weeks I have had eggs w/ no problems. I also had a few pieces of cheese and I have actually lost 2 more lbs.

So, for 2 months I was strictly meat, water and some wine. Now I can add back cheese & eggs (in moderation) and continue to lose weight. I think with eating zero carb, there is a lot going on in our bodies, healing, detoxing and adjusting. We have to give our bodies time to adjust to this WOE and it takes time. Not days or weeks, but months. Even the Bear tweaked his diet many years after this WOE.

I think it is important to just stick with the diet and be patient. Changes will happen.
RE: Zero-Carb/Meat and Water - jeepifer - 10-03-2008 08:14 AM

Remember how frustrated I was that my scale stopped moving downward? It's on the march again. I'm at my previous low weight, my "tight" jeans are a bit looser, and most importantly, even though I'm having emotional issues, I have no desire to run off to the sugary, carby junk like before. Progress! *happy dance*

Not sure if it's the ribeyes, or the strength training I started, or both, but I'll take it! I'm averaging about 1 lb. a day total intake on the beef and I only know this because DH tried to cut the steaks to be 1 lb. each and that's pretty much what I eat in a day. I'm not being retentive and measuring every meal!

Energy level is constant. I should be very tired today, as I hardly got any sleep last night (not LC related) but I'm okay. Not as perky as normal, but not falling-down asleep either.

I did try the "stix" this morning and they're still turning, but not nearly as dark as a week or two ago. Hope this means I'm working through to ketoadaptation!

Charles, you aren't the pied piper? Aww, shucks. 😊

(b) desirable?
for there to be sub-threads of this thread?

We'll have to take it case by case. We did not need a meat, water and coffee thread. I love the 100-day challenge thread although it could have been here as well. One does not have to be different than me in order to post here. We recognize that people are on their own individual journeys and we all respect and appreciate that. Don't ever feel bad about posting.

However, people need to master the search function and as long you select "posts" instead of "threads" you can very easily find what you're looking for.

Anyone who has read this thread knows that we do regularly repeat questions that have been answered before because it's more important that people understand the science than it is to be rigid about rules.

I don't mean to be so rigid but if you have been reading closely on this board, Jimmy and many others are not zero-carb and they're not comfortable with the perception that the entire board is dominated by our way of eating. Therefore, as good citizens, we try to be accommodating.

Regards,

Charles

How about an FAQ section under the diet description at the top of the forum page? As long as all diets are allowed to have a similar section under their descriptions. The administrative problem is deciding who will be allowed to do the FAQs for other diets.

This is true and something that we've been kicking around. Part of me likes the idea of a FAQ but more of me likes the idea of repetition because more people can get these things straight in the minds the more they read them.

I have suggested a forum for each plan, but this would be much like the old forum which was very busy with too many little forums. The idea of this forum was for a more streamlined approach.

Let's face it. Zero-carb is quite a concept. It's amazingly simple yet amazingly complex at the same time. For some, it's the easiest thing they've ever done and they wonder what took themselves so long. For others, it's quite a conundrum and goes against their background so much that they become angry.

The idea that someone could be healthy on supermarket beef and tap water sounds pretty extreme unless you have been doing this and have the health to show for it. I try to be as accessible as possible so people can see that I am a real person who struggled with this just as they do. I've had some amazing success and it only gets easier and easier to do.

There will be some major changes soon and those of you who are really into zero-carb will not be disappointed.

Regards,

Charles

RE: Zero-Carb/Meat and Water - sean - 10-03-2008 05:58 PM

Oh Regina Regina Regina...Just the facts please darling.

Maasai adults drink only soured milk. I've not only been there, but I recently contacted a friend of mine to confirm and although not Maasai herself, she lives in Tanzania and gets food from the market where the Maasai sell their wares. Shockingly enough she told me she can't get "straight" (meaning fresh) it is always sour. She stated she knows of no African that drinks milk that hasn't been soured. I'm not saying this is always the case, but I think she has the inside line on the diet of these people, don't you think???
So much for their lactose carbs, I know, I know, their RDA of sugar now must come from blood.....

And amazingly enough I found this little douzzy on line about pregnant Maasai women : (if you would, pay close attention to sentence #5)

Early Childhood >
Pregnancy in Maasai Culture

A pregnant woman in the Maasai community is treated like a queen. Her meals are prepared for her in order to ensure that both she and the baby will remain healthy. Her food is selected very carefully to ensure that both she and her baby will be healthy. The amount as well as the quality of food a woman eats while pregnant is carefully controlled. A pregnant woman is not allowed to drink whole milk; only in certain times can she drink skim and sour milk. Pregnant women also enjoy special diets made from of a mixture of traditional herbs designed to keep the blood and stomach clean. Pregnancy is carefully monitored by midwives until the mother gives birth, after which the child will be cared for by the whole community.

Is this a fact since it is from the net, who knows, but it sure looks that way. I just find it shocking that the Maasai actually think that thing inside the woman is a baby, and not a blob of dead tissue How primitive, and unprogressive of those Maasai gals.
If anyone has read Dr. Price's work it is quite clear that he was dumbfounded by the ease and simplicity of childbirth among natives. The women were built properly on their carnivorous diet and as he said about the Inuit, the women didn't even "wake their husbands" while giving birth. Sounds like an American maternity ward to me....my oh my - I'll have to read a little more thoroughly but I dont recall the section where the ladies started eating salads once pregnant....

Finally here is a little passage from a book written in 1843 about meat and water and the Guachos. A Treatise on Food and Diet by Johathan Pereira

Many facts could be adduced to prove that an exclusive diet of animal flesh is amply sufficient for healthy nutrition. Sir Francis Head relates some interesting particulars respecting the Guachos, inhabitants of the Pampas, in South America, which have an important bearing on this question. After stating that they often continue on horseback day after day, galloping over their boundless plains, under a burning sun, and performing labors almost of an incredible description, he remarks: "As the constant food of the Guacho is beef and water, his constitution is so strong, that he is able to endure great fatigue, and the distances he will ride, and the number of hours he will remain on horseback, would hardly be credited." Sir Francis Head also brings his own personal experience in proof of the correctness of the above statement.

"When I first crossed the Pampas," he remarks, "I went with a carriage, and although I had been accustomed to riding all my life, I could not at all ride with the Peons (drivers of the carriage) and after galloping five or six hours, was obliged to get into this carriage; but after I had been riding for three or four months, and had lived upon beef and water, I found myself in a certain condition, which I can only describe by saying that I felt no exertion could kill me. For a week I could daily be upon my horse before sunrise, could ride til two or three hours after sunset, and have really tired out ten or twelve horses. This will explain the immense distances which people in South America are said to ride, which I am confident could only be done on beef and water." (Rough Notes, by Sir Francis Head, p.29).

There are numerous facts of similar kind which might be quoted, but the fact that an exclusive diet of animal food is fully sufficient to sustain physical powers is too well established to need further proof.

Now if it was not even worth arguing about back in 1843 why on earth are all the detractors so attracted to Charles and BEAR??????

Since there has been some talk lately about the different forums/formats, why not set up a forum for all the - educated WELL beyond their intelligence - types and they can place bets as to who dies first on this forum due to their beef and water diet ...

One final thing, can someone help me understand how the Mongols, Comanches, Inuit and Guacho babes gave birth???? Havent these silly primitives ever heard of the RDA???

**RE: Zero-Carb/Meat and Water - Hilary - 10-03-2008 09:07 PM**

I am so glad that I posted here when I started. I am on day 4 and having really bad detox symptoms. I am O.K. and getting through it, but it is hard. Except for my coffee (cut the AS in 1/2), I am having my first ZC day. It was knowing that I was going to have to check in at some point that kept me from cheating.

I had a baby two weeks ago and everyone is bringing food, pasta, cookies, and such for us. It is so nice and the rest of the family is eating it up. My DH totally supports me. But smelling all the food was hard. Thanks guys for being here.
RE: starting meat and eggs today - kacey - 10-03-2008 10:19 PM

Just catching up from my last post about progress from 9 days ago. I have now lost 7 pounds. WHOOSH! I added coconut oil to my 2 cups of coffee in the morning. (and one cup of tea in the afternoon) I am not using cream. Very, very tiny amounts of cheese (like 2 times over last 2 weeks). Meat, meat, and meat. A few days I had a glass of wine. 1 day I had some salad.

I am still on 3 meals a day - but I'm hoping to get away from that soon. I'd like to eat more, less often. I am still having horrific bouts of nausea but I'm OK with that if I'm losing weight. (I know it shouldn't be that way but I'm desperate to get the weight off and this is the first thing that has worked in a long, long time. I did lose some on the 'liquid' diet - which I actually wonder how that works since it has so many carbs and so little fat??? But I felt like CRAP.)

My skin looks great. My hair is shiny. (I have problems with this due to thyroid but all this fat is really making a difference.) I am on about 75-80% fat a day. Minor carbs (a few eggs, etc). Rest protein.

I am still sleeping ALOT. Weird. Still waiting on the major burst of energy. I don't feel bad, fatigued, or sluggish, but when I'm ready for bed there is NOTHING to keep me awake! Then I sleep and sleep and sleep.

Next week, son's surgery. Being 'locked' in at the hospital so I'm really freaking a little in how to prepare for that. I'm going to take a cooler with some stuff. That should last the first two days anyway. We'll see after that.

I'll post again sometime next week. Here's hoping for another 7 pounds lost!!! 😄😄😄

RE: Zero-Carb/Meat and Water - suzanneyea - 10-04-2008 03:01 AM

Hilary,
How are you doing with the baby? I went through a horrible detox period too, it just dragged on and on and I was so frickin tired and felt so sick and dizzy. However, I think that is one of the things that keeps me so focused, I never want to go through that again. Even when I gave up eggs, I went through a mini detox! Just from stupid eggs! I have found having high carb foods around not as tempting as having low carb treats. I would never ever eat bread or pasta, but now I make things like cream cheese muffins and oppsie rolls for my son and those are tempting from time to time. There was a period I could not make them, just too tempting. So, hang in there, it will get easier. At least the diet part, the being a mom part just gets harder, lol.

I'm with you on this one. It seems we have this thing in us that wants to "justify", not just eating LC treats, but eating them to excess. It's almost like they have the same addictive powers as sugar even though they use AS. It must be the vicious AS/Insulin spike circle. I have resisted true sugary-carb-laden treats time and again with no problem, not even the least tempted to indulge for I know sugar's evil power and hate the thought of it's intensely unrelenting cravings. For me it is best not to have the LC
treats around at this point. And the thing is, even though many LC treats/versions of the real thing are pretty low in carbs, they seem to have the ability to quickly stall you or pack on an extra pound or two. Again, moderation just doesn't seem to have a place in my brain!

The more positive reports we can get of LC/VLC/ZC-ers successfully competing, the better :-)  

Well, most of you know that I have done 2 sprint triathlons (which take roughly 1.5 hours), both VLC and 5 Adventure Races, the last few being zero carb. Adventure Races take anywhere from 4-7 hours. At my last 5.5 hour race, I did not take in anything to eat the entire race after a very high fat ground beef breakfast. We rocked and we won our division!! (teams of 3 that is similar in nature to The Amazing Race - you don't know what you'll be doing, you're following a map, seeking out checkpoints, performing team challenges along the way, riding mountain bikes but also including running, kayaking, canoeing, climbing, and whatever else the crazy race directors can come up with!)

Sounds great, and perhaps in keeping with the kind of "sport" our hypothetical hunter-gatherer ancestors might have been doing (minus the mountain bike of course 😊).

Quote:

I have another AR this weekend, leaving Friday afternoon and competing first thing Sat. morning. Planning to repeat my large breakfast of all ground meat and tons o fat, about 1.5 hours before race start and taking in only sips of water along the way.

I'll let you know how it goes!! wish me luck....

Good luck! 😊

Mike

Barry Groves, for one, preaches against artificial sweeteners in "Natural Health and Weight Loss". The way he puts it is that artificial sweeteners have a more intense sweetness that perpetuates the craving for sweet food to a greater extent than even sugar.

Personally, I just object to them on principle, in the same way that I detest any food that pretends to be something else. Thus I hated margarine and low-fat spreads, even when they were thought to be healthy. I'm feeling smugly vindicated on that one now.

"I can't believe it's not butter" - ha, but I can believe I'm being conned!

Not almost like, just like.

"For as long as humans have lived on Earth, they have been eating foods that taste sweet, such as sugar cane and honey.

So, the brain has a conditioned response in reaction to eating something sweet.

It is called the Cephalic Phase Insulin Response (CPIR), and it’s responsible for the fat-storing effects of diet beverages, including diet sodas, diet tea, coffee, energy drinks, sports drinks, and flavored waters.

This adaptation in humans is a reaction to the ingestion of sweet-tasting foods. The body learned to associate sweet-taste on the tongue with the resulting sugar-energy-load that landed in the stomach.

The brain came to perceive sweet-taste with the need to program the liver to prepare for the arrival of an outside source of high energy – sugar.

As the tongue senses something sweet, it programs the brain to set into motion a series of biochemical events. It doesn’t matter if the sweet taste comes from natural honey or from artificial sweeteners.

This biochemical cascade triggers the liver to stop the manufacture of protein and starch from its body-reserves, and to begin to store the glucose-energy that circulates in the blood.

In the case of diet beverages, the sweet taste sets these events into motion.

But when no calories actually appear in the stomach, this causes the body to demand real food, with resulting hyper-urges from the liver to overeat, or to drink more of the sweet-tasting liquid, and the cascade repeats itself.

Almost instantly, the body starts producing insulin, the “fat” hormone, which stores sugar in the blood stream, and programs the adipose tissue fat cells (belly fat) to store, store, store.

This Cephalic Phase Insulin Response (CPIR) creates reactive hypoglycemia (low blood sugar), which further triggers strong cravings for more sweet-tasting items, and high glycemic foods.

After the taste buds are activated by a sweet-taste, the urge to ingest food can last from 1 to 2 hours. So, you are hungry for hours, because no real food or calories has satiated the body’s need for energy.

And now, the body is producing insulin for no reason, because the brain has instructed the liver to store instead of burn/release its storage supplies.

The result is fat, fat, fatter - the Cephalic Fat Spiral."

Just as an FYI we had a discussion somewhere about CPIR before and artificial sweeteners. The contention was did all artificial sweeteners cause such a response or just some. I don't think it matters. The sweet response is ingrained. Heck Phase I insulin response is ingrained no matter what you eat. Which is why you are better off if you can not eating but every 5-6 hours or longer.
RE: Zero-Carb/Meat and Water - hpseids - 10-04-2008 07:26 AM

That is SOOO exciting about the new ZC forum! Whoohoo!! I can't wait.

MAC and others, what are your thoughts on Stevia? I haven't had anything sweet tasting since I starting vLC 2 weeks ago and I'm doing great, but I'm wondering about Stevia for the future in small amounts, as it's not technically an artificial sweetener, but a sweet tasting plant that supposedly doesn't effect blood sugar...at least that's what they claim. Thoughts?

RE: Zero-Carb/Meat and Water - Charles - 10-04-2008 07:31 AM

By the way, zero-carbers, I am more than please, I am ECSTATIC to announce that MAC and Suzanne will be joining me at the new forum, livinZEROcarbdiscussion.com

We hope to see you there as well!

Charles

Stevia from what I've read is far better than other AS since it is made from a plant. There are 3 types of Stevia: pure, packaged with maltodextrin (sugar) and liquid stevia. Since eating or drinking anything but water raises an insulin response, having stevia sweetened products with a meal or just after a meal is not such a bad thing IMO as you raise your insulin levels by eating anyway. I wonder if Stevia by itself
doesn't raise insulin levels as I just posted a few posts back about sweet tastes and insulin. I say use small amounts. If your weight loss stalls drop it and see if your weight loss resumes.

**RE: Zero-Carb/Meat and Water - suzannevea - 10-04-2008 07:57 AM**

What are you using the stevia for? I tried it in my morning coffee and did not like the taste at all, way too bitter. I put one equal in my coffee and I figure since I only have the one cup a day and that is my only artificial sweeteners, I can live with it.

I haven't had anything sweet tasting since I starting vLC 2 weeks ago and I'm doing great, but I'm wondering about Stevia for the future in small amounts, as it's not technically an artificial sweetener, but a sweet tasting plant that supposedly doesn't effect blood sugar...at least that's what they claim. Thoughts?

Stevia from what I've read is far better than other AS since it is made from a plant. There are 3 types of Stevia: pure, packaged with maltodextrin (sugar) and liquid stevia. Since eating or drinking anything but water raises an insulin response, having stevia sweetened products with a meal or just after a meal is not such a bad thing IMO as you raise your insulin levels by eating anyway. I wonder if Stevia by itself doesn't raise insulin levels as I just posted a few posts back about sweet tastes and insulin. I say use small amounts. If your weight loss stalls drop it and see if your weight loss resumes.
Good advice MAC, thank you. Maybe I'll try just a little and see what it does to my cravings, etc. I definitely don't want to touch Splenda anymore, which I think I became pretty addicted to at one point...using upwards of 10-15 packets a day (!) and I definitely don't want to go down that road again. Calorie free or not, it was certainly producing an insulin response in me as I wanted more and more...plus chlorinated fake sugar is pretty nasty.

Yeah, Suzanne- just wanting to put a packet or less in my cup of coffee/and or tea. I found a brand I think tastes really good (for Stevia haha) so I'd be happy with just that. I can go check the name if you're curious but you seem perfectly happy with you coffee and equal...and it's DEFINITELY working out just fine for you! 😊

I'm sure 1 and only 1 packet of anything-- equal, splenda, stevia-- would probably be fine. I just don't want to start down a slippery slope of a little of this, maybe some heavy cream, then cream cheese and yogurt, then yogurt and berries, cream cheese muffins, pumpkin desserts with nuts...it gets out of control quick for me! LOL! So I'm treading very lightly and keeping variety at a minimum...

---

**RE: Zero-Carb/Meat and Water - Kristi31 - 10-04-2008 08:27 AM**

I really look forward to the new zero-carb forum...can't wait! woohoo! 😊

**RE: Zero-Carb/Meat and Water - Riley - 10-04-2008 08:32 AM**

I'm excited about the new forums. LC, VLC, and ZC are very different diets although they do seem similar because of the lack of carbs. We need our own house.

I just have one suggestion.... Can we try a different URL? livinZEROcarbdiscussion.com seems to be a spin off of this forum. From reading what happened I don't think this is the case. Let's make a clean break and be original with the name/URL.

**RE: Zero-Carb/Meat and Water - Charles - 10-04-2008 08:33 AM**

Keep in mind that it's not only this thread that will be gone, but also any journals and other threads that you have started, these will also be removed from this forum. I will depend on you to tell me that you want your personal journal migrated to my forum. If you don't tell me, I will not move it and it will be deleted if it contains the title or a discussion of zero-carb. This will be a strictly low-carb forum after November 1st.

**RE: Zero-Carb/Meat and Water - suzanneyea - 10-04-2008 08:34 AM**

I am very strict about my one coffee. I have seen way too many people start to add things back into their diet and the list can grow fast. I look forward to the new forum as well, should be fun. Zero carb has helped my life so much. I wake up in shock everyday at the transformation in my life.

**RE: Zero-Carb/Meat and Water - Charles - 10-04-2008 08:35 AM**
Riley Wrote:

Riley, I'll give that some thought. The thing is, Jimmy is kind enough to grant us space on his servers and a lot of what you see on this forum will be directly moved to the new one. I will use the same interface and things will be similar although the content will be drastically different.

I just wanted people to be as comfortable in their new home as they are here.

Regards,
Charles

RE: Zero-Carb/Meat and Water - suzanneyea - 10-04-2008 08:39 AM

Plus, I bet a lot of people will be on both boards.

New Title - "Meat does a body well done" or "Meat for a well done body".

RE: Zero-Carb/Meat and Water - montmorency - 10-04-2008 08:42 AM

I'm going to put my immediate response to Jimmy's latest on ZC here, rather than that specific thread, and leave it to Charles to respond there.

The expert I am most surprised about is Gary Taubes, since he explicitly states in GCBC that meat contains all the essential amino acids and vitamins, with the possible exception of vitamin C, and then gives a very convincing case why vitamin C may not be an issue for zero-carbers. Of course it's true that muscle meat may contain a few carbs, as does liver. This is why The Bear states that for practical
purposes, ZC is about less than 5g carbs per day. That's simply a point of fine detail.

Similarly organ meat is a bit of a non-issue, since it comes into the category of "meat". From what I have read so far, some Inuit/Eskimo ate some organ meat, others didn't. I personally eat organ meat now and again; others may not, but we're still basically on the same path, whether it's technically "ZC" or not.

I see some of the other "experts" talking about our old friend fiber/fibre, even though Gary Taubes did a pretty good job in demolishing it in GCBC, and Bary Groves does the same at http://www.second-opinions.co.uk. Fiber by definition has no nutritional value, and the only thing to be said for it may be to do with constipation, but many of us have found that this too is a non-issue on a meat, fat, and water-based path.

Regards,
Mike

**RE: Zero-Carb/Meat and Water** - Charles - 10-04-2008 08:45 AM

Thanks, Mike, but I wish you would copy your reply over to that thread because I would like them to be together, if you don't mind. I plan to address each of these "experts' and I already posted on Johnny Bowden this morning. I never eat organ meats, EVER. I challenge anyone to find some deficiency in my body!

**RE: Zero-Carb/Meat and Water** - montmorency - 10-04-2008 08:47 AM

Charles Wrote:

Fine, will do Charles. And oops, I had missed the story on the new forum. Sounds very exciting, and I'll be there.

Regards,
Mike

**RE: Zero-Carb/Meat and Water** - suzannevea - 10-04-2008 09:20 AM

I think I would rather starve than eat an organ meat! Gross!

**RE: Zero-Carb/Meat and Water** - Mel - 10-04-2008 10:06 AM

I'll be moving over to the new forum. October 15th, 2007 was when I started LC. I was 3/4 of the way through reading GCBC and I saw the light. When I joined this forum last spring, I was looking for a way to break out of a weight loss stall. I kept lowering my carbs. I currently am eating VLC but I have noticed that with two or more ZC meals in a row, I experience a "whoosh" of weight loss that shows up in my clothes getting baggier.

I'm grateful to Jimmy for starting this forum and to Charles and the rest of the pioneer ZC'ers for sharing
their thoughts and experiences.
Melinda

Some people feel the same way about fish - my wife for one, but Stefansson included fish in his "meat" category, and as we know, at least some Inuit ate fish some of the time. Let's not get too hung up on organ meat. It is, IMHO, if you'll pardon the mixed metaphor, a red-herring in the wider discussion. For those of us who do eat it occasionally, very light cooking is the way, but then, that seems to be true of all meat.

There is an unprintable joke I could make about liver, but this is a family forum 😊

Regards,
Mike

RE: Zero-Carb/Meat and Water - Hilary - 10-04-2008 10:36 AM

"I was thinking about you this morning. I remember on the last forum that you and someone else were zero-carbing and doing very well. I know that you achieved your goal weight and got pregnant. Were you eating zero-carb (or close to it) when you became pregnant and then you started eating carbs while pregnant?"

Charles

Charles,

I was keeping it around 10 or under. I got to goal and then well, I got pregnant. I was keeping it pretty LC, but the pressure from everyone made me quit. I got depressed, gained weight, felt horrible and it just spiraled. Now, I don't give a crap what everyone else thinks because I was a lot healthier than them, running my 5Ks and being happy. Now, with the baby a lot of people are still giving me trouble, but I want the feeling of health back. I don't honestly know if I will stay ZC, I am going to give it a month and see how goes. But if not ZC, then still VLC.

BTW, I took the baby to the dr. yesterday and she is up 1lb 3oz in 11 days per the Dr.'s scale. So, I'm thinking that she is just fine. Everyone remarks about her beautiful coloring and how alert she is.

I am hanging in there, and yes Susanne, I was looking over my AS, LC surgery recipes and I was contemplating it. I didn't do it because I know you guys are here, so I posted instead. Thanks, MAC for the explaination of how the AS works to release insulin. I am more hungry once I eat these things.

RE: Zero-Carb/Meat and Water - Kristi31 - 10-04-2008 10:41 AM

I actually really like some organ meats. Raw or slightly cooked. The only liver I really enjoyed was from bison. But cooked, I enjoy calf liver too. To each their own. 😊
RE: Zero-Carb/Meat and Water - Charles - 10-04-2008 10:49 AM

Hilary Wrote:

That's just fine. My wonderful adversary, Regina, would say that those measely 10 grams gave you the proper nutrients you needed to get pregnant and that you couldn't have been so successful if you would have been at zero before you started. Of course, I disagree, but that's just me.

I hope you get back there, but as with everything, it's your choice. I'm with you no matter which way you go. And by the way, even if you go to 20 grams, you can still post at the new forum. We won't kick you or anyone else out!

It's not, my plan or no plan over there.

Regards,

Charles

Me too! I am very grateful I found this forum. I started Atkins feb 2008, but I kept my carbs under 10. Atkins says you can stay on induction for up to 6 months. This made me wonder what is wrong if I kept doing 10 carbs forever. I really liked the diet and how I felt, I didn't want to add back carbs ever. So, I began researching low carb and no carbs on the internet and found this forum. Shortly there after this thread was created. Nobody convinced me to go zero carb, I already wanted to be ZC before I even got here. I just wanted to know if there was anything wrong with it. With all the research I have done I can't find any evidence that there is anything wrong with ZC, so I am going to continue to eat ZC, because I feel great! 😊

I feel the same way. I started atkins induction mid-July, but felt horrible...dizzy all of the time. I did some research, found this forum and I feel amazing! As long as I feel great, I'll stay with it.

RE: Zero-Carb/Meat and Water - dixonge - 10-04-2008 03:59 PM

Dangit. I just got here and now it's all moving. Except the new URL isn't working yet. And I have questions. But I still have a lot of reading to do.

Here's to the new site...

Here's to the new site...

November 1st is the date. We'll be working behind the scenes to get this thing working.

I don't know what people can do to help, but I'll tell you, just as you look on this forum and see sponsor adds, I'm going to need them for the new forum as well so we can defray the cost. I would love to have people from the meat industry. If you are aware of any ranchers with websites or anything like that who you think may want to sponsor an add on the new forum, the by all means talk it up. I don't mind even seeing ads for steak sauce or seasonings even though I don't personally use these things. I would much rather a person used these types of things and eat meat than some other thing.

Atkins and people like that don't mind the publicity but it would be much better if it were companies we at least use. I'm going to approach my supermarket where I get my free beef fat from. They're probably too ignorant to care, but it's worth a try.

Regards,

Charles

Cheers to the new site!

RE: Zero-Carb/Meat and Water - dixonge - 10-04-2008 04:31 PM

beef.org seems to sponsor a lot of sites...

Speaking of fat, I picked up a little tray of fat from Kroger tonight. I'm about to start my first batch of dehydrated food for hiking and I figure pemmican would be as good a place as any to start. Thanks for the tip!

RE: Zero-Carb/Meat and Water - Charles - 10-04-2008 04:36 PM

Speaking of Pemmican, I did buy my food dehydrator from Wal-Mart which is like Dana's, I believe. Now, I'm looking for the right lean meat. I was going to use some lean bison or something, but I'm not sure. I have to check my Stefansson again, but I think the most preferred fat was the fat around the kidneys. I wonder if a rancher or someone could get me some of the choice fat. I know I can use back fat, but I just wonder if it's possible to get some of the higher quality fats he mentioned. I want some premium pemmican made to order like it is in the book. I don't want any crap in it either!

Charles

RE: Zero-Carb/Meat and Water - cleochatra - 10-04-2008 04:36 PM
Hey Charles! I read you are getting a new board and see you're talking about defraying costs.

You can get free board hosting software through: proboards (my favorite), ikonboard, phpBB, invisionfree and simplemachines.org, to name a few.

I would go for free forum software, and then in the future if you decide to go full-bore, consider at that point taking on sponsors and pay for forum software through vbulletin. I've run a few boards, and I've found the free software tends to be less glitchy and just as effective as more expensive board software.

Blessings and good luck to you.

Thanks for the warm wishes. I have thought about that, but the last livinglowcarbdiscussion forum used some free stuff and we got hacked severely, so much so that we were out of commission. With the company we use, they handle the security, maintenance, backup, etc so it's one less thing I have to worry about since I have a full-time job in addition to this.

I don't mind paying for it initially because I think we'll attract some good sponsors if the numbers are anything like they are over here. I expect them to be.

RE: Zero-Carb/Meat and Water - travis t - 10-04-2008 05:26 PM

Hey, just checking in to say that i have not died from meat and butter yet. I haven't posted in a while because i don't get on the internet much at home and usually get caught up at work. Well all of that stopped about a month ago. I work for Whirlpool and about a month ago corporate head quarters in Mich. called the head of HR at our plant about internet usage on a few computer terminals, mine was flagged as the No 1 in the entire corporation. Hey at least i am good at something. Needless to say i have not been on the internet since then.
Looking forward to the new site as it should be great.

travis t

RE: Zero-Carb/Meat and Water - cleochatra - 10-04-2008 05:28 PM

I have never had a forum hacked before. Do you really think it will be an issue? I am shocked you think you might get hacked. 😞

I understand if you're expecting someone could do that, but forums like the Magic School Bus run on paleo plans and they haven't had any problems with hacking that I know of. I'm just cheap, and in this economy, thinking about paying for something you can score for free ...

I hear you, though! I am just being a mom over here. LOL.
Thanks for your response.

Jamie

Well, our last forum got hacked and we still don't know who did it, although we have strong suspicions. This particular thread has caused a lot of controversy and upheaval in the low-carb world. I just think it's better to be safe on this one, plus I don't want the hassle of managing the details because I really don't have the time.

I will definitely give thought to what you're saying, for sure!

**RE: Zero-Carb/Meat and Water - Living_healthy - Yesterday 07:53 AM**

Question.....What is your take on eating shrimp? This and tuna are the only "fish" that I will eat. But I don't eat them because of the mercury issues. I read somewhere a few years ago that it takes 1 year for the body to rid itself of mercury. Can't find that info any more. What's your thoughts on this?

---

**RE: Zero-Carb/Meat and Water - cbnebraska - Yesterday 08:09 AM**

Well, I'm back. I'm going to post this here even though it is already in my journal (called Zero Carb- Me & My Kids), simply because I talked about my race in this thread as well and many of you may not read my journal.

The race this weekend ended up taking 9 hours and 4 minutes!! Holy moly! That was a doozy. The longest race I'd done up until this one was 5.5 hours, I believe. We did win our division (women's), but there were only 3 teams of women. However, we were the only women's team that didn't quit half way through!! Woo-hoo!! There were 28 checkpoints spread out over Lord knows how much countryside. It took place in Cozad, Nebraska, which is a VERY small town that is a 5 hour drive from where I live. This race director created a BRUTAL course. Today I am physically exhausted. My muscles don't really want to work and my IT band on the outside of my right knee was a big problem during the race and is very sore now. I definitely have some work to do there. My hip doesn't hurt, which would seem to be a GREAT thing, however, I've been told the hip and knee thing are both IT band issues, so it's obvious the problem is still there.

We rode our mountain bikes and hiked/ran through miles and miles of pasteur along cattle trails. I can't believe some of the terrain those big animals make it across! Plus, they were right there along the trails staring at us with those big eyes!! Occasionally they would all of a sudden go darting across the trail! And I will tell you, there is NO grain feeding going on there. They have tons of grazing lands and they are VERY happy cows. These ones had kind of a longer fur and most of them were a beautiful reddish color. There was a black one here and there, but mostly reddish in color. My teammates kept joking that I need to quit salivating over them and keep moving!! Ha ha.

We also canoed up and down a canal for over two hours, stopping at various times to get clues or hit checkpoints along the way!! As luck would have it, we did while it was cloudy and windy, which is awful when wet. Ugh. (It did clear up later and get sunny - of course while we were running!!) I always take the back position when we row in any events because I like to steer. Other fun challenges we had to do: roll hay bales (huge!!), pull ourselves across the canal in a big silver trough of some kind, piece together a puzzle painted on big cement cinder blocks, use a telescope to locate a clue placed on a far away hill, solve word puzzles, and I can't even think how many more right now. We scaled some
incredible hills both on foot and on bike. I fell so many times I can't even count!

All that being said, it was a blast, but yet it was a lot less fun after about 7 hours. The last 2 were when I started to develop a bit of a pissy attitude!! My knee was killing me when we had to run and we made one very bad wrong turn that added 30ish minutes to our ordeal, caused us to miss our last checkpoint AND forced us to climb a very long, very brutally steep gravel road. Missing a checkpoint adds 30 minutes to your official time, so official time was actually 9 hours 34 minutes.

Lastly, and most importantly, I DID THIS ALL WITHOUT EVEN ONE CARB CROSSING MY LIPS!!!!!! For breakfast at 6 am, I heated up and ate a 1/2 lb. beef patty with lots of extra strips of fat from the broiled steak fat I had made at home. (Well, okay, maybe one as I had a single cup of coffee with whipping cream.) The race started promptly at 8 and I was fired up!! I packed in my pack a second 1/2 lb. patty so I'd have some fuel along the way. I ended up waiting until 3pm to eat it, as there was a good section when we'd be climbing on foot through lots of hills and having a patty in my stomach would not be uncomfortable. The kicker is, I really wasn't hungry, or low on energy, I just decided it was probably time to eat. I wish I could say it gave me some sort of boost, but not really, it seemed irrelevant. Honestly, I was not low on energy at all, the entire race, but my muscles were certainly exhausted. To me, that is just a huge confirmation that this IS the right way for me to eat even when I participate in these physically demanding events. I figured I was being fueled seamlessly by fatty acids, both dietary and stored, so there was no "wall" or lag in energy. I kept thinking about the tribal hunters and I knew it was no problem!! Woo-hoo.

Moving on, I've been catching up on my favorite threads, and have been reading for a few hours. I think it's time to spend time with the family now that they are up. I'll check in later!

Charles, please move my journal to the new site.

I don't have a problem with shrimp or fish. I will eat a couple of pieces of shrimp every now and then but fish isn't a regular part of the way I eat. For the record, any and all meats are just fine in my opinion. I typically eat beef, fat and water, but that's not 100% nor does it have to be for anyone else.

The beef, fat, and water stuff got started mostly because of Ogg/Mimi and her tirades. She seized upon my typical diet and concluded that I advise pregnant women to eat this and only this which is really not true. I think a woman would be fine on such a regimen if she so chose, but that's just my opinion.

Fish is fine, in my opinion. I don't have any thoughts about the mercury although it does sound pretty serious. Although, I haven't heard of any studies with zero-carb and mercury issues so the jury would be out for me. I wouldn't be surprised if someone said that the mercury exits faster when carbs aren't in the way, but I haven't heard that.

Regards,

Charles

Moving on, I've been catching up on my favorite threads, and have been reading for a few hours. I think it's time to spend time with the family now that they are up. I'll check in later!

Charles, please move my journal to the new site.

Gotcha! Congratulations again! You're my hero!

I forgot to ask Regina Wilshire what she thinks about our athletic prowess over in this forum. We do an awful lot of races, running, working out, etc around here on different kinds of meat and water. Surely, we are exhausting our nutrients and we should be suffering from vitamin deficiencies. When someone goes out and does what Cynthia did this weekend, one has to wonder....

Now, if she would just get pregnant...😊

Regards,

Charles

RE: Zero-Carb/Meat and Water - Beth - Yesterday 08:25 AM

Personally, I just object to them on principle, in the same way that I detest any food that pretends to be something else. Thus I hated margarine and low-fat spreads, even when they were thought to be healthy. I'm feeling smugly vindicated on that one now.

The one that always baffled me is the meatless hamburgers that even have grill marks on them! No matter what your WOE- that's just SO WRONG!!

Beth

I would SO not hold up under fire the way you do Charles!! She would have me crying I'm sure!! I lose my ability to think when I become emotional and unfortunately, I get emotional more than I'd like to. I would just have to say "whatever" and move on - just like I teach my kids to do in many situations!!

And, you must have forgotten that I am 40 years old and my youngest child is 7 1/2 years old!!!
However, if by some failure of modern technology AND an act of a higher power, I do end up pregnant, I assure you I would remain on my same eating plan!!

**RE: Zero-Carb/Meat and Water - Jeff - Yesterday 08:33 AM**

Charles, good point about excercise exhausting our nutrients......or not. LOL It's worth noting that Bear is an avid exerciser. After 50 years of zero carb and exercising, he is has suffered no deficiencies.

My muscles don't really want to work and my IT band on the outside of my right knee was a big problem during the race and is very sore now. I definitely have some work to do there. My hip doesn't hurt, which would seem to be a GREAT thing, however, I've been told the hip and knee thing are both IT band issues, so it's obvious the problem is still there.

Awesome job at the race. I have always wanted to do one of these races.

I have a good remedy for your IT band it's called a foam roller. You can pick one up at a "relax the back" store or [online](http://example.com). It's kinda hard to describe what to do but basically you lay on the roller right on your hip and roll down to your knee following your IT band. It's going to hurt but trust me it will help.

Living_healthy Wrote:
Question.....What is your take on eating shrimp? This and tuna are the only "fish" that I will eat. But I don't eat them because of the mercury issues. I read somewhere a few years ago that it takes 1 year for the body to rid itself of mercury. Can't find that info any more. What's your thoughts on this?

I don't have a problem with shrimp or fish. I will eat a couple of pieces of shrimp every now and then but fish isn't a regular part of the way I eat. For the record, any and all meats are just fine in my opinion. I typically eat beef, fat and water, but that's not 100% nor does it have to be for anyone else.

The beef, fat, and water stuff got started mostly because of Ogg/Mimi and her tirades. She seized upon my typical diet and concluded that I advise pregnant women to eat this and only this which is really not true. I think a woman would be fine on such a regimen if she so chose, but that's just my opinion.

Fish is fine, in my opinion. I don't have any thoughts about the mercury although it does sound pretty serious. I, basically, eat ribeyes. Sometimes I eat pork, brisket, and ground beef. I can't remember when I ate
chicken last. I, only, wondered how safe shrimp and tuna are. Ribeyes are quick and easy and I'm on my way to doing something besides eating.

My husband gets upset because I don't cook any more. He'll ask, "What's for supper?" Last night, I said, "Have you noticed that I rarely eat supper any more?" He then found himself something to eat. He doesn't fuss at me because he does notice the improvement in my overall health and his benefits from it. The cousins up the road invite him daily to eat with them, which he does. Do I feel a little guilty about it today? Yes, therefore, I will cook him some of his fresh mustard greens, from the garden, and pork chops. For now he has an invite for lunch and I don't have to worry about it until supper.

Sorry, I rambled on.....😊

Cynthia, I am so proud of you. You are awesome!

Well, thanks! I don't think of myself that way, but I will tell you, we are a unique bunch that does this type of racing. Most of us have extreme type personalities and most of us live outside the box in some area or another. Diet wise, most of them are like the other athletes I've met at my triathlons or at the gym - convinced that carbs are the holy grail. However, most follow their chosen diets with complete conviction and quite rigidly so they tend to be open to my unusual ways - and those of others. Some of them have hilarious pre-race routines that are so superstitious in nature. Me, not so much. My morning fat routine, and now pulling out a hamburger patty to gnaw on, have become a joking point among us that I take quite well. I'm still new at Adventure Racing, so many of them check up on me, give me advice, offer up gear, etc..., but most have learned not to bother offering up "nutrition" as the gels and bars are called. I did have one bad episode a month or so ago that I won't go too far into but that had mostly to do with me trying to eat beef jerky (will NEVER touch the stuff again!!) and then drinking WAY too much water (once again, NEVER again). I did get some flak on that one, everyone trying to convince me that I should have taken in the carbs- but, after yesterday, I hope that has been squelched!!!!

Anyone who finds this type of racing interesting should google your state and Adventure Racing. Also, Urban Adventure Races - they are a blast as well. I'm sure you'll find a site. Ours here in nebraska is nscracing.com (Nebraska Sports Council). Our state is fairly new in the arena, but many states have been on the bandwagon a lot longer and probably have more of them.

THANK you! Another member just suggested that roller and some other balls, so I am off to some online sites right now to check them out! If I'm going to continue being a "Weekend Warrior" I need to be sure my body is prepared - otherwise I'll have a hard time justifying doing these races. After all I do to eat healthy, I'd hate to think I'm counteracting it all by destroying my body in other ways. (Charles, that's for you!!)

Also, although this has nothing at all to do with ZC, I have another question for all of you. Do any of you have trouble sleeping comfortably? For years, my neck and shoulders are so sore when I wake up. I solved part of my problem by wearing a mouthpiece (I know, oh so attractive, but at least it's clear and only obvious when I talk) once it was determined that I clench in my sleep and was doing damage to my jaw, however it didn't solve it all. My shoulders fall asleep when I lay on my side and my neck down into the top of my shoulders is sore when I try to sleep on my back. I have a contoured pillow, but it leaves my head cranked at a funny angle as well. Anybody know the secret to a comfortable night's sleep? I can't sleep on my stomach, it makes my lower back hurt. Help?

**RE: Zero-Carb/Meat and Water - waywardsister - Yesterday 10:46 AM**

Cynthia, congrats! You're one tough babe.

I'll definitely be joining you all over at the new forum! And I like the name as it is 😊

This thread moves so fast, and I've had computer trouble since Friday and got way behind! So forgive me if I'm responding to posts that are about 6,000 pages ago.

A gluten-intolerant someone mentioned hydrolysed protein a few pages ago and said that it acts like gluten or contains gluten - not true, from what I understand. Not that it's something I'd be jazzed about eating anyway 😄. This someone (sorry, the 'quote these posts now' feature isn't working for me at the moment) mentioned that they react to HP's, and I just wanted to let them know that hydrolysed corn, soy protein etc don't contain gluten - but if the label doesn't say where the HP comes from (ie: hydrolysed vegetable protein), don't eat it be it could be gluten. Lots of GI ppl react to soy as well, in varying amounts, so that could be the culprit with non-gluten HP's.

Dairy - I've been experimenting lately with sheep and goat dairy. I bring this up bc some ppl here mention reacting to cheese, etc (weight gain and such). I get reactions like this from cow dairy, but not from sheep or goat. Now I don't seem to have an insulin problem, so that could be why, but if you do want to have some dairy now and then it may be worth testing yourself with sheep/goat stuff. I noticed that I don't bloat or get cravings, or become hungry after I eat it (or want to eat beyond my normal appetite), or retain water. Yup, I'm excited! With cow cheese, I'd get a block and eat it in a day or two bc I'd find ways to eat it with everything; with sheep cheese, I actually forget it's in the fridge. This is huge for me. I used to melt cheese on anything I could heat up. I found goat creme fraiche at the farmer's market this morning, and it will go well with my old '70's Julia Child cookbook - lotsa meat-with-fat-sauce recipes.

I wonder if this could be due to historical usage - perhaps sheep/goats were easier for HG's who became pastoralists to round up and 'use'? I'd love to know what animals were 'husbanded' first in various regions. Baby goats/sheep that had wandered from the herd would be fairly simple to snatch up and carry back to camp. I think. (Zog had a little lamb?)
Charles, I think we need a "Wild speculations about our wild ancestors" section in the new forum.

RE: Zero-Carb/Meat and Water - hpseids - Yesterday 03:22 PM

This is probably obvious but- zerocarbforum.com Differentiates itself from this forum but is still clear and easy to remember.

Cynthia, awesome job!! I told you you're badass! I'm ashamed of my sloth-ness now...

waywardsister- great points about dairy. I hate such a love-hate relationship with it, as in I love it and it...well, maybe it doesn't hate me but it doesn't love me quite so much. I laughed when you talked about buying a block of cheese and melting it on EVERYTHING until it was gone two days later...umm, me too. Including melting it on an empty plate. DEEElish! So tell me more about your sheep/goat dairy experiments...do you mostly use goat cheese and that creme fraiche? Any other ideas...any that I could find at a regular supermarket? Mmmmm...cheese...last time I was at the store (with no cheese left at home) I bought ONE pack of 10 slices of sharp cheddar to try to instill...well, force...some portion control. So sad.

My update is that I'm cutting back to weighing only once a week (maybe twice, haven't decided). So I haven't weighed since Thursday (I record it in a little notebook). I'm excited to see a more accurate trend rather than day to day fluctuations. I want these 20ish lbs OFF. They're just getting annoying now.

I'll keep thinking about forum titles, Charles. Thanks for asking for our input!

RE: Zero-Carb/Meat and Water - susannevea - Yesterday 04:03 PM

Ha ha!! You guys are hilarious. I can't think of anything you all haven't.

I also want to address the issue of a FAQ page. I don't think a FAQ page would keep anyone from jumping into the forum when they feel ready. I know that many times I would love to give people something to read that explains our WOE more coherently than I can, but there really isn't one. Although I love GCBC, not everyone can get into such a heavy read. I do have the link to the article written by him "What if it's all been a big fat lie?" and I have given that to a few people, but I would love to have a FAQ page to recommend. Most people won't read 412 pages of this forum and even those that will feel obliged to read through all of it, spending days to find answers or explanations that would take less than an hour if it were all put together in a FAQ format. Hell, I think it would help a lot of us with remembering some of the scientific terms and processes that don't stick with us. A glossary page would be fabulous as well. It would, of course, be a work in progress, but I would love a framework around which to form my responses and a place to re-visit the basics when I forget something.

So, my vote is YES (please). I'm sure there are some of you out there who could help Charles with it as well. Even coming up with the questions and terms to include would allow him to search this forum and copy and paste some of his previous answers, cutting down on the work.

What do you all think?

I agree about the 'zeroing in' part - I wonder if using the word health will make it sound too general?

but then, losing weight down to proper proportions, gaining some lean muscle mass and running marathons is pretty freakin' healthy.

OK, yeah, you've convinced me.

**RE: Zero-Carb/Meat and Water - Charles - Yesterday 07:52 PM**

Okay, we're all set. Thanks everyone for your help in coming up with the name of the new forum. I will provide additional information in the coming week as it becomes available. Just keep posting and keep living for now and soon we'll be outta' here!

**Intro and questions - dixonge - Yesterday 08:28 PM**

ok, I know the new forum is coming, but I've got comments and questions NOW.... 😊

Intro: I did Atkins years ago, actually got down under 200 for the first time in ages. Then we slowly but surely drifted away. At the beginning of 2008 I was up to 240 and I went back on low-carb with zero exercise as my new diet plan. Lost 20 pounds, plateaued, slowly began 'cheating' and floating back up again. But I read GCBC and found Charles' discussion of it. Took note of the zero carb idea but just barely.
More recently started the infamous 'Couch to 5K' running program. Came back here looking for some advice on running and carbs, finally started reading some of the zero-carb posts. It is clicking for me so far.

Now my fridge is full of steaks, brisket and burger patties and the wife is hoping both of us can break through our weight stasis.

That is all for now...

---

**RE: Zero-Carb/Meat and Water - suzanneeya - Today 02:52 AM**

I workout everyday and love it, it gets me going for the day and helps with my mental health. I only do 30 minutes cardio and 30 minute weight and stretching. Everyone seems to have their own plan, a lot of people only workout once or twice a week. You need to find out what works for you and your lifestyle.

Do not forget chicken, cold chicken is so yummy too.

---

**RE: Zero-Carb/Meat and Water - hpseids - Today 05:38 AM**

Zeroinginonhealth is great!!

Just checkin in...weighed in this morning. I'm thinking I'll weigh twice a week, Mondays and Fridays, to see if weekend eating (which isn't bad or worse, just a little different) changes anything. I ate very little yesterday because I just wasn't hungry and my weight this morning was only .2 lbs. lower than the lowest weight, from Thursday. It's ok though because I woke up knowing it would be higher than it is...I just had that feeling. Maybe too much cheese Friday...? I just felt kinda bloated (sorry, TMI) which is really weird for this WOE. Anyway, I know it'll pass...I did, however, wake up with lots of energy after less sleep than usual!

I'll let y'all know Friday if it's gone down, for anyone who's interested...maybe I'm not eating enough but I'm barely hungry (which is bizarre for me lol)...I'm sure my appetite will regulate itself once I'm more used to it...I'm only ~2 weeks in. Of course other factors, cravings, energy, heartburn (no more!) and others are really important, primary concerns...but I'm not gonna lie and say the weight loss part isn't important too! It'll be nice once I lose what I want to lose and am maintaining and don't have to think about it anymore 😞

I agree with Suzanne- sometimes munching on a cold roasted chicken leg or some wings for breakfast is all I'm in the mood for. It IS yummy!

Exam tomorrow...off to the lab. Happy Monday! 😊

---

**RE: Zero-Carb/Meat and Water - southern-dahlin - Today 06:25 AM**

Morning all........all the ideas are grand and I really like the 2 below.

insulinbusters.com

and zeroinginonhealth
RE: Zero-Carb/Meat and Water - nyteez - Today 06:58 AM

Zeroinginonhealth seems too general. I found Jimmy's forum because I was wanting to know about low carb. I may not have found or paid attention to zeroinginonhealth site.

I like zerocarbage. I think carbs or insulin should be part of it.

RE: Zero-Carb/Meat and Water - MAC - Today 07:08 AM

nyteez Wrote:

I can see both sides. How about (although long), zeroinginonhealthwithzerocarbs or zeroarbyourwaytohealth or zeroarbtotohealth.

Charles wants to emphasize the health and/or the insulin control.

RE: Zero-Carb/Meat and Water - LindaSue - Today 07:16 AM

I cast my vote for "zerocarbage.com". It's short and to the point. Also easy to remember.

RE: Zero-Carb/Meat and Water - Sambezious - Today 07:19 AM

Wow! Major changes are happening around here! I guess I need to drop by more often and see what everyone is up to. Charles, I wish you much luck with the new forum! You are a class act and one intelligent person! I've enjoyed reading your posts, so, if you don't mind, I'm gonna join up with your forum too! I don't follow a *true* zero carb diet (although I do try and stay below 10 carbs per day), but I do enjoy reading the posts and educating myself on all aspects of low carb'ing.

Thanks for all the wisdom you've shared over the last couple of months that I have been a member here. I'm sure the new forum will be a big hit!

Take care,

Sam

Cheese is very bloating for me as well as constipating, it's very salty, which makes me thirsty, which makes me drink more water, which causes more bloating, which weighs more...... etc.... Also, didn't you say something about having had alcohol? Unfortunately, it seems to stall me more than anything, even than coffee. I don't think it's as obvious in people who have more weight to lose, but if you're only trying to lose a few, alcohol could be the culprit..... I find that my stalls last around 5 days or so after alcohol. Ugh, and I LOVE my Merlot!

I think maybe Charles already made his decision on the website name. He said something like "we're all set to go" a few pages back... However, how about

zerocarbsforhealth.com
nocarbsforhealth.com
zerocarbhealth.com

Maybe someone said these, but I've lost track.....

My hunch is that using insulin in the name will most likely be understood to be for diabetics. Obviously not true, but we've got to get people to the site before they will realize that.

Also, Charles, maybe for ease of construction of a FAQ page it could just be a page that is constantly added to, one question at a time, as they come up. As a question is asked in the forum and you answer it, just copy it to that page in some sort of relevant order and the page will grow slowly. A note at the top would point this out. Eventually the page would be complete and you wouldn't have any extra work to do. The note could then be removed.

On the same note, THANK YOU so very much for all the work you do here!! I know that you have no intent to make money from all this as your interests lie strictly in educating people about what you've learned. That is so incredibly admirable and selfless and goes against capitalism in every way!! You are the ultimate volunteer!! Regardless, I hope that someday you are able to make money from it anyways.

RE: Zero-Carb/Meat and Water - cbnebraska - Today 07:49 AM

Okay, my question is

zero carb age or

zero carbage

I guess it doesn't matter, but carbage is a made up word that will confuse most people. I would never use
it in front of people who eat carbs and it is insulting to equate their food to garbage......... even though it is!!!

Just the possibility of having it confused is reason to think about it.

---

**RE: Zero-Carb/Meat and Water - nyteez - Today 07:49 AM**

Quote:
Also, Charles, maybe for ease of construction of a FAQ page it could just be a page that is constantly added to, one question at a time, as they come up. As a question is asked in the forum and you answer it, just copy it to that page in some sort of relevant order and the page will grow slowly. A note at the top would point this out. Eventually the page would be complete and you wouldn't have any extra work to do. The note could then be removed.

A faq page would be kinda hard and would eventually be 400 pages long because there are so many questions. There is no easy way to put information in any kind of order in a forum thread. I think the easiest thing would be to have a Sticky explaining to people how to use the "search" feature.

---

**RE: Zero-Carb/Meat and Water - ANOVA - Today 08:26 AM**

If I were trying to use a search engine to find out about zero or no carb diet forums, I would probable type in "zero carb diet forums". Would using some or all of these words in the domain name push us to the top of a search or not. I'm not privvey to how search engines rate a domain. Who are our web gurus?

zero-carb-age is catchy.

If this thing is going to pay for itself (or maybe be profitable) people need to find it.

John

BTW: CBNEBRASKA;
Awesome ride. Hope to be able to post my own exploits soon.

---

**RE: Zero-Carb/Meat and Water - lynn hopes - Today 08:37 AM**

Yes I vote for zero carbage too. Zeroing in on health is too long and there are spelling issues with it also. We don't want people missing out on the site because they can't figure out the domain. A shorter, snappier domain name seems better.

---

**RE: Intro and questions - Charles - Today 08:38 AM**

dixonge Wrote:
ok, I know the new forum is coming, but I've got comments and questions NOW....

Okay, but I didn't see any questions.....

I will say that your experience is all too common for the modern low-carb plans. I will continue to repeat
this until everyone gets it. Zero-carb was the first thing and low-carb came along later. Blake Donaldson was the first doctor and he even consulted with Stefansson. So why didn't he go zero-carb?

He treated obese people and he didn't think they would take to the diet so he studied several groups of Inuit and found a district who already were influenced by whites. They had a minimal amount of vegetables in their diet and the seasonal fruit. Donaldson seized upon this and prescribed this regimen to his patients.

What's so wrong with this?

Because he was only concerned with weight loss. Insulin had not been discovered to be the menace that it is today because no one understood fat metabolism and that insulin is the regulator of fat metabolism. Insulin itself was only discovered in 1920. It took until Yalow and Berson came along in 1965 and proved its role. The won the Nobel! Dennis McGarry came along in the 1990s and was able to trace the train of progression from hyperinsulinemia to Type 2 diabetes and obesity.

Anything that increases insulin, induces insulin resistance, and induces the pancreas to compensate by secreting still more insulin, which will lead to an excess accumulation of body fat and make a person prone to the metabolic syndrome and all the diseases of civilization. To reverse it, one must decrease insulin and keep it that way.

I just bought Gary Taubes' book in paperback today and he wrote a new "after word" and in it, he even acknowledges that he should have stressed insulin more than he did and the deleterious aspect it has on all health, not just weight loss.

None of the low-carb experts seem to get this today. You must!

Your Atkins diet didn't work then because it never controlled your insulin and thus it didn't control your hunger. Write this down and remember it forever:

Charles Wrote:
No diet will work for anything or anyone if it does not control your insulin!

We need to "zero in" on this concept (Thanks, Con) and digest it and tell it to everyone who will listen.

Zero-carb will work for anyone if they are able to overcome their upbringing and adapt their tastes to the types of foods that our bodies prefer.

As The Bear said, if you are hungry, you are eating carbohydrates, plain and simple. There are no good carbohydrates, only bad. Once your adaptation to bad fuel has run its course, the only thing that can be done to control it is to eliminate the carbohydrates.

Sorry to be so blunt, but that's just how it is!

Regards,

Charles

RE: Zero-Carb/Meat and Water - lynnhopes - Today 08:41 AM

I wanted to ask you ZC's a question while I have you here also:
I know Atkins has the carb ladder where he puts the least damaging carbs in order. I am wondering what you ZC's would put if you designed a carb ladder. Obviously white flour and sugar and sweeteners are out. But would it be meat, then eggs, then cheese, then cream, then coffee/tea, then alcohol, then nuts, then veggies? What order would you put these in?

Opinions please. I am trying out different meats at the moment as I was veggie for quite a while so lots of meat I have never eaten and I am trying to train my palate. In the meantime I am always eager to learn about ZC.

Thanks!

RE: Zero-Carb/Meat and Water - Charles - Today 08:49 AM

Sorry, guys and gals, I was ready to go forward last night and I went with the "zeroing in" because I will use that as a theme throughout the new forum. There will be some aspect of FAQ that I can use because of that name so I think we can find a nice compromise. I too liked the zero-crbagge name, but something about the other touched me on a different level. All of our so-called experts are focused on carbs when they should be concerned about insulin which affects not only weight, but also health and we're first and foremost about being healthy. This is why the first one stuck, followed by insulinbusters, and then followed by zero-carbage.

I will add these other terms in the description of the site which will make it easy for search engines to find the forum.

Regards,

Charles

Thanks!

You have to look at this anthropologically.

1. Meat as it provides all necessary nutrients.
2. Eggs
3. root vegetables
4. Nuts
5. Seasonal fruits

The rest are out. Husbandry of animals (dairy, cheese) came along a lot later than feasting on carcasses or killing woolly mammoths. Plus genetically asian populations are lactose intolerant.

Scarlet
Honestly from my experience my body cannot tell the difference between veggies,nuts,cake.

I would rate them as
(1)flour sugah veggies nuts....worst
(2)eggs,cheese
(3)coffee,cream

Now this is how my body honestly seems to respond to them....I don't drink alcohol so i cannot answer that one.

Charles i got the insulin quote in my siggy.....hehe

I also want to note that when I did well on the Atkins Fat fast.....i used only lower carb items like cream cheese.
If I used nuts or peanut buttah even in small amounts I became a carb-o-holic on a binge!

**RE: Zero-Carb/Meat and Water - caroline - Today 09:01 AM**

I have found exact same thing with peanut butter. It makes me physically sick along with almonds. This is since I am on this WOE.

Yes what is in organ meats that you miss if you only eat muscle meat and not other parts of the animal such as brains, etc? Now if it is Vitamin A which as far as I can tell is absent from muscle that would mean that one would want to eat butter or take cod liver oil for the Vitamin A. But vitamin A is stored as I understand it and it takes a long time to deplete oneself of it if I understand things correctly. And is this another of those vitamins like C that only gets depleted because you are eating carbs?

I'm not sure about depletion, but since it does get stored I am not taking the cod liver oil all the time. After I get through a bottle I'll wait a few weeks before starting a new one. Maybe a little more steady in
the winter for the Vitamin D due to lack of sun. Seems to me that all that is missing from the muscle meats is the Vit A, D, and E possibly, though I am not 100% sure on E. I know it is in eggs, but I am not currently eating them.

I was just about to e-mail you that question. Do I go and purchase the other name or can I do it through the site?

**RE: Zero-Carb/Meat and Water - Charles - Today 09:43 AM**

I'm not so sure about the nutrients in muscle meats. I know what the USDA site says, but they only list the nutrients per serving so if there is a small amount of these other nutrients in the meat, they don't register. However, I am firmly convinced that meat has all these nutrients in the proper amounts so if there is not much present in the fattier portions, we must not need so much of it. Since I have no deficiencies, I would worry about over-supplementation of these nutrients which are not abundant in meat such as Vitamin C and A. Any of you who lift weights and make muscles should know that you obviously have vitamin A in good supply!

Regards,

Charles

**RE: Zero-Carb/Meat and Water - Charles - Today 09:53 AM**

Okay, gang. Both names will work for the new forum. You can type zerocarbage.com or zeroinginonhealth.com. I'm moving right along...

He DOES make the statement that meat provides all the necessary nutrients except Vitamin C, but in another thread, the way he was quoted implies that he wasn't referring to muscle meat only.

Here is the exact quote by Tabues from Jimmy's Blog:

“It does seem a bit extreme going to consume meat and water only, and as Dr. Carlson points out, muscle meat might not be sufficient to provide all the vitamins needed, if that's all that’s being consumed. So, yes, why limit it to store bought meat and nothing else, other than to set up a hypothetical situation for discussion? Finally, one minor point: even a diet of meat and water is not zero carb. There will be a few percent carbohydrates from glycogen stored in the muscle.”

Me, I don't mind the Cod Liver Oil at all, I just take a spoonful before one meal a day most days. I figure, why risk it. It's not like I'm forcing myself to choke down some broccoli 😞

**RE: Zero-Carb/Meat and Water - [cbnebraska](#) - Today 10:21 AM**

Do those of you who supplement with some vitamin or another actually notice any kind of difference in your body when you do so? I just can't help but believe that our bodies would tell us if we needed something. They are so good at speaking to us. If we are feeling great, staying healthy, losing weight, showing no issues whatsoever, why should we assume we're missing something? I would be nervous taking something "just in case" when I'm so healthy...

I have noticed something very peculiar recently and I'm wondering if I'm crazy.... I have noticed that the reflex that makes my heart quicken and my hair follicles stand on end has been extremely heightened. I know this sounds absurd, but I just notice that I am much quicker to act when I need to. Examples would be as simple as something slipping out of my hands that could smash my toes or a loud noise. Do any of you, by chance, notice anything like this? I was just wondering if maybe my body is more "on" than it used to be.

One would think so. Vitamin A takes a long time per Regina. I noticed my teeth haven't fallen out eating mainly pretty close to zero carb this past year. 😐 How long did it take to get scurvy? Not that long if I remember right and your teeth start to fall out if you get scurvy. I think the thing I would like to know more about is this depletion of vitamins eating carbs. How does that work? How fast? etc.

Well, not long, according to Taubes. On that same page that Dave quoted, 321, it says that scientists were able to induce pellagra, scruvy and all of them very quickly when they fed refined carbohydrate diets to animals. It seems that if your diet is only refined carbs such as rice, you can break out with this stuff pretty quickly. I've never heard of an exclusive meat-eater getting scurvy.

Stefansson gave the three explorers (who ate carbs instead of the meat) in his crew fresh meat. It didn't specify that it was an organ meat which cured the scurvy; just some fresh muscle meat. That's enough for me.

Regards,

Charles
On a different forum a member sent the Bear a few question because of his training and some carbs he
need's; he gave me his o.k. to print both questions and answers on this forum.

Here's "the Bear"'s reply:

1 - If muscle glycogen doesn't vary with exercise, why do we "hit the wall"?
That is the liver, which on carbs fills with glycogen while removing it from the blood. the bloating then
interferes with blood transit and slows furnishing fat on demand. After ketoadaptation, fat moves freely
and the liver does not act as a first line of action (sweeper) to remove the glucose from the blood, first as
glycogen, and then converting it into fatty acids..

- A long adaptation period is needed to zero carb adaptation. What will happen if, after adaptation it
happens to eat some carb? Shall we wait for that long adaptation period after just one carb meal?
Takes from two to four weeks only to keto-adapt. Eating carbs will interfere with adaptation for the
simple reason that glucose is so toxic it will kill you very quickly (diabetic coma) if not removed from
the blood- thus the adaptation is quenched, insulin floods out and the carbs stored as fat... and you must
start over.

2 - In a 2 minutes high intensity effort, after ATP depletion (ATP stoks endure just some 10 seconds)
glycogen is needed to provide energy via the chain: glycogen - glucose - pyruvic acid - lactic acid
This is what we know. It that chain wrong? Is there a study that proves it wrong?
It does not happen. ONLY ATP provides the energy for muscular contractions, and is renewed by an
enzymatic process involving n-carnityl-FFA complex. You are completely wrong about the ATP supply.
What you have partially described (pyruvic/Krebs) is part of the conversion process for making fat from
glucose.

3 - You say that you never get muscle soreness, but later you say that if you train hard you get doms.
This is a contraddiction. What about a serious athlete who trains hard almost everyday? I agree that
one can train moderately with zero carb. But it's impossible to have big training volume with zero carb
(recovery time will be too long)
Quite simple- if you train every day you will become weaker and smaller. NO 'serious' athlete trains
more than two or three days/week. Your body does NOT grow from exercise, which actually damages it.
Working too heavy or for too long causes enough damage to make you sore, the proper level does not.
You only grow or improve in strength and fitness while resting and recovering from exercise.

4 - I agree with you that both muscle fibre type work on ATP-ADP, that is produced from fat, but when
you have to resinthesitze ATP quickly and in oxygen debt (anaerobically) glucose is needed to provide
the required energy. This is chemistry. I agre that ADT-ATPi's done with FFA (if there is enough
oxygen). Where is the required energy taken, if there's not enough oxygen to oxidize FFA? (i.e.
working at an anaerobical regime)
No you are wrong again, as you have been from your first paragraph.

5 - You say you are a very active person, ok. But there's dofference between dancing and training just
for hobby, or training hard everyday (someone twice a day) for racing and possibly get some good
results. For instance I am a cyclist and my long rides are 4-5 hours at medium-high intensity. Do you see
what I mean?
I see that you have nothing to contribute, and like to make a lot of 'noise' about bullshit. You haven't a
clue as to my level of activity OR my fitness. Only fools train twice a day. Overtraining is not worthy of braggadocio.

6 - Again, glycogen is not the fuel, it's the energy source to produce ATP from FFA via lactic acid formation.
Wrong.

- You say that glycogen only serves as a storage to regulate blood sugar levels. So, what's the purpose of sugar in blood, is we don't use it?
SOME tissues do use it- tendons, cartilage and dense nervous tissues for instance.
On a zero carb regime, we use a very small amount of glucose- <5gm/day in the presence of ketone bodies, a fat metabolite which substitutes for glucose and provides the major energy source for the few tissues unable to utilise fat. The normal blood level is ~100 mg/dl, or a total in an average person of less than 5 gms. Glucose is VERY toxic, only insulin is somewhat more damaging- but won't kill you quite so rapidly as excess blood glucose.

Take my advice, don't believe what you hear about diet and biomechanics- it is all rubbish.

If you like meat and love fat, and can eat it rare and without salt, and want to eat the all meat way, and are happy doing that, then go for it. If not- then stay where you are.

I know it is the right way, but I really have no interest in arguing with anyone who can't accept what I have to say, and trust me, after 50 years eating this regime, there is no question whatsoever about what is real and what is nonsense. Science? All lies- told for money.

I am including my simple rules. Be careful and don't obsess over the food- if you can't eat it with pleasure and without thinking much about it you should stay where you are dietary wise.
--

Cheers.

If we are feeling great, staying healthy, losing weight, showing no issues whatsoever, why should we assume we're missing something? I would be nervous taking something "just in case" when I'm so healthy...

I've been supplementing about once a week with a multivitamin. I tried going without one, but I was still getting muscle cramps in the middle of the night. Once a week seems enough to keep them at bay. Once I've been on zero carb for a few months I'll try and drop them all together.
I have noticed in the last week or so that I am bruising A LOT. I've always bruised easily, but I am covered now! Just from the slightest bump...it looks completely gross. Anyone else have that problem?

RE: Zero-Carb/Meat and Water - Charles - Today 11:26 AM
That's the Bear. One of these days I'm going to develop such moxy and you people aren't going to be able to deal with me. Don't obsess over this stuff. Eat fatty meat, drink water and get over it! 😄

I would try to cut the salt. That completely eliminated my leg cramps.

Charles

Okay, THIS IS IMPORTANT:

I just got off the phone with Jimmy and I have to tell you all that I'm not so sure I will be able to move the things on this thread. I'm trying to work with Jimmy's company to get a backup of this forum so I can migrate the threads but I'm not sure they're willing to do it.

I don't know conclusively yet, but I want to warn you that your journals and even this humongous thread will be history on October 31st unless something can be worked out.

MAC had given us information on priting the thread out to PDF and things like that, but I don't know of an easy way to get that stuff to the new forum without a backup of this one.

If anyone has ideas, now is the time to share them!

Regards,

Charles

The PRIMOPDF tool really only works well for single pages of HTML as it just captures a print page to PDF. Pages have to be done one at a time to the best of my knowledge. A real pain.

Moxygoshthisitchesherpes? Just kidding, I know what moxy means. LOL!!

RE: Zero-Carb/Meat and Water - nyteez - Today 11:46 AM

Aren't they removing these posts & journals anyway? Why not just give you the backup, takes 30 seconds?

We will think of something! I would hate to lose all this info.

RE: Zero-Carb/Meat and Water - snailspace - Today 11:51 AM

After Jimmy's blog over all the fuss about zero carb and pregnancy, and his announcement that you are going to have your own zero carb forum, I had to check in and see what's up lately. It's been a long time since I've peeked into this particular forum, and I was interested in reading more about zero carb, so I started looking into this thread. Holy cow, it's long! I spent a lot of time just skimming, getting highlights, with a bit of more in-depth reading.

What really piqued my interest are all the first-hand experiences with vlc here, and the positive effects that it's had on all of you. Not only weight loss, but improvements in your overall health. Stunning!

You might just find me hopping on board, too. I've had moderate success with Atkins, but have hit a long-term stall, just hovering at the same weight for months on end, not losing at all. If this will get the losses started again, then I'm all for trying it. I'll watch for the new forum, and catch you over there.

As far as organ meats go, I eat them because I like them, not for any special nutritional value. Right now I have beef liver in the fridge, ready to pan fry in a bit of coconut oil. Since by husband is not a liver enthusiast, he'll get something else.

RE: Zero-Carb/Meat and Water - southern-dahlin - Today 11:56 AM

Chiara
I bruise easily on Low carb plans also. I have heard everything from ketogenic diets thin the blood, to vitamins causing it.
Just to ease your own worries you could have a blood workup done. Maybe someone else will read this and respond.

We will think of something! I would hate to lose all this info.

Just a suggestion - if you have a journal you might want to go there and then click on "View a Printable Version" in the lower left-hand corner. Then do a 'save-as' to save that page to your hard drive. I've already done that with this thread, just in case.

LOL! Me too, I'm saving this thread in Word.

THE END
