I took the plunge today and finally gave up coffee, tea, eggs and cheese. I'd been moving in this direction and want to see if this WOE will help with some of my persistent problems: hungry two hours after meals, needing to eat in the middle of the night to get back to sleep, low energy and too high percentage of body fat.

I didn't think I'd need to get this extreme but after reading Charles' post "The Thin Man's Diabetes" from Men's Health and Liz Pavek's article on reactive hypoglycemia (see below), I feel convinced that I need to do something to regain my metabolic health.

This first day was tougher than I thought but I made it. I was pretty lethargic for much of the day but I am very excited that I made it through a second night without eating. The hardest thing was giving up coffee. Here's hoping that this will get easier over time.

Reactive Hypoglycemia
by Liz Pavek

Reactive hypoglycemia is usually the first sign that an individual has reached a dietary point of no return. It is actually the earliest stage of Type II diabetes, but diabetes can be held at bay by hypoglycemics through careful attention to the diet; so far, the only treatment that is available for hypoglycemia.

But there is nothing that will cure RHG once it gets established. The only way to deal with it is to put yourself on a STRICT low-carbohydrate diet, and STAY on it. As Dr. Starlanyl states in her article, this condition will lead to Type II diabetes if it is not carefully managed.

Without carbohydrates to stimulate more insulin, the blood sugar will normalize very soon after this change in the diet is made. If the change continues and the sufferer is meticulous in his avoidance of starchy and sugary foods, the fat cells will begin to respond to glucagon in the blood, and will start to release the stored fat, which is either turned back into glucose and burned for energy or excreted.

Dr. Robert C. Atkins, M.D. and others have all clearly explained the sugar/insulin/fat metabolic process and thousands of people have lost tons of fat by following their prescribed programs, all of which work, to a greater or lesser degree. The Atkins Diet is a very good one for RHG. Dr. R. Paul St. Amand, M.D., Assistant Clinical Professor of Medicine Endocrinology --Harbor-UCLA, says, in a nutshell: "Only a perfect diet will control hypoglycemia." Fasting from carbohydrate foods is a good way to get control of the oversupply of insulin.

Without the carbohydrates that would normally be in the diet, the receptor sites gradually begin to reappear, the insulin is there to take the sugar into the cell for energy. Et voila! The sufferer is suddenly carrying around his very own 24-hour, open-all-night lunch pail. Once the switchover to the combustion of stored body fat is complete, the body will cruise easily and the "feed me!" signals will disappear. One nice thing about this fast is the fact that if it is carefully adhered to, the symptoms will disappear, and the blood sugar will move into the normal range (80-120mg/dl). The more strictly the sufferer follows the fast, the more relief he will get. The individual will immediately know if he has taken in insulin-stimulating foods because he will again feel hunger pangs, something that disappears completely when the body is utilizing its fat stores. Without insulin, the body has no "feed me!" signal.

In the first few days, the receptors on the muscle cells will begin to reappear, slowly at first, but soon in large numbers. The individual might feel some fatigue or lethargy at this time. This is normal. The body
is trying to force itself to switch from consumed sugar to its own sugar, which will take a couple of days. Like your car, when the gas tank is empty, the car chugs and coughs and shuts down until you refill the tank. The same thing happens with your body. When its "sugar" tank is emptied, it struggles for several hours searching for a new source of energy. During this period, glucagon will be released once again and the switchover will be complete.

Soon, all the receptors are restored and over a period of time, if the individual is diligent, all the stored fat will be consumed, and the body will shift into a more normal sugar metabolism. When the blood sugar normalizes, energy is restored, and body temperature is back to normal.

This does not mean that the sufferer can go back to his high-carbohydrate diet, however. His sugar metabolism is broken, and will never be fixed.

This return to "normal" is only because of the stringent diet the sufferer has chosen for himself. But this is a good thing. Carbohydrates are not a part of the natural, prehistoric diet of humans, and they are very difficult for the body to handle because they demand so much from the pancreas and other glands. By removing these carbs from the daily diet and making the change permanent, the sufferer relieves that burdensome metabolic stress and is once again able to enjoy life without the worry of constantly gaining fat no matter how small his meals and portions, suffering from repeated episodes, or dealing with a somnolent metabolism and related glandular insufficiencies.

When the fat is consumed, the sufferer can return to a more normal (but still low-carb) diet, such as the Atkins diet. This process can take days, weeks, or even months, depending on the fat blanket and the amount of insulin stored, but if the sufferer is diligent, the fat will come off and the blood sugar will normalize.

For hypoglycemics, the fat loss is almost secondary to the relief from the terrifying and debilitating symptoms of this disorder. Those sufferers I have talked to all say that it is the ability to sleep through the night without frightening episodes and to be warm and alert at all times that keeps them dedicated.

The fat loss is a wonderful "side effect," but is not the primary reason for the fast. Check your blood sugar once or twice daily with a glucometer to get an idea of what is going on. For hypoglycemics, it will be highest in the morning and lowest in the evening. When it gets down around 90 mg/dl and stays there, you can call your fast a success.

Caveats:

1. Even a small sugar/starch carbohydrate feeding during this fast will shut down the process for about 24 hours and cause the carbs to be stored as fat once more. Only diligent attention to the diet will return the body to the fat-utilization stage.

2. The older you are (especially if you are a woman) the harder this will be to accomplish. Post-menopausal women have a tendency to thickened middles anyway, as a result of the secondary estrogen secretor role of their abdominal fat. If you fast for any length of time and not only don't lose, but continue to gain, the chances are very good that more than your sugar metabolism is at fault. If this happens, get an adrenal and thyroid panel from your doctor. Sometimes hidden problems like hypothyroid or cortisol disturbances can be behind your metabolic problems. Don't hesitate to ask for these tests, and follow your doctor's instructions.

3. The diet must be very strictly adhered to. Meats, poultry, fish, fats, cream, butter, lard, tallow, eggs, and cheese are the only free foods on this control diet (no vegetable oils or shortenings for reasons that are explained elsewhere on this site). Non-starchy vegetables like broccoli and cauliflower may be eaten in small amounts, as well as green beans, cabbage, and asparagus. Eat sparingly, if you wish, but don't starve. Fats are very satisfying if one is not consuming carbohydrates, so don't refrain because you are afraid you will be hungry all the time. Have no fear: This is a very comfortable time as long as no carbs are consumed. And do not be afraid of animal fats in your diet. Rather than being the heart/blood pressure villains they are claimed to be, they are nutrition-dense and highly efficient as sources of energy, besides being like "Roto-Rooters" in your arteries. Steak and butter, if you wish. Fish and cream. Meat and Cheese. Once the normal blood-sugar level is reached, you should be able to add small amounts of other foods (vegetables and small servings of fruits) back into your diet.

Many people won't even attempt this regimen because it is so restrictive. I've had people tell me "But, I can't give up my bread!" "What will I eat??" "I hate fat!" "I'll just die if I don't have my cinnamon roll
every morning." Fine. Nobody is forcing anyone to eat the way I recommend. If their cinnamon rolls mean more to them than life, they should go for it. These people will probably have Type II in another couple of years. They will be the ones who will probably die in their mid-seventies, if not before. But there are some who want to live without needles and Glucophage. They are the ones who will get serious about removing the insulin-loaded fat and untangling the metabolic knot.

4. As long as you have stored insulin in your fat cells, you will continue to have hypoglycemia. The stored insulin spells "no room" in the blood to newly secreted insulin, which means new fat cells must be stimulated for more insulin and fat, and so on ad infinitum. Only by not stimulating any new insulin can the individual begin to use up the fat/insulin stores. I cannot emphasize enough how very important it is not to cheat on this diet. If you want to regain your health, you must, in the words of Clint Eastwood in The Outlaw Josey Wales, "...get plumb, mad-dog mean!" Get mean with yourself, and you will fool your body into using up its store of fat. Stay with it and don't let anyone distract you from your goal, because, for reactive hypoglycemics, this is a matter of life and death.

5. This condition will never go away. It is yours forever, probably as a result of a family history of defective sugar-metabolism genes, so always keep it in mind. (I even went so far as to get a medic-alert bracelet to remind myself when I am tempted that what I have is lifelong, as well as potentially life-threatening.)

R HG is actually a form of diabetes, and you are stuck with it. So stay with your diet, and avoid having to take insulin, which is what will happen if you develop Type II diabetes. You will get your hypoglycemia under control, but it will always lurk under the surface, waiting for you to slip up. If you don't like the adrenalin flashes and the other symptoms, this is what you have to do to get control of them.

6. Do not fail to eat fat with this diet. Three tablespoons of butter or so a day (more won't hurt), whipping cream in your coffee, or coconut oil two or three times a day is the bare minimum. Without it, you might even get ill. You must have some form of saturated fat on any strict fast or high-protein diet. Saturated fats are NOT fattening, no matter what anybody tells you to the contrary. They do not stimulate the production of insulin, which must occur in order for calories to be stored as fat. They are, however, extremely nutritious, biochemically essential, and your body needs more saturated fats than almost any other nutrient, except perhaps water and protein. Do not be afraid of butter, steak fat, whipping cream, cheese, lard, cream cheese, or eggs while doing this diet. Butter and coconut oil are very good forms to use, since they are just about the only foods you can be certain are absolutely carb-free.

RE: Zero Carb / Meat and Water - Charles - 05-07-2008 07:52 PM

Good luck, lady! Make sure to eat plenty of fat so you can gain some energy if you're still feeling bad after two or three days. It's kind of like Induction all over again. Hang in there and you'll feel right as rain shortly!

Best regards,

Charles

RE: Zero Carb / Meat and Water - weirdstuffinmydesk - 05-07-2008 11:27 PM

why no eggs or cheese? most of the cheeses I buy have zero carbs listed. I am still learning about this so bear with me. 😊
So you are basically eating only meat (any seafood?) and water all day?
RE: Zero Carb / Meat and Water - Mary - 05-08-2008 11:35 AM

You go girl. I have been looking for your post.

Mary

RE: Zero Carb / Meat and Water - Lauren - 05-08-2008 02:26 PM

Thanks Charles. I felt much better this morning and my hunger was in check today. The most amazing thing for me is that last night was the third in a row without waking up hungry. I feel very motivated to keep going.

RE: Zero Carb / Meat and Water - Lauren - 05-08-2008 02:35 PM

weirdstuff,

I am trying this because I wasn't getting anywhere eating a more varied LC diet. I really want to keep it simple to see if I can tackle some of my persistent problems. The Liz Pavek quote below got me motivated. That and remembering all of Charles' posts on his success with the all meat and water diet. He had the most success after giving up eggs and cheese. I just want to give myself the best possible chance.

"Soon, all the receptors are restored and over a period of time, if the individual is diligent, all the stored fat will be consumed, and the body will shift into a more normal sugar metabolism. When the blood sugar normalizes, energy is restored, and body temperature is back to normal."

RE: Zero Carb / Meat and Water - Charles - 05-08-2008 05:50 PM

Cheese and eggs are a problem when someone has really bad hyperinsulinemia. Hyper insulin secretion will keep the body constantly hungry and keep fatty acids from being mobilized which leads to fat storage. Keeping the diet clean in this manner should slow the insulin release and allow more fat to be mobilized. For Lauren, it appears to be working if she's sleeping longer and not waking up so hungry.

RE: Zero Carb / Meat and Water - weirdstuffinmydesk - 05-08-2008 11:02 PM

ahhh okay that makes sense. I may go this route eventually. Thanks for sharing Lauren and Charles!

RE: Zero Carb / Meat and Water - Charles - 05-09-2008 09:42 AM

Looking back, I don't know that I really explained. We humans are hyperphagic (eat more than we need) during the day and hypophagic at night (where we live off the excess fatty acids consumed during the day). Hyperglycemia doesn't let you rest, in that insulin levels do not recede low enough between meals to let your body mobilize stored fat.

When you cut your carbohydrates, your body is still accustomed to getting some glucose and it typically does so from your diet. When you cut the carbs, there isn't much to be found so your body begins to really scour your diet to find what it can. People interpret this as "low blood sugar" and they eat carbs and they feel better.

Because hyperglycemics secrete so much insulin in anticipation of meals the "resistant" tissues like the
liver and muscles, do not give up their glycogen quickly enough and gluconogenesis is going at a slow rate initially because there is some in the diet, even on 10 to 20 grams per day. Therefore the person has a "craving" for sugary things to compensate for the large amount of insulin. The cheese and eggs help fill the need because they contain carbs. However, the carbs within them are stored and not burned.

The truly zero-carb diet allows virtually no carbohydrate from the dietary which forces gluconogenesis to step it up a notch and slows the rate of insulin secretion in anticipation and as a result of meals. This is why the cravings come under control within a week of a zero-carb diet because the anticipatory insulin secretion really slows.

With lower insulin, there should be more fat mobilization (burning) and thus higher weight control, unless there is something like cortisol or some other hormone which is causing fat storage rather than mobilization.

Hope this helps,
Charles

RE: Zero Carb / Meat and Water - Mary - 05-09-2008 11:07 AM

Charles,
Everytime I read something you write I understand it a little better. Do you think since I lost 7 lbs in about 10 days when I started a few weeks ago that would be a good sign that my hormones are working correctly or would it take awhile to show up?

Thanks for all the help,
Mary

RE: Zero Carb / Meat and Water - nyteez - 05-09-2008 11:40 AM

This is a great thread, thank you Charles for your info. I was supposed to do Meat & water this week, but didn't. I eat a lot of eggs so I will cut those out too. I lost 10 lbs when I first started Atkins in Feb, but have stalled. I still keep my carb intake to under 5, but maybe that is too many. I don't have any cravings, but I am tired a lot.

Lauren: I noticed coffee makes me have cravings for food. If I don't drink coffee I don't even think about food until lunch, if I have coffee I am hungry all day. I now just take a no-doze (caffeine pill) each pill is like one cup of coffee. I just take one in the morning with water.

RE: Zero Carb / Meat and Water - Lauren - 05-09-2008 11:48 AM

Thanks for the further explanation Charles. Reading things like that really keep me going.

This morning was another tough one. I craved coffee but didn't give in. I felt pretty lousy until about 10:30-11:00 and then I started to perk up and this afternoon I feel good. That's atypical for me because usually I'm up and working by 6 am and those first several hours of the morning are my best and then I go downhill at about 3-4:00.
I've been eating mostly ribeye's and burgers with a little pork and dark meat chicken. I'm not measuring the food or counting calories, just eating until I feel full. I weighed myself on the first day but I'm going to wait a week before weighing again. I want to take it slow this time. I think it will take patience to get where I want to go.

RE: Zero Carb / Meat and Water - Charles - 05-09-2008 02:09 PM

Mary,
Oh, no, that's a great sign. You have every reason in the world to be optimistic. Your body is doing exactly what it's supposed to do. You are not hungry nearly as often, you can sleep better at night, and your body is beginning to regulate your weight. That's what's supposed to happen. It already knows what weight you function best at, you just have to stay out of the way and continue to provide nutrition that your body can use. Eating this way makes it very easy.

If you have to go this far to get your metabolism going, you are much like me and there is not a lot of room for error. Therefore, keep it up and you'll see that it only gets easier especially as the pounds continue to drop and you feel so much better.

RE: Zero Carb / Meat and Water - nyteez - 05-09-2008 02:14 PM

nyteez,
Make sure you eat plenty of fat, not just meat. By fat, I mean fatty protein. There's no need for mayonnaise, butter and coconut oil if you eat fatty protein. Coffee is a major deal-breaker and most low carb plans. Caffeine can cause fatty acid storage. Whatever kind it is, if it has this effect on you, that's a good sign that it's time to return to good ol' water!

RE: Zero Carb / Meat and Water - Charles - 05-09-2008 02:16 PM

Lauren,
You're exactly right. It will also take a little time for your body to adjust. You'll be pumping out more ketones and your body will be making more glucose out of protein so this can slow you down a bit, but hang in there. It may take a little willpower at work, but I think you'll find it's worth it in the end. Just think of those 7 pounds in 10 days and how great you felt when you stepped on that scale. In few days you'll do it again and feel even better!

RE: Zero Carb / Meat and Water - nyteez - 05-09-2008 02:30 PM

Charles,
Fatty Protein? Like the fat on meat? It is kind of hard to find fatty cuts of meat here, all the butchers cut it off. It is a shame because all the flavor is in the fat. Rib eyes are usually OK as far leaving the fat. Is mayo, butter & coconut oil as good as the meat fat? My skin was really dry for a few weeks, so I started adding more fat and it is better. Can you eat too much fat?

RE: Zero Carb / Meat and Water - Charles - 05-09-2008 02:53 PM

nyteez,
Just because they cut off the fat, doesn't mean it's still not fatty assuming we're talking about a ribeye, beef spare rib, ground beef, dark-meat chicken, etc. I don't do mayo because of soy and butter and coconut oil are as good as it gets besides meat. I just don't have anything to put them on. 😊
You cannot eat too much fat!

This is what your body runs on so don't be afraid of it. Embrace it. Once the carbohydrates are removed, your body will handle fat just fine!

RE: Zero Carb / Meat and Water - nyteez - 05-09-2008 03:25 PM

I never noticed the soy in mayo! I just looked and yup, soybean oil #1 ingredient! That might be part of my problem. Soy makes me extremely tired. I eat eggs w/ mayo or tuna w/ mayo for lunch most days. No more mayo for me. We have lots of trout & bass in the fridge. I always wrap the fish in foil w/ lots of butter & bake in toaster oven, yummy. I like the taste of coconut oil, I can just eat it off the spoon, like it's cake frosting 😋

RE: Zero Carb / Meat and Water - Charles - 05-09-2008 06:00 PM

O! Weston A. Price group gets all fired up about soy. I just avoid it in case they're right. I haven't progressed to coconut oil off the spoon, but hey, if it works. The Tokelauans ate tons of coconut and fish before adopting the Australian mainland diet of refined carbohydrates and they became sick. When some of the returned to their traditional diet, they regained their health.

RE: Zero Carb / Meat and Water - MAC - 05-09-2008 06:44 PM

Bought some Nutiva coconut oil last week to see what all the fuss was about. Extremely mild coconut taste. Given that it is 100% pure fat it doesn't taste oily or fatty. If you do eat it straight off the spoon it does taste like frosting!

RE: Zero Carb / Meat and Water - Charles - 05-09-2008 06:58 PM

Are you serious? I might have to go downstairs and try some. My wife uses it on vegetable that they eat. Hmmmm......

RE: Zero Carb / Meat and Water - MAC - 05-09-2008 07:31 PM

Yep I was serious. At least it tastes that way to me. Since I am eating really low carb these days fat doesn't taste fatty. I think you adapt to the taste of fat when you eat low carb.

RE: Zero Carb / Meat and Water - weirdstuffinmydesk - 05-09-2008 08:16 PM

I will have to try it off the spoon too MAC. Frosting YUM!

Charles, I am not sure what my stall is, well actually I am finally moving again now that I cut out the
sugar free stuff. I sleep fine, am generally not craving things (except the sugar free stuff, but the more I
ate of it the more I craved it), have plenty of energy (given my heart condition which can be problematic
occasionally). The more I read your posts the more I am thinking of zero carb.

RE: Zero Carb / Meat and Water - RobinM - 05-09-2008 09:16 PM

Charles, thank you so much for providing the links for the soy info. I've read before that you don't
promote soy and was wondering why.
Now I know!

Again, thank you! 😊

RE: Zero Carb / Meat and Water - Charles - 05-09-2008 09:38 PM

You're welcome, Robin!

MAC, I tried it, but it just tasted like fat to me. I didn't get the frosting bit, but oh well.

RE: Zero Carb / Meat and Water - Charles - 05-10-2008 11:38 AM

MAC Wrote:
What brand did you try? The frosting description was something that a previous poster in this thread had
used to explain the taste and texture. I thought it was a pretty good description. Other posts on CO
although not in this thread seem to indicate that the taste of one brand varies markedly from another.
The one I bought was Nutiva. Lot of people swear it is good for weight loss. I haven't seen that effect
but I am not consuming 3 tbps/day.

You know me, I'm using the brand we found at Wal-Mart. Do you order Nutiva online?

RE: Zero Carb / Meat and Water - MAC - 05-10-2008 12:18 PM

See this thread. Coconut Oil comparisons Buy the CO at Wally World in the vitamin section and not the
food aisle according to this thread.

I bought my 1 lb jar of Nutiva CO at a local Vitamin Shoppe. About $12.50 with tax. You can definitely
get it a lot cheaper online if you buy in bulk via Vitamin Shoppe or VitaCost. Shipping costs almost
force you to buy in bulk.

RE: Zero Carb / Meat and Water - nyteez - 05-10-2008 01:32 PM

Charles: The coconut oil your wife uses is processed to take out the flavor. If you cooked veggies in the
unprocessed coconut oil they would taste like coconut. LOL! It is only good in cooking sweet foods or
baking. I used make the best bread with it. Just look for natural cold pressed virgin or extra virgin
coconut oil. It looks like crisco, but has a low melting point like 80 degrees or something. I get mine
online at puritans pride. It is usually about 7.50 for a 16 oz jar. You can google Tropical Traditions too. There is a ton of info on coconut oil there.

RE: Zero Carb / Meat and Water - nyteez - 05-10-2008 01:38 PM

Also its a great massage oil or skin moisturizer, it is a light oil (not greasy) that absorbs right into the skin, the only bad thing is you smell like coconuts all day. :O)

RE: Zero Carb / Meat and Water - Charles - 05-10-2008 03:38 PM

nyteez,
Thanks for the heads-up, but I think I'll leave that to the rest of my family. I'll just continue you with my fatty protein. It's all good!

Thanks,

Charles

RE: Zero Carb / Meat and Water - Lauren - 05-11-2008 07:36 PM

Well, I made it through the weekend but it was really hard. I felt good physically and I'm thankful for the best sleep I've had in a long time but I REALLY missed eating more of a variety of foods. I especially missed coffee and tea.

To get me through the weekend I've been keeping busy but also reading a 2006 thread started by "The Bear" on the Low Carber forum. Here's a link in case anyone is interested. [http://forum.lowcarber.org/showthread.php?t=287013&page=1&pp=28](http://forum.lowcarber.org/showthread.php?t=287013&page=1&pp=28)

It kind of gave me a little hope that some of these cravings will go away over time. He eats more of a varied diet than Charles (meats and also cheese, cream and eggs). He started his WOE at 20 though so his metabolism probably wasn't as screwed up as mine is. He says that it takes three weeks or so to become keto adapted. I'm just hoping I start to adapt to this WOE so it gets a little easier. I really want to do it long enough so that I can see the true results and decide from there. I don't want to bail early and miss out on knowing if this is something that could really help me.

How have others coped with these cravings and how long did they last?

RE: Zero Carb / Meat and Water - Charles - 05-12-2008 09:28 AM

Lauren, I certainly had cravings too. It wasn't all "smooth sailing" for me. I also started with meat, cheese and eggs and I was going along pretty well that way. I ate three eggs and a steak every morning for months. However, one day I came to the realization that breakfast was my least productive meal. I was hungrier much faster after eating eggs and cheese than I was when I just had meat.

So then, I changed my breakfast to meat only and I was able to go further into the afternoon without getting hungry again. Not only that, but I noticed that I started dropping pounds when I stopped the eggs and cheese.

I made another observation that fatty ground beef made me fuller faster than sirloin steak and I felt much
better after eating ground beef. Therefore, I changed my breakfast to about one to two pounds of fatty
ground beef and it was wonderful. I also lost more weight to get to my current 155 just by changing my
breakfast.

That made it very easy to discontinue cheese and eggs because I was somehow holding on to a few
pounds with them. There is nothing like success to fuel excitement.

I'm not saying you have to eat like me, but you should always be carefully monitoring the effect that the
various foods are having on you and your metabolism. If you feel sleepy after eating something or you
find that you can't go 5 or 6 hours between meals before hunger begins anew, that may be a sign that a
particular food is not working. The goal is to eat the optimal diet for your metabolism.

At the very least, you should want to know what that optimal diet is so that if you get into trouble with
food, you can go back to that way of eating for a few days and correct any issues.

Finally, there should NEVER be any food or drink that you just HAVE to have or you'll feel sick. That's
an addiction and that has no place in anyone's life. Food should always be something you can take or
leave. Variety is all in your mind. After a while with no variety, you'll find that you come to crave what
food you do eat. When I go to a Brazilian steakhouse where they just serve different kinds of meat, I go
out of my mind because of the great variety!

---

RE: Zero Carb / Meat and Water - weirdstuffinmydesk - 05-12-2008 09:52 AM

Hey Charles,

So the only seasoning you use is sea salt? I saw you mention Celtic Sea Salt, is plain sea salt okay? How
come iodized won't work or shouldn't be used?

Thanks!

---

RE: Zero Carb / Meat and Water - Charles - 05-12-2008 11:41 AM

Weirdstuffinmydesk,

Yes, that's right. This is one of the many things I've read about the subject and it was enough for me to
make the transition. I've also heard that the subject is highly controversial; that there is no difference
between the salts, but I do happen to like the taste of Celtic sea salt (even Kosher rock salt) better and if
it has some extra nutrients than the other stuff, plus the fact that it's not processed, makes it good in my
book:

*The salt that you find in table salt and most processed foods is sodium chloride. Salt in this form has
been processed at high temperatures, which changes the molecular structure and removes vital minerals
from the salt. Table salt also contains additives, anticaking agents, and even sugar. Excess salt
consumption is associated with high blood pressure, fluid retention, heart and kidney disease.*

**Trash It:** Dump out your salt shaker and toss out all other packaged or processed foods with a high
sodium content. This should be pretty easy for most people.

**Stash it:** We have been told for years to avoid salt, but following this advice can lead to even more
problems. We are all salty on the inside--our blood, sweat, tears, and even our urine--it's all salty. It's important to replenish the salt in our body, using the right salt is what makes all the difference in the world. The best way to put salt back into your body is to use Celtic sea salt. This high quality salt contains over 80 balanced minerals from the sea. Celtic sea salt is essential for maintaining proper fluid balance and utilization in the body. It also normalizes blood pressure, enhances digestion, and nourishes the adrenal glands. Celtic sea salt is available at many natural food stores.

I've also learned on my zero-carb diet not to drink so much water. Excess water consumption dilutes your sodium levels and sets you up for that nasty hyponatremia, which can be fatal.

The linked article talks about ADH, anti-diuretic hormone which causes us to retain water. I learned in GCBC that it's actually carbohydrates that make us retain water and therefore we tend to need more water to balance the salt maintained in our kidneys. When we cut the carbs, the kidneys release the salt so we feel like we need more water and salt. I find that if we just drink to thirst --actually, a little bit less than that and also salt to taste, then we consume less of both and electrolytes are fine even after a half-marathon.

I also don't drink during exercise because it leads to cramping (just as it did in the old days when we were told not to eat and drink during exercise!)

Hope this helps,

Charles

**RE: Zero Carb / Meat and Water - Mary - 05-12-2008 12:41 PM**

*Quote:*
I made another observation that fatty ground beef made me fuller faster than sirloin steak and I felt much better after eating ground beef. Therefore, I changed my breakfast to about one to two pounds of fatty ground beef and it was wonderful. I also lost more weight to get to my current 155 just by changing my breakfast.

Charles,

You eat 1-2 lbs of ground beef at a time. No wonder I didn't get full I would eat 1 patty. How funny!!! I'm starting zero carb in the morn. Will stop and get ground beef on the way home tonight. Love it.

This has been a hard 10 days and will be really ready to zero carb. Have gained back about 3 of the seven pounds but at least not all seven of them.

Lauren, It sounds as if you are doing very well. I am not looking forward to all the craving. Hopefully we will be so busy this week that it will be a non issue.

Mary

---

**RE: Zero Carb / Meat and Water - Charles - 05-12-2008 01:44 PM**

Mary,
I get the 73/27 ground beef roll at Wal-Mart. I make it into patties and fix two of them in the morning. I just kind of eyeball them and they are thick.

If I eat leaner ground beef, such as the 85/15, I can eat more of that because it takes more to get me full. On weekends, we buy the family pack of 85/15 patties and typically have them for Saturday afternoon lunch. I eat about 5 or 6 of them. I eat until I'm full.

---

RE: Zero Carb / Meat and Water - Mary - 05-12-2008 02:22 PM

Thanks Charles,

It worked this time. Are you talking about the preformed patties at Wal Mart. I will look into those. Since now you weigh less that I do I will follow your lead as to the amount of meat unless of course I'm full sooner-ha.

---

RE: Zero Carb / Meat and Water - Lauren - 05-13-2008 04:59 AM

Charles Wrote:

[Lauren, I certainly had cravings too. It wasn't all "smooth sailing" for me. I also started with meat, cheese and eggs and I was going along pretty well that way. I ate three eggs and a steak every morning for months. However, one day I came to the realization that breakfast was my least productive meal. I was hungrier much faster after eating eggs and cheese than I was when I just had meat.

So then, I changed my breakfast to meat only and I was able to go further into the afternoon without getting hungry again. Not only that, but I noticed that I started dropping pounds when I stopped the eggs and cheese.

I made another observation that fatty ground beef made me fuller faster than sirloin steak and I felt much better after eating ground beef. Therefore, I changed my breakfast to about one to two pounds of fatty ground beef and it was wonderful. I also lost more weight to get to my current 155 just by changing my breakfast.

That made it very easy to discontinue cheese and eggs because I was somehow holding on to a few pounds with them. There is nothing like success to fuel excitement.

One thing that I got from this post Charles is that your diet is the result of an evolution. That, through trial and error, over time, you have found the diet that works best for you. I can say that the things I've given up in the past- alcohol, cigarettes, diet soda- were not especially hard to give up once I made up my mind. I tried giving these things up unsuccessfully at first but over time, I became ready and then it was relatively effortless.

I can tell that I'm not at that point with the meat and water diet. Yesterday, I had some herb tea and eggs. I may need to make this more of an evolution rather than a big jump in diet. Although I believe that I'd get the best results with all meat and water, I'm going to just have to work towards that until I'm ready.

Because I've liked the effects so much, I'm still going to go the almost zero route but I'm adding back herb tea, eggs and cheese. One thing this effort did for me though was to break my taste for sweet which
I used to satisfy with stevia in black tea and occasionally, stevia in plain yogurt.

So I will continue, eating as near zero as I am able. I will strive for an evolution of a diet that works best for me. I'm still thrilled about the great sleep I've been getting and also the reduction in my hunger throughout the day. I now really see how important eating fat is and also taking away carbs, the trigger of hunger.

I'll be following the zero carb threads for inspiration. Good luck Mary. I'm thankful that people post their experiences. If it weren't for the GCBC posts, I never would have gotten even this far.

---

RE: Zero Carb / Meat and Water - LindaSue - 05-13-2008 05:14 AM

I find that I'm gradually learning to love zero or nearly zero carb. Lately whenever I've eaten something with a lot of veggies or sweet things, all I can think about is how much better I feel without those things. I feel bad for those who visit my site looking for new recipes, but I really look forward to my boring burger and steak meals so I haven't been doing much recipe testing these days.

My son took my husband and me out for dinner to Chili's on Mother's Day and I had the Mushroom Jack Chicken Fajitas. They were good but the plate was about 80% veggies and 20% chicken. Yesterday my stomach was gassy and bloated and I felt miserable. Today I will stick with ground beef and steak and maybe some eggs. I don't eat eggs every day like I used to but I'm not sure yet if they are a problem food for me.

---

RE: Zero Carb / Meat and Water - Lauren - 05-13-2008 06:35 AM

That's great to hear LindaSue. I know you didn't enjoy all meat and water the first time around so it gives me hope that you are enjoying it more and moving in that direction. Thanks for posting the update.

---

RE: Zero Carb / Meat and Water - Mary - 05-13-2008 07:12 AM

This gives me hope, Linda Sue because you had some problems when you began the meat experiment. I love meat and want this to work so much. It sounds as if patience is a necessary ingredient. How much meat do you think you eat at a time. I did start with the ground beef this morn. Took my last meds yesterday morn and am still feeling icky from them. Very bloated but hopeful that the meat will help. Have a great day everyone.

---

RE: Zero Carb / Meat and Water - Charles - 05-13-2008 08:46 AM

Mary,

No, for breakfast, I get the big roll and make patties myself. The roll is the best because it's 73/27 (more fat). It's to the left of the pre-formed patties. I do get the pre-formed patties from time to time but I try to get the 80/20s. However, they sell the 85/15 in a big family pack and it's cheaper to get them, even though they are leaner. However, I find I have to eat more of them to get full than I do the 80/20s.
Lauren Wrote:

One thing that I got from this post Charles is that your diet is the result of an evolution. That, through trial and error, over time, you have found the diet that works best for you. I can say that the things I've given up in the past - alcohol, cigarettes, diet soda - were not especially hard to give up once I made up my mind. I tried giving these things up unsuccessfully at first but over time, I became ready and then it was relatively effortless.

This is very, very true and I have to always remember that as well. I'm usually better when I deal with people in person. Just this morning I started a young lady and her husband on a low-carb diet and I actually given them the Atkins Induction food list. I tell them to just eat what they want from that list, but stay on the list. After a week or so, I find out if they are losing. If they are, I tell them to continue because even though they are eating more carbohydrates than I would eat, they are coming from a high-sugar diet. If they are not losing, we begin to look closely at how many carbohydrates they are eating and then I might have them start to cut down or remove things.

It's all an evolution. Because of my Atkins background, I figured everyone looked at it like that but I'm beginning to see that's not necessarily the case.

I do understand that it's difficult to go from 30 carbs to zero and it can feel pretty miserable and uncertain for a time. It's just hard to remember those feelings now that I've gone through it. It's now truly effortless after all my months of trial and error. Gary Taubes described it perfectly. Sugar is simply an addiction. Addictions are hard to shake.

I hate the feeling that I've been eating something for a long time and I don't lose weight or feel better until I remove it. Once I remove it, it's gone and I wonder what took me so long to figure that out. However, it is a learning process.

The thing that LindaSue described also happened to Stefansson's fellow explorers. When they got back to civilization, they would immediately go for the carbohydrates. After a while, they would voluntarily go back to the all-meat diet because of the way it made them feel, despite the fact that it was so "boring." When your body gets accustomed to the meat, it won't want you to go back to less nutritious food. Let this be a fair warning!

It can truly be a safe haven.

Mary Wrote:

I think it may be an evolution for me this week. Wow, I am addicted to carbs again, darn!!! Headache all morning. Still bloated from the meds and feel icky.

Am looking forward to the safe haven and your way of life.

Mary
If you feel bad when only eating meat, then try some vegetables. You can certainly come off of carbohydrates slowly if going whole hog is too much at one time.

If you go this route, I recommend that you eat your carbohydrates and don't succumb to the kind you drink. The ones in liquid are much harder to get rid of and you consume so many more grams of liquid carbohydrates than those naturally present in foods. A few veggies might make some of the "ickiness" go away and perhaps you can cut those down over time.

This weekend, I'm going to buy some steak from Whole Foods to get a taste of the grass-fed kind. I'm not really convinced it's so much better for me than my factory-farmed stuff. I think it's better for the animal, but the jury is out on how much better it is for me. The expense kind of settles the argument though!

I'd be worried that they would taste so good that they would spoil me and I'd never be satisfied with the cheap stuff again. Those ribeye steaks that I cooked last night were wonderful. My husband went nuts over them too. Now I'm going to be tempted to pay full price for rib eyes instead of the cheaper chuck eye steaks that I've been buying but maybe the indulgence won't break my budget too badly. I do find that I'm spending a lot less on food these days now that I'm buying mostly just meat. All those veggies and other things really add up. Now I just need to convert my husband to zero carb and I'll only need to shop one part of the store for food!

That's a great point. Unfortunately for me, my grocery budget is way too high so expense will always be a factor. The funny thing is, I don't eat most of what comes in my house. My wife and children eat eggs, cheese, and vegetables and the kids get additional items for their lunches such as low-carb wraps. These things really add up. I so wish I could get my whole family to eat zero-carb instead of low-carb, but I guess it's better than nothing.

Once upon a time I worked in Argentina. That was over twenty years ago. If I remember correctly most of their beef is grass fed. It tasted pretty good to me. At the time I thought it tasted better than grain fed beef. But the cost here is the US means I am probably not going to go that route. My uncle who went on business trips to Argentina said he preferred good old grain fed US beef. Might be an individual thing. I
had some frozen Australian grass fed ribeye a month or so ago and didn't much care for the taste. Might have had something to do with it being frozen.

RE: Zero Carb / Meat and Water - Mel - 05-14-2008 09:10 AM

I recently bought some grass fed ribeye steaks from a local ranch that specializes in non-factory style meat. I cooked them up along side some ribeye steaks from Costco. Two things: (1) the Costco meat tasted better than the grass fed by a bit and that might be because the grass fed is catering to the low fat market so the good fat mouth feel was missing and (2) the grass fed had been frozen and I can't get it fresh. I very much prefer fresh so I won't be buying a freezer. I pay $7.99 per pound at Costco. The grass fed was more like $13/lb. So, in my experience, don't worry about getting "hooked" on the expensive grass fed beef. Another beef trick I do is buy the organic ground beef that, once again, is low fat. I add an equal amount of ground lamb, which is "naturally" grass fed because that is what they eat but is too fatty to grill! Mixed together, the fat is just right. I pay $4.99/lb for each.

RE: Zero Carb / Meat and Water - Lauren - 05-14-2008 01:29 PM

WEEK 1: Update

The good:
1. Great sleep, no night eating (first time in probably 25 years that I've slept through the night for a week without waking up to eat something). It feels miraculous to me.
2. I'm experiencing the feeling of not being hungry on a regular basis. I got hungry earlier this afternoon and thought I might have to eat something between meals (which I really didn't want to do) but I drank a glass of water and have felt full ever since. I know this is an old trick but it never worked when I was eating carbs.
3. Although I didn't stick to the all meat and water goal, I didn't eat any nuts, berries, plain yogurt, stevia or vegetables all week. These had been hard to let go of completely but I feel good about it now. I'm still eating meat, poultry, fish, eggs, cheese (a bit), butter, coconut oil and herb tea. It's a work in progress.

The not so good:
1. I weighed in this morning and I'm exactly the same as last week:
   119 lbs 27% body fat 50% water 5'4"
   I know I'm in ketosis because I use the keto strips. Maybe the fat in adipose tissue is just not on the move yet? I know I'm on the right track though and metabolic health is most important. I believe fat loss will happen if I stick with it. I will continue as is and if nothing changes, I will have to move closer yet to meat and water.

Anyway, I enjoy the detective work in all of this.

RE: Zero Carb / Meat and Water - realityjunkee - 05-14-2008 07:34 PM

Wow Lauren, how tall are you? Your weight does not seem too high. How are you measuring your body fat %? How fit are you? If you are using a Tanita scale, you may need to set it on an athletic setting to get a more accurate body fat %. If your resting pulse rate is less than 60 and you exercise 7-10 hours weekly you should be weighing with an athletic setting. I know I'm a fat lady telling you this, lol, but I have been struggling with the same issues. I lost 30 lbs in the past 3 months, have been working out 5-6 days a week by jogging and lifting weights and the Tanita scale only showed a 2% reduction in body fat.
My resting pulse rate is 58. When measured on an athletic setting the difference is 10% less. So...long story short, I just don't trust those scales. If you are doing a caliper method or water measurement, then I'd believe it.

RealityJunkee makes an outstanding point. How tall are you? Are you at the size you want to be at but not the weight? I know that I am 10 pounds more than what I was as a senior in high school, but I wear the same size.

Weight really does not mean much!

The fact that you're sleeping through the night means your body is burning fat throughout the night and your insulin is low. If someone were to inject you with insulin in the middle of the night, you would wake up and go find something to eat.

The key to all this is to remember that your body regulates weight, not you. All you have to do is listen to it and eat when it tells you. Please do not drink water when you're hungry. If you're hungry, you should always eat.

Hunger is not a bad thing. Even if you eat too much, the weight gain will be very temporal. It will vanish after a day or two. For example, I ate a big Hardee's 2/3 pound Monster and another 1/3 pound Thickburger for lunch yesterday. Last night, I went to Golden Corral and ate way too much. This morning I was up 1.6 pounds. However, today, I'm not really hungry and I only ate two patties for breakfast and at lunch I'll have a steak. It's already been 5 hours and I'm not quite hungry for my steak yet.

Tomorrow I will get on the scale and I will likely be down a pound or two. That's how it works. Just keep eating properly and let your body do its thing.

**RE: Zero Carb / Meat and Water - Lauren - 05-16-2008 05:05 AM**

RJ & Charles,

I am 5'4" and do use a Tanita scale.

I agree that it's not the number on the scale that's so important. The thing for me is that I do not feel lean. I have excess BF on my hips and thighs, no doubt from losing muscle and gaining BF from all my high carb/low protein dieting in the past.

I'm trying not to focus on the scale too much and let my body regulate my weight (and not my brain). It's hard to let go of all the years of conditioning. Hunger not being a bad thing is very new for me- it was my enemy for so many years! It didn't even occur to me that drinking water to quell hunger could be bad but I get your point Charles.

I think the key for me is patience and persistence.
Well, this is where the zero-carb way of eating will shine. When your body is not making glycerol phosphate there is no reason to store fat in those areas. I find my waist and other areas shrinking while the scale stays the same. It's almost magical.

When I lost weight on low fat my love handles persisted while the rest of me shrank. Now, the love handles vanished and my overall body composition gets more balanced.

If you check out my journal, you can see the leaner and muscular me and compare it with pictures just from a year ago. There isn't that much scale difference but there is clearly a difference in body composition.

Wow, I just checked out the photos and that is a real transformation.

A couple of years ago I was able to keep my weight in the 108-111 range for a while on a low fat starvation regime but I did not feel thin because of BF in those areas.

I was wondering what you think about this quote from The Bear?

"Ketone metabolism is not a 'rapid response mechanism'. Full keto-adaptation takes several weeks, and until that has been done, a slowly reducing level of ketones will spill into the urine. Once adapted, the ketones are barely present in the urine, having been used by the body (in place of glucose). "

I was wondering if this is why my energy level isn't more constant. I'm not feeling lethargic like I was but I've yet to feel like exercising. I've always hated to force myself to exercise but look forward to wanting to since I usually feel very good after doing so.

I was wondering if this is why my energy level isn't more constant. I'm not feeling lethargic like I was but I've yet to feel like exercising. I've always hated to force myself to exercise but look forward to wanting to since I usually feel very good after doing so.

It sounds to me like he's explaining why the keto strips may stop changing color after a couple weeks or so. At first your body will make more ketones than it needs but will eventually adapt by only making as much as necessary. Even though the sticks no longer change color, you are still in ketosis and burning fat.

Personally, I thought that Dr. Atkins put too much emphasis on using keto strips to test for ketosis. Not everyone will produce enough ketones to change the color of the sticks and that can be discouraging if your diet plan says that they MUST change color or you're not in ketosis. It's simply not true that you're not in ketosis if they don't change color.
Here is a link to a paper about a number of studies involving keto-adaptation titled "Ketogenic Diets and Physical Performance"

Here is a short excerpt:

Adaptation
The most obvious of these is the time allotted (or not) for keto-adaptation. In this context, the prescient observation of Schwatka (that adaptation to "a diet of reindeer meat" takes 2–3 weeks) says it all. None of the comparative low-carbohydrate versus high-carbohydrate studies done in support of the carbohydrate loading hypothesis sustained the low carbohydrate diet for more than 2 weeks [5], and most (including the classic report of Christensen and Hansen [2]) maintained their low-carbohydrate diets for 7 days or less.

There are to date no studies that carefully examine the optimum length of this keto-adapataion period, but it is clearly longer than one week and likely well advanced within 3–4 weeks. The process does not appear to happen any faster in highly trained athletes than in overweight or untrained individuals. This adaptation process also appears to require consistent adherence to carbohydrate restriction, as people who intermittently consume carbohydrates while attempting a ketogenic diet report subjectively reduced exercise tolerance.

Here is an interesting explanation by The Bear:

Ketosis is the situation in which ketones are voided in the urine. It takes place within a few hours of blood glucose stabilising and no glucose entering from the diet. At this point many of the body-structures, such as the brain and deep dense tissues like cartilage and tendon will still require glucose and will not take up the ketone byproducts of fat metabolism. So the excess ketones are voided and the necessary glucose is obtained from glycerol and liver glycogen. If carbs continue in small amount, this condition will persist. If however carbs do not reappear in the diet, then the body begins to adapt to using the ketones as food hence the term keto-adaptation. During the period of adaptation, energy levels are subjectively low. As the body begins to run most of the glucose-dependent tissues on ketones, energy increases several fold and some additional benefits are realized, such as a lack of 'hunger pangs', increased endurance time, increased strength, a feeling of well-being, and rapid bodyfat loss. Keto-adaptation takes time, from a very minimum of about 2 weeks in a very remarkable person, to from three to six weeks in most people. This is a very hard but very important first hurdle to overcome in getting comfortable in the all-meat dietary path.

Sorry I have been out of the loop for several days. There is something that I wanted to ask Charles about this whole process.

It seems like you put a LOT of thought and energy into what you put into your body, the quality (ie iodized sea salt vs. celtic). What confuses me is why you would put any meat from walmart or low grade E type meat into your system. They are proven to have tons of hormones and anti-biotics which many authors/doctors are now stating are a HUGE part of the weight gain issue in America.
I have been rolling this around in my brain quite a bit. It really makes me worry for your safety, if this is all you are eating for your diet. I am not in any way criticizing or judging, I am truly concerned and confused. Maybe you have already talked about this and I missed it.

We buy local beef from the meat market that is free range, hormone, chemical free and have been doing so for a few years now. We can really taste the difference in the meat. It is WAY more expensive and I cringe sometimes at the bill, but in the end know that it is the better choice for our bodies.

Thoughts?

---

RE: Zero Carb / Meat and Water - **Mel** - 05-17-2008 11:27 PM

One example doesn't make the exception but if our factory meat is as bad as you describe, and it's a HUGE part of the weight gain issue in America, how come Charles is lean and healthy? I was trying to find an article I recently read about factory beef that pointed out its good points but I can't find it tonight. I'll look for it tomorrow and post it when I find it. It made me feel a better about consuming it since I don't like the flavor or leanness of grass feed beef.

I just like to question everything now that I've read GCBC including the notion that our beef supply is inferior.

---

RE: Zero Carb / Meat and Water - **weirdstuffinmydesk** - 05-17-2008 11:35 PM

I don't think it is one instance but many that have brought this info to the public awareness. I guess I should say long term accumulative effects. Charles may be healthy today, but what about the long term effects say in 10 or 20 years?

---

RE: Zero Carb / Meat and Water - **LindaSue** - 05-18-2008 06:35 AM

The Bear Wrote:
Keto-adaptation takes time, from a very minimum of about 2 weeks in a very remarkable person, to from three to six weeks in most people. This is a very hard but very important first hurdle to overcome in getting comfortable in the all-meat dietary path.

That's very interesting, Lauren. It's also interesting that most of the low carb plans say that keto-adaptation will take place during a 2-week induction period and one that's not zero carbs at that. I wonder why The Bear believes that this adaptation takes longer for those eating zero carbs than for those eating 20 carbs or less on plans like Atkins Induction.

Maybe I'm missing his point. Is he saying that if you're getting the keto sticks to change color then you're not really in ketosis and are still sort of in between using glucose for fuel and using fat for your primary fuel? Is he saying that once the strips stop changing color, that's the sign that real fat-burning has begun?? If that's what he's saying then it contradicts the idea that you are either in ketosis or you're not. I've heard it said that you can't be sort of in ketosis any more than you can be sort of pregnant.
Thousands of people have been losing fat with the Atkins diet all these years and they're not eating zero carb and they are in ketosis. How does The Bear explain that?

---

RE: Zero Carb / Meat and Water - **Charles** - 05-18-2008 06:38 AM

Sorry, Rachel. I'm in Asheville for a 15k race this weekend so I haven't checked in. I'm on my
Blackberry so it's hard to type. I may have to answer better tomorrow.

I simply don't buy the whole grass-fed is better argument for humans. I do believe it's better for the animals but the effect to humans is minimal. Why do I say this?

Well, first of all, my ancestors and even the Inuit ate meat at "levels of decay that would horrify a European." They didn't have stainless-steel pots and pans or convection ovens yet they were so much healthier.

Yes, the animals get hormones but they also eat grass or grain which I can't. Of course they also have four stomachs. I don't.

More to the point, as we learned from the Frenchman LeMagnen's work, our bodies simply do not care if our fat and protein comes from food or tissue, it just takes what it needs to keep us going. The rest is up to our immune system.

If people get sick from meat, it's more likely the carbohydrates that ruin the digestive tract and thus weaken the immune system which is rooted there.

Doctors clearly know very little about nutrition or they wouldn't continue to recommend we eat that which makes us sick.

Finally, I don't buy the "longterm argument" either. The fact that a diet change can make such a drastic difference in health, there is simply no reason to believe that my health will change as long as I continue to eat that which made me well.

If I don't and I return to the high-carb lifestyle, then you and I have every reason to believe that I will suffer any or all of the diseases of civilization just like every other people who eat more than approximately 70 pounds of sugar each year.

There is a suggestion that perhaps those on a zero-carb diet may not live as long. I'm okay with that because they will have been active and healthy years! Besides my great grandmother made it to 94.

Regards,

Charles

---

RE: Zero Carb / Meat and Water - weirdstuffinmydesk - 05-18-2008 08:30 AM

Thanks Charles! I hope you did great in your race.

I think I am going to have to agree to disagree w/you on this one though. I just don't think that long term exposure to potentially toxic chemicals can be good for anybody long term. That is okay though, it is really good to see your thoughts on it. More food for thought so to speak. 😊

Either way here's to a long and healthy life may you reach 94 and beyond! 😊

When your body gets accustomed to the meat, it won't want you to go back to less nutritious food. Let this be a fair warning!

It can truly be a safe haven.

I found your statement to be very true. I had been eating ZCHF and had become accustomed to it. I went off of it for several reasons, while I've been caring for my terminal sister in her home. I can't stand the return of carbs and it's effects on my system, so I have returned to what my body wants. My stress level has greatly decreased since I resumed eating the way that I should.

Thanks, Charles, for all of your informative posts.

RE: Zero Carb / Meat and Water - Lauren - 05-18-2008 12:40 PM

LindaSue,

I agree that it's confusing. What it sounds like to me is that you don't get the full benefits of increased energy until keto adaptation takes place. He doesn't mention how it effects weight loss. Did you read the linked study? It seems to support his idea. I posted it here to see if Charles would respond since he unquestionably be keto adapted.

My husband is on LC compared to what he used to eat but he still eats a few WW crackers, vegetables, nuts and even a bit of chocolate every day and still has managed to lose 25 pounds. I on the other hand could never lose weight eating what he eats. I'm assuming it is because he has quite a bit of weight to lose while I do not.

I'm sticking with the meat/eggs/cheese to see what keto adaptation feels like if it is, in fact, different from ketosis. A lot of people make different claims and I guess there is only one way to find out- to experiment ourselves!

RE: Zero Carb / Meat and Water - LindaSue - 05-18-2008 03:40 PM

I just finished reading the study, Lauren. The findings are pretty consistent with what Dr. Atkins and others said in regard to being keto-adapted. It normally takes place after a week or in as little as two weeks. For some people it may take a couple weeks longer. Since the study doesn't deal with weight loss, it doesn't explain why some people can become keto-adapted while eating 20 carbs or more per day while others must eat nearly zero carbs to achieve the same thing. Maybe Dr. Atkins was right when he said that 20 carbs per day is virtually the same as zero carbs for most people. He also said that those who can't lose on 20 carbs per day must gradually reduce their carbs until they figure out what level works for them.

And, those who claim that if you're not eating around 20 carbs worth of vegetables per day that you're not really "doing Atkins", are wrong because Dr. Atkins never said that. He said over and over that his diet was meant to be customized to the carb level that would work for each individual. What he DID say was that most of the carbs that are eaten, at whatever level, should come from the lowest carb veggies
and not from sugar and other junk. Of course he assumed that we needed the nutrients that are found in vegetables and can’t be found in sugar and junk food. We now know that we can get the nutrients we need without veggies as long as we eat enough fat and protein. Perhaps if Dr. Atkins had lived longer he would have learned that his patients wouldn’t need all those supplements that he prescribed so much if they cut their carbs to the barest minimum rather than gradually increasing them over time.

RE: Zero Carb / Meat and Water - Charles - 05-19-2008 08:07 AM

The Bear Wrote:
Keto-adaptation takes time, from a very minimum of about 2 weeks in a very remarkable person, to from three to six weeks in most people. This is a very hard but very important first hurdle to overcome in getting comfortable in the all-meat dietary path.

I'm sorry, Lauren. I went away for the weekend to run a race. Stephen Phinney had the same opinion in this article where he tested athletic performance on cyclists following both a high-carb and then a high-fat diet. Two weeks is the about the earliest it can happen, but it generally takes a bit longer. Two weeks is likely under controlled conditions in a metabolic ward because there, the subjects ate the same meals and they were not trying to lose weight. These people were in peak physical condition and that fact didn't make a bit of difference.

Most experiments like this one don't last long enough. These athletes were able to match their performance after keto-adaptation but who knows, they may have exceeded it after a couple of months of keto-adaptation.

My experience was similar to this. I was able to run a race two or three weeks after beginning my zero-carb diet, but it only got easier over time and now I don't think about it at all. All of this talk about using up your glycogen stores and carb-loading is complete and utter crap.

I did not turn my keto-strips purple at any point. I did show ketosis a few times when I checked on zero-carb but it's not something I really think about very often.

Quote:
Maybe I'm missing his point. Is he saying that if you're getting the keto sticks to change color then you're not really in ketosis and are still sort of in between using glucose for fuel and using fat for your primary fuel?

Whenever you drop your carbohydrate level, your body has to adapt to the fact that there is less glucose available. It adapts by over-producing ketones and many of them are wasted because there is still adequate glucose available for tissues that use it. Our bodies always address things from a "long-term" perspective. It tries to anticipate needs rather than reacting to what we do.

Therefore, your body excretes the extra ketones through urine and they make the strips turn color. The Bear is saying that the body is not keto-adapted at this point; meaning, that most tissues are NOT using the newly-formed ketones and they are being wasted. The purple strips only show waste, not whether your body is using ketones.

The "lack of energy" you feel is your raised insulin level that is high because your body is used to dealing with higher glucose levels. It takes time for your body to scale the machinery back and not store so many fatty acids during the day. It's usually looking for energy because glucose keeps it from dealing
with the fatty acids you already have on hand. Now, your body will be free to deal with fatty acids without starting up the storing mechanism called "glycerol phosphate."

Quote:
Is he saying that once the strips stop changing color, that's the sign that real fat-burning has begun???

Yes, assuming you've kept the carbohydrates low enough. That means the tissues that can use glucose have now adapted to using ketone bodies.

Quote:
If that's what he's saying then it contradicts the idea that you are either in ketosis or you're not. I've heard it said that you can't be sort of in ketosis any more than you can be sort of pregnant. Thousands of people have been losing fat with the Atkins diet all these years and they're not eating zero carb and they are in ketosis. How does The Bear explain that?

The Krebs cycle has shown us that this idea is totally false. We all burn fat at a reduced rate during the day, and we burn fat exclusively at night. The only question is if we are mobilizing more fat than we are storing. If we are mobilizing more, then we are said to be "fat-burning" and if we are storing fatty acids, then people think we're "running on glucose" which isn't true at all. This just means our bodies are efficient at removing it. All those skinny people out there on high-carb diets just happen to have bodies that can get rid of glucose more efficiently than others. That doesn't mean that it's healthy to do so. This is why they get disease later in life despite their lean bodies.

The way we burn fat for fuel is something that far too many of us don't understand and this needs to be corrected. If you understand what I wrote in the last paragraph, you also understand why things like intermittent fasting seem to work. Our bodies live off of a long-term food supply that constantly cycles fatty acids through our bodies. We all store some fat during the day but at night we live off of what we have stored. This is why your weight will fluctuate during the day. At night, we stop eliminating carbohydrate from the body and we only burn fatty acids.

So the ideal situation would appear to be to just stop eating so much so our bodies are forced to burn fat. The problem is that during the day our bodies have become accustomed to eating and storing. If you cut calories during this time, your body will compensate at some point so the gains that intermittent fasting seems to engender are only temporary.

The other key point to understand is that our bodies simply do not care whether the fat and protein come exogenously or indigenously. This means that if you don't eat enough, your body will get its fat and protein from your lean muscle mass. This may make your scale go down but it just means you'll lose muscle not fat. Eating fat and protein to appetite insures your body gets its fat and protein from your diet and leaves your muscles alone.

The key is to restrict eating things that cause fat storage (carbohydrates) and to maximize eating fat during the day giving your body the fuel it needs to mobilize fatty acids at night. It doesn't matter how much is eaten, it just matters whether we're mobilizing fat or we're not.

This post from Dr. Eades nails the point home:

It's looking like the intermittent fast is another of those ideas in science that looks good in animal studies then not so good in human studies, proving once again that rats and mice aren't simply furry little humans. And it appears - for humans, at least - that the intermittent fast is indeed beginning to look like the reality of a late-night gimmicky infomercial: long on promises, short on delivery. I suspect that
it is also a cautionary tale about the applicability of caloric restriction studies to humans. Sorry to be the bearer of bad news, but that’s the way science sometimes works. Lab results and reality are often two different animals.

Guest writer biography: Dr. Michael Eades is one of the best-known bariatric (obesity treatment) doctors in the US and was the first doctor to introduce insulin resistance to the mainstream via his books, including the national best seller Protein Power.

for fuel if you are not burning fat either?

Lauren Wrote:
Thanks for answering my questions (and also Linda Sue's).

You're welcome, Lauren and Linda Sue!

That's just it. There's never a time when you're not burning fat. There really is no "fat-burning mode." That's bad information that's out there. What they're describing is the period where there's still too much anticipatory insulin being secreted and this causes you to burn fat (mobilize fatty acids) at a slower rate than you otherwise might.

So your next question should be, "well, if I've always been burning fat for energy, why was I fat?" Because your body was preoccupied with glucose throughout most of your days and at night your body could not mobilize enough fat to make up the difference. Therefore, you were stockpiling a small percentage of fatty acids from each meal that your body could literally not get to.

This is why people always say "if you burn more than you take in." That's the observation and I understand why they make it. Unfortunately, it just doesn't work in the way they are saying it.

It's not that you "burn more than you take in." Rather, you store slightly more than you are able to mobilize. A low carb diet works by changing the balance to mobilizing more than you store. It does this by gradually reducing your body's anticipatory insulin response to the food you're about to eat.

My body still secretes insulin before a meal, but not nearly as much as it did three years ago. Now, I get more of the benefit of the foods that I eat whereas before, I only got the benefit of 90% and I stored the other 10%.

Does this help?

Charles

RE: Zero Carb / Meat and Water - Lauren - 05-19-2008 12:03 PM

Yes Charles, thanks- it does help. How do you know that your body still secretes insulin before a meal? Do you just know the science or are there symptoms that you experience physically?
P.S. I hope that you had a good race.

---

**RE: Zero Carb / Meat and Water - Charles - 05-19-2008 01:01 PM**

*Mel Wrote:*

One example doesn't make the exception but if our factory meat is as bad as you describe, and it's a HUGE part of the weight gain issue in America, how come Charles is lean and healthy? I was trying to find an article I recently read about factory beef that pointed out its good points but I can't find it tonight. I'll look for it tomorrow and post it when I find it. It made me feel a better about consuming it since I don't like the flavor or leaness of grass feed beef.

I just like to question everything now that I've read GCBC including the notion that our beef supply is inferior.

Mel, I just debated this with Jimmy yesterday when we went to lunch. I hadn't read his blog post, but after reading your comment, I read it and I figured I'd take this post to argue it a little better.

First, I wholeheartedly reject any "toxic environment" claim that so many like to make. To blame obesity on factory meat is really a stretch because most of us don't eat that much meat. This argument really hints at the low-fat nonsense because grain-fed animals are leaner. All low-fat diets advocate lean meat. However, we know that the healthiest peoples in the world ate fat in large quantities. If the American factories have found a way to add more fat to animals, then they should be commended!

While in Asheville, NC this weekend, I looked through a stack of menus so that we could meet the Moore's for lunch. We rejected most of these restaurants because they did not serve fatty protein. 90% had the meat wrapped in some sort of sauces, gravies, bread, flour, you name it. Very few eat any meat in this country without bread so it's very difficult to blame it on meat. When we remove the bun from these burgers, we find we can eat them every day and be quite healthy. So why doesn't anyone go after the bread industry?

In developed nations, the poorer people are likely to obese. The NHANES study confirmed this observation. This was first documented in 1965. Albert Stunkard and his colleagues at New York Hospital reported that they surveyed 1,660 New Yorkers and found that obese women were six times more common at the lowest socioeconomic level than at its highest.

These observations have been confirmed repeatedly throughout the world in both children and adults. The less wealthy people are not eating meat. Sure, supermarket meat is less expensive than grain-fed, but it's still far more expensive than the cheap carbohydrates that line supermarket shelves. Not only that, but we can eat supermarket meat and become healthy as long as we restrict sugar consumption.

And this "long-term" argument really makes me scratch my head...Let's see: If I eat carbohydrates today, I get fat tomorrow, but somehow, over the long term, I'm going to be healthy. If I eat supermarket meat today, I get lean, but over the long term, I'll get sick?

John Higginson was the founding director of the World Health Organization’s International Agency for Research on Cancer (IARC) for two decades. In the 1950’s he compared cancer incidence between the United States, Denmark and African populations. Cancer in African natives was remarkably uncommon which led Higginson to conclude that cancer had an environmental cause and diet and lifestyle were the primary suspects. In 1963, the WHO concluded that “the majority of human cancer is potentially preventable.”
Higginson suggested that perhaps 70 to 80 percent of all cancers could be prevented. Richard Doll and Richard Peto published a 120-page analysis in the *Journal of the National Cancer Institute* and they concluded that **75 to 80 percent of cancers in the United States might be avoidable with appropriate lifestyle and diet changes.**

In the last twenty-five years, the fundamental implication of their work has been lost. They essentially said that man-made chemicals such as pollution, food additives, and occupational exposure played a minimal role and that diet played the largest role causing 35 percent of all cancers though the uncertainties were considered so vast that the number could be as low as 10 percent or as high as 70 percent.

Higginson said “The release of industrial chemicals could not explain, for example, why the non-industrial city of Geneva had more cancer than Birmingham in the polluted central valleys of England or why prostate cancer was ten times more frequent in Sweden than in Japan.“

Nevertheless, this focus on carcinogenic chemicals as the primary cancer-causing agents in the environment also carried over to nutritional-related cancer research in the laboratory. In September 1976 at the Cold Spring Harbor Laboratory, cancer researchers held talks focused on chemicals shown to be carcinogenic in animals and the possibility that they might be found in infinitesimal or great amounts in human diets, drinking water, or pharmaceuticals.

In the mid-1970s cancer epidemiologists began to convince politicians and the public that many cancers were caused by what Peto and Doll called the “gross aspects of diet” instead of the ingestion of trace carcinogens and the like. Food became the focus and the low incidence of cancer among Seventh-day Adventists and vegetarians was often cited as evidence that meat is carcinogenic and that green vegetables and fruit are protective although colon cancer, for instance, among Seventh-day Adventists was no lower than among Mormons, described by Doll and his colleague Bruce Armstrong as “among the biggest beefeaters in the United States.”

By the end of the 1990s, clinical trials and similar investigations failed to demonstrate that dietary fat, meat, fruit, and fiber hypotheses of cancer played any role. Meanwhile, cancer researchers made little attempt to derive alternative explanations for those 10 to 70 percent of diet-induced cancers, other than to suggest that over-nutrition, physical inactivity, and obesity perhaps played a role.

As you can see, we've been down this road before. There is nothing new under the sun.

Jimmy cited these reasons to eat grass-fed on his blog. I'll tell you what I think of them.

Jimmy Wrote:

**THEY ARE LOADED WITH OMEGA-3 FATTY ACIDS**

Yep, unlike their factory farm counterparts, grass-fed meats only eat grass from a pasture rather than the forced diet of grains, grains, and more grains. There's a reason the big farms feed their cattle grains--IT MAKES 'EM GET REALLY FAT! You avoid the nasty side effect of all those omega-6s and instead reward your body with omega-3s when you choose grass-fed instead.

Why does this bother us? The fact that they get really fat? This is a good thing. The factory-farmers should be commended. Have you ever had a well-marbled ribeye? Man, it's amazing and healthy because I eat one practically every day for lunch.
Any time there is a "deficiency" argument you have to first wonder why any particular nutrient is "deficient." People put this argument on every bad food out there and it is really surprising that we now have low-carbers citing this same argument against factory meat.

The reason we are deficient on Omega 3's is because we eat a diet heavy in Omega 6. We have removed saturated fat from our diet and we have consumed excess oils and trans fats as Drs Enig and Fallon so beautifully explain. We eat a diet rich in Omega 6 at a cost to our Omega 3. If we cut down on Omega 6, our Omega 3 will surprisingly be just fine, without the fish oil!

Drs' Enig and Fallon identify the problem well but their prescription requires a little thinking:

In summary, our choice of fats and oils is one of extreme importance. Most people, especially infants and growing children, benefit from more fat in the diet rather than less. But the fats we eat must be chosen with care. Avoid all processed foods containing newfangled hydrogenated fats and polyunsaturated oils. Instead, use traditional vegetable oils like extra virgin olive oil and small amounts of unrefined flax seed oil. Acquaint yourself with the merits of coconut oil for baking and with animal fats for occasional frying. Eat egg yolks and other animal fats with the proteins to which they are attached. And, finally, use as much good quality butter as you like, with the happy assurance that it is a wholesome—indeed, an essential—food for you and your whole family.

Let's consider a factory-porterhouse steak with a quarter-inch layer of fat. After broiling, this steak will reduce to almost equal parts fat and protein. Fifty-one percent of the fat is monounsaturated, of which 90 percent is oleic acid. This is the same stuff found in olive oil! The same is true for red meat, eggs, bacon and lard! All of this suggests that eating a porterhouse steak in lieu of bread or potatoes would actually reduce heart-disease risk although virtually no nutritional authority would say so publically. The same is true for factory or grass fed beef.

Jimmy Wrote:

BETTER TREATMENT FOR THE ANIMALS

Again, the big factory farms just don't care about how the animals are treated. It's a business about making meat as quickly as possible so they can make a buck. But organic, grass-fed animals are treated very humanely and not subjected to the poor treatment that is part and parcel of what happens on those other farms.

I agree with this, but this has little to do with me. Some people can't stand to see animals slaughtered for any reason and I can empathize, but let's not get it twisted. These animals are here to benefit mankind, not the other way around. If there is a way to be more humane, we should be. However, if it comes down to providing healthy and cost-effective food for human beings, then bring on the factory. I'm sorry! Save the children, leave the whales!

Jimmy Wrote:

THERE ARE NO ANTIBIOTICS USED

Grass-fed animals don't need any antibiotics in them like their grain-eating counterparts do because they don't deal with the health complications that high-carb diet brings on.

Animals consume many things that are not healthy for me such as grass, manure, you name it. They also have four stomachs and we don't really know the extent to which the anti-biotics are transferred from the meat to humans and how well it survives the cooking process.
Consider the !Kung Bushmen of the Kalahari. The prevailing opinion of anthropologists is that hunting and gathering allow for such varied and extensive diet that includes large and small game, insects, scavenged meat (often eaten at “levels of decay that would horrify a European”) and even occasionally other humans, that the likelihood of the simultaneous failure of all nutritional resources is vanishingly small. When there was a drought, they would relocate to the watering holes where the game would also congregate out of necessity. This resiliency is thought to explain why hunting and gathering survived for two million years before giving way to agriculture.

John Higginson of the World Health Organization looked at the problem of carcinogenic effects in 1976 at the Cold Spring Harbor Laboratory. They concluded that "only a very small part of the total cancer burden could be directly related to industrialization." They tested drinking water, human diets, and pharmaceuticals. They concluded that cancer was more related to diet, but their clinical trials consistently produced zero. They've been trying to call meat carcinogenic and fruits and vegetables safe for years but no trial has ever proved this. Even the Mormons, who are among the biggest beefeaters in the United States had lower colon cancer than the Seventh Day Adventists who are vegetarian.

Quote:
YOU GET LOTS OF CONJULATED LINOLENIC ACID

Conjugated linolenic acid, or CLA, is a powerful fat that is created in the stomach of a grass-fed animal which is extremely healthy as an anti-cancer agent.

As I already stated, even 51 percent of a supermarket porterhouse is oleic acid, which is also found in olive oil. Grass-fed beef may have more at the cost of lower fat, but clearly there is adequate oleic acid in factory beef.

Quote:
SAY BYE BYE TO E. COLI

When you select organic meats, the risk of consuming E. coli tainted meat is next to nil. E. coli generally exists inside of animals with a highly acidic environment which is typical of grain-fed cattle. The lack of acidity in grass-fed beef make it less likely that E. coli could even exist there.

This is another one that's been floating around and used against raw milk and anything else they don't want us to eat. E-coli naturally occurs in raw milk and in red meats. However, our immune systems normally render this harmless. However, when you feed this meat to a sick population with poor immunite response due to the high-carb nature of their diets, it should not surprise us that this happens. This society is germaphobic and we get sick at the same time every year. This isn't normal.

However, studies that have tracked individuals on very low-carbohydrate diets show that they typically do not get sick as often as the larger society. We've heard that reported on this forum that immune response is much greater since they have restricted carbohydrates in their diets. I rarely go to the doctor. In fact, I haven't seen her since she told me she was going to put me on a statin a couple of years ago.

Quote:
NO NEED FOR STEROIDS OR GROWTH HORMONES

You want a cow to get bigger, you inject it with steroids or growth hormones. This has become so routine these days that nobody stops and thinks about the consequences of what happens when humans begin ingesting all that into their bodies. Again, it all comes down to trying to make a buck as quickly as possible instead of insuring the safety of the food supply.
Again, growth hormone may not be so great for the cow but there is no proof that this is bad for me. Americans are all shorter now than we were 100 years ago so this growth hormone sure hasn't helped! If this is what causes them to get fatter and provides that beautiful marbling that I love so much, give them some more! Mankind has always enjoyed the fattier cuts of meat from an animal and this fat is the key to saving us from disease, along with restricting or even eliminating carbohydrate from our diet.

Quote:
NO ADDITIONAL ANIMAL BY-PRODUCTS FED TO THEM

An organic meat farmer does not risk contaminating his cattle with animal by-products which can subject the meat to things like Mad Cow Disease. Just the grass, man, just the grass.

We've already been through this.

The proponents for grass-fed beef believe that grain should be used to feed the world's children. We've already seen the effects of this. It doesn't take long for the effects of grain to show up on a child. Obesity is growing and it exists alongside the poorer people all over the world. Cheap food is killing us. They hate grain-fed beef because it makes the animals fatter. This fat is what they believe causes obesity and causes poor health. However, we all know that fat is not unhealthy and in fact is more beneficial for humans.

Grain-fed beef has more fat, tastes better, is cheaper, and much healthier than lean meat. If you're afraid of deficiencies, stop eating that which creates deficiencies in the first place!

RE: Zero Carb / Meat and Water - Charles - 05-19-2008 01:52 PM

I know my body still secretes too much insulin because if I wait too long to eat, I have cravings. That's what made me try brie this weekend. I was in the store late at night on Friday and I had this urge for a snack. I walked by the ice cream, the Hershey's and even the cheesecake. I picked them up, read the ingredient labels and put them back down. I found the brie and I found this uncured sausage roll in the fancy cheese section and it didn't have any garbage in it. It was wonderful! If I can remember the name, I'll tell you what it was. It was some fancy summer sausage with no MSG, nitrates or nitrites, which I'm allergic too.

RE: Zero Carb / Meat and Water - Mel - 05-19-2008 02:09 PM

Thanks for the nice long answer, Charles.

I still haven't found the beef article that I read recently that I wanted to quote. It was a report about a recent beef industry conference. One speaker pointed out that the reason there is no need to fear the growth hormone (and other additives) is that it is administered very early in the feedlot process. It does it's boosting job, gets metabolized out and is no longer in the animal months before slaughter. If drugs are needed or used later then there are rules for how long the animal has to stay alive to wait for everything to get metabolized out. Also, the first half of life for all our factory beef is played out on the range, eating grass, for up to a year, raised mostly on family owned ranches. The second half, 6-18 months, is spent at the feedlot eating mostly grain, "finishing". They have to get to a certain weight,
about 1200, to be selected for slaughter.

I would guess that some quality/price differences of our grocery beef would come from the quality of the feedlot feeding and medical practices.

---

**RE: Zero Carb / Meat and Water - LindaSue - 05-19-2008 03:26 PM**

Thanks, Charles. I know that I will probably never be able to afford to buy grass-fed beef and must be satisfied with marked down supermarket meat. You've eased my mind considerably with your logical explanation. I very seldom buy into the scare mongering that says that any single food is going to kill us or make us sick. Although I'd never say that things like Splenda are actually good for us, I'm also not so sure that they're as bad for us as some people would like us to think. I think it's more likely that those who tell us that grain-fed beef is bad for use and grass-fed beef is the only beef that is good for us are saying it for financial reasons more than anything else.

---

**RE: Zero Carb / Meat and Water - Charles - 05-20-2008 07:44 AM**

Thanks, Mel. I wish I could say things as succinctly as you did. That was quite a paragraph you wrote because I didn't know any of that! Fantastic stuff. If you find the article, please post a link.

I really wish the beef industry would get their act together. They should be the leading proponents of a low-carb lifestyle. I can see it now: Carbs cause disease and death. Eat Beef for life!! or "Fat does a body good!" or "Got Beef?"

---

**RE: Zero Carb / Meat and Water - MAC - 05-20-2008 07:53 AM**

Agreed. And they could be joined by the pork industry and the chicken trade group. I wish the heck the pork industry would go back to a fatter hog too. The hogs have gotten way too lean and butchers need to leave a bit more of the fat on the meat. Bring back lard!!

---

**RE: Zero Carb / Meat and Water - Charles - 05-20-2008 08:08 AM**

Well, I never told you. On Friday, I went to Earth Fare for the express purpose of buying two grass-fed steaks for dinner. I got to looking at this meat and it was the smallest, leanest bit of beef I had ever seen. It was about $21.00 each and it wasn't worth it at all.

I left there and went to INGLES and found two big ribeyes (yes, I ate both of them). I spent $22 for both of them and they were amazing. They were every bit as good as the ribeye that I had at Flat Rock Grill with Jimmy on Sunday. They were well-marbled with plenty of fat on them.

As far as Splenda is concerned, that's very much wait and see. I'm not going to be a guinea pig while they figure out if Splenda is healthy or not, that's for sure. I do think it's harmful to the regulation of metabolism. When our cells make a request for something, I believe it's that "something" that they're after. When we fool our appetites with sweeteners and starches our bodies don't get what they were after in the first place which likely causes us to eat even more carbohydrates as many studies are starting to
Therefore, if I'm going to have something, let it be cheesecake or ice cream with real ingredients. The 6 grams of sugar in a piece of regular cheesecake is far less harmful than the tons of chemicals in the fake kind. For me, it would probably be so sweet it would overwhelm me after the first bite! And whatever you do, make sure you eat your sugar (should you choose to), please don't drink it. Drinking causes you to consume far more sugar than you would if you ate it baked in something. What was it, one would have to eat 60 apples to equal the sugar in one Coke?

Regards,

Charles

RE: Zero Carb / Meat and Water - LALINDA - 05-20-2008 08:25 AM

Morning, Charles!!! Long time no see!!! Morning to everyone else as well. I have a couple of questions and I figure Charles can answer them as he is so knowledgeable about eating this way.

First, I keep reading articles that say not to eat but 3 times a day so that our insulin doesn't spike unnecessarily. Then, I read articles that say to eat 5 or 6 small meals a day as it is better for you and keeps your insulin from spiking. (it stays more on an even keel) SO....which is it? Should I eat 3 or 6 times a day?

Second, I have been eating approximately 1700 to 1800 cals a day and am still not losing. I have looked back on my menus and it seems the only time I have lost a little bit is eating 1300 or less calories. I am still not exercising very much because of back troubles and my menu is at least 60% fat and no more that 5% carbs.

I went to a Dr. yesterday and he said my blood work shows that I am an extremely healthy individual. (YEA, ME!!!) So, what more can I do?
I know that I cannot expect to lose a lb a day, but a couple a week would be nice.

Any thoughts would be appreciated!!

HUGS

LA LINDA

I don't think it matters. What matters is your hunger. I think they're mostly wrong about "insulin spikes"
because that doesn't jibe with biochemistry. Our bodies secrete insulin BEFORE our meals, not after. Our bodies anticipate that we're going to eat, either because you see food, you think of food, you smell food, etc. When these events happen, our pancreas goes to work secreting insulin.

Insulin clears our bloodstream of EVERYTHING, fatty acids, glucose, amino acids, nutrients, and anything that could possibly be used for fuel. This is why you feel such acute hunger right before you eat. After food digests, insulin ebbs and fatty acids and all other nutrients slowly return. The food you ate gets added to your food supply. This "food supply" of amino acids, fatty acids and glucose goes through your bloodstream and gets offered to every cell and tissue until something gobbles it up.

In a person with insulin-resistance, the pancreas oversecretes because it simply doesn't know how much glucose you're about to load up on. Because there is so much insulin, it takes longer for fatty acids to return to the bloodstream because the muscles have to be given a chance to eliminate the glucose from the bloodstream. Because of insulin-resistance, there are not as many takers so the fatty acids can't get released as fast as they should. This results in weight gain.

The low-carbohydrate diet works by working on your anticipatory insulin over time. When you cut your glucose consumption, the pancreas gets the hint and begins to secrete less and less until you get a normal insulin response. Hyperinsulinemia may always make the pancreas oversecrete, but not nearly as much as it used to.

Now that you understand that, does this answer your question?

You have to rely on hunger. If you're hungry, you should eat a low-carbohydrate meal. If you delay eating, you get more insulin in your bloodstream for a longer period of time which means fatty acids are not going to be mobilized for a longer time. This of course, means more fatty acid storage.

If you want to go longer periods of time between eating, eat more fat and protein. If you want to eat in two hours, eat less fat and protein. It's really that simple.

LALINDA Wrote:

How much protein do you eat? You can lose weight on a 1200 calorie diet as long as the majority of those calories are fat and protein. If you attempt to balance that equation by eating 400 calories of carbohydrate and 800 of fat and protein, you will be eating an Ansel Keys starvation diet which he described in the "Biology of Starvation." However, if you eat 1000 calories of fat and protein and only 200 of carbohydrate, you have a 50% chance of losing weight as Blackburn and Bistrian found out. This is only from a dietary perspective. If a hormone is being prevented from doing its job because of a physiological problem, then fatty acids will not be mobilized, but stored.

LALINDA Wrote:
I went to a Dr. yesterday and he said my blood work shows that I am an extremely healthy individual. (YEA, ME!!) So, what more can I do?
I know that I cannot expect to lose a lb a day, but a couple a week would be nice.

Try what I've outlined above and be patient. Don't keep jumping around changing foods and diets.
because hyperinsulinemia takes time to cure. It takes consistently eating fat and protein to convince your pancreas to decrease your anticipatory insulin response. Every time you cheat or increase your carbohydrates, you basically start this process over again because your body does not want to be caught with not enough insulin in circulation to account for your eating habits.

RE: Zero Carb / Meat and Water - LALINDA - 05-20-2008 09:29 AM

Charles, thanks for your answers. I guess you believe that I am insulin resistant or hyperinsulinimia(sp)? So what do I do? I am eating low carb and just waiting for the scale to drop. I am eating properly and haven't had a cheat in a month. Not really doing anything that I shouldn't be. Is this what you are saying? And if so, what happens now? Does it at some point reverse itself or can I do something to change it?

Sorry, I am just so dense to the science behind all of this. I am not a technical person.

I just looked at some of my menus and find that the most calories from carbs is only about 160 or so. Mostly fall into the under 100 calorie file.

65 to 75% of my cals come from fat. 25 to 35% of cals come from protein. The rest are from carbs...salad, broculli,cauliflower,etc. Under 10%. I keep it that way so that I am not indulging in too many carbs. I don't want to do that. I want to lose weight. And I am trying very hard, but it doesn't seem to be working. I am just doing Atkins induction. Nothing else. Not cheating, not drinking. Not eating anything I shouldn't be eating.

All bloodwork for my thyroid was good. Does that mean that my metabolism is okay? Just slow because of my age...56? Or, could it be off?

If you remember, I tried to do zero carb and couldn't. I lost 4 lbs the 1st week and never lost another lb the rest of the month.

Thanks for your patience with me, Charles.

Lana, Good to see you. Sorry about your sister. PM me sometime.

LA LINDA

Yes, this is a very helpful reminder. I sense that when I do my 2 week weigh in tomorrow that there won't be a loss so I will keep my focus on working towards a healthy insulin response through diet and trust that the weight will work itself out.

RE: Zero Carb / Meat and Water - LALINDA - 05-20-2008 09:42 AM

Charles, this is today's numbers. What do you think?

LA LINDA

Total: 1330  
Fat: 96 861 67%  
Sat: 27 245 19%  
Poly: 4 36 3%  
Mono: 20 177 14%  
Carbs: 21 64 5%  
Fiber: 5 0 0%  
Protein: 91 364 28%  
Alcohol: 0 0 0%

I am going to stay on Atkins as I feel I can live with this for the long term. I like to eat my veggies and enjoy them. On this plan, I can have them.

Thanks, Lauren.

RE: Zero Carb / Meat and Water - Charles - 05-20-2008 12:20 PM

LALINDA:

I have nothing against the Atkins diet at all. However, to do Atkins, you have to be willing to make adjustments. You cannot continue to do the same things and expect the result to be different. I agree that what you're doing appears fine, but for some reason, we're not getting the results we want so we have to search very hard to find what does and what does not work.

On Atkins, if someone is not losing, they have to drop their ACE down by 5 grams each week until they begin losing again. I'm not very good at numbers like that, but give me an idea of the foods that you eat. Particularly, when you lost the 4 pounds on the zero-carb, what exactly did you eat?

You may need to build a diet around those foods. I don't care if you have to eat the same foods for weeks at a time. If your body responds to those things, then that is what you should eat. I know you love
veggies but if you cannot lose weight with them, they must go. You have to feel this way about ANY food out there. If it doesn't work with your metabolism, it has to go.

This may sound harsh, but you've already invested a great deal of time and energy into losing weight so it may take some real digging in to find out the issue. I have a small list of foods that work for Charles and I eat them 95 percent of the time. I know my weight will stay under control if I regularly eat these foods. You must develop the same type of list.

You're 56. Are your menstrual cycles regular? Are you approaching menopause? These issues are extremely important because they involve hormones. If there is a hormonal issue, nothing you eat (or don't eat) is going to matter one iota.

---

**RE: Zero Carb / Meat and Water - Charles - 05-20-2008 12:24 PM**

By the way, you didn't answer my query concerning hunger. How do you feel eating this much? I eat that many calories for one meal so I can't identify with this. But the question is, is your hunger controlled eating this many calories?

When you tried the zero-carb and lost 4 pounds, how many calories did you eat each day?

---

**RE: Zero Carb / Meat and Water - LALINDA - 05-20-2008 12:45 PM**

Charles, I don't remember what I ate when I tried ZC. I don't remember when it was. Just before the old board went down.

I now eat lots of baked fish, chicken, ribeyes, ground beef, salad, fresh broccoli, cauliflower, green beans, broussel sprouts, zucchini, yellow squash. All fresh, not canned or frozen. I use coconut oil, olive oil, and butter.

I am not hungry. I am hardly ever hungry. In fact, I usually have to make sure I eat because I can go a long time without eating. Hours. I can drink coffee in the morning and not eat until 2 or 3 pm. I don't do that, but I could.

No menstrual issues, Hysto at 35. Left ovaries, but they are dead now. Hormones were off, but Dr. said not enough to warrant HRT. BUT, he is a family dr. Maybe I should see another Dr?

I had asked you about metabolism if thyroid #s are okay. What can you tell me about that? Is it possible that I should see an endocrinologist?

Anything else you can tell me to try, I appreciate it. Maybe I am just going through a long stall as some others have done. I would love to lose about 40 more lbs, but, as long as I am eating foods that are good for me and keeping me healthy, I will continue to do so.

After all, being healthy is what this is really all about.

Thanks,

LA LINDA
Charles, I also take Vicodin once or twice a day. Sometimes I don't take it at all. I don't know a lot about drugs or their interactions with things. Have been taking it for over a year. Could this be the unknown?

I think the thyroid is fine. I would investigate the hysto issue first and foremost. My wife has the same issue. She had the procedure early and it's been awful trying to find the correct hormone. These female parts may have been bothersome, but they are part of a complex homeostatic system and their absence is duly noted! At least you have your ovaries and if they are still secreting estrogen, that's probably a good thing. I know of studies where they removed the ovaries from rats and they gained weight no matter what they ate. However, when they were infused with estrogen, they lost weight.

I'm not saying it's that simple for you, but knowing that balance may be critical to your body's ability to regulate your weight. I respectfully disagree with your doctor. I would want to know what my levels of the different hormones are in my body. Jackie Eberstein told me that if a woman is heavy on testosterone or high on estrogen, any one of these would certainly affect their weight. My wife's doctor advises her to keep trying an HRT for two months at a time and then switch to a lower dose or whatever to facilitate weight loss.

I know there were studies that linked HRT to various cancers and what not, but we don't know if that was more related to their diet. All that said was that HRT did not keep people from having cancer, not that it caused it.
RE: Zero Carb / Meat and Water - LALINDA - 05-20-2008 01:25 PM

Thanks so much Charles. I am going to make an appt with the ob-gyn and see what they have to say. Maybe it will be as simple as that. I really hope so.

I didn't even think about the hormone thing. And if your wife had not had the same problems, you probably would not have known about it either.

Thanks so much Charles. I will let you know how things go.

LA LINDA

LA LINDA

I just noticed the end of your earlier post about the vicodin. That's some powerful stuff. Basically anything that you put in your body has the potential to affect some hormone in some way. It's hard to know the potential effect but you have to assume that it will show up somewhere.

Weight regulation is a part of homeostasis just like internal body temperature, blood pressure, etc. They are all connected via the central nervous system and therefore any effect on one part will more than likely affect another system.

That's important to remember for anyone reading this. Don't for a second think that your weight loss efforts do not affect other systems in your body and vice-versa. If you're eating zero-carb for a significant period of time and you're not losing weight and getting healthier, then you have to look at all other bodily systems and you'll likely find your culprit.

Unfortunately, our medical profession does not appear to be interested in going after root causes. They are too preoccupied with symptoms!

RE: Zero Carb / Meat and Water - LALINDA - 05-20-2008 03:02 PM

Charles, I only take 1/2 of a pill at a time. I don't take it every day. Only when I am in a lot more pain that I can take. I am going to a pain management clinic soon. Hopefully to learn to deal with the pain and not take the pills. I hate taking them. I do not like how they make me feel. I wouldn't make a good drughead. I don't know how people do it.
HUGS,

LA LINDA

You must develop the same type of list.

I really like this attitude of focus on the goal with a willingness to change as necessary.

Since I feel good and stable, I am going to continue eating as I have been for six weeks (four more) before I make any changes. At that time I will make any necessary revisions.

My Two Week Progress Report:

Meat/Cheese/Eggs/Herbal Tea/Water

Start weight/BF/Water 119.6 27% 50%
Week 1 119.6 27% 50%
Week 2 119.4 27.5% 49.5%

It looks like my weight is staying pretty stable for now. My hunger, sleep, and body temp also are stable. I'm feeling comfortable eating this way and have no sugar cravings. I even walked down the cereal aisle with no desire- sweet cereal was always my downfall. I’m getting less interested in cheese and have all but given up the CO and fish oil- mainly because I just forget to take it. I feel good- rested, no bloating, generally physically comfortable. I have adequate energy but have not yet felt like exercising. I have some minor cravings for fruits and salads- light foods- but they are manageable.

This looks very, very good to me. I like how you notice other bodily systems working well such as sleep and body temperature. Weight is another one of those things.
Now that you have things stable, you should be able to influence your energy levels. How so? It's absolutely true that more consumption equals more energy expenditure. Less consumption equals less expenditure. You are clearly at equilibrium because everything is stable and you're maintaining your weight. I assume you can also go 5 or 6 hours between meals.

Here are two scenarios you can try. It doesn't matter which one you do.

Scenario 1: You can go for a nice walk this afternoon or evening. This should make you hungrier either tonight or tomorrow at one of your meals. This means you've shifted the equilibrium balance and your body now wants to compensate with a bit more food. Make sure you allow this to happen. Eat a little bit more meat. Never go hungry.

Scenario 2: Let's say you have two ground beef patties for breakfast. If you are hungry enough, you might try eating three and keep the other meals the same. You should notice that you can go an additional hour or so before needing lunch.

This means that your body is making efficient use of your long term fuel supply as it should. Depending on how much more you ate, you may feel like you have a bit more energy. You may do more housework or feel like taking the stairs or some other little thing that causes you to expend a bit more energy.

It's important to find out whether or not either of these are true for you. If so, you know everything is functioning as it should. If you notice no change, then you have to examine whether or not you're truly getting what you should from your meals. If you don't experience the things I describe, that's OKAY. Try the experiment again in a few weeks.

It's natural to have mild cravings. I have them from time to time too but they're very manageable. What used to be a shouting match, is now a mild conversation in my body. I can usually say something to myself like "I don't eat those things" and that's the end of it.

I'm usually not hungry during my usual routine. When I go out of town or I do something different, then I'm more susceptible to being hungry at a weird hour or something. With more activity, you should get hungrier. It's called "working up an appetite."

Regards,

Charles

**RE: Zero Carb / Meat and Water - Charles - 05-22-2008 01:33 PM**

Lauren Wrote:
Since it's been raining, I'm going with scenario 2. I just bought some beef patties for tomorrow morning. One of my biggest problems has been finding the right thing to eat for breakfast. I was eating eggs and sausage but apparently not enough because I could not go 5-6 hours until lunch. I would then eat an early bigger high fat lunch and then could go all afternoon until dinner. With all of the years of dieting and portion control, it is still a real challenge to feel okay about eating enough. I'm doing better though and trusting more in the process but notice that I backslide with insufficient portions on some days. On the up side, I threw away my food scale.

Thanks for your suggestions Charles. I will try them both.
You can do it, Lauren.

**RE: Zero Carb / Meat and Water - Lauren - 05-23-2008 01:25 PM**

Hi Charles,

I tried this today. I started out with a hamburger patty for breakfast but it didn't seem very fatty so instead of another, I had some leftover beef short ribs. I ate until I didn't want to eat anymore. It wasn't a huge amount of food but it was definitely more than I'm used to eating.

It was pretty amazing. I wasn't hungry all day and just decided to eat at 3:00 because when I thought of meat, it seamed appealing. I tried this earlier in the day and the thought of eating meat was nauseating. I like that little trick to figure out the difference between hunger and cravings.

It feels like magic to have my appetite and food consumption in tune like that. I always thought that my hunger was completely divorced from what I ate- that no matter how much I ate, I'd always be hungry.

I'm noticing that eating properly for my morning meal seems to be the most important for keeping my hunger in check. In reading the other ZC thread, I'd really like to work on keeping my food and mealtimes consistent. I can see why when you find something that works, you stick with it.

**RE: Zero Carb / Meat and Water - Charles - 05-23-2008 06:35 PM**

You have no idea of how proud I am of you today! That's fantastic. The best part is that you were not afraid to try it and to make a change. You're definitely on the right track.

Identify those super foods and eat them regularly. You'll condition your body to expect them and you'll also find yourself actually looking forward to those "boring" meals. It's an amazing thing!

Best regards,

Charles

**RE: Zero Carb / Meat and Water - Lauren - 05-24-2008 07:00 AM**

Thanks for the ideas and encouragement Charles. I also appreciate that you post your progress pictures. Seeing it work for someone else really encourages me to keep going.

**RE: Zero Carb / Meat and Water - LindaSue - 05-24-2008 07:18 AM**

Lauren, I'm glad it's working so well for you!

Yesterday I made an effort to stick to just three meals but didn't quite make it. I had breakfast around 8:00 (2 eggs, 1 tablespoon butter, 1 sausage patty) but couldn't quite make it to 1:00 for lunch (6 ounce
hamburger patty - 8 ounces before cooking). I ate lunch around 12:30. By about 4:30 I was too hungry to put off eating until 6:00 so I had about 3 ounces of ground beef (cooked weight). That did the trick but shortly after that I got terrible acid reflux. That surprised me because I hadn't eaten very much and had only eaten meat. Around 5:00 I ate 1/2 ounce of cheddar cheese which seemed to ease up the reflux. After that I got busy with some computer club work and didn't end up eating my dinner until 6:30. I had another 4 ounces of ground beef (cooked weight).

I thought that eating smaller meals would help with my reflux problem but apparently it doesn't always help. I haven't been weighing myself so I have no idea if I've lost any weight or not. I'm going to wait until I've been eating like this for a week or two before I weigh myself again. I want to work on getting my hunger under control. Today I'm switching things around a bit. I'm eating a 6 1/2 ounce hamburger for breakfast (1/2 pound raw weight), will have 4 ounces of ground beef for lunch and will have my lighter egg and sausage meal tonight for supper. Maybe by having my bigger meals for breakfast and lunch, I'll be able to go longer between meals. I just hope that reflux isn't going to be a constant problem.

I'm also trying not to eat cheese but for some reason it sounded like something that would make me feel better when I had that terrible reflux. I was going to eat a whole ounce of cheese but could only manage half an ounce. I have no trouble eating a lot of cheese when it's melted in a casserole or on a pizza but it's hard for me to choke it down "raw". I kind of nibble at a chunk just to make it easier to get down and a tiny piece fills me up very quickly.

It's just after 9:00 and I've just finished my hamburger. We'll see if I can make it until 1:00 before eating again. Four hours seems like an eternity though. I have to make a quiche for my husband so I'd better do that now while I'm feeling full. Otherwise it might make me want to eat again before lunch.

Hi Linda Sue,

I can tell you that two eggs and a sausage patty wouldn't keep me full until lunch either. For that filling breakfast yesterday, I ate a 6 oz. hamburger patty (pre-cooked weight) AND some boneless short rib slices which are extremely fatty (unfortunately I didn't weigh this- it wasn't a huge amount but it wasn't a small amount either).

I'm always surprised at how much food it takes for me to stay full. I'm working on figuring that out on a daily basis but often I misjudge and have to have a meat snack. I keep wondering, because of your acid reflux, would it be bad to have say, six small meals instead of three? If one eats the right foods in the right amount to fuel one's body, would it matter how many meals this was split into? I forget if it's been discussed on this board but I've been wondering about it.

One day I got up very early and had eggs at 5am, a steak at 8:30 and another steak at 3:30. I was full for the rest of the night. It seems that once I get the right amount of food, no matter the time, that's it for the day. I'm working on trying the biggest meal for breakfast too. This learning how to trust my hunger thing is difficult because it always seems like so much food. The reason I feel so trusting of this process is my new found ability to sleep through the night without eating. This had plagued me for at least 25 years. I'm looking forward to seeing other changes too but I will remain patient.

RE: Zero Carb / Meat and Water - **LindaSue** - 05-24-2008 11:17 AM

Lauren Wrote:

After what happened yesterday afternoon when I got reflux after eating a very small meal, I'm starting to wonder if that makes much of a difference. In any case, it's gets pretty tiresome to have to scrounge for food all day long which is why I'm going to try and train myself to eat three meals. I think I'm eating enough at each meal that I shouldn't need to eat more than three times a day but still not enough to cause the reflux all the time. Maybe four meals per day would be more realistic for me but I'll at least give this a shot for a while and see what happens. Any more than four meals gets to be a bother.

RE: Zero Carb / Meat and Water - **Mel** - 05-24-2008 12:44 PM

LindaSue,

In the spirit of self-experimentation and my limited knowledge of digestion: I know that the stomach will not empty it's contents unless the pH of the contents is just so. I think eating mostly meat makes the stomach contents push toward the acidic end on the range. If the stomach won't empty then I'm pretty sure it will put pressure on the inlet, hence reflux. Here's where you might experiment: try finishing your meal with a few ounces of seltzer water OR a tablespoon of vinegar in a few ounces of water OR some beverage that you associate with a calm stomach. Your goal is to "aid digestion" and bring your stomach
contents into the sweet spot of pH. It's possible you'll need to try these ideas preceding your meal.

Best of luck to you in figuring this out.

---

**RE: Zero Carb / Meat and Water - LindaSue - 05-25-2008 01:48 PM**

Mel, isn't vinegar acidic? It seems like that would be the last thing I'd want to drink if I'm having acid reflux.

---

**RE: Zero Carb / Meat and Water - Charles - 05-25-2008 03:23 PM**

LindaSue:

Don't be so hard on yourself about the cheese. I have recently added it back on an experimental basis. I can eat brie and it's no problem. I even had my Hardees Monster with cheese last week and everything was fine. I removed cheese from my diet along with eggs because breakfast was my least filling meal of the day, plus I immediately lost 5 pounds when I discontinued the eggs. I realized that I never tried cheese without the eggs, so their removal was premature.

I went all of last week without cheese, but I had plenty of brie yesterday morning, I had cheese on a double-cheeseburger for lunch, and I ate way too much at Golden Corral last night. This morning I was the same weight, so the cheese stays for now! The fact that I can take or leave it makes me feel pretty good about it.

Regards,

Charles

---

**RE: Zero Carb / Meat and Water - Mel - 05-25-2008 09:03 PM**

LindaSue,

I think that is true about vinegar but I just didn't want to assume that the problem could only be fixed by adding a base like seltzer. I'd try the seltzer first or something else you associate with a happy tummy but lots of people swear by vinegar in water to aid digestion. It's possible that your stomach has a pH problem that vinegar might fix, go figure. Just in case, I'd wait until you're rested up before experimenting with it.

Melinda

---

**RE: Zero Carb / Meat and Water - LindaSue - 05-26-2008 06:54 AM**

I really don't think that cheese is a problem food for me, at least not in the quantity that I eat. I'm certainly not addicted to it and can take it or leave it. It just goes well with certain things, like on a burger.

Melinda, I'm not sure that my stomach's pH is any different than most peoples' or in any way abnormal.
It's just that I've got a defect in the "valve" that should keep my stomach acids in my stomach where they belong and not up in my esophagus.

**RE: Zero Carb / Meat and Water - lowcarbscott - 05-26-2008 08:42 AM**

Wish I would have read this thread before I bought all of that grass fed beef 😞
Just my own expierence, The more meat I eat the more I look forward to eating it.

Thanks
Scott

Wish I would have read this thread before I bought all of that grass fed beef 😞
Just my own expierence, The more meat I eat the more I look forward to eating it.

Thanks
Scott

Sorry, Scott, I just wasn't impressed with the grass fed. I do appreciate the concept and I understand the push towards it, but I just don't see fattening the animals up before slaughter as such a big deal.

I just wish these hypocrites would look at the fattening process and understand why the same thing happens when humans eat grain as well. They get all wound up about animals not eating their natural diet but they don't even give it a second thought when they advise humans to eat the very thing they don't want animals to eat.

Then they turn around and say, well, eating grain-fed beef causes obesity. It's not the beef, it's the grain!

**RE: Zero Carb / Meat and Water - lowcarbscott - 05-26-2008 10:03 AM**

I hear ya,

My summers as a youth were spent on Grandpa's farm. We fattened up the pigs by feeding them corn and leftovers.
I just cooked up 1 lb cube of ground beef on the grill and washed it down with cool glass of ice water.
Yum 😊
I have spent a lot of time this weekend reading about Zero Carb life style. The more I read and try it the more I like it.

**RE: Zero Carb / Meat and Water - Lauren - 05-26-2008 11:16 AM**

I WILL NOT EAT WATERMELON!

I have been really liking the simplicity of Zero Carb and my cravings have been minimal lately. But today is beautiful, warm/hot, sunny and I just want to stick my head into a watermelon.
For many years after I quit drinking/drugs, on the first warm day of the year (when students played frisbee and dogs ran freely), I would always want to smoke pot. Of course I never think about this anymore but now my new pot may be watermelon :-)

I'm so glad it's going to rain tomorrow!

In spite of these cravings, I am determined to see this keto adaptation through.

That's the spirit!

However, if you do fall off the wagon, there are worse things than watermelon. I think it's relatively low glycemic because it's mostly water, but check with LindaSue to know for sure. I think Laura Dolson keeps a low-carb fruit and vegetable list on her site and melon is okay for most low-carbers if I remember right.

I made it through without watermelon or any other non-meat foods. Actually, I treated myself to a nice fish dinner which helped me get over the hump.

Tomorrow will be three weeks but I'm seriously considering skipping the weigh in this week. It's just before my TOM and I feel bloated. I never weigh at this time because I find it too depressing. As much as I'd like to be losing weight, I really want to keep the focus on health and repairing (as much as is possible) my metabolism. I'm sleeping great, good body temp, aside from fruit and salad cravings, no
sugar/starch cravings.

I'm focusing on the concept of "Patience and Persistence". I don't even want to consider any changes until at least 6 weeks. My energy is still up and down so I know I'm not there yet. On the up side, I already cleaned the entire house this morning. Now it's time for work.

**RE: Zero Carb / Meat and Water - bows** - 05-27-2008 06:00 AM

Morning, Charles and everyone!

I have not posted in a very very long time and have been 'walking beside the zero-carb wagon' since my son's graduation party, but that's another story for a different day!

I've made a couple of changes, after losing my first portion of weight and stalling (lost 75#), and would like your opinions please*

I only drink 3 cups of decaf coffee every morning now instead of regular, each w/ a teaspoon of CO in them..the CO wakes me up in the same way that caffeine (sp?) used to. Then throughout the day I drink water and decaf iced tea (usually totaling at least 64 oz). What is the verdict, Charles, on drinking decaf stuff? NOT instead of water, but in addition to it?

Thank you SO much all!
Debbie

I'm sorry Deb, I just don't have any personal experience with decaf coffee. Since there is no caffeine, what is in it that makes it so compelling?

All I can recommend is that you try it for a week without it and see what happens. If you stay the same, then keep it. If you notice changes then you can certainly re-program your taste for water instead of coffee with sufficient time.

Regards,
Charles

**RE: Zero Carb / Meat and Water - LindaSue** - 05-27-2008 08:41 AM

Some people just like the flavor of coffee. I enjoy a cup of decaf on cold mornings in the winter now and
then. Caffeine never did anything good for me anyway. However, decaf does have some caffeine, it just doesn't have as much as regular coffee. I suppose if you drank enough of it, it could still adversely affect you if you're sensitive to caffeine for whatever reason.

I looked up coffee on the USDA site to see how much caffeine there is in regular and decaf. Here's what I found:

8 ounces regular coffee: 95mg caffeine
8 ounces decaf coffee: 2mg caffeine
8 ounces brewed tea: 47mg caffeine
8 ounces Coke: 14mg caffeine

RE: Zero Carb / Meat and Water - Charles - 05-27-2008 09:30 AM

LindaSue Wrote:

8 ounces brewed tea: 47mg caffeine
8 ounces Coke: 14mg caffeine

So it appears that the critical issue is how sensitive the individual is to caffeine whether or not it makes a difference, right?

RE: Zero Carb / Meat and Water - Lauren - 05-27-2008 10:02 AM

I'm not sure if it's true but this is from a post by "The Bear":

"By the way, the oils in fresh coffee seem to have an ability to stimulate insulin release. Not the caffeine, nor will defatted instant, only whole brewed coffee. I have had to stick to just one cuppa in the early morning, drat it."

Lauren Wrote:

**RE: Zero Carb / Meat and Water - Lauren - 05-28-2008 04:36 AM**

Week 3 Progress Report: Meat/Cheese/Egg/Herbal Tea/Water

Start weight/ BF 119.6 27%
Week 1 119.6 27%
Week 2 119.4 27.5%
Week 3 121.6 27%

Well, I got up enough courage to weigh myself. Since this is the usual TOM when I gain, I'm not going to worry about the two pounds. Hopefully it will be gone by next week.

Charles, I have a question for you. I've noticed that during these past two weeks, I have experienced high energy and appetite suppression at times and low energy at strong appetite at times. Do you think that this means that sometimes I am burning fatty acids and other times not? Would it be logical to go in and out like that or do you think that once you adapt to burning ketones, then it's more consistent? Not that I know exactly what to make of the keto sticks, but they are sometimes purple and sometimes trace. There are no new additions to my menu so if anything, I am going closer to zero since my egg and cheese consumption is getting less and less.

---

We always burn fatty acids, period. The only time you don't is when your insulin rises either in response to a carbohydrate meal or in contemplation of one. So in a sense, you do burn fatty acids sometimes and sometimes not.

Low energy generally means you're not eating enough. Strong appetite should follow these periods of low energy and it's important to feed it. When you're feeling the hungriest, I wouldn't eat cheese or eggs at that point. That's when you want to some fatty beef and you should eat as much of it as you want.

The longer you are on this, the keto sticks should be trace or nothing because that will indicate that you're using all your ketones and not wasting any. I would imagine that during times that your insulin is raised, your sticks might turn purple at that time. Your brain and many tissues use ketones, but your muscles don't use so much. They will burn fatty acids and they will "spare" any glycogen you have in your muscles like they're supposed to.
You're doing fine. Just keep it up. One day soon you'll feel like exercise and we'll get to that. Once you begin some weight training, you'll get the body that you want. Your weight is not the issue at all. You just need some muscle on that frame and you'll be just as shapely as you're envisioning. You won't bulk all up unless you take steroids!

Regards,

Charles

**RE: Zero Carb / Meat and Water - Mary - 05-29-2008 08:32 AM**

Good Morning Charles,

Have a question and just need a little reassurance. I ate alot of ground beef for dinner last night. I probably ate about 14 ounces of meat and it was well done. It just turned out well done and have to admit I kind of loved it. I also had another burger for breakfast which was about 7 oz. Right now (10:30) I am stuffed and probably won't want much for lunch at 12:30 or 1:00. We will see. Both times I ate till the beef didn't taste good to me anymore. I usually eat my beef med rare so dinner will be med rare rib eye so I can get my vitamins. Is this right and does it matter if not all the beef is on the med rare side. I kind of like the ground beef on the done side.

Thanks Charles,

Mary

No, Mary. Eat your ground beef on the done side. That's what I do. I like my steaks medium to medium-well, but I don't play around with ground beef, ground pork or chicken for that matter. I cook it.

Oh Good!!!!!! I baked the burgers at 250 because I was leaving for awhile and wanted something warm to eat at 8:00 when I got home. Wow, I am making them again they were yummy. We only eat well done chicken and pork, also.

Still a little nervous eating this much but it looks like I lost 1/2 pound this morn. I am almost done loosing the 7 pounds I regained.

---

Hi Mary,

How long do you cook your burgers at 250? I always pan fry them- do you prefer baked?

Was that 14 oz. of cooked beef that you ate for dinner? I know what you mean about feeling nervous about eating so much. It makes me feel like I'm jumping off into the abyss. One day I ate a steak for lunch- it was fairly small and I was still hungry so I ate a large hamburger. I was full for a LONG time.

That's the spirit, Ladies. You were full for a LONG time? That's exactly what's supposed to happen. That's why I don't believe in "overeating." If you eat a lot of food, you'll just wait longer before you eat the next time. If you eat a little food, you'll just eat that much sooner. Soon you'll be in control of the situation and you'll decide how full and how long you want to wait until the next meal.

I will probably grab a piece of lunch meat or something on the way to the gym tonight, but it won't be much because I know I'll eat dinner after working out.
You are now living proof that it's not about calories, but about getting full!

Hi Lauren,

I made really large patties and then baked them for about 2 hours. I didn't really plan to do them quite that long but it just worked out that way. They tasted wonderful to me. Like little meat loaves even though I didn't put a darn thing on them. Yummy at least to me.

Yes, 14 oz of the cooked ground beef for dinner. I was really hungry and this morning I ate 3 1/2 oz at about 6:30 and another 3 1/2 oz at 9:30. Nothing since then and I'm still really full. We won't eat dinner till 7:00 so I might have to snack on a little of the ground beef but right now my tummy feels full. Yes, eating a big quantity at one time makes me a little scared. This is a fun experiment.

How are you doing today? Still feeling good and lots of energy?

Mary

---

**RE: Zero Carb / Meat and Water - Mary - 05-29-2008 02:01 PM**

Thanks Charles for all the advice and the reassurance.

P.S. The idea to bake meat at 250 came from Casey. (BlackPhase)

How are you doing today? Still feeling good and lots of energy?

Mary

Hi Mary,
I do feel good. My energy is up and down but overall I still feel very encouraged to keep going. I'm surprised at how much I don't miss other foods most of the time. It sounds like you are doing straight meat and water- that's great. I seem to need a little cheese, eggs and herbal tea now and then.

Besides really great sleep, I am dreaming like crazy. I hadn't remembered my dreams for a long time (I think because I never used to sleep long enough to get to that state) and now I wake up remembering vivid dreams. Also, my hair is no longer falling out. When I was on low fat, it was terrible. It wasn't noticeable but it would scare me how much I would lose when I brushed my hair. My teeth also are improving and stay a lot cleaner.

Even though I'm not losing any fat yet, these improvements are really keeping me going and convinced that my body is responding positively to this diet. I look forward to hearing about your progress as well. I'm motivated when I read Charles and The Bear since it has worked so well for them and has kept them at their ideal weight. I really want to see it work that way for some women.

I am going to try baking some burgers today.

This is such common sense but it feels like a revelation to me.

Charles, were you ever a grazer or did you always eat three meals a day? I used to be a constant snacker and rarely ate big meals. I still have a hard time eating enough to get me through 5-6 hours on a regular basis. I often eat a little, feel full and then stop to find myself needing to eat a few hours later. I'm going to consciously eat a larger lunch today to try to get to dinner at 7:00. It's easy when I'm hungry but sometimes I just don't feel hungry for a big meal but then need to eat again too soon.

Hi Lauren,

I feel well also. I slept very well last night and usually wake up at least once so that is a good sign. No, I am not at the only meat and water stage yet. I have at least one cup of real coffee and a diet coke a day. Some days two cups of coffee but today I'm trying to have de caff for one of the cups. I know that coffee
is a bad thing but I am addicted and love it and will work on that. I have had american cheese this week and will stop that because it's not working well for me. Also, when we go out I pick at a salad. I don't like to call attention to the fact that I'm not eating veg because everyone then wants to give advice. If a person just takes a bite now and then no one says a word. So you see it's a long journey to pure meat and water but that's ok because I tell myself that I'm not in a hurry and good health is the main thing. HA-I WOULD LIKE TO LOOSE THIS WEIGHT IN A WEEK, WHO AM I KIDDING.

Have a great meaty day,
Mary

**RE: Zero Carb / Meat and Water - Divine Miss M - 05-31-2008 12:07 AM**

Charles, Linda Sue, Lauren, Mel, Mary:

Hello! I just got a chance to read thru the entire thread and I'm very intrigued. I've been experiencing 'stall-gains' since November and notice that, of late, I only lose when I do the m/e deal - specifically, lots of eggs. (I can only guess I crave eggs due to sulfur content).

Anyway, I lost 100 lbs. in 6.5 months but I am not yet at goal. I simply can't get past that marker. In fact, I get very close and then bounce right back up, have to go to mostly m/e to lose it but then bounce as soon as I'm 'this close' to the 100 lb loss. I've gone thru that same process so many times I've lost count.

Diabetes runs in my family - mostly from mom to daughter, for at least three generations. Due to what I've read in this thread, my own experience indicates I'm now at the point where I 'have' to eat only protein and fat, so I'm going to join you and get even tougher with myself.

First, I want to be sure I have this 'woe' straight:

- all proteins, including their natural fat  
- however, avoid eggs and cheese and dairy products  
- no caffeine; drink water  
- no 'artificial sweeteners' [not even stevia or Splenda]  
- use Celtic sea salt, if at all possible  
- have lc veggies only if I feel weak or dizzy, but keep the amt scant  

In fact, that is exactly what I've done with some of my 'cycling' but I do use stevia, I do eat eggs, and sometimes cheese. I've basically given up all veggies.

This week, I did m/e and lost 6 lbs., but I'm not overly excited because these are the same numbers I always see.

However, if I understand the guidelines for this lifetime woe that Charles and LindaSue have been following, and I see that it works for me, also, I'll definitely be very excited!

Thanks so much for the interesting thread and the motivation!

---

**RE: Zero Carb / Meat and Water - LindaSue - 05-31-2008 06:45 AM**

Divine Miss M, if you are losing weight while eating eggs, I wouldn't give them up just yet. They may not be a problem food for you. Losing six pounds in a week seems to indicate that eggs are fine for you.
I would keep things the same as you're doing and if you stall then leave the eggs out and see what happens.

How much more weight do you need to lose? Just curious.

---

**RE: Zero Carb / Meat and Water** - lowcarbscott - 05-31-2008 08:18 AM

I have been lurking on this thread all week. I dropped the vege's and fruit last sunday.

I have been eating the following.
Main courses of: beef, chicken, pork, eggs
Snacks: franken food snacks, red wine
Drinks: coffee, water, ice tea, limited diet soda
Exersize, 4 days 30 to 45 minutes

I have seen a dramatic increase in energy. I also don't feel deprived of anything, except maybe beer 😞

Down 4.8 lbs as of this morning.

Thanks all for your posts here.

---

Oooh, frankenfoods. Care to elaborate? It sounds like they're working for you, so far at least. I do use them on rare occasions but they scare me.

---

**RE: Zero Carb / Meat and Water** - lowcarbscott - 05-31-2008 11:17 AM

Linda Sue

Atkins bars and some low carb ice cream bars. I am using one or the other per day.
I also forgot to add that I am still eating butter and limited amounts of cheese.

Scott

---

**RE: Zero Carb / Meat and Water** - lowcarbscott - 06-01-2008 11:32 AM

Well, My 7 day Near Zero experiment yeilded a 5.5 lb weight loss.

I celebrated by grilling a 1lb cube of hamburger for lunch today 😞
DW thinks i have lost it.

Scott

Oh no, Lauren. I used to be a big grazer. On my low fat diet, I ate every two hours. I would really be hungry. I had popcorn, nuts, apples, etc. I was just like the people I observe in my office, they eat every two hours without fail.

One of the things that let me know that low-carb was correct was that I remembered my youth. I used to eat my mother's food and I was always full. I never remember going to bed even a little bit hungry. We weren't rich by any means but we were a meat and potatoes type of family and we always ate to satiety.

When I began low-fat dieting, it didn't feel natural because the food tasted terrible and I was always hungry. I got skinny (221 to 178) and everyone said I looked gaunt and too skinny. When I got to 178 on my low-carb diet, everyone talked about my muscles which they still do at 156. I'm never hungry anymore unless it's time to really eat.

When I finished my race this morning, a guy was talking to me and he was remarking how he could now go and eat breakfast and not have to feel guilty about it because we just ran a 6.2 mile race. I thought to myself, I never feel guilty about my breakfast and I can always eat as much as I need to get full.

The zero-carb lifestyle is about not having to make apologies.

Scott

Great job, Scott. If eating those things is working for you, I can only look on fondly with jealousy. I used to love the Atkins bars and I really use to put away some low-carb ice cream. I just reached a point were I couldn't go any further so I dropped them to continue on. I always said I would have something like that rarely, but I never seem to get around to it.

Thanks so much for the interesting thread and the motivation!

Welcome and I hope that something here inspires you not to give up and that hopefully we can plug up what's missing and you'll be on your way to a lasting solution.

It sounds like a life sentence, but it really is that, a life-sentence and not a doorway to an early disease. If you can find the right combination of foods that lead to good health and your whole body works better as a result, then you would be following what is by definition a healthy diet. When you get on board, you will find that you don't even miss the old things, especially those things that will make you feel less than you feel when healthy.

I know I can have any number of foods. I could have a piece of cake or whatever it is. I could just go back to my stable of established foods for the next few days and everything would be fine. However, as I go on through life, I find that I don't want to put these things in my body even for a short period of time because I love how I feel on my healthy diet. I love how I look, how I feel, how all my bodily systems work just like a college student, and there's no need to mess with that.

Again, welcome and best regards,

Charles

RE: Zero Carb / Meat and Water - Divine Miss M  06-04-2008 02:04 AM

Charles, thanks for that encouraging note! I have to say that there is 'no way' I'm giving up! I have come too far to do that, and I really don't consider eating 'this' way a sentence. I'd be happy to do it to feel better and be at goal wt. for the rest of my life. That's been my attitude since Icing last May, despite what others may say to me - e.g., that 'it's impossible' to low carb for life. Baloney - it's all about mindset and metabolism, which I am convinced is the real battle.

My problem is discovering what is stopping me from finishing this journey to goal, so I can continue my low-carb lifestyle at maintenance. I am fully aware that this lifestyle isn't until goal but forever. And honestly, that's fine by me. :>

I do know I have a serious problem with water retention, but my doc is no help except to say it's due to the arthritis or the fibromyalgia and I just have to learn to endure it. [Not!]There 'has' to be a solution to getting water retention under control. Something is 'seriously up' when a person can lose and drop it like the proverbial hotcake within a week [we're talking stuff like a 7 lb. overnight gain or loss, or 15 - 18 lbs. total gain in a week, followed by losing it when going to all fat/protein]. The last time I had my kidneys checked, doc says all was ok, but that doesn't answer 'why' I have such severe water retention when the weather changes, here in Michigan, where Mother Nature seems to have perpetual mood
Lemon water helps me with that water retention difficulty, btw, but it seems I have to swim in the stuff to keep it manageable.

Linda Sue, thanks for the advice about the eggs. To answer your question, I have quite a way to go yet. According to various charts, I should be anywhere from the 140's to 155. Now I know from experience that I'd be super-thin at that weight; I'm small-boned but I have the classic figure 8 figure which means I can carry more wt. that I seem to be. At any rate, I'll be happy at 165 or at a wt. close to it - if I feel great and have 'good' tone at a higher wt., I'll be happy with that, too. So for now, I'm aiming for 165 but I am more concerned about measurements at goal, since wt. is a 'relative' thing.

As of today, I am 228 [again] after a bounce to 234, which means I'm once more in the downward trend [which never lasts; the up and down cycle has been my experience since Nov. 2007]. My lowest was 214 [the 100 lb. marker] but the wt. will not even stay there much less drop further. Instead the scale just bounces right back up as soon as I'm at 215-216, regardless of sticking with m/e or exercise. I think a 6 month bout of 'stall-gains' is enough already!

So here we go again; in the meantime, I'm starting a new regime, including a natural cleanse that especially supports the liver. Some reading on fibro indicates a lack of sulphur may be the cause of the illness, so I'm also adding a few more supplements, in addition to everything else I already take. (The extra need for sulphur may also explain my recent cravings for eggs, eggs, eggs, which is what had me wondering 'why'. I mean, whoever heard of a craving for eggs, of all things?)

As I wrote earlier, I also suspect candida is a culprit or 'roadblock' to my final success of regained health. [I've come a long way, not only with weight but in getting off all meds, and that is something I will always keep in mind.] Due to a year of low-carbing, I think candida is under control but not eradicated, which would also account for the bounces, as well as some other symptoms that keep resurfacing when I least expect it.

So that's the quick fill-in on yours truly..

Thanks for the warm welcome!

---

**RE: Zero Carb / Meat and Water** - Clabbergirl - 06-04-2008 07:18 AM

I am sort of proud of myself and just had to tell someone. I think I can count yesterday as the first full day of eating this way that I've managed. I ate nothing but meat or cheese at every meal/snack. I was super busy so I didn't have much time to think about things, and I had precooked some ground hamburger so it made transporting to work easier, both obstacles I am very worried about on a continued basis. I didn't even have a chance to see any TV, which probably made it easier to hold back on cravings for carbs. (Those Pizza Hut commercials KILL me!)

This morning however, I'm having cravings well before the time I usually do. Is this pretty normal? I just ate a bunch of beef jerky, then read the empty package and saw it had sugar in it, although a small amount. So am I left with making my own jerky on top of cooking for breakfast, lunch and dinner the night before? I want to do this, but I'm drawing a blank on how to stay ahead of my meals and hunger, and keeping things portable. I cooked 6 lbs of hamburger the night before last, and already 3lbs of it is gone. The other 3 will be gone by lunch, and I will have to find something for dinner, which won't be happening until around 7 for me considering my schedule. I boiled a dozen eggs over the weekend, then consumed 10 of them (with mayo) the next morning in one sitting, and only stopped myself because I
felt guilty that I ate so much. At that rate, I will have to buy 5 or 6 dozen eggs a week. Is this excessive, or is this the norm for those eating eggs on this lc/zc diet?

I'm feeling very glad that I made it one day, but also very unprepared to continue, and that's setting myself up for failure. My husband has been helping prepare meals for the family lately, but he won't be able to do that forever, and I'm worried about fixing their meals and then not eating them (because I hate cooking and see eating what I cook as some sort of weird reward for making the meal in the first place). How do others cook carb meals for their family and not eat them? Sheer willpower? I feel like an alcoholic in a liquor store in that kind of situation.

This forum is great, and thanks for any suggestions. I have a lot of mental blocks on this whole eating plan, and if my questions seem childish or contrary, I do not mean them to be that way. I'm not even sure I know what hunger is half the time, it's probably a lot of compulsion to eat carbs, carbs, and more carbs.

---

I am very proud of you. Sorry it took me a while to see your note. I've been having so much fun over in the Eades discussion thread that I've neglected to check my favorites.

The cravings are due either to the cheese, eggs, or both. Those things both give me cravings and weight gain so I had to eliminate them from my diet. I really like cheese too, but for now, only brie gets in occasionally. You may try your ground beef without the cheese and eggs and see what happens. If you weigh a lot, you should eat a lot. Don't apologize or feel bad. You don't want to eat at the level you're going to, you want to eat according to your appetite and as you shrink down, your appetite will adjust some. Either way, you won't notice it. Just eat until you're full and that's it.

If you're not hungry, don't eat. Don't think you have to eat three or four times or whatever. I just don't want you to go around feeling hungry. By the same token, you don't need to eat "just because."

Clabbergirl Wrote:
This morning however, I'm having cravings well before the time I usually do. Is this pretty normal?

It may be for you due to the level of hyperinsulinemia you experience. You should be able to last 5 or 6 hours. If not, then you have to eat more often. Eliminate the cheese, eggs and sugar loaded jerky and see if that takes care of the cravings and allows you to stay full longer. Jerky shouldn't really be that bad in spite of the sugar, but the nitrates and nitrites bother people as well so that's something you'll have to watch.

Clabbergirl Wrote:
So am I left with making my own jerky on top of cooking for breakfast, lunch and dinner the night before?
If that's what you want. I do cook breakfast and I make lunch in the morning before I go to work. Fortunately, I don't have to worry about dinner. You could always get a Monster plain at Hardees. Fabulous sandwich. Their burgers are the most flavorful in my opinion than any others, although I wouldn't hesitate to get any burger if that is what was available and I was hungry.

Clabbergirl Wrote:

Hopefully, LindaSue or some of the others will chime in here with ideas. Unfortunately, I eat the same things most days. I do bacon and ground pork for breakfast (experimenting by substituting from my ground beef since the pork has more fat) and for lunch I have a ribeye from Wal-Mart.

Clabbergirl Wrote:
Is this excessive, or is this the norm for those eating eggs on this lc/zc diet?

There is no "norm." The questions only concern you, your appetite, how long you can go between experiencing hunger, and whether you are losing weight. That's it.

Clabbergirl Wrote:

I'm not in the situation where I have to pack food to take with me. Any time that I have had to in the past, I was eating more carbs so I had a lot more options (salads, etc.). Since I eat hamburgers or just cooked crumbled ground beef most of the time now, that's what I'd pack in my lunch. Any kind of leftover meat would be good. If you don't mind using some mayonnaise, you could make egg salad, tuna salad or chicken salad. Hard boiled eggs are easy to pack as well.
Clabbergirl: Well, it helped me to imagine a skull and bones on certain foods...cuz that's what they are, especially for us. In the beginning, when I was still honestly hungry, I had more protein. Didn't need much, since it fills one up so quickly, and the tummy is happy for hours [as my littlest one phrases it].

I also got to a point where dinner is simply protein and salad, for all concerned. We kept it simple when I started out with lowcarbing - intending to make it work, no matter what - but I'm also fortunate that my dh is not super-picky and doesn't demand certain foods. Also, most of my kids are older now, so if they want something that I will no longer make, they will make it. Those occasions are fewer and farther between - mostly, it comes down to times when they want mashed potatoes or rice pilaf. We no longer buy potatoes, rice, etc., on a regular basis, and the kids are converting to low-carb tortillas when they want bread. One of my older boys still wants the bread and that is hard to control with a 21 yo young man. 😞

There was a time when I fixed a meal of protein, veggie or salad, two starches for my large family...now, as I noted earlier, it's down to 2 dishes for dinner. Breakfast and lunch are also super-simple, like eggs and Canadian bacon (if you can handle the eggs), or no-nitrate 'fried' Italian salami (like Genoa, if you can find it). Sometimes, if we're in the mood, we make homemade low-carb cheesecake with an almond-meal/flaxseed crust for a dinner dessert. I don't do indulge often, since I usually maintain my wt. the next day but it's a nice treat for the family and it's still low-carb. (I'm trying to slowly convert all of them to a low-carb lifestyle; it's not perfect yet but everyone is much more conscious of sugar, sugar products, anything that ends with 'ose', MSG, and other things not good for us.)

Simple, but it worked. I think that's what they call KISS - Keep It Simple, Sweetie!

I made it another day without succumbing to the carb monkey on my back - whew! This is half way into Day 3. I hope it gets easier with time. Charles, I do weigh a lot for my frame, so maybe my appetite is to be expected at this number. In the last 4 years I've gradually switched from a pear shape body type to an apple shape (or maybe an apple and pear combined!), to my frustration. A lifelong friend who has watched me yo-yo through the years told me some time back that this weight gain looks different on me from the others - I look 'puffy'. I'd had an inkling there were insulin/metabolic issues for some time, but when I was tested for diabetes then, it was negative.

My mother was a newly diagnosed Type I diabetic when she was pregnant with me, and I was born a full month early weighing in at 10lbs 9oz, and we are not big-boned people. They told her diabetic babies were usually overly large because of the disease. Every doctor I've mentioned that to writes it off like it has nothing to do with how my body processes sugars, but I have always wondered how could it not?

This high protein/high fat diet really is my last ditch attempt at control. I have the desire, and am working on the motivation, now I just need the skills. I may be carting a 30 gallon cooler with me to work for awhile, but hey...

One question: How do you handle eating at a pizza restaurant or pizza buffet? Scrape things off the top and eat just that, or live off the shredded cheese from the salad bar (provided you can handle cheese OK)?
Clabbergirl Wrote:

Congratulations! It does get easier, but you have to stay out of your body's way. It will adapt but it takes a little time. Your body is accustomed to predicting what you're going to do. Once it sees that you're not doing those things anymore, it will attempt to adapt to your new diet.

Clabbergirl Wrote:
Charles, I do weigh a lot for my frame, so maybe my appetite is to be expected at this number.

I think so. I only weigh 156. I can't imagine a 200 pound person eating less than what I eat. I don't feel like I eat less than I did when I was 207. I suppose maybe I do, but I don't really think so. I certainly feel full when I stop eating just as I always have. I never go hungry, at least not for long anyway.

Clabbergirl Wrote:

If you read the article, "Thin Man's Diabetes" then you know that by the time the test reads positive, the major damage has already been done. Those tests are fasting tests and they don't tell you what your bloodsugar level is most of the time.

Clabbergirl Wrote:

Hey, some people pay thousands of dollars to get their weight reduced. They endure surgeries, tortures, liquid diets, you name it. The diet industry is a billion dollar industry. I'm not suggesting any products and I'm not getting paid to tell you anything either. I'm telling you to eat real food that your body was designed to easily and efficiently handle. When you do this, your body will regulate your weight just as its supposed to.

All you have to do is listen to your body and eat when it tells you to.

Clabbergirl Wrote:
One question: How do you handle eating at a pizza restaurant or pizza buffet? Scrape things off the top and eat just that, or live off the shredded cheese from the salad bar (provided you can handle cheese OK)?

I would not go to such a place 😞 But, if I had to... I would see if they have chicken wings. I really can't imagine what I would actually eat there. I don't eat cheese or tomatoes or their products so I'm not sure. I suppose I would look for any meat and just scrape it off.

Actually, to be honest, I probably wouldn't eat anything there. There have been times where I just wanted to socialize with my friends so I would go to a restaurant with them and just get a glass of water and chat. Then, I would go and get some real food later. Alternatively, I would eat a big, juicy steak before I go and just drink water at the place.

Regards,

Charles

---

Thanks for such a quick response.

I have teenagers, and imagine I'll find myself at a pizza parlor or movie theater sooner rather than later. I can hardly stand to eat raw vegetables anymore (IBS supposedly) so even a salad can be excruciating. Right now I don't trust myself to ignore the carbs in a "carb-rich environment", so maybe I should do my best to ignore these kinds of minefields. Bread and meat are pretty much the only things I have left, and a diet of starches has gotten me nowhere.

I know you recommend cutting out coffee, diet drinks, etc., but I'm honestly not ready for that yet. One thing at a time. This forum is a great place - wonderful info and support!

Thanks so much.

Thanks so much.

You're welcome. I have three children also so I completely understand. Try Golden Corral instead. They
have pizza and stuff too, but they also have some much better food on their buffet.

I know, the drinks sound harsh, but what I've found is that they are like gateway drugs. One can ingest far more sugar through a drink than they can if they were eating sugar. Not to mention, recent studies show that those zero-calorie things actually raise your insulin and cause cravings which leads to a person eating more of these frankenfoods than they would if they just ate the real thing.

When you have a "taste for the sweet" in your mouth, it makes everything else so much more difficult. You will gravitate towards the saucy meats, the cheeses and even nuts and other spices. All of these things tend to keep your insulin elevated and when its elevated, you are not mobilizing fatty acids.

Don't worry, you're perfectly fine doing it "one thing at a time," but give some thought to what's going on in your body. It's a small price to pay when your health is at stake and I want to see you succeed.

Best regards,

Charles

I still drink herbal tea so I'm not there yet either but I just wanted to give you some encouragement about giving up diet drinks. My husband and I used to go through a case every day. Our whole fridge was full of cans of Diet Slice and Diet Coke. I also used to put about 12 packets of Splenda in our morning oatmeal. We're now soda, artificial sweetener, and sugar free. I still can hardly believe it because I used to feel life would not be worth living without it. If we can do it, anyone can. I can honestly say that I don't miss it. It feels really good to have that monkey off my back.

When you're ready, you will be able to do it. Good Luck!

**RE: Zero Carb / Meat and Water - Clabbergirl - 06-05-2008 08:33 PM**

How did you ever get over that much of a sugar addiction? Holy cow!

I'm not that bad, but I drink about 2 cups of coffee before work with splenda (and now heavy cream & a tbsp of coconut oil). I don't drink many diet cokes during the week, but the weekend is heavy with diet coke. I believe wholeheartedly that diet cokes make me hungrier than if I don't drink one, or hungry sooner. I drink herbal teas throughout the day and I've started taking stevia with that...otherwise it's water or maybe Crystal Light for a treat. I have to do things one at a time, at least right now. But I'm amazed if you had that much sugar substitute in your life, how you did it...cold turkey or gradually?

---

**RE: Zero Carb / Meat and Water - Charles - 06-06-2008 06:24 AM**

Clabbergirl Wrote:
How did you ever get over that much of a sugar addiction? Holy cow!
It was easier once I read this:

**Stomach cramping and diarrhea are certainly not as serious as the conditions associated with some of the non-nutritive sweeteners, but the sugar alcohols can cause other more serious problems. One of these conditions is metabolic acidosis, which can lead to acid reflux and an increased risk of cancer of the larynx. And diabetics and hypoglycemics should be aware that sugar alcohols do raise blood sugar levels, although not as much as sugar. Sugar alcohols also promote dehydration and loss of electrolytes, creating feelings of excessive thirst. This is a potential concern to those who consume a lot of low-carb, energy bar types of foods. Exercising after consuming these types of products may put one at risk for heat stroke, muscle cramping and cardiovascular problems. Those who are trying to avoid carbohydrates and burn body fat should also know that sugar alcohols will immediately take the body out of ketosis, the state wherein fat reserves rather than dietary calories are being metabolized. . . assuming that the body was in a state of ketosis to begin with.**

---

**RE: Zero Carb / Meat and Water - Clabbergirl - 06-06-2008 06:39 AM**

Ah, but I shouldn't believe everything I read, now should I? 😐

I'm kidding, or rather, secure in my denial at this point. Even if none of things were true, and they probably are, I can logically see how the taste of sugar will just make a person want more, making a carb-free way of life even harder in the long run. I didn't see that Agave nectar on the list - is that an "okay" one?

The first time we "kicked" diet soda, we got a water cooler. It helped to have cool, clean water to drink. I think we paid off a credit card balance quickly with the money we were no longer spending on soda. We were off it for about a year but then moved and the stress weakened us.

This time, we quit again cold turkey and it's been over two years. We had to go cold turkey both times since we were so out of control.

Starting LC was the beginning of the end with the artificial sweeteners. For that, I tapered off to using 1-2 packets of stevia per day. I have only been completely AS free for about a month- as long as I have been eating near zero carbs. I sometimes still crave a sweet but I don't want to open that door again. The taste for sweet is such a downfall for me and it seems easier to just to not have any at all.

As for Agave, I think that it's just as bad.

---

**RE: Zero Carb / Meat and Water - Vesna - 06-06-2008 06:13 PM**

Hi, gang, I found this thread earlier today and have been reading through it.

I started meat and water earlier this week and am struggling through it! No coffee. No cream. I was soooo tempted to get coffee out of the vending machine yesterday afternoon and the day before that. I think the reason I was able to not obsess this afternoon was mainly because I was getting energy just from the fact that it's Friday.

I just feel weaker and more tired as the day and evening wears on. Maybe I'm not making myself enough to eat? Maybe the mistake I made in my whole foods + salad experiment, where my calories dipped to 1200-1500/day with <20g carbs, was not eating enough? Maybe I have this reactive hypoglycemia that I've been hearing so much about lately? I get hungry, but it takes so long and so much energy to prepare anything to eat...

Ain't that a cranky how-dee-do!

Here's my public Fitday URL in case anyone is interested: [http://www.fitday.com/WebFit/PublicJournals.html?Owner=weasel%21](http://www.fitday.com/WebFit/PublicJournals.html?Owner=weasel%21)

Hi Vesna,

How are you doing with the meat and water? I'm always interested in how it's working for people (especially women). I haven't been able to stick to all meat and water yet but my diet is very meat-centric and my carbs are less than 10 per day. Thanks for sharing your fit day info.

RE: Zero Carb / Meat and Water - Clabbergirl - 06-09-2008 08:01 AM

Vesna I can relate on it taking a long time to prepare things. I struggle with this too. To those who think it doesn't take long to broil a steak or fry a burger, what is your secret because that is more time than I have some days. Frying or broiling a steak not only involves defrost & cook, but then clean up - which is probably the real reason I dislike cooking. I bought myself a toaster oven this weekend so I could broil steaks maybe easier/quicker, but didn't use it yet. I almost hate to get it dirty!

I am very new so I can't give much in the way of advice. I would like to ask you how the quality of your sleep has been during this first week, and commend you on the great job you've done on a very tough task. Have you been getting good sleep and drinking lots of water? Water consumption seems to directly affect how much energy I have..meaning if I get dehydrated, my legs feel like they are moving through sand.

RE: Zero Carb / Meat and Water - Vesna - 06-09-2008 08:09 AM

I'm working on a much longer post. Meantime, I've been feeling awful, but better today. My sleep has been awful, but better last night. Walking through sand: good description. I love to cook, but not so much when the ingredient list is so narrow.

Later!

Vesna I can relate on it taking a long time to prepare things. I struggle with this too. To those who think it doesn't take long to broil a steak or fry a burger, what is your secret because that is more time than I have some days. Frying or broiling a steak not only involves defrost & cook, but then clean up - which is probably the real reason I dislike cooking.

Just put the frozen meat in the refridgerator a day or two ahead of time to thaw out. Saves the time of having to defrost. With respect to cleanup, get a cast iron pan to cook with. Once it is well seasoned you just have to wipe the interior with a paper towel. No cleanup. The heat will kill any bacteria.

I second this advice. I do the same thing. I just put my lunch ribeyes in the fridge the night before then in the morning, I put them in the oven on "broil" and they don't take too much time. I've gotten to wear I can put them in on low/broil as I get into the shower. I flip them after the shower, then I run up and get dressed (assuming I don't have to iron) and the steak is done.

I put foil in the pan so clean up is just carefully removing the foil and tossing it away. The pan is already clean. For breakfast, I cook my ground beef (I'm back to that now since it's fattier than the ground pork) on a cast iron griddle and I just melt the fat and wipe it off. I tell my children not to touch it when they clean the kitchen!

Vesna Wrote:
I'm working on a much longer post. Meantime, I've been feeling awful, but better today. My sleep has been awful, but better last night. Walking through sand: good description. I love to cook, but not so much when the ingredient list is so narrow.

Later!

You may feel bad for a few days, but hang in there. It will pass and soon you'll feel better than you have in a long time. Just make sure you're eating fatty protein, not lean stuff. Try not to overcook the meat too much. It doesn't have to be medium-rare or anything like that, but you want to get the nutrients from it. There is no need for supplements of any kind.

Keep us posted!

Charles

RE: Zero Carb / Meat and Water - Vesna - 06-10-2008 05:25 AM

One week completed.

Cold turkey. Nothing but meat and butter and water since Tuesday, with the exception of mayo (homemade -- essentially just 1 cup peanut oil + 1 egg = 10 oz. mayo, so no soy or chemicals) Sunday and Monday. No coffee, no tea, no veg, no salad. No cheese, no cream, no eggs, no cream cheese, no sour cream. I'm using butter to increase the fat ratio. (I can't afford steak and other expensive (= higher fat) cuts each day.)

It's been rough, no kidding. A shock to the system. If it weren't for the recent discussions on reactive hypoglycemia and hyperinsulinemia, I wouldn't know how to begin to interpret what's going on.

I'll feel fine until I eat, and then, while I'm eating, I'll begin to experience a tremendous drop in energy, so that if I'm home I can only collapse onto the couch, or if I'm at work after lunch, I fight the exhaustion, trying just to keep my eyes open and my brain focused enough to stay on task.
I've been sucking down bottle after bottle of water (I refill my 20-ounce bottles; I'm no water-buying sucker). Not because I believe in consuming 8x8 or other mass quantities of water (I don't), but because I feel dry -- the water is just going down.

Sleep has varied from OK to horrible.

The suffering was compounded by TOM that arrived on Friday. Awful cramps through Saturday and keeping me awake most of Saturday night. Usually I eat a few squares of dark chocolate and they magically make the cramps melt away. That cure was not available to me. I tried aspirin, but it didn't seem to do anything. Also my leg muscles ached, helping to keep me awake. Also stayed awake most of Monday night.

Sunday I felt fine until I ate sirloin steak with butter for breakfast. The more I ate, the hungrier and weaker I got, until I was just full and completely attenuated. I gradually felt better by mid-day, when I felt OK, but still weaker than my usual energetic, bouncy self.

Then I had lunch. Available was part of a chicken we'd roasted the night before, and nothing was left but the white meat. I couldn't bear the thought of eating all that lean protein. Then I thought of chicken salad. I diced the meat and seasoned with some fresh herbs from the garden and a squeeze of fresh lime, then stirred in about a half cup of mayonnaise. After eating my half and then the half I'd prepared for my husband, I felt better than I'd felt for a days. I was taken aback later to see, in Fitday, that was nearly 1000 calories of mayo! I took in about 3500 calories that day, according to Fitday.

Weight: I started at 150 last Tuesday. By Sunday morning I weighed 145. On Monday morning (the day after big mayo day), I weighed 146. This morning I weigh 147.

What I miss: coffee, tea, cream and its descendants (sour cream, cream cheese), eggs. Without cream cheese and eggs, I can't make Oopsie rolls. Cream and eggs are so malleable; I can get creative with the cookery.

Basically, I feel like I'm doing time.

I'll keep this up another week, then decide what to do next. Thanks for the encouragement!

---

RE: Zero Carb / Meat and Water - Clabbergirl - 06-10-2008 05:57 AM

Oh dear, Vesna. That sounds like a tough way to go. I hope it gets better for you. I've been slugging through the last two days as well, but I'm not doing as restrictive of a plan as you are. I'm not sure if my issue is food-related or sleep-related (I have sleep apnea and am using an old mask until a replacement arrives).

I want you to know, there have been several moments when the thought of eating another piece of meat makes me sort of depressed - so you aren't alone in that hesitation. You said you are usually energetic - how would you rate your energy level on a scale of 1 to 10 (ten being super energetic) now, and how would you rate it before you started this w.o.e.? I'm curious because I'm hardly ever 'energetic', no matter what I eat, so while this walking dead feeling I'm having isn't all that far off from normal for me. But for someone who normally feels good, I have to think this is a serious adjustment. I think it says a great deal about your personal resolve and dedication to stay with this through the rough spots. I'm behind you!
Clabbergirl, thanks for the encouragement.

I guess I'd say that normally my energy range is 7 or 8, occasionally 9. I'm not one of those people who has endless reserves of energy and gets tons and tons of things done. On the other hand, some people think I am. So I guess I'm somewhere in between.

These days, my energy range is more like 6 at the top -- for a few hours in the morning -- and 2-4 the rest of the time. This afternoon, for instance, I'd call it a 5 while I was at work. Then it plummeted to 3 by the time I'd gotten home. I managed to get back up to a 4 and take my son with me to hoe and mulch in the evening, at the community garden at my workplace. I was surprised I could do it, but I was moving slowly and methodically. However, when my son (4) wanted me to chase him around the grass, I couldn't run; I could only walk. Usually I don't have to think about breaking into a run.

(This is on a scale of 1 to 10, where 1 means you can't drag yourself out of bed and 10 means you have the pep of an infomercial host.)

I'm finding myself thinking, "This had better pay off." If I keep losing pounds, that'll give me a motivation to suffer through, hoping to get to the point where, as Charles says, I'll feel better than I've felt for a long time. Because right now, I feel not so good. If I don't lose pounds, it will be very, very, very hard to stay motivated.

Is homemade stock -- as from chicken bones or beef bones -- OK on this plan? Does that count as meat and water, if I've simmered bones in the water for several hours? Or will the amines slow me down, or something like that?

No, that's fine. What worries me is what you are eating? I know you're eating meat, but what kind? If you're eating chicken it should be the dark meat, the fatty stuff. Sirloin steak is also very lean. I would much rather see you eat some fatty ground beef or some beef spare ribs or even a ribeye thrown in there. I rarely eat the kind of meat you're describing and I've never felt the way you're describing. Do you have any pork or beef spare ribs or some ground pork?

I don't put butter and oils on my meat, I just use the naturally occurring stuff that comes from the meat itself. Lean protein will make you feel like you're describing. It's called rabbit starvation and it saps your energy. The Inuit were very familiar with this in the springtime when there were only rabbits available.

Try to get some fattier stuff. I wish you ladies were in my low-carb meetup group. I would take you out to Golden Corral and get you some good meat to eat!
Okay, this is Day 9 for me and I'm feeling pretty tired too. I still keep thinking it's a CPAP issue, but I can't rule that out until later in the week. I'm hoping it's that and not this diet. Here's an example of what I ate yesterday:

- coffee w/heavy cream & 1 tbsp coconut oil
- 2 tbsp peanut butter
- approx. 5 oz ham
- 1 oz cheddar cheese
- 4 Arby's Roast Beef sandwiches (no buns of course)
- 3 cheddarwursts

This isn't in the order I ate things in, but you get the idea. There's fat in everything except maybe the roast beef. I'm hoping Arby's sandwiches are OK because this is a new thing that has really saved me the last couple of days while I've been running from one place to another.

This morning I went to work late and at 10am had 5 fried eggs (in coconut oil) and 4 slices of canadian bacon (in the leftover coconut oil and their own juices). I wasn't hungry until almost 3. I can't say I was full of energy, but I was OK.

How bad am I doing on this? I know Charles recommends losing the cheese and dairy stuff, but I'm not ready to do that, yet. Or coffee. It's easy to blame those things, I understand, but they may not be the problem for everyone that they are for Charles (or maybe they are). I'm hoping the steps I'm taking will have some positive effects before I start getting all nuts with the dairy - surely? I haven't weighed myself during this so I have no idea if anything has been lost - that will come later too.

dear clabbergirl,
I've been trying zero carb for a short time myself also. Giving up so many foods isn't easy!!!!!! I noticed that the meats on your menu were a highly processed and cured and therefore "overcooked". One thing that helped me was not eating until I was hungry for meat and then cooking fatty fatty real not processed meat so that just the outside was seared and the inside was still quite rare. Suddenly it tasted wonderful compared to overprocessed or overcooked meats. When I'm not hungry the thought of fat and meat is nauseating but when I'm hungry it is the most delicious thing in the world. The Bear on his site states that when meat is cooked in this way every nutrient we need is present. I'm guessing that a lot of nutrients are destroyed in the curing or cooking processes.

c

Clabbergirl, what's CPAP?

Hi, everyone!
I'm starting this tomorrow.
I remember a very long and fascinating discourse between Charles and someone else on the old forum regarding why zero carb is effective and why plant materials are not necessary in the human diet. I've thought on that quite a bit, and after reading this whole thread over the past 45 minutes or so, I know it's time to "go there". I love green veggies, I really do, but I'm ready to make this step to get myself in control and to get some sleep for crying out loud! That is my biggest problem. I wake nightly between 2 and 4 am, struggle to get back to sleep, wake like a zombie in the morning to receive the children I keep--and about die the rest of the day trying to keep myself upbeat and alert. I have no issues other than being morbidly obese and tired, so I don't foresee any issues.........

On the limited food side of things, I don't feel I'll have a hard time. I despise eggs, they nauseate me entirely. I have tried to begin my day with eggs for three days now and throw some remainder away gagging every day. ICK. However, I love love love beef, in all forms. Matter of fact I crave doubles and triples from Wendy's all the time, it's crazy. But that brings me to a couple of questions...

First, and this may be a societal brain wash I must get rid of, but I thought beef could really stall weight loss?? Thoughts on this? I'd be happy eating beef day in and out. When I think of the hunting/gathering people of old, I must consider that a great deal of what they ate was beef or beef like. So..?

Secondly, what's the deal with things like breakfast sausage and beef sausages? Bacon? Should I leave them due to nitrates, etc.?

Third, what about grilling? I love a slab of grilled meat or fish.....is this ok? Someone told me recently something about carcinogens released when grilling?

Thanks for any advice! I'm going to eat some ground beef. Mmmm.

---

**RE: Zero Carb / Meat and Water - LindaSue - 06-11-2008 04:27 PM**

Clabbergirl, I have to agree with con. Just about everything you're eating is processed and loaded with carbs and other junk. I think that the only carb-free thing in the menu you posted was the coconut oil.

Clabbergirl Wrote:
coffee w/heavy cream & 1 tbsp coconut oil
2 tbsp peanut butter
approx. 5 oz ham
1 oz cheddar cheese
4 Arby's Roast Beef sandwiches (no buns of course)
3 cheddarwursts

Depending on the brand of ham you're using, and how many carbs are in the Arby's roast beef, that menu contains about 20 carbs. Since I didn't count the roast beef, it could be even higher than that. I just went to the Arby's site and the roast beef has zero carbs. I read a post somewhere today that said that the cheddarwursts have 3 carbs each so you got 9 carbs just from those.

---

**RE: Zero Carb / Meat and Water - caroline - 06-11-2008 04:34 PM**

Clabbergirl,

I don't know how this affected other people, BUT...not to make you feel more possessive of your foods you love...I absolutely LOVE peanut butter (which according to Charles is suspicious--indicative of addiction-meaning you feel compelled to eat it.), but I noticed not so great symptoms eating it. I almost bought it again at Trader Joes, but decided against it.

Peanut butter has aflatoxins and is known to be moldy. Peanuts are notoriously moldy, and if you look at the info on mold, which Jimmy had when he interviewed Matt Kaufman, it's the cause of all kind of
problems. I agree with the other people, that you would benefit greatly to move into less processed foods. You won't feel deprived when you're eating some yummy fatty meat.

Hope this helps...

RE: Zero Carb / Meat and Water - **Vesna** - 06-11-2008 05:35 PM

However, I avoid MSG. It sets off cravings and is just no good for ya. I'm including processed meats this go round, but only if they have a short and clean enough list of ingredients.

Charles, thanks for all the advice. It is encouraging. I would love to take you up on your invite! We don't even have Golden Corral around here.

I thought I was getting plenty of fat -- according to Fitday, ranging from 61% to seventy-something. I suppose that's not enough. The day I got 84%, I felt pretty good! However, I feel pretty good today, although Fitday thinks I only got 65%. (Their database is a little screwy and it takes forever to customize things.)

Problem with the ground beef is, the ground beef available around here is leaner than what you describe. However, I think I've figured out how to deal with that. Yesterday for breakfast, I mixed my ground beef half and half with some really fatty ground pork sausage -- a brand DH just discovered that has a beautifully short ingredient list. Breakfast tasted better and I had good energy to lunchtime. This morning, we were out of the sausage, so I minced a slice of bacon into my ground beef. It was pretty darn good. I'm thinking of putting bacon through the meat grinder and mixing it with GB later.

Here's what I figured out for the chicken: instead of buying another whole bird for roasting, I bought a package of quarters -- cheaper even than legs or thighs on their own! Buttered and herbed it when I came home for lunch, and we had it roasted for dinner. Luscious. Without any of the white meat that I never liked anyway.

A question: What do you all think about including cream in this regimen? If cream is OK, then what about cream cheese and sour cream, which are made from cream. If cream is not OK, then what about butter, which is made from cream?

And what about eggs?

Oopsie fans will know where I'm going with this -- if cream cheese and eggs are OK, that opens the door to Oopsie rolls!

Regardless, though, I'm going to try to tough it out without cream or eggs until I've put in two whole weeks.

Suddenly it tasted wonderful compared to overprocessed or overcooked meats. When I'm not hungry the thought of fat and meat is nauseating but when I'm hungry it is the most delicious thing in the world.

Everything I ate was pretty processed, but I guess I'm resisting what's starting to sound like a life of ground beef and steak. I like steak, but I've never liked fat on anything, even before I was old enough to know what dieting was. I can't get that stuff out of my mouth quick enough if I accidentally eat some on a piece of meat, and the suggestions here to eat yummy fatty meat make me kind of squeamish because all I can picture is the spongy, gets-bigger-as-you-chew-it fat on a steak. <shudder> I do not know if I can swallow that, literally and figuratively. Link sausage I can stomach, but sausage patties are something I have turned down in the past. Maybe if I ate them with butter or something?

The cheddarwursts are microwaveable in 1 min. I added the Canadian bacon for breakfast because I'd read someone else on this board used them, and it seemed like a nice option. I was afraid 5 eggs wouldn't fill me up (it hasn't before, yes I sound like a glutton) and I had to leave right after eating. The Arby's roast beef is just darn convenient (and thank you LindaSue for looking up the carb content).

If I have to cook every night and pre-pack pounds and pounds of meat, I don't think I'm going to be able to do this. If I get to work and I didn't bring enough, I'm screwed until I get home. I get a very short lunch break, can't make it somewhere and back for take out on the break, and there's no cafeteria. I'm starting to feel like I should carry half a side of beef just in case I get hungry and I try to 'eat to fullness'. People are saying just defrost a steak and cook it later. I have 4 steaks that have been defrosting in my fridge for 2 days, but I haven't cooked them because by the time I'm at home and done with the laundry, it's 11 and I'm the walking dead. I work full time, am a full time college student, the parent of 2 teens, and I volunteer as a CASA. There isn't a lot of room for me to grill, bake, fry, or package, let alone grocery shop. I'm getting the feeling the only people doing this type of plan are those who have leisure mornings, or who have a kitchen at their disposal 24/7. I realize most of you probably work outside the home, but I need/want things that are portable, non messy, and can be eaten cold about 40% of the time. I can't even have heavy cream? I thought I read people here were putting it in their coffee or tea.

I know everyone is busy these days, I'm not asking for special treatment. I read back over this and realize I sound like one big excuse maker, but all the things I've brought up are problems I'm facing that I'm trying to work through. Folks are saying here that this is an easy way of eating, but I think it has been a very difficult way of eating so far, and I'm not even to zero carbs yet.

Had to vent & whine a little. Thank you all for your help and support in this.
Clabbergirl,

I think those are reasonable questions and not whining.

Maybe you should start by stepping back from your current plan and choose to eat low to low-low carb for now instead of very, very low carb, just until you get the hang of food provisioning. You could buy a bunch of 73/27 hamburger at Walmart and make patties up and cook them just until safe, so most of the fat stays in the meat instead of the pan. Make a quick batch of mayo, low-carb ketchup, and a bit of dill relish for your special sauce and take a safe amount of the above with you to work. Change up the flavor of the hamburger patties by putting different spices on each. Always have a ziplock of nuts with you to get you by in a hunger emergency.

I personally use very heavy cream in my coffee but I'm not in a big hurry to drop my extra pounds. I just love this way of eating because I feel so much better. I average about 15-30 carbs per day and I still slowly get lighter. I used to just slowly get heavier.

Oopsie Rolls are an updated version of Dr. Atkins's ('72) Revolution Rolls. They are a magical ersatz bread consisting entirely of eggs (separated, with the white beaten stiff) and cream cheese. They can be augmented with seasoning and protein powder.

http://livinlavidalocarb.blogspot.com/2008/03/cleochatras-amazing-low-carb-oopsie.html

Thanks for the explanation of CPAP.

The bit of horrid sponge that gets bigger as you chew it is not the fattiness that I'm referring to. I share your ick take on that. I mean fattiness that's evenly and, for the most part, invisibly distributed throughout. Like the way a croissant or doughnut is fatty, but you don't experience chunks of butter when you eat it.

You do realize that a sausage patty is identical to a link sausage, just not stuffed into a casing?

Low maintenance, non-perishable fast food: Do you like sardines? (Flavor and quality varies wildly among brands, so experiment.) I keep a stockpile in my desk drawer at work. My co-workers think it's odd and wrinkle their noses, but on the other hand, many of them keep a stockpile of crackers and breakfast cereal. So who's the odd one? My department manager, as soon as he got promoted to manager, decreed that I had to eat them in the break room, or at least not in the workroom. Fair enough!

😊

Clabbergirl, I understand that your situation makes it difficult for you to prepare a lot of food in advance so you're doing the best you can. Since you're already paying for things like lunchmeats and sausages, how about spending about the same amount of money to buy frozen pre-shaped hamburger patties? At least you'd save the step of having to divide up ground beef and make it into patties.
I don't see any reason for not using cheese, cream, cream cheese and sour cream on this WOE as long as you've determined that they're not problem foods for you. Two Oopsie rolls have less than 2 carbs, 15 grams of fat and 8 grams of protein. Those are very good ratios.

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-12-2008 06:41 AM**

Sitting here eating my half pound burger with bacon and an ounce of cheddar, something keeps going through my brain that I can't shake. I need some education and support, please! 😞

The Dr.'s Eades expound a little in all their books, and on Dr. Eades' blog, on how if your calories don't have a deficit between what you need and what you have, that regardless of being low carb you won't lose weight.

Now, please understand I'm not being argumentative, but I would like to question this with Charles if I may. Charles, you look absolutely amazing, fit, healthy, well muscled, and your color is vibrant. However, you are maintaining, are you not? Your muscle mass also calls for a great deal more "food" than someone's body would were it not so well muscled. What about those of us who have a considerable amount to lose? That thus far are pretty sedentary? I don't feel we should watch calories, or even count calories per se, but shouldn't there be a common sense balance? In other words, as long as I feel satisfied I should not push myself to necessarily want everything simply drenched, right? I am well aware of how rabbit starvation feels, as that is precisely where I was one year ago when I bowed to some temporary insanity and followed Kimkin's K/E. I have never felt that bad in all my life...however I notice if I eat too much fat, I feel somewhat ill. I feel there is a delicate balance to our bodies that we must be aware of, and I just don't see pushing fat on myself...does this make sense? I would love to hear Charles' opinion on this because I know he'll share a great deal of "why" with me, which is what I need--but I'd love everyone else's input as well. Thanks so much. 😞

**RE: Zero Carb / Meat and Water - Vesna - 06-12-2008 06:46 AM**

Anne Marie, may I suggest that you first read the thread about Dr. Eades and calories in General Low-Carb Discussion? Your question is explored at great length there, by Charles and others.

Then, if you still wonder, come back and ask more, either on this thread or that, or wherever it seems best. 😊

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-12-2008 06:47 AM**

Thanks, I appreciate that! 😊 Haven't learned all the ins and outs of this new forum yet, so this is very appreciated. Thanks again!

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-12-2008 08:02 AM**

Okay, I had read the first few parts of that thread the other day but didn't get so far as Charles' excellent explanation. This is great informational support and it gives me a lot of resolve to stick to this.

Further, in recalling other information from Charles I've read at length, it appears to me that any carb bearing food, no matter how small an amount (like eggs, cheese, cream), is going to have serious and
negative impact on me. My insulin response prior to food is probably very extravagant. As such, anything I put in my mouth with carbs in it is going to immediately be attacked and keep that insulin response going at full speed. And therefore keep my fatty acids from flowing. So I'm going all out. It's meat and water for me baby. I'm going to try this for four weeks. If calories indeed don't matter, let's see how much weight I lose in that four weeks. There should be nothing to hold me back if I don't eat any of the above mentioned items, ingest no caffeine or diet drinks, or other extras.

Hopefully ya'll won't get tired of seeing me post. 😊

Is it just me or does anyone else think Charles should write a book of his own???

P.S. No one has answered my question about grilling...anyone out there have thoughts? I don't have the beef question anymore because I'm pretty sure I'll be told it's pure and fatty protein and that's not what holds people back, it's all the stuff they're eating with the beef or something like that. 😊

---

**RE: Zero Carb / Meat and Water - nyteez - 06-12-2008 08:19 AM**

Hi everybody! I haven't been on a while, I've been crazy busy, but still sticking to no carb. I am learning cheese/dairy is a problem. After reading that Charles tried Brie and really liked it, I had to go out & get some. I have always loved brie so I ate the whole wedge in 2 days! LOL. Well, I gained back 2 lbs that week. I guess I can't eat cheese. 😢 I have since lost the 2lbs again and another lb, since banning cheese from my house.

clabbergirl - I am a really busy person too. It took me about 2 months to get my eating plan down and it took about that long to make my cravings go away. I craved cheese mostly and ate too much. Cheese sticks are so convenient. Now I eat mostly hamburger patties, eggs & meat. My george forman grill is a major life saver. It takes 3 mins to cook a frozen hamburger patty, 6 mins for a thick ribeye steak, 4 mins for a small frozen chicken brst. It is such a time saver.

Here are some of my favorite quick foods to go:

Cold chix brst are great dipped in ranch dressing!
Hard boiled eggs or egg salad
Tuna salad
chicken salad
sliced cold steak with salad mix and blue cheese or ranch dressing. I put the dressing in the bottom of the container, then the meat on top, then the salad mix. That way the salad doesn't touch the dressing and get soggy.
Bacon is a great snack, I'll cook up the whole package at a time to have the bacon ready to eat.
Cheese sticks
rolled up ham slices with cream cheese inside

Just stick to low carb foods and eventually it gets alot easier and you will be less hungry and have more energy. Adding more fat gave me more energy and got me out of my 6 week stall and I eat less. My typical day:

I am not usually hungry in the mornings anymore, but if I am I have a hamburger patty w/ 2 eggs.

Lunch - either a hamburger patty or 2
or sliced chicken or steak w/ dressing & salad mix
Dinner - meatloaf, or a hamburger patty, steak, shredded pork cooked in the crockpot topped with cheese & green onions & avocado, or a couple of nice big sausage links.

Just stick with it! It will get easier

**RE: Zero Carb / Meat and Water - Charles - 06-12-2008 08:52 AM**

Clabbergirl Wrote:
coffee w/heavy cream & 1 tbsp coconut oil
2 tbsp peanut butter
approx. 5 oz ham
1 oz cheddar cheese
4 Arby's Roast Beef sandwiches (no buns of course)
3 cheddarwursts

The dairy and coffee aside. The Arby's sandwiches are the only decent thing on your menu, unfortunately. Peanut butter, cheese, cheddarwursts? Are you able to go to the bathroom with all of this? Just reading this makes me constipated. 😞

There aren't many "energy" foods on here except the Arby's, but it's still processed and leaner than what you could buy in a store. The best deli roast beef only has 5 grams of fat per 6 ounces. That's not much. Ham is pretty lean as well. It has 15 grams of fat but it also has 38 grams of protein. You want to find food that has a higher fat to protein ratio.

It's not surprising that you feel this bad. You have to find some fatty protein to give your body some energy. It's takes fat to burn fat and there isn't a lot here. Fatty ground beef should be cheaper and provide far more energy.

Keep working at it.

onlyabtrfly Wrote:
First, and this may be a societal brain wash I must get rid of, but I thought beef could really stall weight loss?? Thoughts on this? I'd be happy eating beef day in and out. When I think of the hunting/gathering people of old, I must consider that a great deal of what they ate was beef or beef like. So..?

The Inuit in one part of the world ate Caribou. The Indians of the Great Plain ate buffalo like it was going out of style. I'm about 8 pounds under my goal weight and I did it primarily eating beef so I say, "so much for stalls!" It would cause you to stall if you were on a semi-starvation diet because your poor body would store every bit of fat and protein it could get from beef to save you from yourself! 😞

Onlyabtrfly Wrote:
Secondly, what's the deal with things like breakfast sausage and beef sausages? Bacon? Should I leave them due to nitrates, etc.?

I avoid these foods with nitrates and nitrites. They give me a headache and make me nauseous. I have been able to find uncured bacon without nitrates and nitrites but sausage is harder. Hormel makes a good brand of bacon and I found some very good beef bacon at Whole Foods.
Onlyabtrfly Wrote:
Third, what about grilling? I love a slab of grilled meat or fish.....is this ok? Someone told me recently something about carcinogens released when grilling?

This is garbage. Grill to your heart's content. It's probably always best not to overcook so you can benefit from the nutrients in the food but I know that the Inuit cooked their food and Stefansson and Anderson ate cooked food during the all-meat trial in the 20s. They were all just fine!

Onlyabtrfly Wrote:
Thanks for any advice! I'm going to eat some ground beef. Mmmm. 😊

This is great. More of us reading this thread should eat more ground beef, as fatty as you can get it. This is perfect energy food! I can eat this stuff for breakfast and I'm not hungry for lunch for 6 hours. Let hunger always be your guide. If you can't go 5 or 6 between meals, then the food you're eating may be too lean or you may not have eaten to appetite.

---

**RE: Zero Carb / Meat and Water - Charles - 06-12-2008 09:14 AM**

Onlyabtrfly Wrote:
What about those of us who have a considerable amount to lose? That thus far are pretty sedentary? I don't feel we should watch calories, or even count calories per se, but shouldn't there be a common sense balance? In other words, as long as I feel satisfied I should not push myself to necessarily want everything simply drenched, right?

First of all, despite my "well muscled look" which I thank you eternally for saying, I have to tell you that I'm also pretty sedentary. You wouldn't believe it but I promise you, I really am. I sit at a desk from 9 to 6 every day. I do run but I only run on Sunday and Wednesday. I lift weights on Monday and Thursday. That's about it. I don't walk fast (old women out-walk me all the time), and I'm not always moving. When I go home in the evenings, I play XBox 360 with my 16-year-old if I can get him to play me a game. I should not look the way I do.

As far as the "common-sense balance," that balance is hunger, plain and simple. I'm not asking you to eat fat until you're sick. I'm asking you to eat fat until you're sated. I can only go up to the buffet at Golden Corral two or three times and I'm finished. I don't stuff myself but I never leave the table hungry.

This will vary between people. A large person should have a bigger appetite than me, I'm sorry, but it's true. If you're 300 pounds, you should not be eating like you're 150 pounds. That's what got you fat in the first place. Your body was not getting the proper flow of nutrients to its cells so it was necessary to blow you up to 300 to get the flow right. You must increase the flow of readily useable fuel and your body will reset the "crimp" in the hose which means weight loss. That's the way it works.

Restricting calories is as bad as eating carbohydrates because they both serve to restrict the flow of fuel.

You can't ask too many questions. I welcome all of them. I know I tend to repeat myself but when I read the comments that some make I'm quite sure that they still don't understand how our bodies actually work.

Regards,

Charles
Thanks so much, Charles. How do you like my new avatar? Hee hee. I absolutely get this and I appreciate your response. I'm somewhat in shock right now. I ate an 8 oz burger this morning topped with 3 slices of bacon, with an ounce of cheddar (which I'm omitting b/c of the small carbs-I want this body to get NOTHING to hang on to and "crimp" me further!) at about 9 this morning. Usually by now, even low carbing, I'd be a starving manic, foraging in the the pantry for something forbidden to eat because of the hunger. This is unreal. I don't feel out of control. I'm so chill right now it's beyond belief, and I'm also not sleepy. Usually right now I'm fighting sleep while the kids are napping. This makes me utterly overjoyed. This is only with two meals this way. Wow.

All I can say is yippeeeeee! 😊

One other thing for right now, if you don't mind, Charles--what about the wafer thin beef, you know, the philly cheese steak type? It says it's 100% pure beef. Are they ok? I love the taste. My husband likes Hardee's like you, but I prefer the taste of Wendy's beef. Those steak um types taste the same....help?

RE: Zero Carb / Meat and Water - **Charles** - 06-12-2008 09:29 AM

Vesna Wrote:
However, I avoid MSG. It sets off cravings and is just no good for ya. I'm including processed meats this go round, but only if they have a short and clean enough list of ingredients.

I definitely agree with this.

Vesna Wrote:
I thought I was getting plenty of fat -- according to Fitday, ranging from 61% to seventy-something. I suppose that's not enough. The day I got 84%, I felt pretty good! However, I feel pretty good today, although Fitday thinks I only got 65%. (Their database is a little screwy and it takes forever to customize things.)

It's hard to go by ratios and things like that because they use averages. The only way to know how much fat is in something is to look at it. If you see fat, it's there. If you don't, it's a crapshoot. Your energy level has to be your guide. If you have good energy, a good sense of well-being and you're full for 5 or 6 hours, you know that you got good fat.

Vesna Wrote:
Problem with the ground beef is, the ground beef available around here is leaner than what you describe. However, I think I've figured out how to deal with that. Yesterday for breakfast, I mixed my ground beef half and half with some really fatty ground pork sausage -- a brand DH just discovered that has a beautifully short ingredient list. Breakfast tasted better and I had good energy to lunchtime. This morning, we were out of the sausage, so I minced a slice of bacon into my ground beef. It was pretty darn good. I'm thinking of putting bacon through the meat grinder and mixing it with GB later.

Whatever works. I get my ground beef from Wal-Mart and it's in the roll that Mel described. It's inexpensive and it's perfect. Matter of fact, I'm going there about 6 pm to get some more!!!

Vesna Wrote:
Here's what I figured out for the chicken: instead of buying another whole bird for roasting, I bought a package of quarters -- cheaper even than legs or thighs on their own! Buttered and herbed it when I came home for lunch, and we had it roasted for dinner. Luscious. Without any of the white meat that I never liked anyway.

I should have mentioned this. We buy leg quarters at Wal-Mart also. That's one of our favorite meals.

Vesna Wrote:
A question: What do you all think about including cream in this regimen? If cream is OK, then what about cream cheese and sour cream, which are made from cream. If cream is not OK, then what about butter, which is made from cream?

I don't have anything to put these things on since I only eat meat. If they allow you to continue losing weight and they don't cause cravings, then you should include them.

Vesna Wrote:
And what about eggs?

They make me gain weight and despite eating three for breakfast, I can only last about 3 hours until I'm hungry again. That, for me, was unacceptable. Plus, I think they "lock me up" if you know what I mean. Since I removed them from my diet, everything was smoother. If you can avoid all these issues then eggs should be fine. The key is you have to always be paying attention to the effect on your body. If you stall or gain, you have to be strong and take the questionable thing out of your diet or limit it.

It makes sense to leave those things out for a couple of weeks to get your weight loss moving. Once you've established some regular weight loss, then I would add those things to one meal per day for a week. At the end of the week you can assess any change that may have occurred. At that point you can decide whether it stays or goes. I wouldn't add them all at the same time. I would add one thing for a week and see what happens.

Keep your diet fairly monotonous and it can become a very powerful tool to assess additions to your diet. That's how isolated peoples would have lived. Their food supply didn't change for hundreds of years so when they added something, it was obvious if people got sick.

nyteez Wrote:
Hi everybody! I haven't been on a while, I've been crazy busy, but still sticking to no carb. I am learning cheese/dairy is a problem. After reading that Charles tried Brie and really liked it, I had to go out & get some. I have always loved brie so I ate the whole wedge in 2 days! LOL. Well, I gained back 2 lbs that week. I guess I can't eat cheese. :O(. I have since lost the 2lbs again and another lb, since banning cheese from my house.

Dana:
My brie experiment didn't go so well either. I finally isolated for it and it just didn't work. I only gained two pounds but it was a consistent two pounds so it had to go. I tried American with brie and thought maybe it was the American but it turned out it was both.

I also tried using bacon and ground pork for breakfast but I went back to the ground beef because it has
more fat and I can go about an hour longer without hunger eating it.

I think I'm finished experimenting now. My body clearly wants to stay at 156 so I'm happy with that. We'll see what happens when the fall comes if I have some seasonal weight variation.

Charles Wrote:
The dairy and coffee aside. The Arby's sandwiches are the only decent thing on your menu, unfortunately. Peanut butter, cheese, cheddarwursts? Are you able to go to the bathroom with all of this? Just reading this makes me constipated. 😁

LOL. 😁I'm doing fine in that department, better than ever actually. Not eating raw vegetables and wheatey high fiber products has been wonderful, gastrointestinally speaking. I can't stomach raw veggies anymore (I love them!) and that's what sort of led me in the lo-carb/no-carb direction in the first place.

I think the light bulb is starting to flicker at last. Hamburger, hamburger, hamburger. If nothing else, hamburger. Crumbled, pattied, formed into a meatloaf, barely cooked - doesn't matter as long as it's the fatty 73/27 ratio of fatty hamburger meat. Cheap and plentiful at most markets - okay. What can I safely season it with? Remember, I'm a cooking novice who dislikes the whole process, so be gentle with me on seasoning ideas.

I entered my menu from yesterday into an online calculation tool and did a little better on ratios than before: 4g carbs, 150g fat, 153g protein for a grand total of 1977 calories. Most of this was bacon and eggs. What kind of ratio of fat to protein am I going for? More fat than protein, right?

That's not as important to me, really. The ratios are irrelevant. The point is having plenty of fat. If you overdo it on the protein, your body can handle that just fine. The problem comes from too little fat. Try to listen to your body more than you do the online calculator. If you lack energy, increase fat. Protein should always be present at every meal so there's really nothing to worry about there.

Also, listen to your hunger. If you can go for long periods then everything is fine. If you can't, then make adjustments. Fat is the key and I think that's the reason that history says people on very low-carb diets with high calories lose more weight than people who eat a smaller amount of calories. More fat equals energy so you're likely to be more active and your body will need to power those activities. If you don't satisfy your hunger then you'll be working against your body.

RE: Zero Carb / Meat and Water - Clabbergirl - 06-12-2008 10:34 AM

I must admit, yesterday I wasn't very hungry. I am finding that I'm not really looking forward to eating. That sounds odd maybe, but for the first time in my life, eating is starting to become a chore of sorts (for lack of a better word). I don't hate doing it, believe me, but I haven't found myself looking forward to dinner or where we might go out to on the weekend. That is groundbreaking for me - really. I suppose it will get more like that too, knowing there are only a handful of things I need to eat. The lack of variety might be a good thing for me in the end because maybe I will be freed up to focus on other things. It's a very foreign concept to me. I don't know what I weigh exactly, but do you think 150g of fat is decent for a 250+ person?

I buy the Wal-Mart brand of Steak-Umms now and then and they're pretty good and zero carbs and no
additives. They have a lot of fat in them, which is also good. I don't drain off the fat that's left in the pan.
I pour it over the meat.

I find that a good ratio of fat to protein is when the number of grams is close to the same for each, just
like your example. With your carbs that low, I'd guess that your fat intake is about 75-80% of your
calories which is great.

Carbohydrates have an awful lot to do with emotions and it's not surprising when you consider that high
insulin also causes lower "insulin growth-factor" or IGF. IGF is used to destroy amyloids in your brain.
When those amyloids are not destroyed, it leads to dimentia and Alzheimer's. It's like insulin has more
important functions but when it's used to try to stave off carbohydrate addiction, other chores get left
undone.

I don't believe that eating was supposed to be as social as it's become. I think it was only supposed to be
a small part of our lives but instead it's all we think about and it tends to consume us. I feel bad
whenever I read that someone "doesn't look forward" to eating and it depresses them some to think of
more meat, but this also lets you know how psychological it has become.

Stefansson's men had the same observation as you. But, there's good news ahead. Here's a sample from
Stefansson's book:

Stefansson Wrote:
Not so long ago the following dietetic beliefs were common: To be healthy you need a varied diet,
composed of elements from both the animal and vegetable kingdoms. You got tired of and eventually
felt a revulsion against things if you had to eat them often. This latter belief was supported by stories of
people who through force of circumstances had been compelled, for instance, to live for two weeks on
sardines and crackers and who, according to the stories, had sworn that so long as they lived they never
would touch sardines again. The Southerners had it that nobody can eat a quail a day for thirty days. […] 

During the first few months of my first year in the Arctic, I acquired, though I did not at the time fully realize it, the munitions of fact and experience which have within my own mind defeated those views of dietetics reviewed at the beginning of this article. I could be healthy on a diet of fish and water. The longer I followed it the better I liked it, which meant, at least inferentially and provisionally, that you never become tired of your food if you have only one thing to eat. I did not get scurvy on the fish diet nor learn that any of my fish-eating friends ever had it. Nor was the freedom from scurvy due to the fish being eaten raw—we proved that later. […] 

On reaching the ship each does get all he wants of what he wants. The food tastes good, although not quite so superlative as they had imagined. They have said they are going to eat a lot and they do. Then they get indigestion, headache, feel miserable, and within a week, in nine cases out of ten of those who have been on meat six months or over, they are willing to go back to meat again. If a man does not want to take part in a second sledge journey it is usually for a reason other than the dislike of meat. 

These things are very psychological and if you can get past 6 months, you'll find that you just don't want carbohydrates. Even if you have them, you'll only go back to the meat because you loved the way you felt and how healthy you were!

RE: Zero Carb / Meat and Water - **ValidRouge** - 06-12-2008 11:16 AM

I have a question for you guys. Do you drain any of the fat off after cooking the ground beef??

(that's my favorite part, btw)

RE: Zero Carb / Meat and Water - **MAC** - 06-12-2008 11:19 AM

ValidRouge Wrote:
I have a question for you guys. Do you drain any of the fat off after cooking the ground beef??

Gosh no! 😊
RE: Zero Carb / Meat and Water - onlyabfly - 06-12-2008 11:26 AM

NO WAY!!

Seriously...are ya'll for real? I would throw up if I did that. *chuckle*

RE: Zero Carb / Meat and Water - Clabbergirl - 06-12-2008 12:25 PM

I've been tossing all of it down the sink, and giving the colander an extra shake!

I don't know if I can use that as a 'sauce', but maybe I'll be less diligent in getting rid of it.

(Oh, by the way, in ref to a previous comment, I know sausage is sausage no matter how it's packaged, but I just can't take it in patties for some reason. The taste, texture, I don't know what it is.)

RE: Zero Carb / Meat and Water - LindaSue - 06-12-2008 12:49 PM

ValidRouge Wrote:
I have a question for you guys. Do you drain any of the fat off after cooking the ground beef??
I don't drain it either unless I'm using the meat in a casserole or something like that where it might be too greasy if I left it in. When I pan fry my hamburgers, I pour the fat from the pan over them too. I would never pour grease down the kitchen drain or my landlord would have a fit. Plus, I'd rather eat it anyway.

RE: Zero Carb / Meat and Water - Clabbergirl - 06-12-2008 01:05 PM

LindaSue Wrote:

I don't think I would pour it down the sink either. I think it's against the law in Raleigh. I let it get mostly hardened and just either put it in a can or put it in the trash. The plumber is just too expensive! 😞

RE: Zero Carb / Meat and Water - LindaSue - 06-12-2008 02:04 PM

As far as I know, grease should never be put down the drain. Hot water may help wash it down from the pipes under your sink but the fat will harden up once it cools farther down the line. I've even read that
using a garbage disposal for food scraps isn't such a great idea either.

Because we already have issues with the plumbing in our kitchen, I put nothing but water down the drain and almost never use my garbage disposal. A few years ago we had a plumber come who ran a special camera down the pipes in our kitchen. He had a monitor where you could see what the camera was "looking" at. There is a bend in our pipes (perhaps caused by a tree root or something) that is causing water to back up in that spot and there was a huge glob of grease floating on top of that water. I should point out that I have ALWAYS been very careful never to purposely put grease down the drain and only the residue that was left on our dinner plates got rinsed down and yet we still had that big clog of grease. Since the landlord isn't willing to put in new pipes, it's up to us to keep anything but water from going down the drain and causing nasty, disgusting water to back up into the sink.

Our case is rather extreme but it could happen to anyone. We have to wipe down every plate, piece of silverware and cookware with paper towels before rinsing them and putting them in the dishwasher. It's a royal pain but it beats having to have the plumber out once a month to snake the drain.

The moral of the story is to eat your grease and save your plumbing!

RE: Zero Carb / Meat and Water - caroline - 06-12-2008 02:44 PM

Good idea, LindaSue!

After you mentioned that you drink your liquid, I made sure to drink mine from my burger meal. And we have had the exact same experience with the pipes. I NEVER put grease down there, or even food scraps b/c we can think of a lot better ways to spend money than on unnecessary plumbing!

I wonder what Stefansson's WOE was like after the 1-year experiment and throughout the rest of his life, in light of this remark.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-13-2008 05:09 AM

Happy Friday morning, everyone! 😊

On day 3 of this all meat and water regimen, I am down from 320.6 to 316.4 pounds today. The funny thing is that I feel so much better. I guess maybe b/c I had switched to low carbing again anyway, so I was kinda over some of the starting hurdle as it were. My sleep has improved somewhat. I woke at 4:30 this morning very hot but fell back into a pretty comfortable sleep until 7.

I've seen mention of others on here waking up hot, what is that about? While I never wake up hungry, I often toss and turn as I get too hot, then too cold, then hot again. What is this phenomenon? I'm looking forward to it going away, that's for sure.
Hope everyone has a wonderful meaty day and is looking forward to a nice summery weekend.

**RE: Zero Carb / Meat and Water - Charles - 06-13-2008 06:49 AM**

This is a very good sign. Because we store fat during the day and utilize it at night, the fact that you are able to sleep demonstrates that you are mobilizing fat at night and your insulin is low. It should only improve!

I have this too, but I never really attributed it to my way of eating. That's interesting. I go from covers, to no covers and I used to wake up in a sweat. It's much better now, I don't have the sweating, but I do need it cooler in my room and I only need the sheet!

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-13-2008 07:02 AM**

Hi Charles!

At the beginning of this thread there are several mentions of this waking up hot or drenched with sweat as part of a problem. Hyperinsulinemia or something? I was just wondering if that was some sort of symptom. Either way, I'm feeling better than I have in forever by the hour and I just can't shake the joy I feel from it. It's crazy, I know so much about the low carb world, and have for years....but it took reading this very thread to really make it all make sense to me in terms of why nothing but meat and fat are needed--and why they alone are so helpful to me personally, having such an insulin whacked system. 😊

I wanted to tell you, I went back and forth several times with the meat at Walmart last night, but finally buckled down and bought the 73/27 beef. I cooked it up in patties this morning with sea salt and pepper, and IT WAS DELICIOUS! It tastes soooooooooo much better than the lean 94/6 or so that I usually get. I'm amazed. LOL!

Welcome to tasty wonderfulness that is fat!

What a crazy, mixed-up world, eh? Where even in the world of low-carb, so many of us are still brainwashed about fat. Not only are we brainwashed to believe that it's bad for you, but we're brainwashed to believe that fatty food tastes icky. It's not easy to push past the social conditioning just to try it.

And at the same time, there seems to be a push to exonerate sugar. Drink some pop and chow down some gummi bears -- they're fat free, so how bad could they be?

---

RE: Zero Carb / Meat and Water - Lauren - 06-13-2008 07:21 AM

I used to wake up drenched in sweat and feeling intense hunger and need to eat something to get back to sleep. I can only guess that I was pumping out insulin even at night and consequently my blood sugar would plummet and then the adrenaline kicks in.

"Eventually, the blood sugar will normalize (thanks to the adrenalin/cortisol, which stimulates a sudden removal of glycogen from the liver) and he will regain his comfort level once more until the next episode." (from Liz Pavek)

I'm not sure of this explanation but it's the best I've been able to piece together.

Amazingly, it's been over a month and I'm still sleeping great...no hunger...no eating...no sweating.

I still have not been able to budge that proverbial 10 pounds that I would like to lose so I've been working on blood sugar stabilization by eating small protein and fat meals 6X per day.

---

RE: Zero Carb / Meat and Water - travis t - 06-13-2008 07:28 AM

Charles,
Could the night sweats have been caused by nocturnal hypoglycemia. You said you saw this sometime ago but it has gone away now. Your liver could have been a little short on the glucose production and allowed your blood glucose to drop to low. This could cause a release of stress hormones to regulate blood glucose. Now that your liver is fully on line you don't need the stress chemicals to make your blood glucose and all is running smoothly.

RE: Zero Carb / Meat and Water - Charles - 06-13-2008 08:28 AM

onlyabtrfly Wrote:
At the beginning of this thread there are several mentions of this waking up hot or drenched with sweat as part of a problem. Hyperinsulinemia or something?

Yes. One of the studies we read in GCBC regarded rats and a discussion of hyperphagia. Humans and rats store fat in the day time and live off of that fat during the night which keeps us from waking up every two hours looking to eat. If you inject sleeping rats or humans with insulin while they are sleeping, they will wake and search for food.
With hyperinsulinemia, if you are having insulin secretions during the night, it's a sign that your insulin is poorly controlled and you're not mobilizing fatty acids at a time when most people do. This will keep weight on. By the same token, if you eat during the day and you can't go 5 or 6 hours without hunger, that means you are hypersecreting insulin, not hypoglycemia as many believe. Any method of weight loss has to involve conditioning the body to increase periods where you fat is mobilized and not stored.

I'm glad you liked it. I had it this morning as well. I tried to substitute ground pork and bacon instead of ground beef for a couple of weeks but I'm back to the ground beef. It leaves me sated about an hour longer and I bothered to read the label and found that the ground beef has more fat than the ground pork.

RE: Zero Carb / Meat and Water - con - 06-13-2008 09:06 AM

Hello ZCers,
So i've been VLCing for 4 months and finally was able to give up cheese and eggs a few weeks ago. An interesting observation about how conditioned my thinking is; after Charles mentioned how isolated people ate the same foods daily and therefore easily noticed the effects of any change immediately, I FINALLY started paying greater attention to my body's voice. After a big breakfast of 1 lb. meat, I noticed was hungry 1=2 hrs later. I had been forcing myself to wait 4-5 hrs. to my next meal(after all, that's what Charles said, wasn't it?) Sooooo....finally consciously noticed that although I WAS forcing myself I still was hungry. So today I fixed a huge amount of meat(2-3 lbs.) with 1/2 cup fat/pan drippings over it and ate until I couldn't look at another piece! I don't feel stuffed-- I just can't eat another bite of meat or fat. SO we'll see what the hormones have to say now if anything. Can I really trust them with my health? I never thought of carrying out the research on myself before although that is what Charles has been telling us all along. duh....

Yep, I saw this in Men's Health this month. They observe correctly that diet soda causes more cravings and leads people to consume more carbohydrates but they recommend the regular stuff instead! AAARGHHHH!

I was in Wal-Mart last night and noticed that they have a new Three Musketeers Bar and a new Snicker's Bar with less fat in them.

The Three Musketeers Bar has about 40 grams of sugar whereas the original had 31. The new Snickers had 31 grams of sugar whereas the original had 27. However, I just read a press release that Snickers has a new bar with a low-glycemic index but it has caffeine in it to give you a boost without affecting your blood sugar. (If it were just that simple....) We must understand that it's not just the amount of sugar, but
the taste (real or just imagined) also leads to insulin secretion and only re-enforces hyperinsulinemia.

A “Snickers Charged” bar has 25 grams of sugar (only 8 less then the original) but it has 60 milligrams of caffeine! Just to give you an idea of how much that is:

1 - 8-ounce soft drink contains 20-40 milligrams (about 150-170 calories)
1 - 8-ounce regular coffee contains 65-120 milligrams (5-100)
1 - 8-ounce energy drink contains 72-80 milligrams (110-140 calories)

This stuff is outrageous!

Travis, I just don't buy the hypoglycemia business at all. If I was hypoglycemic, then I would be able to mobilize more fat. What you're describing is common to hyperinsulinemia. The liver has glycogen but it's not giving it up because of high insulin levels, not low insulin levels. The liver will secrete glycogen (which it makes via gluconogenesis) to stabilize blood sugar but only when insulin is low, not high.

This understanding of hypoglycemia that has become so common is based on the mistaken notion of Newburgh, Edward Rynearson and Clifford Gastineau, which they wrote in the clinical manual, *Obesity*. They said that "insulin puts weight on only by lowering blood sugar to the point where patients overeat to remain conscious." This hypoglycemia was considered a rare pathological condition, one with no relevance to everyday life, and so only in that condition were elevated insulin levels to be considered a causal agent in weight gain and common obesity.

Since then, we've discovered that insulin does far more than just regulate blood sugar. It also regulates fat metabolism. Oskar Minkowski identified the role of the pancreas in diabetes. It's believed that he was ageusic, meaning that he had no sense of taste. He noticed that the urine collected from his dogs (who had their pancreas's removed) attracted an inordinate number of flies. Some say he tasted the urine. However, if he was indeed ageusic and missed the taste of the urine he might have noticed the smell of acetone from the ketone bodies and this might have led him to conclude that removal of the pancreas causes fatty acid metabolism to go awry as well. This may have led Frederick Banting to later conclude that insulin was the primary regulator of fat metabolism.

Fortunately, his misstep didn't cost us anything but time because the great French physiological psychologist Jacques LeMagnen (among others) came along and figured it out:

*Our homeostatic system that has evolved to maintain blood sugar in a healthy range establishes an internal environment in which the cells are primed to burn glucose for fuel and only glucose can satisfy that demand, yet there is no expendable glucose in the system. High insulin levels prevent the liver from releasing the glucose that's stored there as glycogen. As a result, it's glucose that we crave. Even if we*
eat fat and protein (cheese slices for instance), the hyperinsulinemia will work to store these nutrients rather than allow them to be used for fuel.

Therefore, to cure this, we have to condition the pancreas to expect less glucose and thus secrete less. This can only be accomplished by continually depriving the body of glucose so it adapts to not expect it. This explains why the symptoms were present early but disappeared later. This also explains why sleep improves as our bodies adapt to the diet.

Thus the recommendation to increase carbohydrate consumption and/or increase meal frequency to further stimulate the mobilization of fatty acids will only work to a point. Either way, the pancreas has to be conditioned to secrete less. Hyperinsulinemia must be controlled. I doubt that it can ever be cured.

Again, any treatment that helps us mobilize more fatty acids or increases the frequency of such mobilization should help to promote weight loss. Hunger must be the guide, not some artificial number of calories or feedings.

never thought of carrying out the research on myself before although that is what Charles has been
telling us all along. duh....

I don't know what you weigh, con, but I weigh 156 and I can easily eat a pound or two of ground beef
for breakfast. If I weighed 200 or more, I would expect to eat twice that. The goal is to increase the flow
of fuel to your cells which will cause your body to reduce it's fat stores. If you can only eat 1lb and
you're hungry two hours later, then you should eat again. Don't eat 3 pounds if you're only hungry for 2.
I'm just saying eat until you're full. You don't have to literally stuff yourself. By the same token, you
shouldn't leave the table hungry either.

I think there is something to conditioning your body to eat at regular, spaced-out intervals but hunger
and hyperinsulinemia are a tough duo to conquer.

I'll be very interested to see how this goes for you. Please keep us posted.

Regards,

Charles

I will be interested too. I tried it and gained three pounds and got scared. Now I'm trying to eat fat and protein when hungry, just smaller amounts.

I would really like this to work for me but I wonder if one is hyperinsulinemic and is secreting excessive insulin, won't that cause weight gain even if one is only eating meat and water?

RE: Zero Carb / Meat and Water - Charles - 06-13-2008 11:19 AM

Lauren Wrote:
Charles- Doesn't excessive insulin secretion drive down blood sugar? Isn't that what is considered reactive hypoglycemia? I assumed that hyperinsulinemia and reactive hypoglycemia went hand in hand.

It would except for one problem: Insulin resistance! That's what started the whole problem in the first place. Normally, insulin does it's job by pushing glucose into the cells. If the cells become resistant, then insulin cannot push the glucose into the cells and therefore it stays in circulation. Thus the pancreas must secrete more and more insulin to accomplish what used to take a little.

This results in high insulin levels and it serves to make even more cells and even tissues resistant. Your liver and insulin work together to keep blood sugar stable. The liver will make glycogen from protein to stabilize it and insulin will move glucose to the cells to stabilize it. If there is more blood sugar than is optimal in the bloodstream, insulin doesn't care. It just wants it stable.

So you should see from this that the damage occurs long before there is high blood sugar. The effect of too much insulin on the cells causes resistance long before the blood sugar is actually high. The high blood sugar is a symptom, not the cause.

Lauren Wrote:

You should have only been eating fat and protein when hungry to begin with. I don't advocate eating unless a person is hungry. After you've become full, then you stop. You shouldn't feel as if you're forcing yourself to eat or anything like that. One does not need to leave the table hungry, that's all. I don't understand what you mean by this...

Lauren Wrote:

Have you ever heard the phrase, "it takes money to make money?" I think it's similar with the body. It takes energy to burn energy. If you don't provide enough fuel, you will conserve what you have. If you provide enough or even a little more, it should result in more activity which causes you to mobilize more.

This only works if you are eating true zero carb and water. You cannot add fake stuff and a little carbohydrate here and there because that causes fat storage. If you're eating only protein and water, there is nothing to make triglycerides out of because there is no glucose in the diet. Thus, it's very difficult to put on weight regardless of what you weigh.

RE: Zero Carb / Meat and Water - travis t - 06-13-2008 12:34 PM

Regarding night sweats
Dr. John Berardi, Ph.D had a story about injected insulin and bodybuilders that I think is interesting
“i know several renegade bodybuilders who have injected themselves with insulin in order to take advantage of insulin's huge anabolic effects. But some of the dopes have gotten the carbohydrate timing wrong and nearly collapsed from low blood glucose values.
I remember when one particularly huge buddy of mind forgot to take his post-insulin carbohydrates and went out to eat at a sushi restaurant. Since he and his date had to wait in a long line, the insulin started to drop his blood glucose into coma territory. The big SOB had to run into the restaurant (sweating, pale, and shaking - the body's attempt to normalize blood glucose) and demand some sugary food before he passed out and died. He got the food and lived to see another day, but I'm certain that he'll never forget to take his post-insulin carbs again.”
I agree with you charles about insulin resistance being the start of the problem and that more and more insulin will be secreted to do the job. I’ve heard it before that once insulin builds up high enough that it by sheer force will drive the nutrients into the cells and thereby drop blood levels of fuel below normal and this is when the brain panics and calls for blood glucose. The body will release fight or flight hormones (Epinephrine and norepinephrine) to raise blood glucose
I have never heard of anyone being sweaty, pale, and shaking from too much insulin but this is about how our metabolism fights back to restore blood sugar after insulin has facilitated clearing fuel from circulation. I know that Dr Berardi is talking about injected insulin but the same thing would happen on a smaller scale in someone who was insulin resistant.
travis

is nothing to make triglycerides out of because there is no glucose in the diet. Thus, it's very difficult to put on weight regardless of what you weigh.

I have been eating meat, eggs (no more than 2 per day), and cheese (less than 2 oz. only occasionally) for over a month. What I was doing before was eating when hungry and stopping when I felt like not eating anymore. This could sometimes be a fairly large amount of steak. I never ate when I wasn't hungry. I got nervous though watching the scale go up. I was 7 pounds above my ideal weight to start with and at the end of the month, I was 10 over. I got afraid and now I still eat when I'm hungry but I consciously eat less. I leave the table feeling fine but not really "full" like I had been when eating larger amounts. It's hard for me to believe that eating less than 5g of carbs in cheese and eggs would actually cause me to gain weight- stay the same, maybe, but not gain. Assuming that I'm eating fake stuff reminds me of Eades accusing people who are not losing of eating tons of nuts, cheese, etc. Sometimes this is not the case.

I understand this is working perfectly for you Charles and now I want to see it working for others as well. There may be factors (menopause, severe insulin resistance, things yet unknown), that keep it from working exactly the same for all. For now, I will continue to eat a little less and keep a watch on the posts here to see how it's working for others.

RE: Zero Carb / Meat and Water - usmaid - 06-13-2008 06:14 PM

Hi I'm new here but have been lurking in the shadows for several weeks. I lost 100lbs about 8 yrs ago with old fashioned calorie restriction then quit smoking about 3 yrs ago and put on 10 lbs. I've been struggling ever since. Started Atkins the first of March. Nothing happened. Although I will say it was WONDERFUL to eat meat again! But I didn't lose or gain- nothing. I was fasinated by this meat and water WOE. I've been doing this now for more then a week and I've actually gained 2lbs! Clothes are still feeling the same, jewelry still feels the same. Is it possible that it just doesn't work for everyone the same?

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-13-2008 08:03 PM

Hi, Lauren and usmaid. I don't know if Charles will get to respond quickly or not--I think he said something the other day about not being on too much on weekends and he runs a lot...not that I'm speaking for him, it just sounds like both of you might be frustrated so I wanted to offer some support. 😊

I don't think Charles means to sound accusatory, Lauren. He firmly believes what he finds true, as we all do when we really believe in something, and he might come on strong but he just wants people to be healthy and free of their burden of overweight and/or health issues.

I'd like to address your comments about nuts and cheese. I totally, totally understand where you're coming from, please believe me. It's insane to think that a few nuts or some cheese would really bog someone down. But may I ask if you would even consider, just for a period of one week, cutting them out completely? Just to find out if it's possible is all. Not saying you're wrong or that you're doing anything ridiculous, nothing like that. Just do it to prove yourself correct. May I ask how old you are? May I ask how far you are from your goal weight? I didn't go back and look, but are you the one at about 119 or so? Is it at all possible that your body might just be happy at that weight and what you need is some good toning to lean up?

Please let me share my own story with you both. I first did PP 9 years ago. To my amazement, between the dates of Feb. 18th and May 22nd of that year (yes I'm good with dates like that *wink*) I lost 57
pounds. I was amazed. I was shocked. I was only about 30 pounds from goal weight, went off to college that fall, and ate pasta and other white menaces and drank ice cold Cherry Coke from a tab until I had ballooned up to 20 pounds past my original weight of 257, to 277. When I got home from that year, I lost twenty pounds lc'ing off and on all summer-leaving me at 257 for my wedding. A year later I miscarried and found myself in a black hole that was just...I don't even remember a great deal from that time, only bits and pieces. Somewhere down that road when I began to come back to life so to speak, I found that I had ballooned up to 346 pounds. This was unbelievable to me. My doc wanted to allow me to undergo fertility treatments, so I agreed. After four months of nothing, I told her we needed to stop, that it was my weight. I tried Atkins for the first time then, from November of 05 to February of 06. As far as I knew, I was infertile and would never have children. Then when the scale crossed 296, where I was when I became pregnant the first time, immediately I became pregnant with my little boy.

I explain all this for a reason. There is only one relevant difference between my success in 99 and my success in 2006, and that is what I ate. I'm a facts person if you will, I retain dates and scenarios like a fiend. I don't know why, I just do. Here are my food choices from those two times:

Spring of 1999:
Breakfast-two hamburgers or an omelet made with hamburger and mushrooms. Only once a week or so though, because I hate eggs.
Lunch-A small side salad in the school cafeteria consisting of about a full packed cup of shredded lettuce, two thin tomato slices, and olive oil/vinegar, with a meat I had packed at home, usually chicken quarters or salmon or beef patties.
Dinner-Another hamburger if I was hungry, or maybe some broiled fish, and sometimes, tuna or chicken salad plain with just salt and pepper.

I started out packing cheese in my lunch, but it would go all soft and gross before I could eat it, so I stopped it early on. I also enjoyed nuts early on, but after about a three week plateau, my grandma said maybe it was sodium, so I cut them cold turkey. I lost 9 pounds that week.

Fall/Spring of 2006:
Breakfast- A couple of eggs if I could stand it, but usually nothing because when I was working away from my home I left so early it made me sick to try to eat.
Lunch-By then I was hungry. I'd usually get two classic doubles at Wendy's and pull off the bread, and order them with no pickles or onions, just my preference. I'd drink a Dasani with that.
Dinner-Either more beef or fish, chicken, or tuna or chicken salad. I didn't feel like going to the trouble of cooking up veggies most of the time, even though I love them.

Now, do you see the common principle here? Most of my meals contained a huge deal of fat, no cheese, no nuts, no eggs. All the times I tried to go back to low carbing between those two time frames, I ate my fill of nuts, cheese, and other lc legal things to my own detriment. I was always full but just, always craving, never fully able to stick to plan.

The end of last year and beginning of this year, I was really struggling with all this. I wracked my brain trying to figure out those two successes and so many failures. I knew lc worked beyond all else, but why wasn't it working for me now? Had I passed some magical point? Was I immune? What was up? Last year I read and read and read the posts on zero carb and thought, no freaking way. These peeps are nuts! I love my veggies, there's nothing wrong with what I'm doing. And I continued to sit and eat my cheese and nuts snack, my diet drinks, and struggle to eat eggs that I hate, only to have fierce cravings all day and submit to one cheat after another, after another.

When I started reading this thread here on the new forum I thought, you know, maybe I need to look with fresh eyes.
First, I knew eggs contain something called arachaic acid, as do steaks. Lots of people are insanely sensitive to this. It causes fatigue, stalls, brittle hair, dry skin, you name it. I thought great, no problem. I'm cool with letting eggs go.
Second, I knew for me, nuts mimic the starchy yummy feeling of carbs in chips and things of that nature. Sure they don't taste the same and the carbs are way less, but you still get that delicious crunch and tantalizing texture that you do with carby foods. I was willing to cut them simply because I knew it whet my appetite for other things. Throw in that I knew my body latched onto those feeling and was dousing my veins with insulin and I was willing to quit cold turkey.

Third, cheese.......oh how I love cheese. It's so delicious baked on things, as a snack, the goodness of cheese is so comforting. But I knew whenever I ate it, I would start feeling kinda blocked up. Further, with nothing crunchy to enjoy it with, it wasn't as appealing. And it seemed no matter how small the amount I ate, I'd notice stalls. When I ran out, if it was a few days til grocery day, I'd begin to lose a day or two into no cheese. So I decided to nix cheese day before yesterday. In 36 hours, I'm down 4 pounds.

I knew the science years ago, and I knew the opinions of the folks on this thread a year ago. What I was not willing to do at that point was make it completely real to myself. Sometimes we get so caught up in what we enjoy that it seems utter nonsense for someone to question those things. I know it's hard, and seems so dumb from your point of view right now...

So I'm challenging you both, Lauren and usmaid. I'm not being pushy, or trying to shove it down your throats....I'm asking you to give your body seven days on meat alone and water. If you like eggs, eat the white only, the yolk has the arachaic acid. But you're gonna have to add a lot of pure fat somehow to make eggs work! If you eat steaks, soak them over night in olive oil and red wine vinegar. The olive oil opens the grain and the vinegar leeches out the a.a. Add some sea salt and cracked black pepper and you have a beautiful meal. As to steaks, honestly, the fare in most stores is too lean. Go for ground beef at 73/27. That was hard for me to do at first, but I have to tell you, it was so delicious today and I have felt so sated all day. If you're eating lean meat trying to do this, the problem is there's not enough fat to keep your body fueled. If, after seven days, you haven't dropped anything and you still feel aggravated by this plan, then go to one of the other plans and rock it out. No one will be mean or angry about it.

This low carb lifestyle is as individual as all our insulin issues are. You've got to be willing to know yourself...but sometimes, you might need to try something you don't really feel you should have to. If anything, do it to prove your point. That's how science works. Hypotheses are scientific fact until another hypothesis proves the first one wrong. So go with it! Try it out! I'll be cheering you on the whole way, no matter what you find for yourselves or what you end up choosing to do. Either way, you're both worth feeling better. Okay?
Keep your chins up.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-13-2008 08:05 PM

P.S. Sorry the above was so long.

I don't doubt the observations at all, I just think there is another explanation for some of them, that's all. Insulin simply does not cause blood sugar to go low. This is faulty. What happens is this. When insulin is secreted, it clears the bloodstream of all nutrients. That means all fatty acids, amino acids, glucose, nutrients, minerals and anything, and I do mean anything, that can be used as fuel gets cleared out. This is what causes the acute hunger that is felt right before eating. If these guys were injecting insulin, then they cleared their bloodstream for longer than what is normal and this lead to the reaction. It is not low blood sugar, it's the lack of any fuel in the bloodstream for the muscles to use. They are primed to use glucose since there was a major insulin secretion to begin with, but if none is forthcoming from the diet, you get the physiological symptoms of starvation.

Again, if a person is insulin resistant enough no matter how much insulin is present, there will be no movement of glucose into those cells. This is what causes the problems. Insulin cannot "overpower" these cells. It just doesn't get moved there. Now, keep in mind that not all cells are resistant, but the fat tissue and muscle tissue are more aware of insulin than other tissues in the body. The muscles get their fuel from the stream of fatty acids in the bloodstream. Since insulin removes fatty acids from the bloodstream, there is literally nothing to fuel those muscles until there is either glucose or fatty acids returning once insulin ebbs. The shaking happens because there is nothing there.

Travis Wrote:
The body will release fight or flight hormones (Epinephrine and norepinephrine) to raise blood glucose

The fight or flight hormone is adrenaline. It mobilizes fatty acids. It clears the bloodstream of glucose and the muscles only have access to fatty acids. If insulin is chronically high, then this response may not be as potent as it should be. The point is, insulin has the power to override any hormone but it can't overcome insulin resistance.

Lauren Wrote:
I have been eating meat, eggs (no more than 2 per day), and cheese (less than 2 oz. only occasionally) for over a month. What I was doing before was eating when hungry and stopping when I felt like not eating anymore. This could sometimes be a fairly large amount of steak. I never ate when I wasn't hungry. I got nervous though watching the scale go up. I was 7 pounds above my ideal weight to start with and at the end of the month, I was 10 over. I got afraid and now I still eat when I'm hungry but I consciously eat less. I leave the table feeling fine but not really "full" like I had been when eating larger amounts.

With written text, it's very hard to gauge intent and you can't see my face or read my mind just as I can't read yours. I didn't have in mind to accuse you of anything, I was merely answering your questions. I wasn't thinking of "you" in particular, I approached it as a hypothetical. I guess I didn't make myself very clear which I'm wont to do at times.

We don't know if you are not already at the weight you should be at so gaining a few pounds above that low body weight may be your body's way of undoing whatever calorie-restriction you had going prior to beginning this way of eating. It's tough to know that. Rest assured that I have no way of knowing what you eat or don't eat and I certainly don't pretend to know. I was really only answering a hypothetical.
The fact that you sleep better tells me that you're controlling hyperinsulinemia much better than you did before you began zero-carb so that's nothing to sneeze at.

Lauren Wrote:
It's hard for me to believe that eating less than 5g of carbs in cheese and eggs would actually cause me to gain weight- stay the same, maybe, but not gain. Assuming that I'm eating fake stuff reminds me of Eades accusing people who are not losing of eating tons of nuts, cheese, etc. Sometimes this is not the case.

I think you already know my take on this, but after reading what I wrote, I can see why you might think I meant as Dr. Eades meant. I really don't. I've already seen improvement for you. You sleep better, you have more energy and you don't have the cravings you had. As I always say, this way of eating is about so much more than weight loss. I'm sure that blood tests would also confirm what I've been saying to you.

If it is just mere weight loss you're after, then by all means, cut your calories and make yourself smaller. Eventually that is something that someone would have to work out with their own body. I just meant to be clear that I don't expect anyone to stuff themselves with meat. I've always maintained that a person should only eat when they're hungry and not eat when they are not. I don't think it's that big a deal to eat when you're not hungry because the overfeeding studies show clearly that this weight comes off quickly once you stop overfeeding.

Lauren Wrote:
I understand this is working perfectly for you Charles and now I want to see it working for others as well. There may be factors (menopause, severe insulin resistance, things yet unknown), that keep it from working exactly the same for all. For now, I will continue to eat a little less and keep a watch on the posts here to see how it's working for others.

Fair enough. I only asked you to try it. If it doesn't work for you then by all means, find something that does. You won't hurt my feelings. 😊

usmaid Wrote:
Hi I'm new here but have been lurking in the shadows for several weeks. I lost 100lbs about 8 yrs ago with old fashioned calorie restriction then quit smoking about 3 yrs ago and put on 10 lbs. I've been struggling ever since. Started Atkins the first of March. Nothing happened. Although I will say it was WONDERFUL to eat meat again! But I didn't lose or gain- nothing. I was fasinated by this meat and water WOE. I've been doing this now for more then a week and I've actually gained 2lbs! Clothes are still feeling the same, jewelry still feels the same. Is it possible that it just doesn't work for everyone the same?

The question is, what do you mean by "work"? I advocate zero-carb as not only the healthiest human diet but also the best diet to troubleshoot to see if something else is going on. You haven't lost whether you've done Atkins or anything else so it's hard to blame it on diet in your case. If there is some other hormone acting up in your body then that has to be addressed. If you have followed my writings then you know that I believe weight regulation to be a part of homeostasis and it's just one part that the body regulates.

It literally has nothing to do with you unless you are providing bad fuel. I don't know you so I don't
know what you eat, how well you sleep, how long you go between meals, nor your energy level. How about you provide some of that and perhaps we can see what's going on?

RE: Zero Carb / Meat and Water - usmaid - 06-14-2008 03:36 AM

Thanks Charles and AnneMarie for the responses! I'm a 52 yr old, 5'5" female. Back in 2001 I weighed 253 lbs and Decided to cut calories to 1000 per day and exercise. My goal was to lose 100 lbs and I did it in about 10 months. Three and a half years ago I quit smoking and as I said put on 10 lbs that I just can't seem to get rid of. I was bored with calorie restriction so wanted to try something new (6 yrs of no fat yogurt for lunch was enough!). I expected to put on some wt with the sudden addition of meat, butter,cheese and eggs when I first started Atkins. I went up to about 166. I've been hovering right around there ever since. 161, 164, 162,etc. I would really like to be back down around 150. My diet and activity level follow. I am a creature of habit and routine. I love your philosophy Charles to keep it simple! I always have a ON whey protein shake (2g carb) in the am (7:15 am) with 4 oz water and 4 oz heavy cream plus 2T flax seed (4g carb/2g fiber) after 40 min of aerobics or wt training. Lunch (12:30pm) is 2-3 hamburger patties and dinner (5:00pm) is steak, 2-3 pcs dark meat chicken or 2 hamburger patties.I always make extra and that's lunch the next day. IF I get hungry later- not always- I'll make a half protein shake around 8:00. I have the shakes in the am because they're easy and I like them. I add the flax seed because it's suppose to help with hot flashes- which I don't like and am bothered by several times during the day and evening. I'm in bed by 9 and up between 4-5. I feel I sleep well and get through my day fine. Along with my M-F 40 min morning work out, I walk 1.4 miles to work and back- weather permitting- probably average 3xweek and I power walk 40 min Sat or Sun weather permitting. I guess the only thing left are my supplements. I don't take any Rx drugs. I do take a multi vit 1xday, calcium w/vit D 2xday, omega 3 2xday, and Glucosamine with condrostin (sp) 2xday. I think that's about it. This is what I've had the last two weeks with no wt change the first week and a 2 lb increase to 165 after the second week ( I weighed yesterday). I realize without that much to loose I'm not looking for 5-7 lbs in a week but 1 or 2 would be nice and I think reasonable-yes? Things I like since changing to LC? I have more energy, my hair and nails are beautiful, I don't crave the carbs and I really enjoy the simplisity of it! I can see myself continuing this no matter what!

Sorry for being so long but I wanted to provide you as much info as possible. I think the forum is great! And you all seem so nice and informative. Thanks for the help!
Beth- usmaid

RE: Zero Carb / Meat and Water - usmaid - 06-14-2008 04:54 AM

Oh I forgot to add my one vice! I'm a gum-a-holic. I probably chew 4-8x's a day at 1 gr carb per day. That would be hard to give up! I do it during work outs and walking to keep my mouth moist.

RE: Zero Carb / Meat and Water - Lauren - 06-14-2008 05:00 AM

Thanks for your response Charles. I wondered that myself and agree that the few pounds I gained was probably due to prior calorie restriction. No doubt my body was just responding to nourishment. In spite of my complaining, I am really dedicated to this way of eating. The improvement in my sleep, my mood and energy levels, my hair (which no longer falls out when I brush it), have convinced me that this is the healthy way to eat. I know that I am too weight obsessed and that my ideal weight is probably unrealistic. This has been and continues to be a real evolution for me. I wish that I were willing to do the all meat and water test but for some reason, I'm not there yet. I guess I have to evolve at my own pace but I am eternally grateful for the information and guidance that I get from you and the rest on these boards. I love reading everyone's thoughts, theories, experiences and research and I'm happy that you and others continue to be willing to post on this forum.

**RE: Zero Carb / Meat and Water - Lauren** - 06-14-2008 07:35 AM

Hey Charles-

I'm confused about this quote below from Eades. I know you've probably answered this ten times already but if you don't mind, can you comment one more time?

"Eating a very-low-carbohydrate diet ensures that insulin levels stay low. Unless insulin levels are up, it's almost impossible to store fat in the fat cells. With high insulin levels fat travels into the fat cell; with low insulin levels fat travels out."

I seem to remember that you said that no dietary fat will be stored if carbs/glucose are unavailable from the diet, regardless of insulin levels. Is that right?

---

**RE: Zero Carb / Meat and Water - con** - 06-14-2008 11:49 AM

Well so far so GOOD------yeah

So yesterday, I started eating much more meat and fat as an experiment. After breakfast, (2 lbs. meat) I wasn't hungry for approx. 4 hrs. Then I ate about 2 lbs. fatty meat for lunch until I felt sated. THEN, about 2 hrs. later, without eating a single thing, I felt super full? HUH????? Same thing 2 hrs. later. WHAT? In fact, I didn't eat another thing all evening. hmmm...

This morning the scale is down 2 more POUNDS!!!!!

Just to put this in context: I do NO walking/running or much of anything in the way of exercize. I'm also a post menopausal woman who's somewhat dependent on others doing my cooking, although I'm cooking my own meat cause it's so easy. ha

I've been doing zero carb (actually under 5 gms)for three months and averaging 1-2 lbs.lost per MONTH.

I think it's taken 2-3 months for my metabolism to adapt to VLC and when I was finally able to go all the way to zero carbs by giving up eggs/cheese/sweeteners after months of losing 1-2 lbs. per month----just the last 4 weeks I've lost 10 lbs!!!!!!!!!!!!!
The hardest thing is unlearning all the nutritional conditioning. Con

RE: Zero Carb / Meat and Water - con - 06-14-2008 11:52 AM

onlyabtrfly
thank you for your post. It was very inspiring and beautifully written. con

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-14-2008 11:54 AM

You go Con! That is so awesome! I'm down another pound today just since really embracing this Wednesday evening, for a total of 5.4 pounds in 3 days. I'll take it. I'd been stuck before that. It is hard unlearning the brainwash of all other diets, even low carb diets. I don't knock any of them, but doing it this way makes so much sense when you think of our ancestors. Ha, I bet if you brought one of our hunting gathering ancestors into this age from so many centuries ago, they'd look at all our food and think we were a bunch of sloppy messes. 😊LOL!
Congrats again!

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-14-2008 11:56 AM

Aw, I appreciate that so much!
I feel stupid ever voicing my opinion since I have been such an idiot about this miracle of low carbing for so long. I appreciate your kind words-I can't tell you how much that encourages me. 😊Just goes to show head knowledge doesn't always equate to "walking the talk". But, I feel so satisfied this way and so mentally relaxed I know I can last this way.
Thanks again!

RE: Zero Carb / Meat and Water - con - 06-14-2008 02:57 PM

did anybody read Dave's remarks on Jimmy's blog yesterday(fri. 13th)? I was very interested in them and then found dave's website http://www.the spark of reason. I would love to know what you all think.
I think it confirms what Charles has been saying all along.(sorry, don't know how to put in links)

Wow, that's great. It's especially interesting to me that you're losing so much faster without eggs/cheese/sweeteners. May I ask if you have a lot to lose? Please keep posting about your all meat and water experience! You too onlyabtrfly. If you both continue to lose, I may just have to give up eggs, cheese and tea yet!

RE: Zero Carb / Meat and Water - con - 06-15-2008 09:05 AM

Lauren
yeah,
i have a lot to lose. i've been thinking a lot about that question since you asked. i've lost almost 30 lbs now and have 70 to go
but in my head i can't conceive of losing that much. i'd be ecstatic with 40 lbs. more gone.
Can't imagine it though. too much failure in the past and i'm trying not to get my hopes up too much this time.
although.......charles........ zero carb......??????????

Hey, Lauren. Just popped in to check on you. I'm not going to be around much today, but I was concerned about our last exchange. I will try to be more clear when I write. I really appreciate you and everyone here and I just want you to be healthy and happy!

Dr. Eades is oversimplifying again. He admitted that much in his response to me. There is no fat cell door that opens or closes.

Insulin levels do have to be low so fat can be mobilized -- in other words, so fat can continue to travel unimpeded through your bloodstream.
Fat always circulates, period. However, when insulin is secreted (it actually doesn't have to be high at all) fat goes into the fat tissue for a while to allow your bloodstream to pick up the glucose and take it to your muscles. Once you digest your food, the insulin goes back down and fat once again travels in your bloodstream. The goal is to keep fatty acids on the move for as long as possible.

By "fat cells" he means triglycerides. It takes glucose and three fatty acids to make a so-called "fat cell". Triglycerides are treated just like fatty acids. The only problem is their size. They tend to "gum up the works" and slow down fatty acids, which causes them to back up in fat tissue.

If there is no glucose, there are no triglycerides being made. Fat will always go into hiding right before a meal, but it comes back much faster if there is no glucose and insulin levels remain low.

Happy Father's Day to all fathers. I'm off!!!!

See you tomorrow.

Best regards,

Charles

---

What is the difference between fatty acids that flow throughout out the system freely and the fat deposits that sit on our thighs, or other body parts, looking like big jiggly blobs? Those obviously don't move around freely. That fat just seems to sit there all day looking fat and lumpy until we do something to get rid of it by modifying our diet. If that fat is moving in an out of my cells, why don't I temporarily look thinner while that's happening and why don't I suddenly get a big lump of fat somewhere else while the fat is moving around?

---

**RE: Zero Carb / Meat and Water - Vesna - 06-15-2008 05:37 PM**

If there is no glucose, there are no triglycerides being made. Fat will always go into hiding right before a meal, but it comes back much faster if there is no glucose and insulin levels remain low.

I thought fat cells were like tiny little sandwich bags that fat gets stuffed into. I thought fat tissue was a whole bunch of fat cells in one place, like a lot of sandwich bags on a shelf. I heard that once your body makes a new fat cell, it never goes away, it just can be emptier or fuller. I thought all you can do to get thinner is to make your fat cell sandwich bags emptier, but once you've been overweight you're forever cursed with too many sandwich bags and that's why people will always continue to have a weight problem once they've developed it.

But triglycerides are strictly defined as three fatty acids and a glucose. The name has "three" written right into it. So there can never be any more or less than three in it. Therefore, if a triglyceride is the same thing as a fat cell, it can never be more empty or full of fat -- it would always be just three of three.
Are triglycerides the little particles that are visible as body fat when there are enough of them in one place? Are they the same thing as "fat cells"? I thought they were the things that floated around in your blood that you want the count of to be as low as possible. And why do you say "so-called" and put "fat cells" in quotes? Are they the same as each other, or not?

What are the myths and misconceptions, and what's real? Halp!

Con, where are these remarks? What was the headline of the post on Jimmy's blog? Maybe you can quote a little of it here to give us something to search for? Thanks.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-16-2008 05:53 AM

So I think I screwed up yesterday, folks.
I didn't eat anything for breakfast as we were late getting up and ready for church. I had nothing to eat until 1:30, when I ate a pound of beef. I was crazed with the housecleaning bug yesterday, and didn't eat when I was hungry again. (I know, my bad) I kept pushing to get everything done I had wanted to get done and found myself literally puttering out like a car out of gas about 9:45. I felt like I was running on less than fumes at that point. I went and ate almost all of two cans of tuna in mayo because it was fast. But I realize that in no way filled the void of what I should have eaten yesterday...
Now, I didn't mean for yesterday to happen like that at all. However, my assumption is that because I starved myself accidentally yesterday, my body must have hung on for dear life last night and I'm back up several ounces and I slept horribly. Have I answered my own question here? Is this because I didn't eat?

RE: Zero Carb / Meat and Water - con - 06-16-2008 09:52 AM

Vesna,
Fri. 13th column on Jimmy's website SCORES OF LOW CARB STUFF TO TALK ABOUT(and nary a moment to do it)has 9 comments at its end. Dave makes these comments:
"Jimmy. I would be surprised if you could gain much fat via ASP alone. My suspicion is that it would be an uphill battle against a lot of mechanisms that regulate appetite, digestion, and metabolism. I believe something else would need to be broken. A similar situation would occur when trying to lose fat via calorie restriction. When things are working right, I'm guessing it's just as difficult to eat too much as it is to eat too little.

'If you're gaining weight on a low-carb diet, I would think something else is going, probably either some effect besides carbs (like stress) keeping your insulin high. Don't underestimate the potential of stress to crank up insulin. Artificially sweetened foods may cause insulin release, a there are foods containing substances like tyramine (cheese) and certain lectins (maybe nuts?) which bind to insulin receptors.
The low-carb stall represents an equilibrium - the body is more or less "happy" with conditions, and balances food intake, metabolic rate, fat storage etc. to maintain this equilibrium. Obesity, by contrast, is decidedly far from non-equilibrium, and the body is held there only through excess insulin. Remove the artificially high insulin levels, the body pushes back toward it's desired equilibrium, and the fat comes off, which is why (I think) low-carb is so effective.

'People of course want to knock off that last 20 pounds, and one way or another that means you need to shift the balance point. The "fat fast" seems a logical way to do this over a short period of time. Restricting both fat and carbs almost certainly implies calorie restriction. Remember that consuming only lean protein over a long period of time is unhealthy (see "rabbit starvation").

If ASP does indeed play nicely with other mechanisms regulating energy storage, then the good news would be that once you break through the low-carb stall and achieve your desired body-fat, you can return to an "ad lib" diet, provided you keep the carbs (or more importantly, insulin) low.

6/14/2008 12:42 PM

Dave said...

Food groups are a human invention. There are no essential foods, only essential nutrients, and it doesn't matter what foods you get them in (presuming there's not some other toxic effect, as with refined sugar).

Digestible carbohydrates are hard to find in nature. NutritionData.com has a cool feature that allows you to rank foods by nutrient. I did this for total carbohydrates in a 100g serving (I hope that link works for everybody). The first instance you get to of a "fresh" whole food on this list is honey, at #287 (McDonald's honey comes in higher, a little freaky). A few dried fruits appear higher in the list as well, but just about everything else is highly processed manufactured food. The only reason "carbohydrates" would be considered a food group is because humans made it so.

I made and analyzed a "Meaty" recipe on NutritionData as well, consisting of various organ meats, a very rough guess as to the paleolithic diet. I think this makes the "only essential nutrients" point quite well. Nearly every nutrient is quite well represented. A few appear low, namely Vitamins E and K, and calcium, but I suspect this is because the data comes from grain-fed beef. Corn is notably low in these nutrients, whereas leafy green stuff normally eaten by cows is not (grass-fed beef, for example, has about 3-4x the Vitamin E of grain-fed). Of course, people can get these nutrients from plants as well, hence our omnivorous leanings.

6/14/2008 1:22 PM

CON

Vesna,

If I'm getting it....If we aren't losing weight the body is in equilibrium. Therefore we must decrease carbs, (in cheese/nuts) stress, and certain enzymes also in cheese & nuts and artificial sweeteners. By lowering these factors the body must change its actions to get back in equilibrium-think of a seesaw. Some of have to keep lowering and lowering these factors until nothing is left but water and meat. That's probably oversimplifying what Dave said. What do you think?

Dave's website is http://www.thesparkofreason.com.
RE: Zero Carb / Meat and Water - onlyabtrfly - 06-16-2008 10:23 AM

Con, I think that's absolutely right. I've been yo-yoing with this for years, eating all these legal carbs, nuts, cheese, condiments......all that did was leave me hungry and binge-happy. This makes absolute sense to me and your brief summary is perfect, I feel.

RE: Zero Carb / Meat and Water - Charles - 06-16-2008 11:56 AM

LindaSue Wrote:

If that fat is moving in an out of my cells, why don't I temporarily look thinner while that's happening and why don't I suddenly get a big lump of fat somewhere else while the fat is moving around?

Okay, let's go back to school. In the mid-1960s they overturned the time-honored assumption that fat tissue is metabolically inert, and the conviction that fat only enters fat tissue after a meal and only leaves when the body enters a negative energy balance.

The first of three major phases began in the 1920s when biochemists realized that the cells of fat tissue have distinct structures and are not simply connective tissue stuffed with droplets of oily fat. Researchers demonstrated that the fat tissue is interlaced with blood vessels and that the fat cells and these blood vessels are regulated by “abundant” nerves running from the central nervous system.

This led to the revelation that fat cells are constantly in a state of flux instead of just a big “garbage bag.” German biochemist Rudolf Schoenheimer demonstrated that animals continually synthesize and degrade their own cholesterol, independent of the amount of cholesterol in the diet. Schoenheimer moved to New York and Columbia University in 1933 after Hitler came to power. He and David Rittenberg developed the technique to tag molecules with a heavy form of hydrogen known as deuterium so that their movement through the metabolic processes of the body could be followed. They won the Nobel peace prize in chemistry. They put this technique to work studying the metabolism of fat, protein, and carbohydrates in the body.

We can think of eating and satiety as a cycle that beings with the meal and fills the gastrointestinal reserve (the gut). As nutrients are absorbed into the circulation, some are used for fuel immediately and the rest restock the fat reserves, the glycogen reserves in the liver, and the protein in the muscles. As the gut empties, this dietary fuel is either stored or oxidized, the fat reserves become the primary source of fuel. As the fat reserves begin to empty and the fuel flow shows signs of faltering, the inhibition of hunger is lifted and we are motivated to fill the gut and the cycle begins anew.

This “harmony of tissue metabolisms” is orchestrated by the hypothalamus via the central nervous system and the endocrine system of hormones. These regulate the filling and emptying of the various storage depots in response to an environment that might require that we suddenly expend more or less energy or store more or less fat, to accommodate seasonal variations. The hypothalamus does what the brains of insects do; it integrates sensory signals from the body and the rest of the brain and couples them to motor reflexes that permit or restrain eating behavior. It also adjusts this filling and emptying of the fuel reserves to accommodate the immediate need for fuel and the anticipated need for fuel.
Weight stability is nothing more than equilibrium between fatty acids flowing in to the energy buffer of the fat tissue and the fatty acids flowing out. Le Magnen suggested that the body regulates the fuel flow to the cells; the amount of body fat we accumulate is a secondary effect of the fuel partitioning that accomplishes this regulation.

So the short answer to your question is that there is no difference between the fat on your thighs and the fat that goes through your bloodstream. It's all one and the same. We're all interested in the "secondary effect" of the fuel partitioning so for some reason, your body cannot make use of the fuel present in your thighs. If that's the case, it must have to do with carbohydrate metabolism, plain and simple.

---

**RE: Zero Carb / Meat and Water** - Lauren - 06-16-2008 12:40 PM

Charles Wrote:
If there is no glucose, there are no triglycerides being made. Fat will always go into hiding right before a meal, but it comes back much faster if there is no glucose and insulin levels remain low.

Hey Charles,

Thanks for your concern, I appreciate the follow up.

I guess your statement above is the real crux of the matter for many of us. I would love to see a study measuring how long it takes for people who are hyperinsulinemic to return to normal insulin levels (as much as is possible) on zero carb.

I am so impatient and when I see your before and after pictures I want those results TODAY! I forget that it was a journey for you. I still want that magic pill:-)
Vesna Wrote:
Are triglycerides the little particles that are visible as body fat when there are enough of them in one place? Are they the same thing as "fat cells"? I thought they were the things that floated around in your blood that you want the count of to be as low as possible. And why do you say "so-called" and put "fat cells" in quotes? Are they the same as each other, or not?

Researchers proved in the 1960s that our fat tissue is not some big garbage can full of triglycerides. The fat tissue is an active participant in our metabolism. It acts as an energy buffer. It provides storage for nutrients that arrive with the meal but are not immediately necessary for energy. It then releases them back into the circulation. Basically, fat tissue prevents dramatic shifts in the energy supply which would be unavoidable if we grazed like cattle.

Fatty acids are always on the move. What keeps them large is that the triglycerides are broken down before they enter fat tissue and then re-assembled once inside. Before they leave again, they are broken down, and then re-assembled upon exiting the fat tissue. Their movement is exactly the same as fatty acids, but due to their size, they have to undergo esterification and re-esterification which slows down the movement of all fatty acids in and out of the fat tissue. This is the defect that leads to obesity.

Vesna Wrote:
What are the myths and misconceptions, and what's real? Help!

Great question because myths and misconceptions run rampant. I say so-called because people tend to oversimplify the science by using terms such as "fat cells" and "doors to fat cells" when they don't exist. Dr. Eades did not want to explain esterification so he used the analogy of a barn. He figures that if you eat more fat than you need, the fat stays in the barn. He really meant that the same amount of triglycerides are esterified so the effect is similar to fat "staying in the fat cells." The problem is that it doesn't work that way.

The level of glucose phosphate in the blood determines how many triglycerides will be esterified at any time. When you reduce triglycerides, you thereby reduce the rate of esterification and thereby speed up the flow of fatty acids in and out of the fat tissue. When you get this fat moving fast enough, the fat tissue shrinks because there is no more congestion. When we say "speed up metabolism" we really mean reduce the rate of esterification. When we say "slow down" we mean that the rate of esterification goes up.

When understood properly, you should easily see why the calorie concept is so foolish. You can eat as much as you can stand under normal conditions because you're just adding to the flow of nutrients that circulates through your body. When you eat a lot you only increase the time until the next meal. When you eat a little, you speed up the time, that's all. This very thing has been confirmed repeatedly in animals.

To reduce fat tissue, you must speed up the flow of fatty acids in and out of the fat tissue. This is why people who restrict calories only create smaller versions of themselves, complete with fat tissue. They don't really do anything about their fat tissue although their whole body appears smaller. When you do it correctly, you'll shrink your fat tissue and your body will remain strong.
"The low-carb stall represents an equilibrium - the body is more or less "happy" with conditions, and balances food intake, metabolic rate, fat storage etc. to maintain this equilibrium. Obesity, by contrast, is decidedly far from non-equilibrium, and the body is held there only through excess insulin. Remove the artificially high insulin levels, the body pushes back toward it's desired equilibrium, and the fat comes off, which is why (I think) low-carb is so effective.

The only thing here I would qualify is that obesity also represents an equilibrium. By "equilibrium" we mean that the rate of the flow of nutrients is such that the cells are getting what they need. When they do, you maintain weight. This is perfectly natural and what is supposed to happen. This is why even on a zero-carb diet, you won't lose forever, as I have found out.

To lose weight, one would need to increase the rate of this flow of fatty acids in and out of the fat tissue. To gain weight, you simply have to slow down the flow of fatty acids in and out of the fat tissue. Either way, your body will find its equilibrium and fight to stay there because it's only interested in your cells.

Here's the dirty little secret: Your body plays with this equation all the time. When I exercise, the rate of flow increases and I lose weight through exercise. However, once I stop, my body slows the flow down and I eat or whatever is necessary to get back to equilibrium. When a person gets sick, the body also manipulates the flow of fuel to the cells. It increases it to promote health. When you eat less or you overtrain, your body will decrease the flow of fuel to the cells which results in a feeling of sluggishness.

This is important to understand.

onlyabtrfly Wrote:
So I think I screwed up yesterday, folks.
I didn't eat anything for breakfast as we were late getting up and ready for church. I had nothing to eat until 1:30, when I ate a pound of beef. I was crazed with the housecleaning bug yesterday, and didn't eat when I was hungry again. (I know, my bad) I kept pushing to get everything done I had wanted to get done and found myself literally putting out like a car out of gas about 9:45. I felt like I was running on less than fumes at that point. I went and ate almost all of two cans of tuna in mayo because it was fast. But I realize that in no way filled the void of what I should have eaten yesterday...
Now, I didn't mean for yesterday to happen like that at all. However, my assumption is that because I starved myself accidentally yesterday, my body must have hung on for dear life last night and I'm back up several ounces and I slept horribly. Have I answered my own question here? Is this because I didn't eat?

I don't really see any problem here....I wouldn't have eaten the tuna and mayo but that's beside the point. Because we have a long term fuel supply, there's no reason that we shouldn't be able to have flexibility. After all, we don't sit around the kitchen all day. Are you upset because of how much you ate? I don't understand.

I wouldn't worry about the two ounces either. It takes a couple of days to really know what the effect of a day's worth of eating does to us. This is why so many "experts" recommend that you only weight once a week or two. You're fine, just take a deep breath and get back to work. No problem.
con Wrote:
If I'm getting it....If we aren't losing weight the body is in equilibrium. Therefore we must decrease carbs, (in cheese/nuts) stress, and certain enzymes also in cheese & nuts and artificial sweeteners. By lowering these factors the body must change its actions to get back in equilibrium-think of a seesaw. Some of have to keep lowering and lowering these factors until nothing is left but water and meat. That's probably oversimplifying what Dave said. What do you think?
Dave's website is http://www.a spark of reason.
con

I think that is 100% accurate!

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-16-2008 01:54 PM

Charles,
No, not at all. Just the opposite. I didn't eat hardly anything yesterday, ignored hunger, and I think I'm up today because of essentially starving from fat and protein. You've said it yourself several times. There's no way someone twice your weight can eat less than you and succeed. What I was saying is I screwed up by not eating and especially by not eating fat.
I know why you don't like mayo--do you not like tuna either? Don't get me wrong, I could eat beef most of the time, but a little change is nice occasionally. Is there anything you would suggest in it's place?

---

I thought of that after I wrote it. There's NOTHING wrong with the tuna. I was really talking about the mayo because of the soy. Little fluctuations are normal. I don't think you did any serious damage. Remember, you are working from your long term fuel supply, not just what you ate yesterday. Your body can't distinguish it anyway.

I agree that you should have eaten more if you were hungry. I understand now.

RE: Zero Carb / Meat and Water - KimPossible - 06-16-2008 09:10 PM

I have caught up on this thread--okay, read it all--and all I can say is "whoa". I've been considering zero carb for awhile, and this thread has convinced me to take the leap. I'll begin tomorrow. I ate the last of the low carb ice cream tonight anyway 😊.

I will most likely have to re-read to take all this in! Whoa! 😏
RE: Zero Carb / Meat and Water - travis t - 06-17-2008 04:55 AM

A little update on zero carb's. So far i am getting closer to zero but still not there. Most of what i have found that works best is the 80/20 ground beef from walmart. I have been having it for breakfast and lunch at work. I gas grill it at home every night with a little seasoning mix. heat it in the micro at work. I do put quite a lot of land o lakes butter on it and also a dash of A1 and tabasco. It holds me for about five to six hours quite easily. The butter, salt, beef, pepper, and very slight sweet(from the A1) taste combo is very very good.

Two weeks ago i weighed 180 pounds and last night 173 @ 5'8" tall. I do still drink my coffee BTW. 

travis

---

RE: Zero Carb / Meat and Water - LindaSue - 06-17-2008 05:26 AM

That's great news, Travis. Just go easy on the steak sauce because it probably has quite a bit of sugar in it.

---

RE: Zero Carb / Meat and Water - travis t - 06-17-2008 05:57 AM

Thanks LindaSue
The amount of A1 is maybe 1 tbps total.
I may not go to zero, but then maybe i will because i'm thinking about doing a couple of triathlons around the middle of august (BTW my 40th birthday is in august, I guess it's all down hill form here).
One thing i can say is i feel awesome.

---

RE: Zero Carb / Meat and Water - Clabbergirl - 06-17-2008 06:02 AM

Progress!

I visited the doctor yesterday and have lost 8 lbs in 2 weeks, and I'm not even eating zero carb yet! I was shocked because when I started totaling up calories (old habits are hard to break and I was curious), there hasn't been a day that I ate less than 1600 calories with no real exercise outside of once-a-week yoga for an hour. For someone who needs to lose about 80 lbs, I've never been able to drop anything unless I went down to 1000-1200 cal with heavy daily workouts. This is revolutionary to me.

As far as how I've felt, there've been some rough spots of tiredness and foggy thinking, but I have sleep apnea and after getting new CPAP equipment, I believe most of that worn out feeling was due to equipment complications.

The biggest obstacle I've had is figuring out what to eat that's portable and quick-to-eat. After beating my head against the wall, I've finally succumbed to ground beef and steaks since Friday. It really is easier to do than I thought, but does require a bit of planning that I'm not used to. I bought a bunch of the beef rolls (73/27 fat ratio), frozen patties, and some steaks over the weekend, and so far am staying ahead of my hunger by cooking big batches of beef either on the stove or in the oven. I think I like the oven method better maybe. It has made ALL the difference in the world in not draining the fat from the pan. I brown the beef, packaged it in generously-sized, ready-to-carry microwaveable containers, and pour the beef fat evenly over it all (my plumber can breathe easier!). I have steaks in the freezer that I will also broil in my new toaster oven, and I've been making egg salad or having hard boiled eggs pretty regularly. I may try tuna to mix things up...and eventually I hope to make my own mayo.
This past Friday we went to Golden Corral (Charles' fave?) and I was absolutely amazed that I could walk right past the dessert bar without feeling a single pull toward it. The cakes and pies, even the fresh baked breads (my kryptonite), really had no appeal to me. Keep in mind, I'm NOT one of those who easily convinces themselves "I don't want that" just because the diet says something is off limits. I tend to be pessimistic, and when something is off limits, I want it all the more. But I felt no compelling cravings and used no restraint in sticking to the beef and chicken. I did oops and have a little breaded shrimp before it dawned on me there are carbs coating them (duh), but it wasn't great so I passed it by later.

On Father's Day I tried some sweet potato with butter along with my massive steak, but it wasn't the greatness I thought it would be either. I'm back to eggs and beef at present, and am hoping more weight comes off. The only odd thing is that this morning (Tues), I was extremely hot and am pretty sure I had night sweats (been having these since before this new way of eating though), and the morning feeling is new. I almost felt like I was about to have that shaky, low sugar feeling, but when I had a cup of coffee with cream (and stevia), the feeling dissipated. Weird.

Just had to share my good news, and bright outlook toward the future on this WoE! I'm a dyed-in-the-wool skeptic, but the weight loss alone is amazing. If I told anyone outside this board, they wouldn't believe me.

RE: Zero Carb / Meat and Water - travis t - 06-17-2008 06:18 AM

Clabbergirl
Thats great eight pounds in two weeks is awesome.
your kryptonite is baked breads but mine is Mt Dew. One thing is I don't seem to even think about them if i keep my carbs very low.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-17-2008 06:53 AM

I desperately need someone to explain in concise detail what just happened to me. Let me preface this by saying I had a good dinner last night and was getting ready to fix my breakfast at the regular time of 9am-ish.

I was in the kitchen having just given my little ones their breakfast. I was starting a bottle for the baby and I started getting the feeling like I was going to throw up and felt light headed. I put the bottle down and hung on to the counter, thinking it would go away. Well it didn't. I walked into the living room and sat down to put my head between my knees because I was sure passing out was coming up. I thought to take a bite of something, so I went back in the kitchen, snatched a banana off the counter, and took a bite. I was feeling so bad at that point I literally couldn't see straight, my ears were buzzing, and I just broke the banana up and gave it to the kids. I went to walk back into the living room thinking I'd lie down a few seconds and literally collapsed to the floor. I couldn't get up so I just watched my house spin around my head for about five minutes. When I finally dragged myself off the floor I went and got another banana. Sorry if this is TMI but all of a sudden I had the immense need to poo, so I hobbled to the bathroom. Not to be gross, but I tended to that business and ate my banana, and things started easing off. I am STILL shaking I feel like from the inside out. WHAT IS WRONG WITH ME???

I'm not trying to sound like a jerk or anything, but this is how I felt on Kimkins last year only I never collapsed. I am horrified at this because I FEEL SO DARN GOOD EATING THIS WAY!!!! I don't want to stop! So please, someone, tell me what just happened here and tell me how to avoid it. To have lived a week with no cravings and feeling satisfied is so insanely awesome to me and I don't want to
give it up. But I can't be worried of having episodes like this. It sounds like a textbook rapid sugar drop
to me, but with all the science on these thread pages saying that won't happen......what am I to think????
Someone help!!

RE: Zero Carb / Meat and Water - Vesna - 06-17-2008 06:55 AM

Clabbergirl,

That's fantastic! I'm so glad you've found something that works well for you. Also am excited to hear
you're preparing your own food from fresh, whole ingredients. How do you brown the meat in the oven?
Do you shape it into patties, or what? What temp, how much time, what kind of pan?

RE: Zero Carb / Meat and Water - wifezilla - 06-17-2008 07:13 AM

AnneMarie, sounds like hypoglycemia. You CAN get it with healthy low carbing. Jimmy is struggling
with that now and so am I. Stop by Jimmy's journal for details. I have had it since I was a kid. While low
carb improved some symptoms, I still get episodes.

RE: Zero Carb / Meat and Water - travis t - 06-17-2008 07:27 AM

onlyabtrfly wrote "I was in the kitchen having just given my little ones their breakfast" the only thing
that comes to mind is what did you serve the kids? i say this because for some people just looking at,
thinking about, or smelling food can signal the pancreas to release preformed insulin that is has in
storage. This response can cause fuel to be placed into storage and leave a short fall to run the brain on. I
would be willing to bet that you hadn't eaten anything yet.
travis

RE: Zero Carb / Meat and Water - Jimmy Moore - 06-17-2008 07:30 AM

Hey AnneMarie, it is possible you're dealing with reactive hypoglycemia and one of the things that has
helped me tremendously is eating lots of small meals throughout the day. Yes, they are LOW-CARB
and contain fat and protein at each one. If you haven't already listened to my podcast interview with Dr.
Keith Berkowitz from earlier this month, then you should check it out because he gives a lot more
strategies for dealing with this so you don't suffer the ill effects any longer:

http://www.thelivinlowcarbshow.com/dr-keith-berkowitz-on-the-forgotten-blood-sugar-disorder-
hypoglycemia-episode-144/

Let me know if you have any questions! You can see my menus at http://lowcarbmenu.blogspot.com.

RE: Zero Carb / Meat and Water - Clabbergirl - 06-17-2008 07:35 AM

Vesna Wrote:

time, what kind of pan?
I don't know if this is how others have done it, but I used an oven-safe pan of course, and used a spatula to 'chop' up the ground beef into fairly small chunks, adding sea salt only...then I put the whole thing into the oven at 250 degrees for somewhere around 2 hours. I went away and did other things, but did come back half way through to remix/crumble what had already cooked.

RE: Zero Carb / Meat and Water - Mel - 06-17-2008 08:01 AM

AnneMarie,

I suggest you read http://www.phlaunt.com/lowcarb/

Jenny has a suggestion called the 2 gram solution. She is a diabetic and seems to really know what she's talking about. I have had a problem with reactive hypoglycemia and I'd tried her 2 gram "cure". It doesn't fix you but it does get you through the episode without resorting to too much carb.

It sounded like a scary morning!

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-17-2008 08:03 AM

Thanks, folks.
Someone is going to have to give me some symptoms of this or something. I had not eaten yet, and to me, at least right now, Travis' answer makes more sense to me. But my issue with that is why? Why now? I have NEVER had something like this happen to me. If I'm understanding Jimmy's journal thread correctly, it appears one way to find out about this is to guage reaction to certain foods by testing blood sugar? What should I look for? I have a monitor from where I ended up with gestational diabetes while I was pregnant, but the battery must have died because it won't come on. Anyway...what should I be looking for, OTHER than this one episode? What other symptoms are there? I'm losing weight just fine...nothing else has been negative?

RE: Zero Carb / Meat and Water - travis t - 06-17-2008 08:11 AM

onlyabtrfly
The one thing that can think of as to "why now" is that your body tissues are becoming more sensitive to the insulin faster than your pancreas can get used to how much insulin you need. your muscle tissue and liver may be quite sensitive to the insulin and soaked up your blood glucose quite quickly. I think maybe this will go away after some time on a very low to zero carb diet. As your metabolism gets more efficient.

travis

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-17-2008 08:19 AM

Thanks, Travis, I really appreciate your input.

All this talk of reactive hypoglycemia does make me wonder, but my sugar has always responded normally to testing, other than when I was pregnant. I found some symptoms of it and frankly, the ones that I found that apply to me are the same as what's in the Atkin's and PP books for folks that are just totally strung out on carbs. I just started back to serious low carbing last Monday, and started zero carb
Wednesday night. Even though I've known the game for 9 years, I've sat on the bench too much--so I have to say, this is the first time EVER that my sugar would have grabbed entirely by the reigns due to absolutely NO carbs being in my food AT ALL.

Is there anything I should keep my eye on that should further interest me in the possibility of hypoglycemia? Further, I really appreciate everyone's input. I am a why person though, so if you think I am exhibiting signs of it, I need the "why" to help me sort it out. Because we know insulin is excreted prior to eating, the fact that I had just given my kids their breakfast snack of yogurt and bananas and I knew I was preparing to fix my meal makes me think it is just as Travis said. STill, I'd like to know what I should look for if anyone would like to share.

---

**RE: Zero Carb / Meat and Water** - travis t - 06-17-2008 08:35 AM

This kind of proves to me that zero carb diet is very very powerful indeed. One more question are there any meds involved as a change in diet can change the dosage needed for them or even the complete termination of their use.

travis

---

**RE: Zero Carb / Meat and Water** - onlyabtrfly - 06-17-2008 08:46 AM

No, no meds whatsoever.
Except for the fact that I have to lose literally half of myself, I have never had any medical problems and have a clean bill of health. I've yoyo'd horribly with low carb for years, always using it as a bandaid and not the cure that it is....the only reason I can think of that I'm still ok being so overweight is that half of the past several years I've gone several weeks losing weight, I don't know! But I'm grateful for it! 😊 I was afraid of all the posts saying I was probably hypoglycemic, but the more little articles I read on it the more sure I am that I do not have it. However, just because I'm afraid of something doesn't mean it doesn't bear further info, you know?
I agree that this must be a very powerful way of eating indeed. I think I may switch to several small meals though, just because in what I've read briefly this morning it appears that might be a good move for me. Further, I am going to begin cooking my first meal of the day the night before so that I don't find myself in this predictament again. In hindsight, I think I may have felt the beginnings of this a couple of nights ago having not eaten all day. Looking back, I had gone the same amount of hours not eating as I did overnight, ignored some hunger pangs to get things done, etc. The other night I think I must have just barely circumvented it. This is a hard lesson as it was frightening as all get out, but, needful obviously. While I realize we have a long store of fuel if we are overweight, that's not to say that the body will not react in just this way--by releasing more insulin that can be handled when a body has had nothing to eat--yet sees food, thinks of food, prepares for food. Does that make sense?

**RE: Zero Carb / Meat and Water - Charles - 06-17-2008 09:56 AM**

AnneMarie:

I have to agree with Travis. In fact, I don't buy hypoglycemia at all as I've stated before. Hyperinsulinemia is more in line with biochemistry and can certainly cause what you described. You didn't eat much the day before if I remember correctly so what you described falls perfectly in line with Travis's explanation.

When you sense food with one of your five senses, there is an insulin rush. Insulin clears your bloodstream of any and all nutrients. People want to call this hypoglycemia but it's more than that. Not
only is glucose cleared from your bloodstream upon inulin secretion, but also all fatty acids, amino acids, and anything that could possibly be used as fuel. This is the impetus to eat! For the hyperinsulinemic, you get a much greater insulin response than is necessary so you feel the need for carbohydrate more acutely than a normal person. Thus, you reached for a banana. Because of insulin resistance, the carbs that a supposed hypoglycemic would reach for would largely be stored as fat.

Eating more often appears to help because you are conditioning your insulin response better with more frequent meals but reaching for carbohydrates only exacerbates the problem because it doesn't address the conditioning aspect. If you are well-fed, you shouldn't have such an acute response. Hunger is a call from cells and insulin will always answer the call. In your case, insulin will answer louder than it does in others and you have to condition this response.

You have to be sure to eat regularly of nutrient dense foods. Tuna and things like that don't offer much in the way of fat and you need real saturated fat to fuel your activities. Keep yourself fed and you should continue to lose weight and get stronger as a result.

Regards,

Charles

Mel, thank you so much for posting this link. It's very informative. It has me wondering about reactive hypoglycemia, but is helpful in that it explains it's usually temporary if one experiences it. The info about potassium deficiency is especially interesting to me because I have terrible charley horse attacks at least once a week in my sleep and I've heard they are a result of low potassium. More info to absorb - I am learning so much.

---

**RE: Zero Carb / Meat and Water** - **onlyabtrfly** - 06-17-2008 10:47 AM

Charles, thanks for your input on this. I couldn't find it earlier/didn't have time, but I knew you had remarked somewhere here about hypoglycemia to this extent.

I do want to explain that my reach for a banana was in desperation. If you read carefully, you'll see that first I took a bite, and it wasn't until I found myself in a heap that I went ahead and ate the whole thing. 😞I truly, truly didn't want to eat the banana, but there was nothing already cooked that I could eat. This is why from now on there will be food stocked and stored and ready to be eaten no matter what. Just because I wasn't eating until 9 in the morning or so doesn't mean I should do the same thing now. My body has a long way to go before it really believes me that I'm not going to load it with carbs SO I am going to have to eat first thing in the morning, before the kids are here. Before the senses note that someone else is eating and not me.

Darn banana. I don't feel as good today as I have for a week. The thing with that blasted banana is, all I could think was what if I pass out cold and I have a house full of kids. My son can't go five
Charles, I just want to be sure I completely understand-hyperinsulinemia is something one can condition themselves out of with hard work and control I hope?

onlyabtrfly Wrote:
Charles, I just want to be sure I completely understand-hyperinsulinemia is something one can condition themselves out of with hard work and control I hope?

Well, don't think I'm upset with you for eating the banana. Hey, if that's all there is, that's all there is. I was just trying to explain the mechanics as to why that might have been something you reached for.

Everything I've read coupled with my own experience indicates that this is very reversible but it takes hard work. Taubes compared sugar to an addiction and it shouldn't surprise us that withdrawal is so difficult. Many people will lapse many, many times before they're finally able to beat it. The lapse will happen sooner when doctors are suggesting that people need carbohydrates to control their condition.

We know that our bodies don't need carbohydrate for any purpose but they still crave sweet-tasting things and this is a truly vicious cycle that's very difficult to overcome. Sure, in my explanations I may make it sound easy, but I had a hard time losing 65 pounds. Just this year has it become "effortless" but I have to always be diligent.

Just because our bodies tend to react in peculiar ways doesn't mean it has to be a weakness. It should be seen as a source of power. You are probably far more attuned to your body and its needs than you have ever been. When you get down to the basics, you become acutely aware of everything and hunger is no different.

I know for myself, all functions are just so much more acute. When I'm sleepy, I need to sleep. When I have to go (sorry) I really have to go. When I'm hungry, I really need to eat.

However, when I'm full, there's nothing you can wave in front of me that will make me eat it. My mind is clearest and all parts work very well. I can run long distances and lift heavy weights.

What I'm saying is that you must find ways to deal with whatever limitation there is. In your case, I would make sure I had something to eat every 5 or 6 hours -- even sooner if necessary, but you want to establish a regular routine of eating, regulated by your hunger, and I think this will condition your response and you will function better as a result.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-17-2008 11:53 AM

Oh, of course Charles! I didn't think you were upset with me! On the contrary, I was upset to eat the stupid thing but I knew I had to do something right away. A hot pan with cooking beef would not have been a good thing had I actually blacked out or something...always erring on the side of caution with my little ones. 😐

Seriously, I knew it would give the internal carb demon a little more control over me and I shoved it down before I could taste it to try to maintain some semblance of mind control at least. I didn't want to
give an inch. Anyhoo, you are right, it's only been a week but things are much more acute than they have ever been buried under a barrage of carbs or so called legal carbs. I'm determined to beat this thing. I don't know that I've specifically mentioned it here, but the thing is, I want to have more children. This is the only way and I've already proven that in my own life once. Now that the carbs are mostly (darn banana) out of my system, I think so much more clearly and have so much more control. I know as I have never known that I can and I will get back to a point of balance. I was so freaked out this morning because I felt if I couldn't do zero carb there was no hope for me. 😞 I'm so grateful for everyone on this board. Thanks folks! The kids are waking up, gotta go! Everyone have a wonderful, happy afternoon. TTYS!

I just wanted to comment on this...and go a step further and say that sugar IS an addiction. (I'm ignorant of Taubes's exact wording--not having read him...YET). I have seen a drug addiction and a sugar addiction (hand in hand in the same person) and I think we excuse the sugar addiction because the causes really only affect the person--there's no staggering or impairment when driving--the side effects manifest themselves in our bloodstream and in our weight gain (and disease, etc) but we shouldn't kid ourselves--sugar is a very powerful addictive substance--and studies have shown (will have to look them up) that it affects the same neurons as opiates do. *off to make sure I stated that correctly...*

I am cooking up a whole 5lb roll of burgers now...(was already a fan--love that it's the cheapest, too, though I'm not sure on the whole pouring the grease on them...😊)

---

RE: Zero Carb / Meat and Water - KimPossible - 06-17-2008 12:42 PM

Here's what I came across on first Google...a few articles for the idea of sugar being addictive and one that says "not really" though that same article states that "For one thing, our brains depend on glucose to function properly, she said. Blood sugar at healthful levels feeds our metabolisms. 'Our whole biology is geared toward the utilization of sugar as an energy source.'" UH, NOT!

http://articles.mercola.com/sites/articles/archive/2007/08/06/is-sugar-more-addictive-than-cocaine.aspx

http://www.rps.psu.edu/probing/sugar.html

And I take exception, too with the last link's comment that "That doesn't mean living on candy bars is advisable, she adds, but a sweet treat now and then is not going to be habit-forming."

Insert Vicodin in that sentence. "That doesn't mean living on VICODIN is advisable, she adds, but a VICODIN now and then is not going to be habit-forming."

Does stating it that way mean Vicodin is any less addictive just b/c some don't become addicts? NO.

Got a little passionate...sorry 😊

I think you're right, KimPossible! Although I have to dispute the driving part. There is so much road rage out there and people are just plain violent. Did you see that You Tube video were the teen-age girls beat the other girl? These carbohydrates make people violent. They mix sugar with everything that people eat; heck, even the medicines have a sugar coating on them so people can take them easier. This is a serious problem.

On a better note, I'm very happy you're joining us and I can't wait to celebrate with you and your success. Even though I only "know" you on this forum, it seems like I've known you for a long time because you were on the old forum!

Best regards,

Charles

RE: Zero Carb / Meat and Water - Wendyoh - 06-17-2008 02:26 PM

Oh, I disagree on the driving too. When eating higher carbs, I had the worst time driving, b/c I couldn't focus and my vision was always blurred. I don't think a lot of people even realize just how much carbs affect us. They just take this stuff for granted and think this is how they are. That's what I find so sad. If they only knew how good they could feel!

RE: Zero Carb / Meat and Water - rozi - 06-17-2008 02:42 PM

Don't forget drowsiness while driving. More people fall asleep at the wheel than ever before. They blame it on sleep deprivation and that is probably true, but I believe a lot of it is due to carb overload.

RE: Zero Carb / Meat and Water - KimPossible - 06-17-2008 02:54 PM

Oh, I agree about the driving...I just meant that it's not illegal... 😊

Hi Rozi!!!

Thanks Charles! I am excited about this and READY to feel/see the benefits of it. Carbs begone!

RE: Zero Carb / Meat and Water - LindaSue - 06-17-2008 03:43 PM
KimPossible Wrote:

)
I just finished making 11 pounds of ground beef into hamburgers. I fried them and put them in the freezer. I got a super deal today for only 99-cents per pound because it was about to expire. They ought to last me a couple days at least, LOL. I make them into half pound patties so I really do got through them pretty fast, especially if I eat more than one per day.

By the way, I freeze them in a single layer on a foil-lined baking sheet than store them in ziploc bags. I take out what I'll need for a couple days at a time and leave the rest in the freezer. They reheat very nicely in the microwave in about 1 1/2 minutes on 40% power per burger. I somewhat undercook them when I fry them (3 minutes per side) so that they don't end up tough when I reheat them later.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-17-2008 03:57 PM

LindaSue, that's a great idea. After my fun morning I was trying to think of a way to have patties on hand any time. Seems like having the freezer and fridge stocked is a perfect thing to do.

I totally agree with the problems driving due to carb overload. I used to drive 25 miles to work and then back, and was so sleepy the whole time I would literally have bruises from pinching myself. It was completely ridiculous. Also, when I'm carb loaded I feel irritable and grouchy, can't focus on anything, or get anything done. Carbs are the devil. Thus my avatar.

I need a t-shirt with that on it.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-17-2008 04:54 PM

That's so funny Kimpossible, because I am opening a baby boutique online August 25th and my main thing is tshirt sets that I've designed. I'm just waiting to get my quote back from a lady around the corner who has heat press machines and can print my tees. I'll pm you when I've got them in process. I'd love to have a shirt with this on it myself! Maybe I'll ask Jimmy if I can design t's for his forum. Hee hee! LOL.

RE: Zero Carb / Meat and Water - rozi - 06-17-2008 09:47 PM

Hi back Kim! Glad to see you here, I missed you.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-18-2008 03:56 AM

So my total weight loss for one week is an even five pounds. Good ol' Tom popped in to see me yesterday three days early (always happens when I start to low carb/read: ENDOCRINOLOGISTS! Hello, low carb has a direct link to the reproductive system!) and I'm not up my typical seven pounds. So I'm happy as a lark.
Confession time...I had just bought a case of Diet Canada Dry last week when I started this, so I've had one here and there not wanting to waste it. Well I kept noticing at all different times this sort of achiness and tightness in my chest. I was worried it was because I was eating too much fat, and I've never even been in that camp of thought! But this morning I popped the last one open and took a chug, and sure enough, here is this weirdness in my chest. I poured the rest down the drain. I've convinced hubby to stop buying diet drinks, too. All those chemicals...anyway, I'm not proud that I was drinking them, but at least now I know why I felt this way. Another lesson learned.

I'm off to eat four sausage patties for my morning snack. For breakfast I'm having 2 burger patties, for lunch I'm having two nice pieces of salmon cooked in lots of EVOO and butter, another beef snack, and grilled chicken for dinner. (I know, not a lot of fat, but I gotta have something different somewhere!LOL) Then I'll have another beef snack while me and hubby watch a movie tonight.

By the way, Rozi, I love your optimist comment-too funny. 😊

I love this way of eating. It totally rocks. 😊

Clabbergirl Wrote:
The info about potassium deficiency is especially interesting to me because I have terrible charley horse attacks at least once a week in my sleep and I've heard they are a result of low potassium. More info to absorb - I am learning so much.

Clabbergirl, I had the same and they go away when I take magnesium. Not sure if this is coincidence or causation, but it could be the latter.

Try a Google search for leg cramps magnesium and you'll find plenty of info.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-18-2008 04:10 AM

Morning, Vesna. 😊
I've heard magnesium is very good for insulin issues, too. But you have to get the right kind, something about "chelated" this or that? Do you use it?

RE: Zero Carb / Meat and Water - Vesna - 06-18-2008 04:52 AM

Yes, whenever I remember to take my vitamins (2-7 times/week), that's in the mix.

There's lots of info out there about what chelation is -- my Cliff Notes recollection is, it has something to do with making it more like food that your body can utilize and less like just eating a rock.

RE: Zero Carb / Meat and Water - Vesna - 06-18-2008 05:08 AM

Well!! I just completed my two-week meat and water experiment. For me, it was not a magical door to weight loss and well-being. In no way is that a comment on people who report that it works wonderfully for them.
When I was eating just meat, I felt enervated and hungry, especially during and after meals. I don't understand why. It can't be rabbit starvation -- not at 65%-75% fat!

Anyone interested can check out what I ate at

http://www.fitday.com/WebFit/PublicJournals.html?Owner=weasel%21

I'll post more later -- gotta run to work!

**RE: Zero Carb / Meat and Water** - [Divine Miss M](mailto:Divine Miss M) - 06-18-2008 06:57 AM

Hey, Everybody:

I jumped on this wagon June 2, and dropped 14 lbs. by June 11.

However, hormonal flux interrupted and the wt. immediately starting climbing. Those who know me also know 'cheating' is not a usual problem for me. I stick with the plan 24/7. However, this weekend I did cheat, just for one meal. An unplanned cheat, but it happened since the planned Father's Day b-b-q didn't happen and we ended up with a big family shindig at a restaurant. By that time, 8 hours had passed since my last meal, I had a major headache, and I was terribly exhausted. So I ate a hamburger with the bun and hashbrowns - bad choice - but that's as far as it went. Could have made a better choice, but I didn't. Still, as we all know, that's enough to really blow the 'metabolic' advantage for any low-carber.

Anyway, I immediately returned to the Zero Carb aim and considered that one meal a 'free meal,' which I usually avoid. Btw, I'm not completely Zero Carb since I do eat organic eggs, but I'm close.

We'll see how the rest of the month goes. The hormonal flux gain and the carb gain is subsiding, but I still cannot get past the same old numbers. Instead, I easily bounce right back up, as soon as I'm 'this' close. Same old story since November.

There seems to be a set point established, and I'm trying to get past it - WAY past it!

Two weeks is not enough time to tell anything about any dietary change, so that's not so surprising to me.

Fitday may tell you that chicken and bacon have 75% fat but I'm not so sure I agree with that. I don't have the energy from those foods as I do from ground beef. Bacon is quite lean and you also have cheese and sour cream in there. I know you didn't eat a lot, but it doesn't take much for me. Chicken thighs are good at 35 grams but legs don't have but 15 grams of fat for 6 ounces.

Did you drink water with all of this?

If you were hungry when eating this food then it's clearly not the right type of food. I would suggest you try what everyone else is trying and that is to add some fatty ground beef. It's cheaper than the meats you listed and I bet you'll be more sated. The 73/27 has more fat than the chicken legs.

If you're truly hungry then you're not getting enough nutrients from your food. If these are cravings, it only tells us how much hyperinsulinemia you have. Insulin signals hunger and helps prime our body for food. If you were hypoglycemic, then I don't think your hunger would be so acute.

I have no dog in the fight so you can try whatever method works for you. However, I think for zero carb to help with your hyperinsulinemia, you may want to try some fatty beef. You can't solely rely on fitday. You have to rely on your hunger and pay attention to what your own body is telling you. From my vantage point, it's saying that it's hungry and not getting enough nutrients from what you're eating. You have to change it up.

Regards,

Charles

I'm a little confused. I just checked out your Fitday from the last couple days and on 6/14, it says you had yellow cake. Is this correct? Even if it was just a small bite, I think this takes away from a meat/water only experiment, don't you?

**RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 09:45 AM**

Hi, Charles:

I'm 5'8, and I'm currently 224. I was 220 last Thursday and gained 5 lbs. by Sunday, even though I was still on plan until that Sunday night restaurant dinner. (Pifflle)

A brief history on yours truly: I lost 101 lbs, from May 3, 2007 thru November 24, 2007 (from 315 down to 214). And I've been stuck ever since...except for these insane stall-gains.

When I say 'insane,' it's because I am usually on plan. As a rule, I am strict with myself, and I don't have weekend splurges. I have made occasional mistakes or 'to heck with it' choices with the woe, like I did this weekend, but they are extremely rare.

My last fasting blood glucose was 115. A previous 3 hr GTT provided results that matched with Dr. A's chart in that the 2nd hr spike was a bit too high for comfort. Doc wasn't too concerned, though he said the 2nd hr. spike is an 'indicator' that I could be going into diabetes, and that's as far as he went. I'm convinced I'm 'pre-diabetic,' aka hyperinsulinemia. There is a family history of diabetes on my mom's side, all the way back to my gr-gr-grandmamas.

My workout plan is water calisthenics, water ballet movements, etc. They ease the muscle and arthritis pain but also stretch and strengthen my muscles, since 'endurance' exercises are still beyond my ability [due mostly to the fibromyalgia and 'mild' lupus. Doc says the kidney tests are fine so he approved the lc diet with its higher protein content, but he offers no other help].

Btw, I tried EFGT and it did work, to a point, but the lesser amts. of proteins at lunch and dinner had an effect on my energy and my hunger. It's a strange thing, because I was never a gungho meat-eater, but I
do feel better eating meat, chicken and fats.

As one can imagine, I feel and look much better, though I'm still overweight, but I'd BE much healther at 165 [at least]. I'd really like to hit a goal of 145-150. But I take it one step at a time...from this point, my first aim is Onederland.

Lcing got me off all my meds - including those for pain, fibro, arthritis, hypertension, GERDS - so it's my lifetime eating style.

I drink at least 120 oz. of water per day, not to mention occasional sugar-free green tea. I avoid aspartame but sometimes I will have either stevia or Splenda, and I have been wondering if either two of those latter products might be part of my problem.

I also take supplements, including Sulfurzyme [for the fibro], MSM, chelated magnesium, prescribed Micro-K [potassium], chromium picolinate, the Super B's, Esther C. These are things I must do, since my health was seriously compromised. I understood my very first goal was to improve my health; losing wt. is very important to me, I admit, but it's really part of the package deal.

So I'm about 2/3 of the way to goal and I'm 'way' ready to make it all the way ---and stay there!

Thanks, Charles, for whatever you might suggest!

Tawn [aka Divine]

---

RE: Zero Carb / Meat and Water - Lauren - 06-18-2008 09:52 AM

This is a question for Charles regarding all of the attempts at Zero Carb as compared with his journey.

Charles, from reading your posts, I know your meat and water only diet has been fairly recent. I seem to remember you gave up cheese and eggs only after you got down to 164. Going meat and water has keep you pretty steady in the mid 150's. Since you were able to lose weight with eggs and cheese, it seems unreasonable that small amounts of these items would keep others from losing. I also seem to remember that you lost some of your weight on a low fat diet.

It might be really helpful to us if you could detail your various stages:
- low fat- how long, how much weight lost?
- meat, eggs, cheese: how long, how much weight lost?
- and any other stage that we might not be aware of?
- also, how much exercise you did along the way?

I suspect that those of us with hyperinsulinemia could benefit from a somewhat less restricted diet for a longer duration rather than meat and water only for a lesser duration. I think the point should be that we should eat as few carbs as possible while our insulin receptors repair and that this can take quite some time. Working towards ZC is great but going the long haul might be even more important. I think that it took a while and a lot of hard work for you to get where you are. We should expect the same.

---

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 09:55 AM

Dear Charles:
I forgot to mention one important matter: I have a serious problem with water retention. I can always feel it coming - and the next day, eyes, fingers and ankles are swollen.

As I said, doc says kidney tests are fine, but the problem continues. When it rains, snows, or when humidity rises, I'm in trouble. The only thing that helps is lemon water or pure lemon oil drops in my water glass.

For months, I've looked into possible causes and natural means to eradicate it. I've tried extremely gentle liver/bladder cleanses, which help somewhat. But again, I never can get past 215. The minute I hit it, the wt. bounces right back up. (No, I don't go out and celebrate that number but stay on plan when I reach it, but to no avail. Increasing, decreasing or changing exercise doesn't help with either inches or scale loss.)

Thanks again, Charles!

Tawn

**RE: Zero Carb / Meat and Water - travis t - 06-18-2008 09:56 AM**

what i have eaten today

4:30 am 16 Oz strong black starbucks pike place roast coffee. ground last night and set to drip this morning.

9:00 am five hamburger patties made from 80/20 beef bought from walmart with table salt and one half stick of butter. No steak sauce or tabasco today. There was so much liquid butter after the micro that i had to chop up the patties so that they could soak up all the butter. It really was wonderful.

10:30 am one twelve oz coffee from the cafeteria at work.

I am planning to eat only twice a day at this point in time. The amount of fat i had will keep me until supper at about 5:00 pm.

travis

---

**RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 10:26 AM**

Dear Lauren:

It seems to me, even among low-carbers, there are enough genetic and environmental variables among us which explain why different lc woes work for different people. That is, for some Atkins or SB might provide success, while others must stick with EFGT or ZC. At any rate, such variations might indicate the degree of hyperinsulinemia. The end result: While some may tolerate cheese, sugar-free yogurt, etc., others just can't.

From what I understand of Charles' explanations, which somewhat reflect Dr. A's 1972 Induction plan, the whole point of going 'off' certain foods is to get glucose under control, body fat burning, and also discover what are our individual triggers. By triggers, I mean bodily [physiological] reactions that trigger the pancreas. If too much glucose is released, then body fat is stored and - to add insult to injury - we get hungry that much quicker. The way to deal with glucose-induced hunger is to consume fat and protein, not carbs.
For myself, I can't deny that eating protein and fat does make me "feel" better in both mind and body. Btw, this statement comes from a girl raised in the Italian tradition, wherein pasta is a stable at lunch and dinner. But so are extra virgin olive oil, dark green salads and herbs, organic eggs, goat cheese, and fresh fruits.

Regardless of our family culture, 'bad' carbs are everywhere. For some of us, even 'good' carbs could trigger too much insulin production.

In the end, I agree with both of you, based purely on objectivity due to scientific variables among individuals, so I'll conclude with this thought:

P/F can and will help but it *can't* hurt because it's absolutely healthy.

travis t Wrote:
9:00 am five hamburger patties made from 80/20 beef bought from walmart with table salt and one half stick of butter. No steak sauce or tabasco today. There was so much liquid butter after the micro that i had to chop up the patties so that they could soak up all the butter. It really was wonderful.

Do you also eat the drippings from the hamburger along with the butter? I would try butter on my hamburgers (that sounds really tasty) but mine have so much fat already that they don't really need it. When I reheat a half pound patty in the microwave, I end up with probably 2 tablespoons of grease on my plate plus whatever fat remained inside the meat. As I eat bites of the meat, I swish it around in the grease so that I get it all and none goes to waste.

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 10:42 AM

Hi, Linda Sue:

My gosh, from what you and Travis posted, I am beginning to wonder if I am not consuming enough fat!

I don't usually eat 'fatty meats' - I have not progressed that far yet, and that itself will be a challenge since never, never have I eaten marbled meat, or fat on meat. This is a life-long issue; when was a little girl, I would not eat if there was any fat on the meat but gave it to my dad. The stuff gags me. I'm still that way - I simply can't make myself do it.

What I've been doing is this: I eat eggs, meat, pork (sometimes) or chicken and add olive oil, evco, or butter to them. I also marinate meat in extra virgin olive oil.

I hope that is good enough for now...however, I have to say I can't get over how much protein I eat at a meal until I'm satisfied. We're talking 4 eggs, sometimes 5-6, and 4 pieces of Canadian bacon, or Genoa salami, fried in butter.

I can easily eat 10 oz. or more of chicken for lunch. Since I eat only white meat chicken [sorry, I really do not like dark meat from the chicken], I add fat to it - like full-fat, sugar-free salad dressing, if the breast is cold. When baking a breast (in olive oil or with a bit of lemon pepper), I could easily eat 2 and sometimes if very hungry, 3. I assume that intermittent increased hunger is due to the fact I'm really doing my best to avoid all carbs [except for those morning eggs].
Comments or ideas - that is, am I following ZC pretty well or...?

Divine Miss M Wrote:
When I say 'insane,' it's because I am usually on plan. As a rule, I am strict with myself, and I don't have weekend splurges. I have made occasional mistakes or 'to heck with it' choices with the woe, like I did this weekend, but they are extremely rare.

Btw, I tried EFGT and it did work, to a point, but the lesser amts. of proteins at lunch and dinner had an effect on my energy and my hunger. It's a strange thing, because I was never a gungho meat-eater, but I do feel better eating meat, chicken and fats.

I'm sorry, I'm not good with acronyms and abbreviations. What is EFGT?

Tawn Wrote:
I drink at least 120 oz. of water per day, not to mention occasional sugar-free green tea. I avoid aspartame but sometimes I will have either stevia or Splenda, and I have been wondering if either two of those latter products might be part of my problem.

I also take supplements, including Sulfurzyme [for the fibro], MSM, chelated magnesium, prescribed Micro-K [potassium], chromium picolinate, the Super B's, Esther C. These are things I must do, since my health was seriously compromised. I understood my very first goal was to improve my health; losing wt. is very important to me, I admit, but it's really part of the package deal.

So I'm about 2/3 of the way to goal and I'm 'way' ready to make it all the way ---and stay there!

Thanks, Charles, for whatever you might suggest!

Tawn [aka Divine]

Okay, so what do you currently eat and when?

What's the effect of these foods on you? For instance, how long do you go between meals? Do they satisfy your hunger?

Do you sleep throughout the night?

What is your energy level like throughout the day?

Do you have cravings, regardless of whether you give in to them or not?

Do you always stall at the same point?

What were you eating the last time you stalled at this point?

I realize that you take the supplements for your health but what happens if you don't take them? Have you every tried taking half of those supplements to see what effect that would have?
Were you taking these supplements when you stalled before?

Sorry for all the questions but that's about the only way I can give an opinion.

Regards,

Charles

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-18-2008 10:56 AM**

I realize it's going to take time and effort to get my insulin issues straight...but does anyone hold out any hope for me of sleeping through the night?

I am so tired of waking up every night. When I wake up, I'm not hungry or thirsty, sometimes a little over warm but not sweating or anything. It's like I just wake up for nothing. It's so infuriating. And it's always exactly five hours. If I go to bed at 8, I wake up at 1am. If I go to bed at 10, it's 3am. That is not enough for me. I am constantly sleepy. I notice that now I'm feeling sooo much better, I'm mentally pretty sharp, and I feel more generally alert. However, there is always a fog of sleepiness over me and I am sick to death of it. I'm so desperate I'm wanting to try sleep aids, but I despise the use of any chemical for my own reasons, so I want to avoid that. Is there something I could do? Eat a snack late? Eat a very large dinner so I can get through the night? I'm so desperate, if anyone has advice please let me know! Thanks!

Sleepy in VA...

**RE: Zero Carb / Meat and Water - Lauren - 06-18-2008 11:17 AM**

Divine Miss M Wrote:

Dear Lauren:

It seems to me, even among low-carbers, there are enough genetic and environmental variables among us which explain why different lc woes work for different people. That is, for some Atkins or SB might provide success, while others must stick with EFGT or ZC. At any rate, such variations might indicate the degree of hyperinsulinemia. The end result: While some may tolerate cheese, sugar-free yogurt, etc., others just can't.

From what I understand of Charles' explanations, which somewhat reflect Dr. A's 1972 Induction plan, the whole point of going 'off' certain foods is to get glucose under control, body fat burning, and also discover what are our individual triggers. By triggers, I mean bodily [physiological] reactions that trigger the pancreas. If too much glucose is released, then body fat is stored and - to add insult to injury -
we get hungry that much quicker. The way to deal with glucose-induced hunger is to consume fat and protein, not carbs.

For myself, I can't deny that eating protein and fat does make me "feel" better in both mind and body. Btw, this statement comes from a girl raised in the Italian tradition, wherein pasta is a stable at lunch and dinner. 😊 But so are extra virgin olive oil, dark green salads and herbs, organic eggs, goat cheese, and fresh fruits.

Regardless of our family culture, 'bad' carbs are everywhere. For some of us, even 'good' carbs could trigger too much insulin production.

In the end, I agree with both of you, based purely on objectivity due to scientific variables among individuals, so I'll conclude with this thought:

P/F can and will help but it *can't* hurt because it's absolutely healthy. 😊

Hi Divine Miss M,

I'm really not challenging that meat and water only is the best way to make progress. I'm just noticing how hard it is for most people (myself included) to follow this diet for the length of time necessary to make a real difference. I was thinking that eating meat, eggs, cheese, cream and even a small salad with dinner (that is without "cheats") for let's say six months might have an overall longer lasting effect than eating meat and water for three weeks if that's all one can manage. From reading the journal posts, I get the sense that it's the "cheats" that really do people in. To achieve metabolic balance, I'm wondering if consistency is more important than perfection.

RE: Zero Carb / Meat and Water - travis t - 06-18-2008 11:19 AM

AnneMarie
I know that you don't want to use any chemicals but i have to say that black coffee is the BOMB..... I have been drinking it for years and it never lets me down, a sugar buzz always lets me down but not caffeine. Most of the time i sleep about 5 hours a night because i get up for work at 3:30 am and get to work at 4:30. I drink my morning coffee not because i am a zombie without it but because it make me feel like superman. As far as something to help you sleep soundly the only thing anyone ever told me was magnesium before bed.
travis

I may go out and get some magnesium this evening. Dude, I hate coffee with a vengeance. I tried to drink it at work when I went back briefly after having my son, and I was a total mess. Whoooooooolllll, I felt like I was going to run up and down the walls or something. Thanks, but no thanks. 😊

IS it chelated magnesium I want?

Lauren Wrote:
Charles, from reading your posts, I know your meat and water only diet has been fairly recent. I seem to remember you gave up cheese and eggs only after you got down to 164. Going meat and water has keep you pretty steady in the mid 150's. Since you were able to lose weight with eggs and cheese, it seems unreasonable that small amounts of these items would keep others from losing. I also seem to remember that you lost some of your weight on a low fat diet.

This is a very good point, but since "others" are not me, then that kind of detracts from your point. I did begin with a low-fat diet in 2005. I went from 221 to 178. At that point, I began to lift weights and I couldn't control my hunger evidently because I went all the way back up to 207. I kept telling myself "it's all muscle."

I began Atkins Induction in January 2007. I did not venture beyond Induction because Chapter 7 of the DANDR described Kekwick and Pawan's observations regarding fat. Therefore, I kept my carbs below 20 grams and most days they were less than 10.

My breakfast consisted of three eggs and sausage for a long time. Then, I went to three eggs and steak. I discovered that this didn't leave me full as long as my other meals did. Therefore, I removed the eggs and cheese. The 5 pounds I lost once I did that was truly unexpected. Cheese went in and out of my diet during the whole time because it was difficult to isolate cheese as being the reason for any stall. It may be okay today but there were other factors that make me leave it out. I may have too much yeast or something because I had Athlete's Foot prior to removing the cheese. I don't have it anymore.

The point is, I wasn't afraid to remove anything that might cause problems.

It's important to state at this point that Gary Taubes does not advocate a zero-carb diet. However, he agrees that his research all seems to point to zero-carb as the diet to which we are biologically adapted to eat and thus one eating in this way could expect to return their body to "biological normality." I'm not sure that equals longevity as Stefansson said, but at least I know my years will be active and productive years regardless of how many I have left.

We have to understand how serious this thing is and I didn't always appreciate it. I learned things throughout my journey and as I did, I made adjustments. It did take a while to get to meat and water but if I would have known then what I know today, it may not have taken so long. I really had a singular focus and my wife will tell you, I drove her crazy because I would buy something and eat it for a while then I would tell her I'm not eating that anymore.

I've tried brown rice, brown pasta, you name it. That stuff was gross! I've eaten more broccoli than the law allows but I've also had some of the worse constipation you could imagine. Once I removed these things, everything, and I do mean everything, worked better. My wife will tell you that too!

Lauren Wrote:
It might be really helpful to us if you could detail your various stages:
-low fat- how long, how much weight lost?

It took me 5 months to go from 221 to 178 on my low-fat diet.

Lauren Wrote:
-meat, eggs, cheese: how long, how much weight lost?

It took me 8 months (January to August 2007) to go from 207 to 164. I even ate Breyer's CarbSmart ice cream during this time, but I drank water.
Lauren Wrote:
-and any other stage that we might not be aware of?
-also, how much exercise you did along the way?

Well, between July and August, I began to use Splenda more and more and I even tried artificially sweetened water. I didn't use it from January to July. The first thing I noticed was leg cramps during and after races. I also found myself dehydrated more often. I gained 6 pounds between September and November.

I read the article "The Sugar-Free Blues" available at Weston A. Price and they mentioned that artificial sweeteners cause these things so that was enough for me. In November of 2007, I gave up Splenda, which meant no more diet soda, tea or anything else with artificial sweeteners. I also began to experiment with zero carb and I quickly lost 12 pounds. I've been that way ever since.

I've tried at various times to add a few vegetables especially since I did eat vegetables between January and July 2007 when I lost the majority of my weight, but after going zero-carb, it seems to have made me even more sensitive to them. I gain weight immediately upon eating them.

What I'm saying is that if I want to eat vegetables regularly, I can look forward to weighing 174-178 pounds. If I eat eggs regularly, I can look forward to my weight staying in the 160's. If I remove them, I can stay in the 150s without effort. That's what I have discovered about myself.

As far as exercise, I began lifting weights when I was on my low-fat diet in 2005. I kept to that same workout and gained weight. Once I switched to low-carb in January 2007, I did the exact same workout but this time, I was losing weight and my love handles finally shrunk. I lifted three days and I ran 6 days.

Now, I lift two days and run 2 days. Exercise had little to do with it because I did the same stuff on both diets. I even ran a half-marathon at 207 pounds. I didn't lose a pound!

You have to make these same discoveries about your own body and act accordingly.

Quote:
I suspect that those of us with hyperinsulinemia could benefit from a somewhat less restricted diet for a longer duration rather than meat and water only for a lesser duration. I think the point should be that we should eat as few carbs as possible while our insulin receptors repair and that this can take quite some time. Working towards ZC is great but going the long haul might be even more important. I think that it took a while and a lot of hard work for you to get where you are. We should expect the same.

Well, everyone needs to decide that for themselves. I think I could have lost weight faster if I had more information, but that's just my experience. As we've discussed so many times, the "urge for the sweet" is born out of an addiction and it's something that has to be overcome.

Once upon a time, it was natural to crave natural fruits and tubers and the like. These refined and easily digestible carbohydrate foods give you an exaggerated response to glucose as compared to the relatively slow response that we get from protein and low-glycemic fruits. Now that I've damaged my receptors for these things, I have to omit them entirely. Sure, I could have them one day out of a month and probably be okay, but why?

Some people can stop drinking immediately and never look back. Some people will go back or just cut their drinking down but deep inside they know that they really are going to have to abandon it to achieve
long-term success.

I don't see this as being any different. I am not telling you that this is easy nor should anyone construe what I'm saying as easy. Addictions are very hard to conquer, but I believe in you just as I believe in everyone else. I think you can beat this.

As you found out from the Bear, it takes time for some of us to beat this thing. If you feel you need more carbs in your diet, then you have to be make that choice. I have no way to stop you! 😅

Regards,

Charles

---

Dear Charles:

You asked:

Q. I'm sorry, I'm not good with acronyms and abbreviations. What is EFGT?

RESPONSE: Sorry! EFGT is Eat Fat, Get Thin.

Q.Okay, so what do you currently eat and when?

RESPONSE: I eat organic eggs, red ground meat [sirloin, to which I add fats when cooking - see post above], white meat chicken, Genoa salami, lean Canadian bacon [cooked in butter], and sometimes, pork chops. That's about it.

I usually do eat in the mornings, within 45 minutes of awakening. From that point, it's about 4.5 hours before I start to feel hungry.

Q. What's the effect of these foods on you? For instance, how long do you go between meals? Do they satisfy your hunger?

RESPONSE: Right now, there is about a 4.5 hr. span between meals, sometimes more, but that is because I increased protein consumption since June 2. Before that, I ate about every 3-4 hrs.

Yes, the current ZC woe satisfies my hunger.

Q. Do you sleep throughout the night?

RESPONSE: Only recently. I also began taking the Sulfurzyme [a natural sulfur supplement] on June 3rd.

Q. What is your energy level like throughout the day?

RESPONSE: It's a variable. Sometimes my energy level is 'ok,' and sometimes great. On some days, it's zilch, and that occurs when the barometer fluctuates up. Fibro does that to a person. This is one huge aspect I'm trying to improve via diet and exercise.
Q. Do you have cravings, regardless of whether you give in to them or not?
RESPONSE: About every 21-24 days. Then I crave almonds or other nutmeats, so I increase my daily chelated magnesium intake.

Q. Do you always stall at the same point?
RESPONSE: Yes.

Q. What were you eating the last time you stalled at this point?
RESPONSE: I was low-carbing but began cycling the lc woes in August. After a major slow-down, I began PP [Protein Power] on October 1st. The stall hit after 8 weeks on Protein Power, in which I lost 28 lbs. in 4 weeks, then another 15 by late November. That was it - no more losses.

Since then, I have cycled thru various plans, trying to break the stall. For example, all proteins with fats, but with lesser amts of proteins, according to the Eat Fat, Get Thin guidelines on LBM and its recommended protein guidelines [which are much less than Protein Power's]. I also stalled at this point on Atkins, but I have not even tried SB since it is too high in carbs for me. With Stillman's, EFGT, PP and Atkins, I get to the same wt. and then bounce right back up.

Basically, however, I cycle now between PP and a some varianton of proteins and fats. I experimented with carbs - going below or above the 30 'total' limit - with varying results. But they never remain a constant. Sometimes I lose when upping carbs with lc veggies and salads, sometimes even a small toasted bagel as my only carbs. That worked for a short time, then it also stopped.

So I returned to less than 20 net carbs a day, lost again, and again the same thing happened. I also stall at the same wt. on only proteins and fats. Nothing seems to break that cycle.

Q. I realize that you take the supplements for your health but what happens if you don't take them? Have you every tried taking half of those supplements to see what effect that would have?

RESPONSE: I've tried all of those ideas - not taking them, cutting them in half, keeping to those I need most. There is no difference in wt. loss, but I will gain even faster and I do feel 'worse' without them.

Q. Were you taking these supplements when you stalled before?

RESPONSE: Yes and no; that is, yes because I took supplements right from the beginning. It wasn't until sometime this past winter that I began experimenting with taking some or taking none. Again, no changes on the scale or in inches - in fact, I more quickly gained - and I didn't feel as well.

Comment from Charles: Sorry for all the questions but that's about the only way I can give an opinion.

RESPONSE: Understood!

Btw, I have 5 more lbs. to go until I hit the magic number that likes to reverse itself. This time, I'm hoping to punch thru it and you'd better believe I'm eagerly awaiting what you have to say.

Again, thank you, Charles.

Divine Miss M Wrote:
I forgot to mention one important matter: I have a serious problem with water retention. I can always feel it coming - and the next day, eyes, fingers and ankles are swollen.

Thanks again, Charles!
Tawn

Has this improved at all by taking your carbs down to zero? That's one of the first things you should notice. Carbohydrates make us retain salt and raise blood pressure. When we remove them both of those things should improve.

LindaSue Wrote:
Do you also eat the drippings from the hamburger along with the butter? I would try butter on my hamburgers (that sounds really tasty) but mine have so much fat already that they don't really need it. When I reheat a half pound patty in the microwave, I end up with probably 2 tablespoons of grease on my plate plus whatever fat remained inside the meat. As I eat bites of the meat, I swish it around in the grease so that I get it all and none goes to waste.

Me too! Swish and Swide...😊

Divine Miss M Wrote:

You're doin' it the hard way, I'm sorry to say. Do you like ground beef? You really have to find some fat. Obesity is caused by internal starvation; i.e. your cells are not getting enough from your food. This way of eating may get you only so far, as you've discovered. To go further, you may have to make some changes. Surely there is something fatty we can find for you to eat....

Lauren found she was able to sleep through the night. You're not waking up hungry so I'm not sure insulin is the problem there. How old are you? As I get older I find I can't sleep all that long either, but I'm not tired. If I get 6 or 7, I'm good. I might wake up once or twice but I can usually fall back to sleep.

Anyone else?

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 11:41 AM

Dear Charles:

I forgot to say I cook in either butter, extra virgin olive oil and, when I have it, extra virgin coconut oil.

Typical menu of late:

Breakfast: 4 fried eggs, 4 thin slices of Genoa salami or 2 small slices Canadian bacon, in butter

Lunch and dinner: Ditto breakfast on some days

---OR 2 slices of ground sirloin loaves cooked in herbs (oregano, basil, salt, pepper, garlic and onion powder], cooked in extra virgin olive oil

---OR white meat chicken breast, cooked the same way

---OR pork chops, cooked the same way

Hope that sheds some light on the mystery!
Thank you...
Tawn

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 11:47 AM

Charles: It would be just my luck to do something the hard way.

So ground sirloin with added fats does not have enough fat? When you say 'ground beef,' may I ask exactly what that means - as in 'ground chuck,' perhaps?

I recall you mention well-marbled steaks....I guess I could try that and I'll do my best to overcome my aversion to fat 'on' and 'in' meat. Honestly, that aversion was born in me; my parents could never get me to eat it.

I'm truly open to suggestions on how to take this step by step, so as to overcome this 'fat in meat' aversion.

Divine Miss M Wrote:

You just have too much lean meat here for me. The butter and oil is good but not great. Can you eat ground beef? The 73/27 we've been using from Wal-Mart doesn't have "visible" fat so maybe that can get you past your phobia? Yes, it's greasier than the lean stuff but you don't have to eat the grease, just eat the meat.

Even if you ate prime rib, you could trim off the fat and you would still get way more fat than you get in the menu you posted.
To reduce fat tissue past the stall point, you have to increase the rate of the flow of nutrients to your cells. If you are doing exercise, then you may have to eat even more. This menu should not stay static if you are exercising.

What about ground beef?

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 11:51 AM

Dear Charles:

Would eating the chicken skin, well cooked until crisp, help? Does it seem my problem is not eating enough fat and too much protein, at this point?

I suppose that is my main question, since I don't quite understand 'how' I'm doing this the hard way.

You're a great help and I appreciate it!

Divine Miss M Wrote:
Charles: It would be just my luck to do something the hard way.

So ground sirloin with added fats does not have enough fat? When you say 'ground beef,' may I ask exactly what that means - as in 'ground chuck,' perhaps?

Yes, that's good. In Wal-mart they sell a roll of ground beef with a 73/27 designation on it. You can make patties from it and eat until your hunger is content.

Quote:
I recall you mention well-marbled steaks....I guess I could try that and I'll do my best to overcome my aversion to fat 'on' and 'in' meat. Honestly, that aversion was born in me; my parents could never get me to eat it.

I would hate for you to eat something you absolutely hate, but I think your body needs it more than you do. Get a ribeye steak and just trim the fat from the edges if you want. If you eat the meat, it will still contain enough fat.

Ours is truly a high-fat diet. You can have high protein if you want, but it needs to be some good animal fat there. Do you like pork better than beef?

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 11:52 AM

OOps, we were posting at the same time. Ok, up the fats. How about proteins? Enough, not enough?

Sorry for being such a picky brain...

RE: Zero Carb / Meat and Water - Charles - 06-18-2008 11:54 AM

You're a great help and I appreciate it!

Yes, that would help a great deal. There still is the problem with the lean meat, though. However, when you cook it too much then you lose the nutritional point, so to speak. I think some high-quality steak that is well-marbled would be easier on you since it would be interlaced in the meat. The one with the bone will be more tastier and may help you get through it.

RE: Zero Carb / Meat and Water - Charles - 06-18-2008 11:56 AM

Divine Miss M Wrote:

Sorry for being such a picky brain...

I don't care about how much protein I just don't like the proteins you're eating. I would like to see you eat protein and fat together, by eating fatty protein such as ground chuck or a ribeye steak. You won't need to eat as much of it and it should sate you and I would think it tasted better, but I realize that's subjective.

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 11:58 AM

Hello again, Charles:

Ok, up fats, try to eat fattier proteins like a 73/27 ground chuck, rib-eye steak. Um...I am not sure if I like pork more than beef...I like butterfly porkchops, if the fat is trimmed off. (!)

I am so sorry to bother you, since I know what it is like to have your brain picked until it hurts!

If I may ask two more questions, are there ratios for which we are aiming between fat and protein? Besides wt. loss, how will I know what is making me healthier - that is, what other signs should I seek?

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 11:59 AM

Dear Charles:

Let me restate that first sentence: Up proteins that already have natural fats in them...Got it!

😊

Divine Miss M Wrote:
Hello again, Charles:

Ok, up fats, try to eat fattier proteins like a 73/27 ground chuck, rib-eye steak. Um...I am not sure if I like pork more than beef...I like butterfly porkchops, if the fat is trimmed off. (!)

I am so sorry to bother you, since I know what it is like to have your brain picked until it hurts!

Pork chops are tasty but they have very little fat on them. However, pork loin chops might be a better choice. I need to take you to Golden Corral with me and the Triangle Low-Carb Meetup so we can really eat!

Don't worry about my brain, if it starts to hurt, I'll charge Jimmy! (I don't get paid by the way, but it's my pleasure to help whoever I can.)

Tawn Wrote:
If I may ask two more questions, are there ratios for which we are aiming between fat and protein? Besides wt. loss, how will I know what is making me healthier - that is, what other signs should I seek?

Ratios can be misleading and it's really difficult to know what ratio a particular cut of meat has without looking at it. Generally speaking cuts like:

beef brisket, beef chuck, beef short ribs, beef tenderloin, beef ground chuck, beef ground round, corned beef steak, chuck eye steak, prime rib, skirt steak, top sirloin, veal breast, veal cutlet, veal loin and veal rib chops all should have a good amount of fatty protein.

As well as lamb rib chops, chicken thighs, Cornish Hen, whole duck, ground pork, keilbasa, pork loin chops, boneless pork loin, pork sausage, and pork spare ribs, beef balogna, beef pastrami, Mackerel, salmon steak, smoked fish, trout, and tuna packed in oil.

RE: Zero Carb / Meat and Water - travis t - 06-18-2008 12:23 PM

Charles you mentioned "beef brisket" and that takes me back to my grandfathers house in Temple, Texas where he would cut fresh mesquite from the trees in his back yard and put them in the smoker for wonderful smoked beef brisket. yum

travis

RE: Zero Carb / Meat and Water - Lauren - 06-18-2008 12:29 PM

Charles Wrote:
Some people can stop drinking immediately and never look back. Some people will go back or just cut their drinking down but deep inside they know that they really are going to have to abandon it to achieve long-term success.

I don't see this as being any different. I am not telling you that this is easy nor should anyone construe what I'm saying as easy. Addictions are very hard to conquer, but I believe in you just as I believe in everyone else. I think you can beat this.
As you found out from the Bear, it takes time for some of us to beat this thing. If you feel you need more carbs in your diet, then you have to be make that choice. I have no way to stop you! 😊

Thanks for the great reply Charles.

The thing is, I don't dispute your conclusions one bit. One of the things that stands out to me about you (this is also true for my husband) is that your resolve is unwavering. I think that, along with your diet, is the key to your success. It seems that so many have good intentions but can't seem to stick with it. Knowing what will work best intellectually doesn't always translate into action. There is something else that has to happen and I think that is resolve.

So while I think that I would have the best results with meat and water, my resolve is not there yet. But I am not discouraged because I have made some progress.

Things I NEVER eat, things that I decline in public with no problem are:
Diet soda, Artificial sweeteners
All sugars and flours, grains, etc.

Things I've eaten at social gatherings:
Salad, vegetables,
nuts, cheese
0 net carb bran crackers (these I actually eat at home- yes, an addiction)

So the way I'm thinking about this is that I know intellectually what will work best (meat and water) but since I don't have that kind of resolve yet, I am working on increasing the items on my "resolve list" and decreasing the items on my "unresolved" list.

I can tell that I've really let go of my "resolve" items. I figure this is best for me- this slow and steady pace forward. Hopefully it will continue. What I want to avoid are periods of eating "perfectly" and periods of "failure".

Along the way, it's great to have you show us what works by example. Surely by reading you and "The Bear" is what has gotten me as far along as I am. It's a great journey and I am enjoying it even though I've got a ways to go.

travis

Sounds good to me. Our grandparents were so much smarter than we are today....

By the way, I'm not really that smart. I just take Atkins' carb counter and look at the fat listed for the particular cuts. They may not be correct for some of them, but I don't think you can go too wrong relying on them. The bottom line is you have to look at the meat and see if there's fat in it or not.
RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 12:30 PM

Dear Charles:

Well, I never knew with certainty but I suspected you and the other kind moderators were volunteers - which is why I am so thankful for your time!

Ok, I think I have it now - and I've copied and pasted your list of proteins 'with' fats in them. I promise I'll do my best on my next shopping trip...boy-oh-girl, are the dh and boys gonna love this! 😊

Charles, thank you so very much - really, really!

Tawn

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 12:37 PM

My dad and my grandpa - straight from Italy - ate all that good stuff; but I was the only one of all the kids and the host of grandkids that was so darned picky about what I put in my mouth.

Sometimes I think there is something wrong with my taste buds. I really despise and gag on foods they ate - fish, most meats, onions, green peppers, garlic, olives, chunky tomato sauce, etc. That's pathetic, but that's the way it's always been. The only things I really like are white meat chicken and veal cutlets. Ok, a Delmonico steak isn't too bad and neither is filet mignon, but who can afford such things these days?

Never mind answering - that was simply a rhetorical question. 😊

If only Daddy and Grandpa could see me now, trying to 'make' myself eat the stuff they said I should, 'once upon a time' that was really not that 'long, long ago'!

Now I have to call family and ask them how to cook steak. I've forgotten how! 😊

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 12:44 PM

Charles, I gently but firmly disagree with you that you are not that smart.

I used to think the same thing of myself, but I learned I really am smart enuf to do lots of things, including figuring out how to improve my health, what's working for me, and what's not. I got this far by reading about low-carbing and nutrition, everything the opposite of what docs and the media teach. Then I got stuck!

So it makes sense to me that eating fatty protein, not just protein AND fats [which is where I misunderstood the idea of this woe], and remembering the great health of my family that eats the 'old way' [not many left who do,though] is more than worth it. That's why I'm more than willing to work on my 'fatty meat' aversion...

I wonder how many ways I can creatively say 'thanks' to you, and to Linda Sue, for this most informative thread?!?

Knowing what will work best intellectually doesn't always translate into action. There is something else that has to happen and I think that is resolve.

You're right about that, but there's more to it than that, at least for me. You see, before 1991, I was a person who rarely ever went to the doctor. I weighed about 154 and I was in the military. I ran and did about any activity I wanted. I didn't take medicine for anything. When I had a headache, I took a nap and it disappeared. I would only take half a dosage of medicine or not take it at all. I figured I was pretty much invincible as most 22 year-olds.

Well, after I got married, I quietly gained 65 pounds over 14 years. I went to the doctor for a physical (at my wife's urging) and it was the most traumatic day of my life. This guy stuck his finger in my ass and told me that I was going to die if I didn't make some changes. He told me I had high blood pressure, high cholesterol, etc. He gave me three months to get it together or he would put me on medication.

Of course, I left his office and went shopping. I went to buy brown everything and I also bought some running shoes. That very night I began running. I ran a whole mile. I didn't know what else to do.

I looked in the mirror and just didn't like what I saw. I didn't like the person I became and somehow I slept though 14 years. My wife was a major carb-a-holic. She ate three-cheese pastas and breads of every type. She introduced me to bagels and all sorts of things that I didn't eat growing up. I was a meat and potatoes type of kid. I ate small portions of vegetables just to keep my mother happy.

Somehow bread became the center of my plate whereas when I was a kid, meat was the main thing. It wasn't a meal unless there was meat present. My dad would have went through the roof if there was meal served with no meat. My wife did this often but I figured it was healthy!

This doctor visit had such a profound effect on me that I started reading everything I could get my hands on concerning nutrition. The low-carb craze was going on and I tried some of the packaged stuff and it was utterly disgusting. I thought low-carbers were all crazy and I thought that to lose weight, you had to cut your portions, cut your calories, and exercise like a fiend. All of this made me starve.

Low carb and zero carb just made sense to me and once I started having success, it only strengthened my resolve. I ate chicken wings for lunch for the first month just about every day. I ate until I was full and even stuffed, yet I was still losing weight. I've never counted calories on my low-carb diet. That was the thing that told me it was correct because I could satisfy my hunger.

As a child, I never remember being hungry!

At 40 years old, I have learned a thing or two and one thing I've learned is that people will not receive any information until they are ready to receive it. There is a point in every person's life where they are more susceptible to things than other times. For me, I hit low carb and zero carb at a time when I was ready and open for it. Because of that, I was ready to do or sacrifice anything required to make it happen.

I didn't care what people thought about it, I didn't care about anyone's opinion. I tried it out on my body.
and therefore I knew it worked. Even today, I have no problem telling the waiter exactly what I want to eat. I feel no social pressure to conform to what others eat.

Just today for lunch, I went to El Rodeo Mexican restaurant with my co-workers.

I've been there many times and the only thing I will eat there is the carne assada, which is skirt steak. I have to order it off of the dinner menu and I get two of them since one leaves me hungry. They used to charge me for the entire entree twice and I paid it. Well, one day the manager noticed and decided I was paying too much. Now, instead of paying $15 for lunch there, I pay $7 because they know I only eat the meat. They even give me extra meat yet don't charge me more!

I have to admit, I now look in the mirror with pride because damn it, I worked hard! There's no going back!

Sorry, I just had to share that,

Charles

---

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 12:53 PM

Dear Lauren:

You said it, hon! Resolve must be unwavering. For example, while at a party, one might consider a bit of salad or veggies to be 'off plan' for THIS woe, but I would consider those choices a much healthier and safer option than jumping into the big ole chip bowl.

It's a strange thing, though, isn't it - to consider a small salad or a few sliced, low-carb veggies as 'off' plan?

Well, I'm off to check the freezer to see if there's any way to increase my 'meat with fat' intake before I must embark on a shopping spree...

When I was eating just meat, I felt enervated and hungry, especially during and after meals. I don't understand why. It can't be rabbit starvation -- not at 65%-75% fat!

Anyone interested can check out what I ate at

http://www.fitday.com/WebFit/PublicJournals.html?Owner=weasel%21

I'll post more later -- gotta run to work!

I'm a little confused. I just checked out your Fitday from the last couple days and on 6/14, it says you had yellow cake. Is this correct? Even if it was just a small bite, I think this takes away from a meat/water-only experiment, don't you?

Ha, ha, you caught me, didn't you? Yes, I had a small taste of a yellow cake I made -- I recorded it faithfully, despite the fact that I knew it would be there for all to see. One-half cubic inch of banana cake, one-eighth linear inch of banana.

Yes, I agree that it takes away from a meat/water-only experiment. (As does the 1/2 peach I ate the following day.) But there it is. 😃

Clabbergirl: Don't you wonder why we're built that way, when our metabolisms demand otherwise?

We may figure out why we physiologically crave the things that are bad for us but why do our taste buds abhor that which is good for us? Seems the rule of thumb is that we should just eat the opposite way to which we are inclined. Sigh.

I am a very determined woman when it comes to low-carbing, but I have not been this kerflummexed in a long while. Eating proteins AND fats is one thing but, for me, eating fattier proteins is going to be one heck of a hurdle.

Gotta do it, though!

You know what? I applaud you for your honesty. If you hadn't put it in your Fitday, who would have known? So maybe it was the smidgen of cake w/frosting and the 1/2 peach that slowed your other efforts...in which case, just consider it a lesson learned, and keep stepping forward.

I admire an honest person who freely admits mistakes. Honesty is always the best policy. Kudos to you, hon!

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-18-2008 06:21 PM

Charles (and anyone else who can offer sleep advice hopefully), I'm 27, going on 28 in November. I never had sleep issues til hubby and I had a queen bed given to us. We got rid of our full size bed and went to get this queen size bed and it was a horrible piece of crap. I mean you could feel the wires poking you, you name it. Now we have a gorgeous year old bed but I still toss and turn like I used to. I don't know if that has a thing to do with it, but I do know once our sleep patterns are screwed up it takes a lot to restore them. Further, that crap matress that we got corresponded to me reaching my heighest weight ever of 346. All that is when it became hell to sleep. I'm so sleepy right now I feel drunk or something. Ugh.

Miss M, you mention Magnesium and some sulfur thing both regarding sleep. Do tell. What are you doing, perhaps it could help me restore some healthy sleep patterns.

Also, Miss M and Clabbergirl both, what we all have is texture aversion. It's a very real thing. Any loose or chewy thing makes me gag forcibly. Even the sight of it will turn me green. With this though, I've found it's not the grisel, it's the marbling that we're looking for--and the marbling doesn't have the
texture that gags us like the outside strip of fat. For instance, ribs make me want to hurl, but if my husband peels off the outside layer of fat and pulls off just the meat for me, it tastes delicious. If I were to see it raw, I'd never pick it up at all. So just try it. Get a good cut of marbled steak and go ahead and cut off that outside strip. Broil the steak with some sea salt and cracked pepper, and it will be delightful. I had a little victory today I wanted to share. Hubby had to go out and buy some batteries, and I was eating my beef patties craving a diet fountain drink like a fiend. We talked a minute and I told him what I wanted, but then said, You know what? If I'm craving it at all I need to avoid it. And so I did, and I feel so smug about it. Artificial sweeteners go to hell!! Hee hee.

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 06:45 PM

AnneMarie: Texture aversion, huh? Ok, see - we learn something new all the time! I'll do my best, I really will, in searching out some finely marbled steak, which I think I can tolerate much more than fatty ground chuck.

To answer your questions, I recently began taking a product called Sulfurzyme, which is pure sulfur mixed with wolfberries [a very high antioxidant], since some studies indicate a lack of sulfur in fibromyalgics. [The stuff might be available in some health food stores; I order mine thru the company.] We fibromyalgics have disturbed sleep patterns - specifically, we don't reach REM or, if we do, we don't stay there for very long. That's the sleep stage in which the body repairs itself. I can't be certain, for it's too soon to tell, but I wonder if returning to fats and proteins, along with the Sulfurzyme, is already helping in improving lots of things, including the insomnia/lack of restful sleep problem. For the last few days, once I fall asleep, I'm 'there' - no more 'snap' waking up all thru the night. [I hope this lasts!]

I take chelated magnesium for lots of reasons, including prolonged 'charlie horses from hell' [like 20 minutes of agony], healthy arteries [magnesium blocks calcium from layering in the arteries] and clogged pipes of the lower GI. The Protein Power Life Plan book has an entire chapter dedicated to the miracles of magnesium. After reading it, I make sure I take at least 400 mg. a day. (Heart patients should not do this but consult with their cardiologists first.)

Congrats on your 'little victory' - which was really a big one! Big but gentle pat on the back to you, hon!

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 06:52 PM

AnneMarie: I forgot to mention - pure lavender oil, dispensed into the air with a quality oil dispenser, or rubbed on the temples, helps with relaxation and falling asleep. I couldn't believe it at first but the oil works, as does peppermint oil [when smelled] for energy or for pain, when rubbed on the skin.

Such oils have to be the purest on the market, the kind that can also be ingested, if one is trying to avoid any chemical toxins. If the product says 'not for internal use,' then its not as pure as it claims to be.

If you hadn't put it in your Fitday, who would have known? So maybe it was the smidgen of cake w/frosting and the 1/2 peach that slowed your other efforts...in which case, just consider it a lesson learned, and keep stepping forward.

The day I ate the 1/2 cubic inch of cake, my total carbs for the day were 20. Two of those came from the cake. The day I ate the 1/2 peach, total carbs for the day were 8. Five of those came from the peach.

What exactly is the lesson? That 7 grams of off-plan carbohydrate over the course of two weeks can prevent weight loss?

That just doesn't make sense to me. In fact, it seems preposterous.

I am a sample set of one -- no control group in this experiment -- so it's impossible to say with absolute, scientific certainty what I would have weighed this morning had I not consumed those tiny morsels of sweet several days ago. However, it seems impossible that I would have weighed any different.

---

**RE: Zero Carb / Meat and Water - caroline - 06-18-2008 08:08 PM**

First let me start out by saying that if it weren't for this group of people on this forum, I would have felt very alone while on this new venture. So thanks to all!

Vesna,

I read your post (I think it was hypoglycemia thread?) about not feeling so good on zero carb. Did you find that your energy came back up when you ate more? I noticed that mine was lagging in the mid-morning to afternoon, and I have been eating an extra meal. That really seemed to help. The odd thing was that I wasn't "hungry" for it, but it did make a difference. I got to thinking about it after asking Charles about how much he was eating.

It seems like with a lot of us (women), we aren't eating as much as we need to on zero carb. It has taken some getting used to for me, b/c I just don't feel ravenous this way. When I do feel ravenous, it is more a craving for carbs, but I notice it passes.

Anyway, it's really helpful to listen to everyone's-Lauren, Divine Miss M, Con, etc. shared experience. I scoured all over the internet, and felt like Charles was the only person who could share this experience. I guess there aren't a ton (not any) forums out there with a bunch of people doing this zero carb because for most, even though it may help with a lot of issues, it is a dramatic change--even compared to low carb.

I find it's getting easier, but the energy flagging was trying for me, as it was for you, Vesna. It is challenging when you are "used" to being a higher energy level, and it seems to shift. Anyway, I'm going to hang in there. I pretty much went from eating full-on sugar, carbs, etc, to low carb for 2 months, to this for a few weeks now. I definitely feel like my life has changed for the better--it's just fine-tuning, and it sure helps to have a great group like this to support this change.

---

**RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 08:13 PM**

You know, Vesna, it was my intention to be supportive, that's all. Sorry you didn't see that.
Hi, Caroline:

I think another issue 'might' be hormonal flux - something the guys just don't have to deal with on a monthly basis, or rather, I should say - not to the degree that women do.

If one hormone [like insulin] is out of whack, wouldn't a 'cascade effect' on estriol, progestone, estrogen, testosterone - and adrenals - make sense?

Vesna, I'm sorry to hear you haven't got a weight loss in this period of time. I'd imagine it feels like you've sacrificed a lot and got nothing for it. Giving up things is one issue, but feeling lousy on top of the absence just compounds missing something. Have you had any positives from the experience that kept it from a total loss (pardon the pun)? More energy? Better sleep? Less hunger?

As simple as we all want this to be (eat fat/protein-insulin resistance problem disappears for example), seldom is the human body so. There are any number of factors that may be stalling your results. Have you had your thyroid checked (by a reputable, up-on-current medicine doctor)? Are you getting quality sleep? Are you using asthma meds or something that might have steroids in it? These are just the tip of the iceberg, but I'm sure you get where I'm going with this.

I hope everyone who goes to 5 carbs or less a day has an amazing loss so they will throw their skepticism or unwillingness out the window, but I realize it's not going to happen that way with everyone. I'm not sure yet if zero carb eating is the answer (although I really hope it is), but I do believe the notion of low-fat not working (at least for me), and I can understand the weight problem insulin causes when it's so out of control. I'm trying to lead with that in mind right now - getting control of my insulin - instead of weight loss. The loss is nice, but I have seen so many times that it's not permanent. I'm not ready to believe that zero carb weight loss is any more permanent than any of the other times. Maybe in a few more months, I'll feel differently. If hope you will have the successes you need to keep experimenting in whatever way you need.

Divine Miss M, (I can't resist saying that--I feel like I'm at a broadway show!):

I think you are ABSOLUTELY right about the hormonal aspect. That's why I was praying to get some input from some women as well. It was a Godsend that I found this thread today. I also think what I am reconfiguring, is that it may not be a week or two--or even a month or two--it may actually take quite a while to get the hormones, the body, the low carb all in sync before it feels "kosher," so to speak.

I think your sense of humor is not only refreshing, but essential. That is what is really pulling me through. I would love to keep this going--where we can talk about our reactions to this way of eating. And I don't think it has to be "perfect." Hey, three carbs, or five carbs, etc. is better than 10 or 20.

As for your mention about the magnesium, I was having rotten leg cramps, muscle twitches, and bought a bunch of supplements, and then they all went away. So I think some of it is just time. But I do feel like my fish oil is helpful.
Also, I think candida, which no one discusses on this forum, is huge for many women. (It has a lot to do with why I cut out the dairy this week, minimal though it was. These factors can stall progress. I'll let you guys know how it goes...)

---

**RE: Zero Carb / Meat and Water - caroline - 06-18-2008 09:06 PM**

As for Clabbergirl and Divine Miss M.'s aversion to fat:

I always had it, too. At the same time, I was deeply enmeshed with sugar, carbs, and a heavy emotional eater. I always needed my food to be entertaining--spice, taste, etc. since I have been eating low carb, little by little, the need for "flavor" dropped. And somewhere, I started liking the fat--not liking, exactly, but I think "needing" is more of what happened. I can't say I could do it without the fat. I would be hungry all day long otherwise. When I don't want it, I don't want it. But when I eat, it feels like the fat is the only thing that sustains. If it's just veggees, it's like I've inhaled air. Charles really got me thinking (I'm sorry if I alread said this) that we might need to eat more than we think (and I think the "more" might be fat.)

---

**RE: Zero Carb / Meat and Water - KimPossible - 06-18-2008 09:13 PM**

Wow! This thread hops!!! And it stays very informative, too--thanks to all of you for sharing your experiences!

I stayed the same as yesterday...but ate some higher carb processed meats...and didn't drink that much water. Still getting honed for this woe...today I ate all beef. just patties...ate until I was full and ate when I felt hungry. The only cravings I had were for diet drinks (which I'm not off of...yet. but that's coming soon for better or for worse...). And I stayed full. Already I can feel the control/satiety from the fat in my diet.

I've never ever liked the fat on the outside of the steak, but have no problem with the ground beef (the 73/27 from WM). I do drain it, but not fanatically...but grissle and chewy fat? BLECH! I empathize!!!

I liked your post, Charles, about your journey. I always knew that you've tweaked it over time, trying to find what works best for your needs and desires in your life and goals...it helped seeing it all in one post though--Thank you for sharing it!

---

**RE: Zero Carb / Meat and Water - caroline - 06-18-2008 09:23 PM**

Hi Kim,

Adorable picture! Is that you or your child? I think I forgot about that part--that I don't mind the fat b/c I am eating fatty ground beef. And I think it was Clabbergirl who noted that it is easier to stomach then.

You're right about the water. Charles mentioned not overdoing it with water, but I noticed I feel "clearer" since I've been drinking more. I have been warming it, not so it's hot, but optimally just warm, and somehow, it goes down easier and doesn't make me feel like I'm swimming.

And I second what you said Kim--Thanks Charles for being so open and generous with relaying your experiences. I've bugged you plenty, and I appreciate your comments.
Well, going to Los Angeles and I'm determined to stay on course on my vacation to the city of Smog and Angels. Have a nice weekend everyone!

RE: Zero Carb / Meat and Water - Divine Miss M - 06-18-2008 10:01 PM

Dear Caroline:

Broadway, huh? Gosh, you're tempting me to belt out a song. 😊

As for hormones ---Yes, yes, yes! I'm as excited as you are to find another lady who suspects the same problem-o! A hormonal cascade effect is a reasonable theory...and, if it is reality, it's going to take time to resolve it. That's why I liked the Protein Power books; they focus on improving health first and provide so much help. They've helped very much, but there is so much more to learn!

I also agree that candida albicans could be another hidden problem. Who among us has not been subjected to many bouts of antibiotics? I'm thankful they [literally] saved my life - quite a few times. But dealing with CA is the pits.

I've recently learned of a natural way to deal with it - and have to try it soon. It's so simple, it's unbelievable - allegedly, the cure is baking soda! I'll get the specifics info on it for those who are interested, but basically - inhaling baking soda placed into boiling hot [naturally distilled] water, 30 minutes a day, allegedly kills candida overgrowth. [So does long-term low-carbing, which also includes avoiding vinegar or products with vinegar in it, like mayonnaise, ranch dressing, etc.]

Isn't it incredible to know that magnesium deficiency was the reason for those terrible leg cramps? We're always learning...

I am trying to recall 'where' I read info on various residues [injected hormones, for example] in animal fat - that's a big concern, I admit. We need the fat, it seems, but we don't need the toxins in it. What to do, except buy organic, grass-fed [not grain-fed] beef? And that's expensive these days.

KimPossible: Hello!!! Your baby pix is so cute!

Well, for my own update, it looks like at least a 3 lb loss from Wed. a.m.'s weight...and that's good. I'll be thrilled 'if' I punch thru the same old numbers soon. We'll see.

RE: Zero Carb / Meat and Water - Vesna - 06-19-2008 04:07 AM

Divine Miss M Wrote:
You know, Vesna, it was my intention to be supportive, that's all. Sorry you didn't see that.

I did see that. I appreciate the support. I do, I do, I really do.

I tend to be frank, sometimes even blunt, and to express my thoughts with zeal, sometimes even drama, because I experience them so strongly. The past two weeks was an ordeal for me, and I would like to be able to share some of my frustration and confusion here in this forum -- an emotional sharing, in addition to the learning process.

I did not mean to direct any of that force against you. If I hurt your feelings, or made you feel like I was attacking you, I apologize.
Thanks again for the support.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-19-2008 04:22 AM

Hey, gang!
Well, after another night of five nice hours and then tossing and turning from 4 am to 6 am, I'm so tired I can barely stand it. One of the children I keep, his mom just called and he has a fever, so he won't be coming today. The other one gets here super early so he sleeps til 8:30, and my little 8 month old guy will be here in a few minutes. What I'm trying to say is this will be a very nice and relaxed day, which I need badly. 😊

I think I'm going to go out and get some chelated magnesium this evening and see how it helps. Magnesium is supposed to really be a wonder supplement and very good for those fighting insulin issues, so I've been wanting to try it for forever, after reading that portion of PPLP.

I feel that my energy is flagging as well. But I know I still didn't eat near enough yesterday. I felt just absolutely lethargic by yesterday afternoon. I was telling all this to hubby, and good man that he is, he made up patties out of the 5.5 pounds of beef we got a couple of nights ago and fried them all up for me so I could just go pick them out of the fridge. With me keeping small children, more often than not I forget/don't have time/just plain don't feel like taking care of myself. Here's hoping today is better because I eat more. Happy Thursday to everyone.

I guess there aren't a ton (not any) forums out there with a bunch of people doing this zero carb because for most, even though it may help with a lot of issues, it is a dramatic change—even compared to low carb.
[/quote]

Actually, there is a No-Carber Forum. I belong to it, also. Some very nice people there, including some folks from here. Here's the link:

http://activenocarber.myfreeforum.org/

Hope it's not gauche to post the URL of a different forum.

RE: Zero Carb / Meat and Water - Vesna - 06-19-2008 05:07 AM

Divine Miss M Wrote:
If one hormone [like insulin] is out of whack, wouldn't a 'cascade effect' on estriol, progestone, estrogen, testosterone - and adrenals - make sense?

I think this is a fascinating and compelling idea. It makes a lot of sense to me.

I do believe fat storage, gain, loss is hormone-driven, rather than "energy balance" driven. There must be more here. I think this is the thread that when you pull on it, it unravels the knot.
Caroline wrote  
"Also, I think candida, which no one discusses on this forum, is huge for many women."

I think candida and other fungi are more of a concern than most would realize. These fungi spit out waste products called mycotoxins some of which are very powerful. Ciclosporin A for example is produced by the fungus (Tolypocladium inflatum Gams) and is used to prevent the rejection of transplanted organs. It brings about an almost complete shut down of our immune system.

One of the reasons i think that the zero carb diet is so powerful is because it is the best way to reduce the favorite food of the fungus...sugar(carbohydrates+fiber).

If you dont think that fungal metabolites can have a powerful effect on humans think about the last time that you encountered a drunk person...alcohol is a metabolite of the yeast(fungus) that consumes the sugar in the grains used to make beer and other drinks(including wine).

Also a fungus produces large amounts of chemicals that are very estrogenic. Maybe this is the cause of the "beer belly" and also could up set the whole apple cart of hormones that keep us fat or thin.

travis

Charles, I appreciate all your interest, encouragement and input!

Charles Wrote:
Vesna Wrote:
When I was eating just meat, I felt enervated and hungry, especially during and after meals. I don't understand why. It can't be rabbit starvation -- not at 65%-75% fat!

Two weeks is not enough time to tell anything about any dietary change, so that's not so surprising to me.

I started with high hopes and the plan to extend the M+W experiment well beyond two weeks once I got to June 18. I was blindsided by how horrible I felt: lethargic, weak, hungry despite how much I ate. Perhaps the most surprising thing was that not matter how much fat I added in the form of butter, it didn't help. Also, I didn't realize until yesterday evening that I had been sinking into depression. I hated my life, and not in a way that seemed to be connected to diet. Depression is not a state that I'm native to.

I could not continue with this regimen. Perhaps after another year of very low carb, going M+W would have a different impact on me. Or if I'd tried this 20 years ago, when I was in my 20s.

I would rather be slightly overweight for the rest of my life than be as miserable as I was for the last two weeks. If that's what it would take to lose the 15-20 pounds. (As far as the other health benefits, remember that I'm only talking about adding the full range of animal foods, vegetables and a little fruit, and coffee and teas.)

Charles Wrote:
Fitday may tell you that chicken and bacon have 75% fat but I'm not so sure I agree with that. I don't have the energy from those foods as I do from ground beef. Bacon is quite lean and you also have cheese and sour cream in there. I know you didn't eat a lot, but it doesn't take much for me. Chicken thighs are good at 35 grams but legs don't have but 15 grams of fat for 6 ounces.

The bacon we get is quite fatty. The roast chicken was also quite fatty, especially because I got plenty of the drippings onto my plate and poured it over as a sauce.

I did not eat cheese, unless you mean cream cheese, which I added in the final days.

Charles Wrote:
Did you drink water with all of this?

Yes, water was my only beverage for the two weeks. I drank to thirst. Especially in the first week, I was really thirsty.

Charles Wrote:
If you were hungry when eating this food then it's clearly not the right type of food. I would suggest you try what everyone else is trying and that is to add some fatty ground beef. It's cheaper than the meats you listed and I bet you'll be more sated. The 73/27 has more fat than the chicken legs.

... I think for zero carb to help with your hyperinsulinemia, you may want to try some fatty beef.

73/27 is not available where I am. Good steaks like ribeye are not in my budget except as an occasional treat. (I know you didn't mention ribeye in this ... particular post, but just FYI.)

I started mixing my ground beef with some very fatty, minimally processed pork sausage and that was a big improvement.

However, when I was doing just meat and butter (to increase fat), instead of getting better, it was getting worse day by day. I came close to an episode like Anne Marie/onlyabtrfly experienced. I managed to propel myself to the couch before I collapsed. Also, my episode came after a big breakfast of sirloin tip steak and butter. (I know, the meat is on the lean side, but I supplemented it with sooo much butter.) The more I ate, the worse I felt. I just don't understand it. (But neither do I want to go back there.) Another difference is that Anne Marie had been feeling good up until that point, whereas I had been feeling steadily worse.

Charles Wrote:
If you're truly hungry then you're not getting enough nutrients from your food. If these are cravings, it only tells us how much hyperinsulinemia you have.

Are you drawing a distinction between hunger and craving here? Or do I misunderstand?

Charles Wrote:
Insulin signals hunger and helps prime our body for food. If you were hypoglycemic, then I don't think your hunger would be so acute.

Why do you say that? Sorry, I don't follow.

Charles Wrote:
You can't solely rely on fitday. You have to rely on your hunger and pay attention to what your own body is telling you. From my vantage point, it's saying that it's hungry and not getting enough nutrients from what you're eating. You have to change it up.

Just to clarify, I'm not relying on Fitday; I'm using it to track after the fact. I'm relying on hunger and paying attention to what my body is telling me, as you say.

The changes I'm making are: allowing all animal foods (including eggs and cheese), allowing coffee and teas, allowing low-starch plant food and mid-starch in small amounts. (E.G., a slice or two of cooked carrot or a green bean included in a serving of collards.) Also, allowing non-caloric sweetener, or at least not holding it strictly off-limits.

RE: Zero Carb / Meat and Water - Lauren - 06-19-2008 06:13 AM

Charles Wrote:
You're right about that, but there's more to it than that, at least for me. You see, before 1991, I was a person who rarely ever went to the doctor. I weighed about 154 and I was in the military. I ran and did about any activity I wanted. I didn't take medicine for anything. When I had a headache, I took a nap and it disappeared. I would only take half a dosage of medicine or not take it at all. I figured I was pretty much invincible as most 22 year-olds.

Well, after I got married, I quietly gained 65 pounds over 14 years. I went to the doctor for a physical (at my wife's urging) and it was the most traumatic day of my life. This guy stuck his finger in my ass and told me that I was going to die if I didn't make some changes. He told me I had high blood pressure, high cholesterol, etc. He gave me three months to get it together or he would put me on medication.

Of course, I left his office and went shopping. I went to buy brown everything and I also bought some running shoes. That very night I began running. I ran a whole mile. I didn't know what else to do.

I looked in the mirror and just didn't like what I saw. I didn't like the person I became and somehow I slept though 14 years. My wife was a major carb-a-holic. She ate three-cheese pastas and breads of every type. She introduced me to bagels and all sorts of things that I didn't eat growing up. I was a meat and potatoes type of kid. I ate small portions of vegetables just to keep my mother happy.

Somehow bread became the center of my plate whereas when I was a kid, meat was the main thing. It wasn't a meal unless there was meat present. My dad would have went through the roof if there was meal served with no meat. My wife did this often but I figured it was healthy!

This doctor visit had such a profound effect on me that I started reading everything I could get my hands on concerning nutrition. The low-carb craze was going on and I tried some of the packaged stuff and it was utterly disgusting. I thought low-carbers were all crazy and I thought that to lose weight, you had to cut your portions, cut your calories, and exercise like a fiend. All of this made me starve.

Low carb and zero carb just made sense to me and once I started having success, it only strengthened my resolve. I ate chicken wings for lunch for the first month just about every day. I ate until I was full and even stuffed, yet I was still losing weight. I've never counted calories on my low-carb diet. That was the thing that told me it was correct because I could satisfy my hunger.

As a child, I never remember being hungry!

At 40 years old, I have learned a thing or two and one thing I've learned is that people will not receive
any information until they are ready to receive it. There is a point in every person's life where they are more susceptible to things than other times. For me, I hit low carb and zero carb at a time when I was ready and open for it. Because of that, I was ready to do or sacrifice anything required to make it happen.

I didn't care what people thought about it, I didn't care about anyone's opinion. I tried it out on my body and therefore I knew it worked. Even today, I have no problem telling the waiter exactly what I want to eat. I feel no social pressure to conform to what others eat.

I have to admit, I now look in the mirror with pride because damn it, I worked hard! There's no going back!

Sorry, I just had to share that,

Charles

Charles,

Don't be sorry- you SHOULD be proud and enjoy every minute of your success. It really is an amazing accomplishment.

There were so many things about your post that interested me. I like the description about your 'moment of clarity' after the scary doctor visit. I've been sober in AA for 21 years and I know it is often fear that has gotten many an alcoholic to have that 'moment of clarity'. I agree, once you have it, there is no turning back.

Ultimately though, it is so hard to know how human beings come to that point about whatever their problem/addiction may be. I've seen people come to AA and 'get it' right away, others who struggle and eventually get it, and still others who never get it regardless of their desperate circumstances.

I do think that this kind of a transformation, whether with diet or other addictions, is necessary to make the big change. I think so many are drawn to you because they can sense that you've had that transformation. This is about more than short lived efforts. People can abstain from alcohol for a few weeks but unless they've had that transformation, they will be unable to maintain sobriety.

Another interesting point is your description of your carb based diet that you and your wife were eating. I really messed up my husband this way too, no doubt from good intentions since I bought that meat and fat were demons. My husband gained about thirty pounds since we were married 16 years ago- now I know it was from our carb based diet. Since we've been doing low carb, he's lost 25+ pounds. He is thrilled that I've reintroduced meat into our diet.

I will be thinking a lot about this post- about transformation and clarity, about deep changes rather than pounds and calories.

As we say in AA, thanks for sharing your experience, strength and hope.

i eat what ever is in the glass bowl that collects after reheating in the microwave. I cook it the eve before on a gas grill so i don't collect the drippings from the initial cooking process. it has been four hours since
i ate it and i still feel as full now as right after. I have no doubt that i won't be starving at 5 or 6 when i grill more for supper (and also xtra for work in the am). this high fat no carb diet ROCKS

travis

I can see now why you add butter to them. One reason that I stopped cooking my burgers on the grill is because they lose too much fat. When I pan-fry them, they seem to come out more juicy too.

RE: Zero Carb / Meat and Water - LindaSue - 06-19-2008 06:26 AM

Divine Miss M Wrote:
My gosh, from what you and Travis posted, I am beginning to wonder if I am not consuming enough fat!

I don't usually eat 'fatty meats' - I have not progressed that far yet, and that itself will be a challenge since never, never have I eaten marbled meat, or fat on meat. This is a life-long issue; when was a little girl, I would not eat if there was any fat on the meat but gave it to my dad. The stuff gags me. I'm still that way - I simply can't make myself do it.

I've loved the fat on meat since I was young. I grew up in a family that liked fatty meat, the skin on chicken (most of us went for the dark meat) and lots of butter. Would you believe that my mom never bought margarine? She refused to eat it but not because she knew it was harmful (who knew back then?) but because it tasted nasty and butter tasted so good.

RE: Zero Carb / Meat and Water - travis t - 06-19-2008 06:29 AM

LindaSue
The burgers are not so dry that i can't eat them. At least not as dry a grilled chicken breast(uuuggghhh). But the butter does add moisture and it also adds a different fat ratio than the beef and also vitamin a. And it also makes it delightful. I't hard to describe kind of like candy but not sweet.

travis

RE: Zero Carb / Meat and Water - Miss Christine - 06-19-2008 06:40 AM

Hi Everyone,
I have been reading all the posts and I am only on page 7 so I still have a lot to go through. However I was reading about what everyone wrote about grass feed beef. Everyone was complaining it didn't have enough fat like the grain feed. That is because when cattle graze like they are suppose to their are leaner, and for a very long time people valued the organs to the muscles meat. The problem with grain feed cattle isn't the they are fatter, it is the grain that they are feed. Years ago it was oats, barely, wheat, however now the grain has is mainly soy, and sometimes parts from other animals. We all know how bad soy is. If you want to add fat to your beef, make sure you cook it in coconut oil, or butter. Also what is stopping you from putting a pat of butter onto of you steak. I know lots of people in my Weston Price group that eat their meat that way.

Charles, I really like what you said about this being an evolution. I have been trying to go to zero carbs for the past week and I just about drove myself nuts. My cravings were so bad I thought I would go crazy. However the past couple of days I add back some carbs and feel much better. While I gain a couple pounds, I am not worried. I would rather have a couple more pounds to lose, than got nuts. I guess I am going to be one of those that has to work myself down to zero carbs.
I am really looking forward to finish reading all the post and learning more.

I'm a newbie at all of this, so take my opinions for what they're worth, but just the fact that you're removing wheat and wheat products from your diet has got to be helpful. I don't remember if you'd stated you've been lo-carb for a bit already, or if this is your first go at it, but either way I think wheat avoidance is a plus no matter how low overall carbs. There's a lot of info on the negatives of wheat, and a cardiologist (Track Your Plaque) even writes a regular blog that includes stories from his patients who've removed wheat for a month and lost weight effortlessly plus improved their heart health. Do what you can do, and you may find that you can do more, but you don't need to feel like you have to do any of it.

The depression can affect your energy levels; I'm sure you're aware of that. Has that eased up a bit?

Miss Christine, if you feel like trying zero carbs again, if I can make a suggestion on what I did: The first week I tried to go lo-to-zero, I had a very full schedule. Neither my hands nor my mind were idle, and I believe that helped. I craved carbs, but I didn't have near the time to act on those cravings that I'd have liked, and this really kept me from giving in long enough for the carbs to start to dissipate. I don't know your schedule of course, but if you've got some free time, the cravings are so much harder to ignore with willpower alone. Good luck either way.

RE: Zero Carb / Meat and Water - Divine Miss M - 06-19-2008 06:57 AM

Vesna: I appreciate the sentiments, and the apology - I really do. Yes, I admit that I did take the response personally, so thank you for the warmer response. Ok, let's start afresh!

After reading your 2nd post today [addressed to Charles], I have to say I am alarmed at the symptoms you experienced. Low energy is one thing but not to the degree you described.

Something similar happened to me on the 'woe that shall not be mentioned' [which is low-fat]. For a very short time, I fell into the 'cut back on the proteins mentality' and went thru a terrible episode. Every day, it was worse. A day came when I could not walk from one end of the desk to the other and came very close to fainting. I began researching on the net and found a study in which people actually died on
that kind of diet regimen. That did it for me. The first thing I did was eat a salad, loaded with protein and fat. I felt better within minutes - literally.

I realize *this* woe is high in fat but since you suffered serious debilitation like that, it very well may be not be the woe for you. [Under the circumstances, I would not continue with it, either.] That is, your degree of insulin resistance might not be so severe, or there could be other [hidden] factors of which you do not yet know. For example, your kidneys or liver might not be able to handle the protein/fat amounts of this woe. [Please note that I am speaking of 'might's' and 'maybe's,' since I am a researcher but not a doctor.]

Among those of us with a genetic predisposition to diabetes, it is only reasonable to conclude that we have individual varying metabolic needs, hormonal levels and, most obviously, other health factors. For example, I share the genetic predisposition to diabetes, but I also have fibromyalgia, degenerative arthritis, and mild lupus - three health conditions that not everybody else on this thread [much less the board] also has [thanks be to God!]. Right off the bat, I have extra health needs that require careful monitoring of the woe, extra supplementation, and exercise considerations that others do not.

Serious debilitation as you described is most certainly not 'carb detoxification' but a strong signal that something else is happening, and it's not good. I would also do what makes me 'feel' better, not worse.

I look at the low-carb scenario in this light: The culture tells us to eat a certain way, as do all the medical establishments. I became sicker and fatter doing as 'they' said. Eventually, we all found out differently and turned to low-carbing.

Why wouldn't it also make sense that that there is enough physiological variation among those who must low-carb, so that the low carb spectrum ranges from ZC to Paleo to Atkins to Protein Power, all the way to the very 'liberal with carbs' South Beach - et al?

Btw! If I may make only one suggestion - for the non-caloric sweetener, please try Stevia or SteviaPlus [the latter contains FOS] or perhaps mix Stevia with Splenda. Avoid aspartame at all costs - too many dangers to health.

Divine Miss M Wrote:
So ground sirloin with added fats does not have enough fat? When you say 'ground beef,' may I ask exactly what that means - as in 'ground chuck,' perhaps?

Usually the cheaper the ground beef, the more fat it has in it. I buy the one that's the next step down in price from ground chuck but ground chuck is still a good choice. The fattiest ground beef doesn't really have a name (such as chuck, sirloin or round). It usually just called "ground beef" or "hamburger".

Divine Miss M Wrote:
Would eating the chicken skin, well cooked until crisp, help? Does it seem my problem is not eating enough fat and too much protein, at this point?

Chicken skin is good but the crisper it is, the less fat there will be in it. Look at pork rinds. They are pig skin but they have relatively little fat compared to the amount of protein in them because most of the fat is rendered out.

Lauren Wrote:
0 net carb bran crackers (these I actually eat at home- yes, an addiction)
How can a cracker with bran have zero carbs? Bran has carbs. What are the ingredients?

Clabbergirl Wrote:
DivineM I am the same as you on this fat thing - I can't stand to chew it. I'm the kind that has always trimmed part of the steak off to keep the fat from getting anywhere near the parts I would eat. My mother would get after me as a kid for "wasting food" this way. Sorry, can't handle that chewy fat feeling.

I wonder if you're confusing fat with gristle. Fat shouldn't be chewy. It's usually soft and almost melts in your mouth. I don't like chewing on gristle either.

KimPossible Wrote:
I've never ever liked the fat on the outside of the steak, but have no problem with the ground beef (the 73/27 from WM).

That was always my favorite part and I'd save it for last.

I can't believe how much has been posted in this thread since yesterday afternoon. I'm supposed to be doing my grocery shopping right now but I wanted to catch up here first. I had no idea how long it would take, LOL.

---

**RE: Zero Carb / Meat and Water - Divine Miss M - 06-19-2008 07:42 AM**

Hi, Linda Sue:

Well, lovely lady, let's put it this way: I cannot eat fat that I can see - i.e., fat on the outside of the steak or pork chops, thin fat lines going thru the meat, like in rump roast or steaks, or the 'white specks' throughout hamburger. Gristle, of course, is the extreme and therefore extremely gross. [Some people are like that about egg shells...if one tiny speck of egg shell gets into the eggs, and the person bites into that eensy shell fragment hiding inside their cooked eggs, the person gags and can eat no more of their eggs. That does not happen to me, but I can empathize when I recall my fat texture aversion.]

'Texture Aversion.' Hmm. I like that - though I don't like 'having' it!

Whether or not it's a mind issue, I can't say - but fat like that truly makes me sick to the point of nausea. I'm trying to get it thru my head that I must make small baby steps, otherwise 'fat like that' is going to stay ON ME! 😞

Hey, it got busy in here because a few of us came in and 'crashed the party.' 😛 See what happens when the thread mama is not looking? 😖

---

**RE: Zero Carb / Meat and Water - Clabbergirl - 06-19-2008 07:49 AM**

I agree with DivineM - the gristle is repulsive, the fat is disgusting. I've accidentally got a chunk of fat (shiver!) in my mouth before, and immediately notice it's slippery, rubbery, oily feel. I have to spit it out - ick! My skin starts to crawl just typing this out. Eww.

But if it's in hamburger, or maybe marbled in the steak, I don't think I notice. It's that glistening-mushy-fat feeling that grosses me. This has been for as long as I can remember, before I even realized I was a fat kid, so I can't even blame it on the diet industry brainwashing.
Hi All,

Couldn't resist before I hop on the plane. Divine Miss M., thanks for the tip on baking soda. I found a lot of amazing info on candida on the atkin's forum site (I found the link off of Jimmy's mention re: the new atkin's site). Even though a lot of it is old, there are great links, tips, etc. You have to ignore the stuff about no meat or vegetarianism, but I also noted baking soda. They also mentioned Fish Oil as being (cod liver in particular) of utmost importance.

Also about the fat, for you guys Clabbergirl, Miss M., who have fat aversion--when I do my ground beef I don't notice little white clumps. Now if you mean you can't even look at them when it's raw, you could just throw it in the pan (I use iron skillet--no butter, no water-it cooks fine) and let it go.

Well, I think it would be great if some of us kept trying so we can all talk about how it is working. Vesna, I wish you the best of luck with your efforts. You can always try a modified version and see if it works.

I definitely feel like I am having to move through a hump. I like you Miss M., notice I will get retention-if I eat the wrong things. (this may not be cause for you.) I found ANY sweetener (I noticed that Vesna was mentioning sweetener) will cause me strange appetite and weird bloat. Stevia seemed to be the only clear one. But I have been going cold turkey.

I get the feeling that there is accumulated toxins (call it whatever you want) and I think Travis is right about that in ref. to candida, and you have to do something drastic sometimes to push your body forward. That is why I am doing the Meat Mode. I feel that for the way I cut everything back, I am not quite seeing the results I want.

As for what Charles mentioned about the struggle with getting clean, which is what Vesna mentioned as well, I feel absolutely like I was an alcoholic--but with food. No diff. to me. Sugar is sugar. This way of eating has really given me so much more clarity, energy, and focus, and I am only in my third month. (Month on zero-ish carb.) If you ever told me I would be able to get through the day without my sugar, bread, starch, I would have laughed. I dearly wanted to, and there were danger symptoms happening all around me, but I ignored them. So many pains and symptoms that I thought were unstoppable have all passed. It scares me to think of the road I was one.

I am able to eat "normally," now and like Charles said, (that's what's great about this--everyone works off everyone else's energy)I don't care if people stare, gawk, or judge. This is the first thing that has been able to change my life so completely and so positively.

Anyway, let's keep it rolling! It really helps to get everyone's experiences!

--couldn't resist one more post before I go to airport.

Thanks everyone,

Caroline
I have a question for all of you zero carbers out there. How does eating this way affect your "bathroom" time?

I find it strange that fiber is supposedly good for eliminating constipation, but I have always found the opposite to be true. Back when I was eating more carbs and increased my fiber to 30+ grams per day, even if I increased my water, I became terribly constipated.

For me, cutting back on not only carbs, but fiber, is what finally has freed me from my constipation.

That said, I also notice that anytime I cut the carbs further, a few days later I always have diarrhea. Does this happen to anybody else? It happened when I cut down to 35gC/day, only lasted a couple days, it was followed by a loss on the scale, which held, and then I felt fine. Again, this past week, I cut carbs even lower, to 25gC/day, and I'm experiencing the diarrhea again. I'm hoping that history repeats and I'll see another loss (which hopefully will stick). Any idea what's going on?

---

**RE: Zero Carb / Meat and Water** - [onlyabtrfly](#) - 06-19-2008 09:04 AM

I don't know, girl, but I've been wondering the same thing. I've had horrible issues with constipation since I had my son, and that is actually why I was terrified to try this out. But, even though I didn't go for a few days, when I did, it was smooth sailing. Now it's been about 3 more days but I don't feel that horrible bloated bound up feeling I did when I was constipated. I know this isn't a lot of info, but just my little take on things.

**RE: Zero Carb / Meat and Water** - [travis t](#) - 06-19-2008 09:11 AM

What i have eaten today.

Last eve. at 5 pm two ball park franks, two beef patties, a small spot of ketchup, and dash of tabasco that i mixed into it. the ketchup was about 1 tbsp, which is pretty small compared to how i used to eat it. Before i used hot dogs as a ketchup delivery vehicle.

today 4:30 am 16 oz strongly brew coffee, 10:00 am five beef patties with table salt and half a stick of land o lakes butter(4 tbsp).
That is 17 hours with out a drop of food or water(other than the coffee this am) I have no idea about the amount of calories and i don't think that i care anymore. just after lunch i drank half of a bottle water 8 oz. Oh and by the way dogs and burgers off of a gas grill....awesome.

travis
ps did get a little hungry this morning at about 8 am but it was very gentile and not the kind that made my brain scream for food.

Lauren Wrote:
0 net carb bran crackers (these I actually eat at home- yes, an addiction)
How can a cracker with bran have zero carbs? Bran has carbs. What are the ingredients?

Hi Linda,
I get these at Whole Foods. They're called "Scandinavian Crispbread". Each fairly large "cracker" is 16 calories, 3g carbs, 3g fiber, 1g protein.

The ingredients are: unprocessed wheat bran (85%), rye flour, salt.

I basically use them as a vehicle for butter when I just have to have something that crunches. They seem to do the trick when I'm about to crack and I figure it's better than falling off the wagon with worse choices.

**RE: Zero Carb / Meat and Water - con - 06-19-2008 10:45 AM**

Wow what great reading!!!!
I've been doing really well on ZC except when I haven't eaten enough THEN I HAVE HUGE CARB CRAVINGS. The scale continues going down and I can't wait to get on it every morning. hee hee! And this is actually happening to a 62 yrs old very sedentary female who's only been losing a couple of pounds monthly!
As I'm learning more from Charles and you all, I can help others. Case in point: DEAR OLD HUBBY who doesn't ...er rather didn't want any help and definitely DOES NOT want to be told what to do. DOH is 70 LBS. OVERWEIGHT and suffers from arthritis and terrible gas /burping. He has...er had to take Alka Seltzer every night or he would be in agony.
I just mentioned that his high intake of refined carbs MIGHT be causing all the problems. I never expected him to listen--but he did and a miracle---yes miracles haven't ceased---happened and within one day no burping, no more Alka Seltzer!!!
Mind you he's been taking AS for 10-15 YEARS! actually 3 miracles happened: he listened, he did what I suggested and he acknowledged that I was right.Actually 4 miracles-I WAS!

thanks everyone
Con

---

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-19-2008 11:02 AM**

Con, that's awesome!
My hubby is on the wagon too, but only has 40 pounds to lose. The wretch won't get on the scale yet so we can see his progress, but I'm betting at our young age and his insane metabolism he'll have lost that 40 pounds in 6 weeks or so. But we'll see. 😐

SLEEP. Oh how I want it. I crave it more than carbs...well actually I'm not craving carbs at the moment but diet drinks, but you get the picture.
I just read several things about magnesium and calcium supplements, and also about the B vitamins. So I'm going out tonight to buy myself a bedtime cocktail. The recommendation was 500mg calcium/250mg magnesium/100mg B complex. I'm going to take that alone tonight. Tomorrow night, I'm going to take it with a tbs of coconut oil. I'll keep you posted on how it goes. I really feel that my horrible feelings are attributed to lack of sleep. I crave nothing except diet sodas when I get hungry, and over all physically I feel fine. But this haze of exhaustion is just killing me. I can't stand it anymore, so I'm doing the supplements. Again, I'll post how it goes tomorrow morning.

Hope everyone is having a great afternoon. 😊

This happens to me from time to time, especially if I don't let my steak cook enough. I need it to be medium well, but if it's too rare, I alway have that. I also find that my stools are looser. Not diarrhea, but just a little looser. No stomach cramps or dehydration though.

I find that it really comes down to the water balance. If I drink excessively, they are looser. If I don't drink enough, there can be problems, so its trying to find that sweet spot with water consumption, which I think is thirst if I only listen to it.

Con

Con, this is why I come to work in the morning! That's absolutely fantastic. I don't know what else to say, that's just fantastic!!!!
I feel like I've said this a thousand times but I really want to make sure it's clear.

Zero-carb is the best thing that any of us can do from a *dietary* perspective. Weight regulation is hormonal, insulin being the chief hormone because it overrides all others. If you cannot lose on zero carb you have to check out any other hormones or problems in your body. That is what homeostasis is all about. You can't separate weight regulation from any other system in your body.

I know it seems strange that a small amount of cake or whatever it is can cause you problems, but the fact that weight regulation is hormonal should clue you in that it makes all the difference. Your body oversecretes for a reason. It didn't use to, but now it does.

William Banting made this same observation back in 1864, that the foods he used to enjoy as a child now make him obese!

It's important to set aside the notion right now that this has anything to do with amounts. It just does not. Your insulin resistance came before your blood sugar levels were high. Your blood sugar only became high as a result of insulin resistance. How do I know this? Because I know what insulin does. It tries to move glucose into your cells. If it's successful, your blood sugar drops. If it's unsuccessful, you become fat.

If you can't sleep, or you have a temperature, or you're throwing up, or whatever else, a zero-carb diet cannot cure that. By the same token, if you are pregnant, a zero carb diet will not stop growth hormones from fattening you up. You have to find out what is causing any system in your body to malfunction and fix it. When you do, you may find that it directly affects your body's ability to regulate your weight.

This way of eating is some powerful stuff because it sort of strips you down to the bare essentials and can serve as a valuable tool to get things regulated. However, it's going to be tougher for some of us than others just as coming off of any addiction varies widely among people.

I don't get any bonus points for how many of you choose zero-carb or any other plan. I hope and pray that everyone finds something that works for them and they stick to it for life. I do get awfully excited when folks like Con tell us how this has changed her life, and at 62!

Everyone in the world should limit or eliminate refined and easily digestable carbohydrates. There is certainly a health benefit to avoiding sugar and grains of all types. How much further you choose to go is up to you and your body.

I'm only here to help. I won't be mad at any of you for not being able to make this particular transition. I acknowledge that it is the hardest of all the plans to implement. At the same time I can only tell you that if you are able to do it, you'll discover a much clearer world on the other side!

Best regards,

Charles

P.S. Now, I'm off to pick on Dr. Mike some more...
Go get 'em, Charles! So funny, PP was my threshold into the low carb world. I love that you can go up against a doctor because of the knowledge you've gained just recently. Tell us all about it! 😊

Hey, Caroline!

I'm wishing you a safe trip! I didn't know the Atkins site had candida info on it; it's been awhile since I've looked at it. I only heard about the baking soda trick about 2 weeks ago but I haven't yet tried it, since I forgot about it until you mentioned candida!

Fish oil has a strange effect on me, as does flax seed oil. I take it and my fingers often swell up like balloons the next day. But eating flax SEEDS does not have the same effect.

I tried flax seed oil again last night [Charles, do not smack me with a steak, wet lasagna noodle or anything else, ok?] and woke up BECAUSE my fingers hurt - they were badly swollen this morning. So off I went to take my lemon water treatment and now they are almost normal. The Protein Power books explain some people might have this reaction to flax seed and explain why. There are also some people who do not feel well when consuming whole eggs. Sometimes I wonder if eggs are also part of my problem.

I also woke up with a headache that only worsened throughout the day. Don't know what the deal is there, unless it's the woe and a die off candida reaction, which is very possible. I know I have candida.

That is another reason I'm on this woe but I am also convinced that hyperinsulinemia is another underlying problem. So there are quite a few things to 'treat.'

I'm with you and Charles. How other people react to what I eat or don't eat is not my concern. I find if I don't bring it to the attention of other people - that is, at a restaurant with a group of people - everyone is too busy to notice. Sometimes, however, a close family member will ask what I did to lose wt., and the reaction is always the same. "Wow, great! But...but...but!" as in "you can't eat bread? potatoes? rice? Never? I could never eat all that meat! Red meat isn't good for you." Or, as the King said to Anna, "Et cetera, et cetera, et cetera!"

Just like night an old friend of the family congratulated me for the great loss but then went into the same old misinformation mode on low-carbing. As I always said, "It's LOW carb, not NO carb" - that is, until now. 😊

---

I posted in the Eades thread here about it already but I didn't write nearly what I could have. I decided not to post to Dr. Eades directly. This guy is out to lunch for sure and it doesn't take an expert to see it. He can't decide whether the problem is carbs or calories just like his hero, John Yudkin. Both they, Anthony Colpo and many others can't get past the calorie nonsense.

I'm sure happy there are people in the world who eat according to hunger and stay lean so ideas like this will always be trumped by real people and real evidence!

That's interesting about the water. I never thought of that. I did drink a lot with my first meal today, and then shortly after that meal, it just seemed to go right through me. No cramps, like you mentioned, just watery.

I am still getting used to only drinking when thirsty. When eating higher carb, I was thirsty all the time, and peeing all the time. I now drink and pee 1/2 of what I was before. It's fascinating. But, even though I'm barely drinking between meals, I'm still conditioned to drink a lot with my meals, out of habit 😳

Hi, Wendy-O!

I've noticed that every time I have higher amounts of fat, the clogged pipes problem goes away. And it's been a problem since I was very young, beginning around age 10 - which, coincidentally or not, is when I entered puberty. Hormones were getting into gear...hmmm. Every time I was expecting, the clogged pipes went on complete strike.

Speaking only for myself, adding fiber in the form of - say, psyllium husks - only makes the problem worse. Just does not work for me. Adding fiber in the form of low carb veggies didn't seem to help, either.

For me, what works - if fat intake isn't taking care of normal elimination, not to mention water retention - is lemon water. Freshly squeezed juice of 1/2 lemon, over which I pour 12 oz. of boiling water. I don't need to add stevia; the stuff tastes like hot lemonade. Within hours, the pipes are literally clanking away...
and then they get moving.

The same can be said about chelated magnesium - I take 400 mg a day, but sometimes I do forget it! I am reminded that I forgot it when the pipes slow down, btw!

I once read the reason why some people have the bouts you describe when lowering their carb intake, but I honestly can't recall it at this time. There 'is' a bodily explanation. Charles might remember...?

Dear Con:

You are such an inspiration! May I congratulate you on your success?

Dh and I are in our late 40's and when the healthy, slim dh developed GERDS, it was a big surprise for everybody. I mean, the guy is like Superman - impervious to almost everything.

Anyway, when I began icing, he was really great about it and didn't complain when certain items were no longer on the table. Guess what? His GERDS - and mine - went POOF!

As for me, I got off ALL meds, and I did via the low-carb lifestyle.

So I'm a big believer that the proper nutrition is a major issue in regard to so many of our common health issues.

KUTG!

But if it's in hamburger, or maybe marbled in the steak, I don't think I notice. It's that glistening-mushy-fat feeling that grosses me. This has been for as long as I can remember, before I even realized I was a fat kid, so I can't even blame it on the diet industry brainwashing.

Clabbergirl, dear girl:

I hate to say it cuz I sound like a whiney, broken record (oops, did i just show my age with that remark?), but I have tried hamburger and ground chuck, cooked the stuff and ate it - but it does taste 'rubbery' and unpleasantly chewy to me.

I can't figure out why filet mignon (which I've tasted twice in my life, and did not expect to enjoy, but I did - I'm not a 'steak' eater) is so delectable but fatty hamburger is such a turn off.

Still trying to figure out ways to up 'fatty proteins' w/o grossing myself out to the point of not eating at all...

---

Did you follow the blog someone did while eating these "insane" amounts of fat and calories? Was it Dave that did that? For the life of me I can't figure out how to get back to it or who it was that did it; for some reason Dave from the old board keeps coming to mind so I don't know...

Anyway, I think he ended up maintaining the same weight doing all that? Calories are meaningless! The bottom line is listen to your body, and the more days into this I get, the more I realize the only way to really get down to the heart of the matter is to strip it down to the barest of essentials. With all the crap out of the picture, there's a clarity about food I've never had. It doesn't mean anything to me-it's just what's to eat to fuel me. I've always been so emotionally tied up with food..........I don't know, I just wish people would look at this whole mess of so called nutrition and realize we are what we are--we were created to hunt meat and eat it, red full fat meat.
I think the Eades and probably a lot of other doctors have the best of intentions but get caught up in the brainwash themselves. Sad thing.

Still trying to figure out ways to up 'fatty proteins' w/o grossing myself out to the point of not eating at all...

The filet mignon is a pretty lean piece of steak even though it's tender.

You know, my daughter doesn't much care for fat either. She's a lean little 11 year-old and she had a hard time with this at first. We don't give her the visibly fat pieces and we had her eat the fat with the meat. For instance, cut a piece with fat in such a way that the majority is meat. She's better with that.

Plus, when you're sitting at a table and everyone else is raving about the good fat, it makes you more apt to try it. Peer pressure works wonders. She also loves pork ribs.

There are many cuts of meat and the fat content varies. I don't think you have to eat big chunks of fat. I think even if you trim the fat from a fatty cut of beef, you'll still get enough fat as long as you like the meat.

I don't know how fatty ground beef can taste "rubbery" unless you're cooking it in the microwave. I put it on the stove with a skillet and a lid. It has a good deal of fat. I don't go back and drink up all the fat, but the meat has plenty.

Just find some beef that you can eat and eat a bunch of it and chances are you'll be fine even if the fat content is not high. Ground Beef has leff fat than ground chuck, but if you like it better that's fine. Do you like lamb or veal better? They would have more fat than icky chicken breast.

Did you follow the blog someone did while eating these "insane" amounts of fat and calories? Was it Dave that did that? For the life of me I can't figure out how to get back to it or who it was that did it; for some reason Dave from the old board keeps coming to mind so I don't know... Anyway, I think he ended up maintaining the same weight doing all that? Calories are meaningless!

It was Jeff and he had a hard time eating 5,000 calories of fat each day. I think LindaSue had the link.

travis t Wrote:
What i have eaten today.
Last eve. at 5 pm two ball park franks, two beef patties, a small spot of ketchup, and dash of tabasco that
I mixed into it. The ketchup was about 1 tbsp, which is pretty small compared to how I used to eat it. Before I used hot dogs as a ketchup delivery vehicle.

today 4:30 am 16 oz strongly brew coffee, 10:00 am five beef patties with table salt and half a stick of land o lakes butter (4 tbsp).
That is 17 hours with out a drop of food or water (other than the coffee this am) I have no idea about the amount of calories and I don't think that I care anymore. Just after lunch I drank half of a bottle water 8 oz. Oh and by the way dogs and burgers off of a gas grill....awesome.

travis
ps did get a little hungry this morning at about 8 am but it was very gentile and not the kind that made my brain scream for food.

Hmm, Travis:

I get it! So you had a hot dog with your ketchup!

Hey, I'm glad to hear this woe is working so well for you. We're all at different stages of easing into it, and it sounds like you're getting along!

My best!

Wendyoh Wrote:
I have a question for all of you zero carbers out there. How does eating this way affect your "bathroom" time?

I find it strange that fiber is supposedly good for eliminating constipation, but I have always found the opposite to be true. Back when I was eating more carbs and increased my fiber to 30+ grams per day, even if I increased my water, I became terribly constipated.

For me, cutting back on not only carbs, but fiber, is what finally has freed me from my constipation. My "bathroom time" is so much better eating nearly zero carbs and zero fiber. I react to fiber just like you. It plugs me up terribly. I don't have a diarrhea problem at all though.

travis t Wrote:

Travis, you could shave off about 3 carbs by using sugar free ketchup. The one made by Heinz is very good and only has 1 carb per tablespoon.

Lauren Wrote:
I get these at Whole Foods. They're called "Scandinavian Crispbread". Each fairly large "cracker" is 16 calories, 3g carbs, 3g fiber, 1g protein.

The ingredients are: unprocessed wheat bran (85%), rye flour, salt.
They actually have 3 net carbs each (6 carbs before deducting the fiber) because the fiber has already been deducted. Wheat bran and rye flour both have carbs and there's not enough fiber in either
ingredient to cancel out the carbs. There have been discussions about these crackers on other forums and it's been determined that food labels in Europe don't count fiber in the carb count so it only looks like they have zero carbs because we're used to subtracting the fiber from the total carbs.

Charles Wrote:
Divine Miss M Wrote:
I hate to say it cuz I sound like a whiney, broken record (oops, did i just show my age with that remark?), but I have tried hamburger and ground chuck, cooked the stuff and ate it - but it does taste 'rubbery' and unpleasantly chewey to me.

I can't figure out why filet mignon (which I've tasted twice in my life, and did not expect to enjoy, but I did - I'm not a 'steak' eater) is so delectable but fatty hamburger is such a turn off.

Still trying to figure out ways to up 'fatty proteins' w/o grossing myself out to the point of not eating at all...

The filet mignon is a pretty lean piece of steak even though it's tender.

You know, my daughter doesn't much care for fat either. She's a lean little 11 year-old and she had a hard time with this at first. We don't give her the visibly fat pieces and we had her eat the fat with the meat. For instance, cut a piece with fat in such a way that the majority is meat. She's better with that.

Plus, when you're sitting at a table and everyone else is raving about the good fat, it makes you more apt to try it. Peer pressure works wonders. She also loves pork ribs.

There are many cuts of meat and the fat content varies. I don't think you have to eat big chunks of fat. I think even if you trim the fat from a fatty cut of beef, you'll still get enough fat as long as you like the meat.

Hi, Charles:

I never made filet mignon in my life, but I figured it had to be lean if I liked it.

Btw, I do not cook in a microwave but only in the oven or on the stove. I used to mix the ground meat with crushed pork rinds OR parmesan cheese, and bake it. With sirloin, I added eggs and baked it on a thin layer of extra virgin olive oil.

As I told ya, I just can pick up the fat [texture-wise], which is why I really have to work on this whole concept. Eating proteins and fats is not the issue; it's eating fattier meats.

Naturally, I would like veal cutlets...just because they are ridiculously expensive. I'll figure it out eventually...as you said, Charles, even if I cut off the fat [and I know I will] on a fattier cut, I'll still get in enough fat - as long as I like the meat.

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-19-2008 01:19 PM**

Jeff, that's right!
Shoot, what I started to say in my post just now was that these so called smart scientists out there act like we can eat insane amounts of calories if we're eating true low carb and that will makes us stall or get fatter...how can that be if it's truly low carb? Good fat is hunger satisfying and it's self limiting. It would seem that these low carb docs would get the big picture. If your hunger is satisfied, you stop eating. Your hunger won't be satisfied if you keep screwing up your insulin receptors. It just makes so much sense.

---

**RE: Zero Carb / Meat and Water - Divine Miss M - 06-19-2008 01:21 PM**

Btw, Charles, your little girl sounds like me when I was little [and lean]. My dad had to do the same with me as you do with your daughter, as I mentioned yesterday. Hopefully, your baby will adjust well and so never have to deal with any health issues when she's still young.

God bless!

You keep talking like that and I just might write a book. However, I would have to write Gary Taubes a big check because I owe so much to him and his amazing research. I just think he needs to focus on the bigger aspects of his work and that was the part on the diseases of civilization, dementia, cancer and aging. When you link carbohydrates to cancer that's far more important than losing some weight. Everyone just got fixated on the calorie vs. insulin stuff but's just the tip of the iceberg.

RE: Zero Carb / Meat and Water - Divine Miss M - 06-19-2008 02:06 PM

Hey, Charles:

Ok...I have to say something. I'm a writer, and a reviewer. I was once a publisher and an editor. [I've also done some investigative reporting.] There's a big NY publishing house that sends me books to review. I know about titles and topics and what attracts the public eye - especially from a marketing standpoint.

People have asked moi to write a low carb book with all the research I've done. Yet I feel there is so much more to learn. You do the same thing as do I - you study, you try it, you look for answers, you find what works, what doesn't, and you pass it on. It's all about information.

My point: A title like that is a winner. I know.

So how do I get started on such a thing?

RE: Zero Carb / Meat and Water - Divine Miss M - 06-19-2008 02:32 PM

Well, this is very simplistic, but you would write your outline, and then get started on a draft.

In the meantime, you'd have to look for a book agent since that's the only way to get in with the big publishers. That alone is tough, very tough.

Another option is POD [Print On Demand], and that means some research. But now there are digital books, and that's another way to go. In fact, it's a very tempting one, since this is the Information Age.

You know how it is - people want 'drive thru' info and they want it NOW.

All great points. These so-called experts never seem to take this from the theoretical to the actual. IF you could eat 7,000 calories of fat and protein....they never stop to consider how often someone could actually do that. Here, we have a person that attempted it yet still did not gain weight and he really had to work at it. We get scared if we eat an extra scoop of ground beef when we're actually hungry. Here this guy is literally stuffing himself and can't get it done.

Yet, it's very easy to consume 5,000 calories eating cheese and nuts. Ethan Sims had inmates eating 10,000 calories of carbohydrates and they were still hungry before they went to bed. That should tell us something profound about carbohydrates and calories, but no, because it doesn't fit with the dogma.

I just read this chapter today! I thought all I had to worry about was that my grandfather has type II diabetes. Now I learn that there's a connection to Alzheimer's, which both of my grandmothers had/have, and cancer (which my mother has had). I have even more motivation now to do VLC for life.

I also found the semi-starvation studies fascinating, and the observation that these people all had low glucose and insulin, and that VLC may promote longevity.

Charles Wrote:

You keep talking like that and I just might write a book.

Charles, I second her suggestion. You have a lot of information and experience at this thus far, and it's sort of trailblazing because of the lack of books on the topic of zero carb eating. Diet books are good sellers in general, and although your book might be marketed as such, the knowledge it could convey needs to be told.

You could interview a host of professionals to back you up, and I'd imagine many of them would be more than willing to help you get this information main stream. Maybe not too many pharmaceutical companies would be, since they make a lot of $ off diabetic supplies and statins, but Jimmy has found some incredibly helpful and resourceful people - you could too.

Some of the books I've picked up off the store shelf are incredibly bad - and I marvel that they were
published by large publishers. But information like you've got? I truly believe it would speak for itself. Please keep this in your mind for consideration.

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-20-2008 06:30 AM**

Hey Charles, if you get a good book deal just remember me if you use my title--hardy har--LOL! 😁

So folks, I took my magnesium and calcium last night and guess what??? I slept through the night!!!!!!! Do you know how exciting this is for me??

I am just...well I'm floored. Plus, I had these cramps in my feet and a little in my calves and they literally melted right out within about 40 minutes of taking the supplements. I know we can get all of our nutrients from what we're eating but honestly? I physically felt so much better after taking these that I'm going to start taking a multi for women in the morning and taking these two at night (the numbers are safe). I personally feel that we as women have a harder time because our chemicals change on a daily basis to ready us for fertile periods, infertile periods, menstrual cycles, and then all over again. We have very delicate balances and I am going to make it a personal challenge to myself to document these changes in my physical feelings. Another thing I'm going to do is get new batteries for my glucose monitor. I had it for my gestational diabetes. I want to look over my fasting numbers, those after I eat, etc. If some one can give me a concise timeframe I should test in, I'd appreciate it. I saw in the thread about checking levels that your glucose should peak at I think 30 mins after eating? And in two hours your body should be done and you should be back to your "base" number? If this is incorrect, please correct me. 😊

Anyway, just wanted to say hello and tell you about my calcium and magnesium adventure in sleep. Ladies, look into it for yourselves if you haven't already--especially if all of a sudden your energy has bottomed out but you're sticking to meat and water. I mean I hope there aren't any weight loss issues that would be caused by these two supplements, if so I'll be sheepish--but I think it's worth a shot for those feeling a little off maybe. Just in my humble opinion. 😊

Congrats on a full night of sleep! I'm sure you're going to feel a little bit better all day because of it. I've been taking a magnesium supplement for the past week at night, but I can't seem to get in the daily recommended for it yet. I haven't had a charley horse yet either, but I usually get them on the weekends anyway. They're horrible so I hope a thing of the past. Good to hear yours are getting better, and do keep us posted on the progress.

I'm very happy you were able to sleep, but I would caution that you don't want to jump in to the vitamins all at once. Why not stick with the magnesium and calcium for a while and let yourself adjust to that? There were some very large recent studies that showed multi-vitamins had no effect and that they could possibly be doing more harm than good.

When you begin a zero-carb regimen, it's not surprising that you will have some deficiencies at first because you've just eliminated several sources. However, because those carbohydrates can cause you to lose nutrients, it takes a bit for your body to adjust. Many also find that their cholesterol rises after starting a very low carb diet and that's because cholesterol is in each fat cell. As they break apart, the cholesterol gets released into the bloodstream so the levels in serum readings are high. However, after some time, the body eliminates the extra cholesterol and things return to normal. I think it's the same way with this.

Our bodies regulate the nutrients in such a way so that if we're getting too much of one nutrient, the body will cause us to only absorb so much of another. The most famous example is iron. Doctors always assumed that women needed iron because they bleed regularly. However, once they actually bothered to study the issue, they found that the body regulates iron on its own. When we need it, the body absorbs it readily. When we don't need it, the body allows it to pass right through us. However, it's possible to take too much iron and cause things in your body to "rust." Now they advise men to never take iron and women to take it only under doctor's advice.

You may even play with lowering the dosage of the calcium and magnesium over time as you get more adapted to zero-carb, assuming you stay with it. There's so much that we don't understand with regard to vitamins that it makes sense to use caution. Food has many co-factors that we're not aware of and they cause us to absorb the nutrients in the food. Without the co-factors, the vitamins are worthless because you'll just lose the vitamins in your urine and that's what happens with multivitamins.

Even worse, you can cause yourself to be out of balance by supplying too much of a particular nutrient and your body will suppress your absorption of a more beneficial one.

Take it slow and be careful.

---

RE: Zero Carb / Meat and Water - Vesna - 06-20-2008 06:48 AM

I also believe that Charles should write a book.

Charles, I'm sure our good man Jimmy would help you in any way he could, considering his own publishing experience.
I would also be willing to bet that Dr. Mike Eades would help you. Despite some of his ideas, he seems like a genuinely good guy. He has written that he would help people (he was referring to Colpo at the time) find agents and get published in whatever way he could, and that it helps tremendously for the author to have a "platform" (established audience), which you certainly do, and could build on tremendously if that were your intention.

Also: there are gazillions of how-on-earth-do-I-get-started resources for prospective authors. Browse a little on Amazon or your local bookstore and you will find them.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-20-2008 07:11 AM

Hmmm, very good information Charles. I will go with what you say for now. I have to admit I have felt my resolve flagging in the last 2-3 days and my husband is none too happy with my appearance or how completely exhausted and out of it I've been. This only hit me after that episode Tuesday. What's your take, Charles? One thing that concerns me is that I know I have an issue with arachic acid. It's found in red meat, though I think less in ground beef. You have to eat a lot of ground beef to get as much of it as you would from a steak.....anyway I just wonder if this could be my issue? If one had to not eat beef, or only eat beef a couple of times a day, perhaps as a snack, what other meats and fish would you suggest take it's place? Dark meat chicken? Salmon? Help! I just want to try to eat something different a day or two and see if I feel better. I am being true to form, nothing, and I MEAN NOTHING but meat in it's own fat and water. Why am I so completely wiped? I felt fabulous up until Tuesday. I need some support with this....I don't want to give up yet or worse, give up from lack of understanding.

You could come and live with my family for a week and then I could know exactly what you're eating and you could eat just like me! 😊

I don't eat ground beef all day every day. I eat it for breakfast. I have steak for lunch, and dinner is whatever I'm fortunate to have prepared for me. Last night, it was baked chicken thighs.

You could eat fish, like salmon, trout and whitefish. You could eat pork, lamb, or any number of meats. The point is to find something you like and eat it. I think that a small stable of foods is good generally but there are many meats out there that should be a part of your diet if you like them.
I've attached the Atkins carb counter to this post. Take a look at the fats in each cut of meat. I tend to pick the fattier ones. There is a great variety to pick from there and all are okay.

Two weeks is a good amount of time to overcome any sluggishness and flu-like symptoms. If you don't feel better after two weeks, then it would be good to do whatever makes you feel better. I never felt as bad as many are describing so it's hard for me to tell you what's happening. I don't expect everyone to experience it the way I did but I don't think we're all THAT different when it comes down to it.

There's nothing wrong with coming off of carbohydrates slowly. The Atkins induction is a good starting point and someone could reduce from there if they need to. I think Dr. Atkins logic is very sound. You find the carbohydrate level that allows you to lose weight, satisfy hunger and eliminate cravings. If you are not losing, you go down in increments of 5 until you find the level. For some people, that level is zero. For others, it may take some weaning and serious resolve to get there.

**RE: Zero Carb / Meat and Water - travis t - 06-20-2008 07:49 AM**

About vitamins,
I used to be the vitamin king. I would take them by the dozen(literally). I got most of them from the life extension foundation. But the thing was i had spent major dollars and effort to research the correct ratios and dosages and i never felt anything(nothing but yellow urine). I couldn't tell when i was taking them or not.

I guess the bottom line is lots of bucks no bang

Travis, I used to take the MegaMen stuff from GNC and my urine was some psychodelic yellow/green! It was wierd but I knew that stuff was going right through me. Since dropping all supplements, everything works better, that's for sure!

RE: Zero Carb / Meat and Water - Wendyoh - 06-20-2008 08:38 AM

I have another question for all you zero carb and VLC folks. Have any of your had symptoms of thyroid increasing after cutting way back on carbs? Such as, are you warmer now?

I was diagnosed with hypothyroidism back when I was still quite overweight and insulin resistant. I have read that insulin resistance may affect the liver and decrease the conversion of T4 to T3. Do any of you know if this is true?

The reason I ask is, since beginning to eat VLC, I feel like my thyroid meds are actually too much for me anymore. It would explain the diarrhea, and my temps are frequently 99.0 or even higher now without a fever.

Most people who have low thyroid have the autoimmune version, which I do not, which always made me wonder if somehow my condition might be reversible?

You got me on that one, Wendy. I tend to be a little colder, I guess because I'm so lean. I'm glad I live in North Carolina and it's the summer because I was pretty cold during our relatively mild winter. I don't know what I would have done living in New York....I suppose I would have adapted!

RE: Zero Carb / Meat and Water - Clabbergirl - 06-20-2008 09:11 AM

Today I woke up a little hungry, took my thyroid meds though (told to wait an hour after to eat), and had
a coffee w/2 tsp splenda & maybe a half tbsp coconut oil (yes I know, can't do it black yet and the liquid stevia is at work). My hunger sort of abated, but as the morning continued, I got hungrier and hungrier. Work prevented me from eating the moment the hunger got strong, but I eventually had 6 eggs w/mayo as a salad to curb it. Maybe 30 min after eating all that, I was hungry again. What is going on? I've done this exact thing many mornings and not been hungry so soon afterward. The only difference between today and the others is that I was out of heavy cream for my coffee and had to skip it.

I brought a limited amount of food for the day, so I'm hesitant to break out my hamburger patties for fear I'll have eaten everything and will be stuck here, starving, for the rest of the day. Anyone want to clue me in on why what has been working previously quite well to satisfy hunger isn't now?

I wish it were that simple. For everything to "work the same" it would be necessary for your activity, sleep and everything else to have been identical. Obviously today, your body needs more fuel than the other days and this is quite normal. That's why the calorie theory is so non-sensical. Who can know how hungry they will be on any given day? We have some idea, but we really don't know until it hits.

RE: Zero Carb / Meat and Water - Clabbergirl - 06-20-2008 09:30 AM

Thanks, Charles. I want an easy answer for everything, but of course I'm seeing that's just not gonna happen.

I decided to try swallowing a tablespoon full of coconut oil raw (gulp), to see if it would hold me off for a bit longer. It may have done just that.

RE: Zero Carb / Meat and Water - travis t - 06-20-2008 09:57 AM

A Cautionary tale by travis
It was a mid summers night eve and mr t thought he was invincible....
Any way last night for supper I was grilling a large ribeye steak and some beef patties on the grill. My wife was making grilled steak fajitas for herself and our girls. I was only eating the beef with Tabasco on it, at least that was the plan at first but the smell of their food and a cocky attitude got to me. So I decided to throw half a flour shell, steak, and the grilled red pepper and onions on my plate with my burgers. I said to myself a month ago I could eat four or five shells stuffed with fixins and never feel a thing so this amount can’t hurt me to badly. Big mistake because of what happened 90 minutes later. We
ate at 5:30 and as I was laying on the couch watching tv at about 7:00 and started to get sleepy so I stretched out and that was all she wrote…..Passed out(and I mean gone,coma). Now I very seldom take a nap but this wasn’t my normal nap because when I take those they almost never last more that twenty minutes(thirty min max). I woke up at 9:55…. Almost three hours(I haven’t done that since I was two).

So half a flour shell and some “good carbs” knocked my you know what in the dirt.

The good news is I think that this is a sign that my body tissues are getting more sensitive to insulin and that my pancreas hasn’t gotten the message(yet) that it needs to make an adjustment. Oh and another thing I get up at 3:30 am to come to work and almost never am I a zombie but this morning when I was and backing out of the garage I got to close to the overhead door and I knocked the drivers side mirror clean off….nice. I have been parking in the same spot for over 11 years.

The better news is by the time I got to work I was ok and had my coffee and at nine I had my burgers and butter…yum Back on track.

travis

**RE: Zero Carb / Meat and Water** - **onlyabtrfly** - 06-20-2008 10:07 AM

Nice, Travis.

Travis makes a good point about things, though. I think zero carb makes you run so "clean" that anything knocking it off a little makes for trouble or at the least discomfort or carboholic symptoms. I'm going to keep at this another full week, so I'll be at two and a half weeks next Friday. I think TOM is accounting for some of my weariness and out of sorts-ness, and that's about over, so I'm staying in the ring another week. I really can't wait to test my blood sugars over the weekend to see what my numbers are. I want to then take a day and eat very very minimal dark green vegetables- a combined total of 10 carbs before removing fiber count--and see what my numbers are. Eventually I will have to eat a carb meal to see what happens I guess. I'm excited about it because the blood won't lie, you know? I want to see the numbers myself. 😁

By the way, thanks again for the vitamin info. You're so right. I can see using these supplements to get my sleep back on track and then weaning off of them as I feel better, but vitamins have never helped me before.

Is two weeks definitely long enough to see if this works? How come so much longer than just nixing most carbs, like down to 20? That usually takes 72 hours. It makes sense that removing carbs all together would take longer for adjustment.....

---

**RE: Zero Carb / Meat and Water** - **Charles** - 06-20-2008 11:12 AM

onlyabtrfly Wrote: Travis makes a good point about things, though. I think zero carb makes you run so "clean" that anything knocking it off a little makes for trouble or at the least discomfort or carboholic symptoms.

Yes, he does. I know that I'm far more sensitive to carbohydrates than I was this time last year when I kept my carbohydrates below 10.

AnneMarie Wrote:

It should give you an indication. It's not really long enough if you're not feeling better. It's like fasting. I even saw in the Bible when God talks about a fast he says that a person's health will return. Going zero-carb is the scientific equivalent because we know that our bodies can't tell and frankly don't care where the fat and protein comes from.

All you're eating is fat and protein so your body should return to biological zero. I have no way of knowing how far from zero you actually were so who knows how long it would take you to feel better. I find these two quotes of Stefansson from back in the 1920s to be instructive:

Viljamur Stefansson Wrote:
The typical method of breaking a party into a meat diet is that three of five of us leave in midwinter a base camp which has nearly or quite the best type of European mixed diet that money and forethought can provide. The novices have been told that it is possible to live on meat alone. We warn them that it is hard to get used to for the first few weeks, but assure them that eventually they will grow to like it and that any difficulties in changing diets will be due to their imagination.

I suppose that if there were truly nothing else to eat, you might have an easier time. Since we're surrounded by choice in this great country of ours, we feel like there must be something else.

And this one:

Viljamur Stefansson Wrote:
Usually I think, the men believe that what I tell of myself is true for me personally, but that I am peculiar, a freak—that a normal person will not react similarly, and that they are going to be normal and have an awful time. Their past experience seems to tell them that if you eat one thing every day you are bound to tire of it. In the back of their minds there is also what they have read and heard about the necessity for a varied diet. They have specific fears of developing the ailments which they have heard of as caused by meat or prevented by vegetables.

I think that about many on this forum. I must be some freak of nature to be able to look the way I do and only subsist on meat and water. This way of eating is nothing new. It should be surprising that this hasn't been studied more than anything else. If we didn't have the diseases of civilization 200 years ago, that should tell us something. It just keeps getting worse. We get all of these autoimmune diseases and cell degenerative diseases but no one wants to attribute it to anything except possibly eating too much and doing too little.

As Stefansson continues:

Viljamur Stefansson Wrote:
We are not on rations. **We eat all we want**, and we feed the dogs what we think is good for them. When the traveling conditions are right we usually have two big meals a day, morning and evening, but when we are storm bound or delayed by open water we eat several meals to pass the time away. At the end of four, six or eight weeks at
sea, we have used up all our food. We do not try to save a few
delicacies to eat with the seal and bear, for experience has proved that such things are only tantalizing.

I have this same experience today. I eat all the meat I want. I never go hungry, Thank God.

How about this one:

Viljamur Stefansson Wrote:
Still, as just implied, the verdict depends on how long you have
been on the diet. If at the end of the first ten days our men could have
been miraculously rescued from the seal and brought back to their
varied foods, most of them would have sworn forever after that they
were about to die when rescued, and they would have vowed never to
taste seal again —vows which would have been easy to keep for no
doubt in such cases the thought of seal, even years later, would have
been accompanied by a feeling of revulsion. If a man has been on meat
exclusively for only three or four months he may or may not be
reluctant to go back to it again. But if the period has been six months
or over, I remember no one who was unwilling to go back to meat.
Moreover, those who have gone without vegetables for an aggregate of
several years usually thereafter eat a larger percentage of meat than
your average citizen, if they can afford it.

Six months is the magic time frame. I have done this and he's right. I have no interest in going back to
vegetable matter!

Stefansson Wrote:
The symptoms brought on at Bellevue by an incomplete meat diet
(lean without fat) were exactly the same as in the Arctic, except that
they came on faster—diarrhea and a feeling of general baffling
discomfort.
Up north the Eskimos and I had been cured immediately when we
got some fat. Dr. DuBois now cured me the same way, by giving me
fat sirloin steaks, brains fried in bacon fat, and things of that sort. In
two or three days I was all right, but I had lost considerable weight.

This speaks to maybe why some of you feel so bad.

Rather than quote this whole thing, I'm going to attach the book to this post. Anyone considering an all-
meat regimen should read it. Chapter 2 of this book involves the Bellevue study undertaken by both
Stefansson and Karsten Anderson. Gary Taubes talks about it, but here you get a first-hand account of
how it was set up and why it was done this way. Many people think the Inuit only ate raw meat or that
they were somehow adapted to eat this way and it can't be recreated today. Well, check out this book
and you'll see that people of many races and nationalities were able to do it and it totally confounded all
the medical experts back then just as it does today.

Enjoy!

Charles
Charles, thanks for even more of your fountain of knowledge.

I do have a question for you, and please note that I am not being argumentative, etc. I personally rather enjoy vegetables...especially those that are acceptable for the low carb diet. Asparagus, broccolli, green beans, squash, zucchini, cabbage, salad vegetables. Further, I am still very young and would like to have more children. Now, I know for a personal fact that the only way I was able to become pregnant with my son was to stay on strict induction style numbers. I ate the above vegetables but so sparingly as to never go above 10-12 carbs per day of them, lost weight as though melting, and felt great. I didn't eat cheese, nuts, or low carb frankenfoods. No dairy whatsoever. I ate abundant amounts of olive oil and butter. Now, my question is, with me still very much wanting more children, I can't help but think it might be wise of me to eat at least a very tiny amount of vegetables so that if I become pregnant I can eat them without my body freaking out. Does this make sense? I am not trying to get out of this easier or anything like that, but I don't want to become more sensitive to carbs before my child bearing years are over...what do you think? Now granted, I know women of old had to eat a lot of meat just like their men.....I'm really twisted up about this and would like your input. Help?

One other thing...in the worst of my carb binging days, because of the constant gnawing hunger and maniac cravings, I'd say I'm coming off days of at least several hundred carbs in food and drink. At least 7-800 per day. My God...killing myself off slowly is basically what I was doing. Eik! Remember, too, I just started back to low carbing, with true heart and intentions two weeks ago this coming Monday.

P.S. Don't mention scripture to me regarding fat, because I could go on for days! All Old Testament sacrifices were to be pure unblemished animals and the FAT was the holiest sacrifice. I had a pretty rotund professor at my bible college who liked to joke that the Lord loved us fat people more because we were a more acceptable sacrifice. He is a wonderful and kind man, so it was very funny from him. ;0)

---

Hi, all,

I'm new to the forum and trying to get started with low-carbing again...

Is this meat and water option a good way to jump start my low carbing? When I did low-carb, it was with Atkins and I did okay in the beginning and it got better along. But that was several years ago. I'm back to eating whatever, no energy, gained so much weight my knees are rebelling and I joined a gym and go in there exhausted and get out exhausted.

I've always read Jimmy's blogs and watched his you-tubes to get motivated back to low-carbing but I've been procrastinating way too much and think I need a drastic move. I loooove meat, chicken, fish, some red meat (not a lot), etc... I'll even forego the coffee -- ugh! did I say that? It won't be too bad--they make horrible coffee here at work and I can't get to my Dunkin Donuts for coffee -- no, I'm not eating the donuts. I never was a donuts fan... (thank God!)

Looking forward to delving deeper into this forum for all the information this forum provides.

Penny
Mary Wrote:
Charles,
Everytime I read something you write I understand it a little better. Do you think since I lost 7 lbs in about 10 days when I started a few weeks ago that would be a good sign that my hormones are working correctly or would it take awhile to show up?

Thanks for all the help,
Mary

RE: Zero Carb / Meat and Water - LindaSue - 06-20-2008 02:39 PM

Welcome to the forums, Penny. Meat and water IS a good way to start low carbing. It will give your body a chance to function the way it should function without carbs getting in the way. Once you've gotten the hang of it, and adjusted to the new way of eating, you can choose to try adding back in some other foods one at a time, such as cheese and a few veggies, to see how you react to them. If your weight loss continues and you feel well, then you may be able to add those things to your diet. If they make you feel ill or cause you to gain weight, then those are the foods to avoid forever.

RE: Zero Carb / Meat and Water - pennypritty1 - 06-20-2008 03:35 PM

Excellent! Thanks, LindaSue.

I know we're supposed to get blood work and sugar checks and all sorts of tests taken before we do this to show the miraculous differences but I've sooo procrastinated that I don't want to wait.

I've just started a great new job, so I'm just now choosing my coverage. I'm looking for a good doctor (the one I'd had before did not like low carb so I don't really want to go back to her--she kept pushing low fat foods at me--ugh!).

Jimmy Moore gave me someone to look into here in NYC and I'm praying he's within my company's coverage.

Thanks!

Penny

RE: Zero Carb / Meat and Water - con - 06-20-2008 04:31 PM
PENNY,
This is certainly the easiest and cheapest way I've ever eaten. But, it did take a few weeks before I could get down to just meat, eggs, cheese, splenda, flax and nuts. When it got down to just meat and water I found that I could only eat when I was hungry. That was weird because I could eat SF cheesecake or nuts and cheese when I wasn't particularly hungry. So it does take a little paradigm shift, but the rewards are definitely there.
Just my experience,
con
p.s. I didn't get any Drs. permission or blood tests

Well, our alternative hypothesis of obesity actually does directly address fertility. In GCBC we saw that reproductive biologists have long considered the availability of food to be the most important environmental factor. The most important variable in fertility is not body fat but the immediate availability of metabolic fuels.

In the late 1980s, Wade and Schneider did work with hamsters and they found that these animals will go into heat whether fat or lean and they go through their reproductive cycles as long as they can eat as much food as they want. If both fatty acid and glucose oxidation are inhibited, and they're not allowed to increase their food intake in response, their cycles stop. They remain infertile regardless of whether they are gaining or losing weight at the time.

Pigs and monkeys do the same thing. They all respond to the metabolic availability of food. Infusing insulin into these animals will shut down their reproductive cycles. As Wade and Schneider said, "If an excessive portion of available calories is locked away in fat tissue, the animal will act as if it's starving." In such a situation, the reproductive and other psychological systems will shut down until more food (metabolic fuel) is available.

We've also learned that an obese person is also starving internally. Despite their large fat depots, their bodies are unable to utilize this mobilize this energy and thus their cells are starving.

The clear implication is that a woman struggling with infertility will benefit more from a diet that lowers insulin but still provides considerable calories and thus repartitions the fuel consumed so that more is available for oxidation and less is placed in storage.

AnneMarie, I hate to break it to you, but you asked. To me, it's all the more important to get your insulin
under control and keep it that way if you hope to continue having healthy children, plain and simple. There is nothing wrong with the Induction-level diet if you find that you can lose weight on it and your body responds to such a regimen. Either way, insulin must be controlled and you must take whatever steps are necessary to control it.

Regards,

Charles

I find this alternate hypothesis on fertility to be so encouraging. I've always had problems with irregular periods, which worsened so much last year when I engaged in very strict dieting and huge carb-ups
around training.

I never understood why some women never lose their periods, even if they get really lean. Yet, here I was, with plenty of fat, yet I didn't get one for 11 months. Pre-mature menopause? Nope. So what the heck was causing it?

I never even thought that my diet was contributing, b/c well, I wasn't that lean, so it couldn't be that. But now I see that if my body thought it was starving (on low calories), and if it wasn't able to effectively use fatty acids for fuel, which was evidence by my lovehandles, then something else must be going on.

Interestingly, I got 2 consecutive periods this past winter, during a time of fairly low carbs, only about 60g/day and no carb-ups.

Then I increased my carbs again, and guess what? No periods.

Not until April, when again, I had been eating somewhat lower carb again. I have still yet to have another, but 3 in one year is huge for me, and I'm finally able to start connecting the dots.

I'll be very interested to see if things start to normalize finally now that I am consistently eating VLC, as well as having increased my calories as well. Don't know if it's related but VLC has done wonders to increase my libido exponentially (which isn't hard b/c it didn't exist before😊), but it wouldn't surprise me if this tied in as well.

---

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-21-2008 07:05 AM**

First of all, I want to make CLEAR that I am well aware of the effects of insulin on fertility. I have personally and physically watched a miracle occur in my very own life to that regard, as I myself have had a child after 5 years of secondary infertility ONLY through low carbing and my understanding of how insulin effects the endocrine system. I regained normal periods after years of irregular or scant periods and no ovulation. I did that through losing down from my heighest weight ever of 346 down to 296 from November of 05 to February of 06, when I found myself 3 weeks pregnant. Literally as soon as 296 hit the scale I conceived. Wendyoh, the thing is, if you know of a time when your periods were regular you MUST shoot for that weight. I would cut your carbs down to what is low as reasonable for you until you get there. If you're already at that weight, you may want to have some hormonal tests done. There IS hope, lots of it, if you get your body back to where it was when you had normal periods. That is your magic number, friend. To ovulate, you must have normal cycles, and to have children, you must ovulate.

Now, as to the question I posed, I feel this response doesn't completely take into thought what I said.

If I am eating zero carbs and my insulin is normal, great. If I am eating a few dark green vegetable carbs, almost all of which can be deducted of fiber, and my insulin is normal, isn't that more optimal for trying to conceive? The description of this post says zero carb is not for women who are pregnant--why is that? Is it merely a disclaimer? We push and strive toward more information constantly on here, we debate points, and I want to debate this one. I feel women can safely low carb WHILE PREGNANT, as that is what I did and my child is emotionally and physically advanced, lean, and healthy. He's not one of the fat babies you see everywhere, and though people tend to want to pick, I'm glad of it. Anyway, that is not what my question was whatsoever.

So I will repose my question to you, Charles: I read and read and read of zero carbers becoming all the more sensitive to carbs after zero carbing. I do not feel zero carbing is effective for a woman trying to...
Hi Everyone,

I have been reading this thread with much interest. It is really because of AnneMarie that I am here. She post on the 200+ thread about how she was going to go zero carbs and it got me thinking. I have read to about page 34 of the thread. I keep trying to finish however it keeps growing. LOL After about page 15 I was ready to try, so I took the leap this morning. I had my first hamburger mixed with 1oz of natural cheddar cheese. It was pretty good. I am not sure I ate enough. Just have to wait and see how long before I am hungry again. It was only 8oz raw. While I didn't fill full, I also wasn't hungry when I finished, so I will just see if it was enough.

I have some healthy issues to deal with and I am hoping that I will finally be able to get the weight off and correct this issues. I have hypothyroidism, polycystic ovary syndrome, which led to insulin resistance. I am also like Tawn that I retain water easily. I currently take meds for my thyroid, insulin resistance and the water retention. I started out in the Kimkins program, and lost 40 pounds, I then left there and gain 10 pounds back and have been yo-yoing since. I have lots to lose and am finally ready to really buckle down. The zero carb makes so much sense to me. I don't like veggies, and only a few fruits so it really speaks to me. Every other time I have tried to lose weight the first thing I would crave would be fat. Of course it was always on low-fat diet so fats were a no no.

I am really looking forward to learning from everyone. I can't wait to feel and look better.

--

Hey, Christine! If you don't like veggies at least you're half way there. 😊

I've just been posting on here about insulin issues leading to infertility or other endocrine problems. Rest assured that the insulin resistance is what led to the PCOS. Insulin the the culprit of all the ills we face as society as far as I'm concerned. It's just finding the right balance for each of us individually that I think is the challenge. You'll know so much about insulin when you get to the last of this thread you won't believe it. Big hugs to you, girl.

Just remember--EAT WHEN YOU'RE HUNGRY! DO NOT let a hunger pang hit you where you don't eat. Make sure you're eating lots of fatty stuff, k? You'll feel really great. Just please don't go hungry! Have a great Saturday!

onlyabtrfly Wrote:
First of all, I want to make CLEAR that I am well aware of the effects of insulin on fertility. I have personally and physically watched a miracle occur in my very own life to that regard, as I myself have had a child after 5 years of secondary infertility ONLY through low carbing and my understanding of how insulin effects the endocrine system. I regained normal periods after years of irregular or scant periods and no ovulation. I did that through losing down from my heighest weight ever of 346 down to 296 from November of 05 to February of 06, when I found myself 3 weeks pregnant. Literally as soon as 296 hit the scale I conceived. Wendyoh, the thing is, if you know of a time when your periods were regular you MUST shoot for that weight. I would cut your carbs down to what is low as reasonable for you until you get there. If you're already at that weight, you may want to have some hormonal tests done. There IS hope, lots of it, if you get your body back to where it was when you had normal periods. That is your magic number, friend. To ovulate, you must have normal cycles, and to have children, you must ovulate.

Thank you for the insights. Unfortunately, I've never been regular. I got my first period at age 16, my second a year later at 17, and had a few more before I went to college. My OB/GYN at the time did no tests and placed me on the pill, which I took for over 5 years. I stopped the pill 3.5 years ago. I had 4 periods the first year, 1 the second, and now 3 this year. The difference now is that I am 99.99% sure that I'm ovulating now when I do get a period. I can tell by symptoms that it is coming, and the symptoms always show up 2 weeks before the period does.

I have had further testing done. My pituitary is fine. My FSH/LH are fine. I don't have PCOS. I don't really have much weight to lose. I weigh 141 and am 5'7". If there was a "perfect" weight for me that allowed me to consistently get cycles, I'd stay there, even if it meant gaining weight, but that doesn't seem to be the case.

I'm just clinging to the hope that eating VLC will regulate my body, by decreasing insulin and allowing me to eat more calories until satiety, whereas I was always restricting calories eating higher carbs.

---

RE: Zero Carb / Meat and Water - pennypritty1 - 06-21-2008 11:21 AM

Con,

So you started off just low carbing and then weaned to the very low carbing? And can you have eggs, flax and nuts in the very low carbing?

Forgive me--I tend to be too literal for my own good. I was reading Linda Sue's breakdown of the Very Low Carbing way and I thought it was ONLY meat and water. I really think I can do this, and then realized that also meant while I can probably give up my morning coffee (with a splash of halfnhalf and fiberfit), I don't know how I'll stop at least having a cuppa hot lipton tea (also a splash of halfnhalf and fiberfit)...

Reality's rearing but I'm determined. I must make the change. Today's way of high carbing and junk food is really hurting me.

penn

con Wrote:
PENNY,
This is certainly the easiest and cheapest way I've ever eaten. But, it did take a few weeks before I could get down to just meat, eggs, cheese, splenda, flax and nuts.
When it got down to just meat and water I found that I could only eat when I was hungry. That was weird because I could eat SF cheesecake or nuts and cheese when I wasn't particularly hungry. So it does take a little paradigm shift, but the rewards are definitly there.

Just my experience,
con
p.s. I didn't get any Drs. permission or blood tests

**RE: Zero Carb / Meat and Water - pennypritty1 - 06-21-2008 11:29 AM**

LindaSue,

In doing this very low carbing, what would I do about constipation?

TMI? LOL--yes, I believe this IS too much information but certainly one of the more challenging things I certainly experienced with low carbing was the constipation of eating so much meat and fat and very little of the veggies.

With this step, I'm out of veggies altogether--

Any suggestions/recommendations would be greatly appreciated. I've been so literal Atkin's minded when it comes to low carbing, I've not really read any other version... is there an actual book on the very low carbing?

penny

**RE: Zero Carb / Meat and Water - lowcarbscott - 06-21-2008 11:51 AM**

A 1/2 pint of Deans Heavy whipping cream(0 carbs) mixed with some coffee keeps thing moving for me 😊

---

**RE: Zero Carb / Meat and Water - con - 06-21-2008 12:55 PM**

hey Penny what I meant to say,
The Bear said zero carbing was 5 gms of carbs daily since eggs, cheese and spices all have carbs and they add up. That's how I started VLC after reading his site on Active No carbers. I'll look for link. Then I started reading Charles' (the real zero carb plan advocate)posts on Jimmy's Forum. Charles advised getting rid of every carb for best results and since I was only losing 1 or so lbs, per month on 5 gm carb plan, I decided to experiment. But I couldn't immediately give up SF cheesecake and cheese omelets. I just kept trying until I could. what helped the most was eating a huge fatty breakfast. Now the results keep me going. I tell myself things like "just another week or just till I lose 50 more lbs. and then I'll have all the gooey carbs I want." But realistically, when I eat 1-2 lbs of meat and fat at breakfast it tastes wonderful AND I have no desire for those carbs for the rest of the day and don't spend time reading cookbooks 0r watching cooking shows(I used to spend hrs. doing this just like the semi-starvation research participants).

Just do the best you can and do it for your dreams and goals rather than just because some authority figure tells you to. Go as low on carbs as you can to still have optimal health and weight results. IT'S ALL JUST AN EXPERIMENT AND WE ARE THE RESEARCH GUINEA PIGS! (end of speech)
Hi Con,

So you are all meat and water at this point? I'm impressed. If I remember, you are a woman, 62, and losing weight. Do you mind if I ask you how long you've been able to stick with meat and water only and how much weight have you lost? I just want to know for inspiration. Any details will be of interest.

Lauren

LOOOL--you're absolutely right, Con. I am definitely guinea'ing myself going VLC, but I'm a willing guinea. 😊

I just know that I was so much happier when I was low carbing.

Thanks. I'll certainly take your advice and I look forward to that link.

penn

con Wrote:
... IT'S ALL JUST AN EXPERIMENT AND WE ARE THE RESEARCH GUINEA PIGS! (end of speech)

just sayin'........
CON

woooow--a whole half pint? That's a lotta heavy cream... lool

I'll love that! thanks!

lowcarbscott Wrote:
A 1/2 pint of Deans Heavy whipping cream(0 carbs) mixed with some coffee keeps thing moving for me 😊

Charles,
I have a question for you. I had blood work done back in May. My cholesterol was up from 110 to 150 and my doctor of course wants me on a low fat, low carb diet. LOL. That was my PCP. I was waiting for
test result from my thyroid doctor at the time, who was testing my hormones by doing a saliva test. He is a doctor who uses both allopathic and homeopathic methods. Of course my hormone test should that my hormones where out of balance. No big surprise there. He also told because of the imbalance is would cause my cholesterol to go up and he wasn't worried about the rise in my latest test results. I have started taking a natural hormone that is helping with the imbalance. You stated that cholesterol will go up after starting to eat meat/water way and at some point will level off and come back down. Do you know how long that usually takes? I am suppose to go back into my PCP to have my cholesterol rechecked at the end of August. I just started this woe today. Will between now and the end of August be enough time for my cholesterol levels to level off or should I wait a little long before getting rechecked? While my PCP is pretty open to my eating low carb, she is on the low fat train.

RE: Zero Carb / Meat and Water - LindaSue - 06-21-2008 01:39 PM

onlyabtrfly Wrote:
The description of this post says zero carb is not for women who are pregnant--why is that? Is it merely a disclaimer?

I want to clarify that I am not the person who composed the description or disclaimer at the top of this forum. I merely copied and pasted those diet descriptions over from Jimmy's old forum over to this one. If I knew who did write any of the descriptions, I gave them credit, but I had no idea who posted some of them.

Personally, I don't see any reason why a zero carb WOE wouldn't be safe for a pregnant woman but then I'm not an expert. To me it doesn't make sense to go from eating a very healthful low or no carb diet to adding in things such as whole grains, which I know aren't good for anyone. Why would an unhealthful diet suddenly become healthy just because someone is pregnant??? There is no sense to that in my opinion. On the other hand, I don't see how there could be any harm in eating a few more good vegetables and things like cheese during pregnancy. If you can tolerate those foods when you're not pregnant then why not eat them when you are? What I do think would be harmful would be to cut calories, fat and protein while pregnant.

I don't think that Charles is saying that eating zero carb causes you to become more intolerant of carbs. He's saying that our bodies change as we age and it's possible to become more sensitive over time. It's not that eating no carbs has caused this to happen and it might not happen to everyone. You might become more sensitive and aware of how carbs affect you after eating zero carbs for a while even if you aren't any more or less tolerant of them.

AnneMarie, I don't think that your body will freak out if you suddenly start eating a few veggies and dairy.

pennypritty1 Wrote:
Forgive me--I tend to be too literal for my own good. I was reading Linda Sue's breakdown of the Very Low Carbing way and I thought it was ONLY meat and water.

Charles is doing meat and water only but not everyone doing "zero" carbs is that strict. I'm not. There are some days when that's pretty much what I eat but other days I do have some cheese, eggs, condiments and maybe even a small amount of veggies. I'm still experimenting to see what works best for me.
I think that the description of zero carb doesn't have to be as narrow as meat and water only. Dr. Atkins considered anything under 20 carbs (not net carbs) to be biologically zero. I tend to eat a lot less than that most of the time or around 5 carbs per day or less.

pennypritty1 Wrote:
In doing this very low carbing, what would I do about constipation?
For me, cutting out almost all fiber has actually cured my constipation. I eat between 0-5 grams of fiber per day. Fiber plugs me up terribly and makes me very bloated and gassy. Since I've been eating this way for a while now, I'm amazed at how just a small serving of veggies can cause all those symptoms to return if I'm not careful. I try not to eat veggies more than two days in a row unless they're very small servings. I treat vegetables sort of like condiments or flavorings rather than a major part of my meal.

RE: Zero Carb / Meat and Water - con - 06-21-2008 01:48 PM

hi lauren,
i plateaued for many weeks before i started 5 gms. carb induction. when i lowered my carbs to 5 i lost 1 lb. after 4 weeks.
i lost 3 lbs. the 2nd month and gained 2 lbs the third month. quite discouraging!
So i began meat and water ZC the last week of may--so far i've lost 12 lbs. and can't believe it. the 1st week i lost 7 lbs. HOLY cow! the next week i lost 1 lb. and the next 2 weeks 2 lbs. per week. For me that is amazing since i do no exercise and eat whenever i'm hungry.

RE: Zero Carb / Meat and Water - caroline - 06-21-2008 02:01 PM

Hi Everyone!

Boy am I hooked on this thread! I just got back from Los Angeles and I had to read this, (after I ate my burger, of course.) So I have good news for everybody wondering how it's gonna work. It's been about 2 weeks eating this way. I even cut out cream, cheese, etc.

I had a weird coating on my tongue, which I felt was candida die-off, and I started doing the almost zero carb b/c I was aggravated that the tongue thing wasn't any better, and I felt I was still "holding" fluid. Well!!! After cutting out the milk, etc., my tongue looks like 80% better! It's truly amazing. Now that is exciting, b/c the tongue is a reflection of what is going on elsewhere. And this is after a very shofrt time. I hope I haven't grossed anyone out--I felt weird shame about it to begin with, but now every morning I get up, I race into the bathroom to check out the tongue.

As for constipation, Anne Marie asked about this, I was a little worried, b/c I went 8 million times a day on my old crappy diet, but I'm finding that if I don't go one day, that I have to not worry about it, b/c my stomach is flatter than ever. I read this article about how our idea that "healthy" bowels mean going every day is not necessarily true. all I have to do to understand that is remember that on my completely unhealthy diet, I was going all the time. And I think that Charles is right about the water. But I am finding that sometimes I'm thirsty and I drink more. If not, then I don't. It's all kind of an experiment.

On a last note, I also did find as someone on this thread mentioned, that my body is EXTREMELY sensitive to hidden ingredients now or something that doesn't work. It take this as a bonus. When we were in L.A. I took a bite of salad that my sister-in-law made b/c it had bacon bits. Well....that morning I woke up and my eyelids seemed gooey, AND after dinner I had this weird full feeling even though all I had was the chicken. The next day I looked in the fridge and read the ingredients on the bacon bits. voila! Sugar, sugar, and mor sugar and sodium nitrate. It does make a difference!
I also found this for bacon. Everybody on here seems to eat it anyway, but I ate one that was uncured but it has sugar and I was starving the rest of the day. So, I think it is an exciting process and our bodies begin to push all that food away.

I managed to stay away from fruits, cakes, etc. the whole time I was there. And the funny thing was that her whole family started eating a bunch of the meat I got. They were really curious about why I was doing it, and I just explained without being pushy. But I think people can "smell" something good, when you are doing something to help yourself.

Also---my concentration is so much better. I could never sit still when watching a movie before. My memory is great now! Anyway, that's all for now.

Thanks everyone for being so inspiring. I'm sure Charles is thrilled to have all of us on this journey so he's not the only one.

I'm so happy that you are all here!

**RE: Zero Carb / Meat and Water - Miss Christine - 06-21-2008 02:09 PM**

I can't remember who was talking about warming up their water. My brother who teaches gyrotonics and does a lot of Chinese medicine work. We had this very talk not very long ago. He was saying that we are the only country in the world that has cold drinks. Every where else drink their drinks either at room temperature or warm. Most other places don't even have ice.

He told me that drinking a cold drink was really hard on the body. It cause the body to cool off internally and then it has to warm everything up again. For some people they can never get themselves warm again after drinking a cold drink, because their body just can't provide enough heat after warming the organs back up. Then for other of us, it causes our bodies to go in to overload and we make to much heat. IE hot flashes not related to hormones. He suggested that I start drinking my water at room temperature and to see if it would help with my "hot flashes". I did and it did. When I have a diet soda which are few and very far between, I still like to have ice in it, however now I only put enough to make it slightly chilled, not ice cold. The only thing I still drink cold is milk, when I do drink it which as of late I haven't. Just thought I would share that info.

**RE: Zero Carb / Meat and Water - Lauren - 06-21-2008 02:58 PM**

Wow, so that's 12 pounds in a month. That is really great. I'm also happy to know that it works for a woman over 40. I had wondered if ZC was better for men but you've proven otherwise!

By the way, how is your hunger and often do you feel like eating? Do you think that your insulin response is good (not hungry all the time)?
RE: Zero Carb / Meat and Water - onlyabtrfly - 06-21-2008 03:33 PM

LindaSue, thanks so much for your response. I'm kicking back on this wonderful super rainy Saturday reading the original Atkins. My hubby found it in an old library attic a couple of months ago when he was installing a new heat pump. My feeling is that each person has their own "biological zero" and I am determined to find mine. I appreciate you understanding my point. I feel that perhaps I am in a different spot in my life than a few others here and I don't want to seem contrary. I have found in my own experience that the medical field is just as clueless about fertility and low carb's effect as anything else. Because of us actively wanting more children and very soon I just feel I shouldn't cut out all vegetables...but I do feel like I have to find the metabolic zero for me so that I know exactly how much my body will tolerate. Since the net amount will be less than 7-10 I hope it's okay for me to post a little here still! 😊 Nevertheless, at least the next week will be zero as I chart my glucose numbers. That will give me a comparison for a week with very low carb vegetables. Hope no one will want to disown me, I just feel I need to test this for myself for my own journey...but I sure would like to stick around here.

RE: Zero Carb / Meat and Water - con - 06-21-2008 04:33 PM

Lauren
I'm never terribly hungry but i eat breakfast anyway because i found out if i go too long without eating i'm tempted by other people's food if you know what i mean. Sometimes i'm hungry 2 hrs. later (?) and so eat again and then usually i can't eat the rest of the day. If I want to eat dinner i have to eat less at lunch.
I'm wondering why because this doesn't make sense to me. I'm trying different things: like i noticed if i really eat a lot i won't want anything for 24 hrs.
con

RE: Zero Carb / Meat and Water - LindaSue - 06-21-2008 04:37 PM

AnneMarie, no one is going to kick you out over a few veggies. Everyone is welcome to post here.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-21-2008 05:16 PM

Thanks LindaSue! 😊

RE: Zero Carb / Meat and Water - Charles - 06-21-2008 05:20 PM

onlyabtrfly Wrote:
So I will repose my question to you, Charles: I read and read and read of zero carbers becoming all the more sensitive to carbs after zero carbing. I do not feel zero carbing is effective for a woman trying to concieve or pregnant, but ONLY because children do need some dairy, they need a little vegetable, etc. (And I'm not debating that---children need to grow and be healthy and while I certainly don't give my child sugars and starches, he eats every lower carb fruit there is, and all lower carb vegetables) So it only makes sense that a woman who knows the real deal with insulin and carbs ought to still consider that her growing child may need more to develop on than meat. That is what I was saying. So that said, everyone is saying if you go zero carb and then try to eat even low carb veggies, that your body can't handle it. I'm not trying to go there, and that's what I was asking. My question was, if I'm eating zero carb, will my insulin be freaked out should the time come to add in some low carb veggies and maybe a little dairy??
First of all, you must establish the need for dairy and vegetables beyond your mere feelings, as precious as they are! 😍 There is NO need for cow's milk or the slightest amount of vegetable matter. Your baby will get the best nourishment from your milk and your fats as it grows and develops. I did not put on this forum that zero carb is not for pregnant or nursing women. Dr. Atkins said that about his plan, but there are many meat-eating societies around the world who simply do not eat vegetable matter or dairy and they are much healthier as a result.

The things you eat and the damage you do to your own body can very well be passed on to your child as we all know. So too can the sensitivity to insulin and the genetic code that tells its body where and how easily it will store fat. To say that zero carb is not healthy for nursing mothers and children means to say that it's not healthy at all. I don't hold that by any means just as the Inuit, Masai, Samburu or any other meat-eating population didn't.

None of our bodies have a NEED for carbohydrates of any sort and that goes doubly for infants and nursing mothers. You want your baby to get milk, then you provide it. It's so much more healthy than cow's milk.

Quote: 
Quote:

I so wish I could predict that for you but I really can't. I learned of the phenomenon in Gary Taubes' book and many people on this forum have reported just that. Basically, cholesterol is something you should not be worried about in the slightest. There is no evidence linking cholesterol to heart disease and the billions of dollars of studies that have been performed did not involve women. If you haven't read Good Calories/Bad Calories, give it a read before August and discuss it with your doctor. Your LDL is not high at 150 in the slightest and even if it went to 250 in August, I still would not be concerned. The predictive markers are HDL and Triglycerides. Those are the numbers to be concerned with. You want HDL over 40 or 50 and Triglycerides under 150, I believe. Each of these are easily achievable on any low-carb diet on this forum, especially this one.

You can start with this article by one of the best in the world.

Regards,

Charles

My feeling is that each person has their own "biological zero" and I am determined to find mine. I appreciate you understanding my point. I feel that perhaps I am in a different spot in my life than a few others here and I don't want to seem contrary. I have found in my own experience that the medical field is just as clueless about fertility and low carb's effect as anything else. Because of us actively wanting more children and very soon I just feel I shouldn't cut out all vegetables...but I do feel like I have to find the metabolic zero for me so that I know exactly how much my body will tolerate. Since the net amount will be less than 7-10 I hope it's okay for me to post a little here still! 😏 Nevertheless, at least the next week will be zero as I chart my glucose numbers. That will give me a comparison for a week with very low carb vegetables. Hope no one will want to disown me, I just feel I need to test this for myself for my own journey...but I sure would like to stick around here.

I wasn't aware we had a policeman around to "kick people out" who did things differently.....

No, really, it's your decision and we would love to hear about your experiences. As I said, there's no scientific reason for any of us to have carbohydrates at all unless we want them. If you feel you need them, then who would argue with that?

con Wrote:
Lauren
I'm never terribly hungry but i eat breakfast anyway because i found out if i go too long without eating i'm tempted by other people's food if you know what i mean. Sometimes i'm hungry 2 hrs. later (?) and so eat again and then usually i can't eat the rest of the day. If I want to eat dinner i have to eat less at lunch.
I'm wondering why because this doesn't make sense to me. I'm trying different things: like i noticed if i really eat a lot i won't want anything for 24 hrs.
con

Con, the rats in Le Magnen's experiments found this same thing to be true for them. If they ate a lot of food, they didn't eat for long periods of time. If they ate a little food, they ate more often. This is because we live off our long term food supply which is the flow of nutrients that go throughout our bloodstream. The food in your gut only stays for about an hour and a half before it's broken down and added to the stream.

This means that your body is running exactly as it should. You should be able to plan your day precisely in the way that you do. If you know you're going to be away from food for a long time, then you know
you can eat a bunch and know that you won't be hungry later. By the same token, if you know there's a
dinner party and you want to be hungry for it, you know what to do as well.

This is precisely what separates us humans from the lower animals; the fact that we have two food
supplies that complement each other. Insects only have one, their gut. For them, a calorie may be a
calorie, but for us it's not that simple because it's advantageous for us to be able to store fat and live off
it.

Every animal in the kingdom has a long term fuel supply and they are all lean and base their eating
behavior on how their biochemistry functions. They only get fat if they are pregnant, hibernating, or ill.

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-21-2008 06:36 PM

It's not so much the feeling that I need them......I don't know how to describe it. I believe that each
person has their own metabolic zero as Atkins described. I want to find mine. I think a lot of people look
at zero carb, as I've told you before, as a last resort. It sounds extreme to them and so at desperate times
they are more willing to listen to why it might be better for them. Thing is, I didn't feel that way so much
as I wanted to give it a try. See, I haven't eaten "clean" the past year and a half when I've come running
back to low carb. I've eaten cans of nuts because they were only 6 net carbs, more cheese than I care to
say, and eggs because I thought I had to even though I hate them. So, as lots of addictive types do, I
swung from one extreme to the next and I wonder if I have-for myself-been unrealistic. Each time I've
eaten "clean" I've had wonderful results. When I say clean, I mean with green vegetables, but always
less than 10 carbs total in a day. So I feel like that's my "metabolical zero carb". I feel I should have
started out eating clean and seeing how it went. Just because plant matter isn't necessary doesn't mean
it's all bad or that everyone hates vegetables and doesn't want to enjoy a little something for the long
term. Let's face it, I have half my body weight to lose. My personal choice is that if a tiny amount of
veggies don't give me insulin spikes, I'd like the availability to eat them without feeling I've screwed up.
I hope this all makes sense.

Now, as to children...I agree with you wholeheartedly. However, I'm not speaking of children once born,
I am speaking of a fetus as it grows in utero. Now, I realize there are many many peoples out there that
don't have the dizzying array of foods that we do, and those mothers don't eat as we do while pregnant.
But I know what I did before and most of the time during my pregnancy with my son, and I guess I feel
comfortable going back there and not so much staying literally zero carb. Now, with my son who is 19
months old, I avoid a great deal of the garbage people feel they just HAVE to feed their children. I also
know his metabolism isn't screwed up--and I refuse to let it be on my watch. Family gets mad at me
when I don't allow them to give him a fry off their plate if we all go out, or bread, or whatever other junk
they want to offer him. My two year old niece and five year old nephew just a few nights ago were
drinking-get this--adult sized sweet iced tea and Sprite. How stupid are people!!Ugh! Anyway, my point
is, while I won't give him anything but meats, vegetables, and fruits, and water to drink, I'm not going to
refuse him to eat those things (he never eats rice, potato, pasta) because this is the world we live in and I
want to raise him with his appetite whetted for those better choices.

Getting back to me and why I'm thinking like I am...my collapse the other day really frightened me. I
have to say I keep going back to that and wondering if I'm crazy to continue with this. I have never, ever
had anything like that happen to me. I am an old hat at low carbing, and unfortunately my current weight
makes me look dumb and like someone who doesn't understand...but I do. So I know how I usually feel
and I've gone from great the first 3-4 days to feeling like a zombie. My husband is worried about me and
asking me to just go back to what I know with no add ins...and he understands all the points and science
perfectly. With eating only meat, it doesn't matter how much I eat, when, the frequency...none of it. I
continue to feel lethargic and just generally unhappy. I guess the point of all of this is I am determined to
go by Dr. Atkin's points and find out with my glucose meter what FOR ME is metabolically zero and go from there. I'm fascinated with numbers and I want to see my own, and put this point to rest in my head and heart.

I don't think there are any police. I just think sometimes I've read posts that don't seem to agree and it kinda seems like there is a sort of backlash. I don't want to sound negative or contrary because this is in fact the zero carb thread. I just want it clear that I'm not naysaying. I'm just wanting to see what is zero carb to my body.

RE: Zero Carb / Meat and Water

Charles Wrote:
Quote:
The predictive markers are HDL and Triglycerides. Those are the numbers to be concerned with. You want HDL over 40 or 50 and Triglycerides under 150, I believe. Each of these are easily achievable on any low-carb diet on this forum, especially this one.

I've been following this thread for the past three weeks and have been working down towards zero carb. Next week it will be bye-bye, Splenda, coffee, and tea. I may have lost a couple of pounds. I haven't had a burst of energy. But I'm sleeping better, and my morning blood sugar has come down some.

Earlier this year, I did three full months of The Bear. I lost about five pounds, and my fasting BS came down a fair amount. My a1c and my triglycerides both went up.

I'm 59, and I've been low-carbing for six and a half years. Sticking to it hasn't been a problem. I've never craved carbs, never liked sugar much. Just recently I realized sadly that nothing about my health is better since I started low-carb. I lost 40 lbs in the first nine months, stalled for six months, stopped smoking, and the weight came back though I didn't change my way of eating. I weigh now just about exactly what I did when I started LC (278) and what I've weighed for 15 years; my weight has been very stable and very high. I'm still taking just as many BP meds as I was when I started LC. My blood sugar has gradually risen. My lipids have gotten worse. I still have low HDL (I'm impressed if it tests over 40) and my triglycerides have gone higher and higher (about 450) in the last two years. Oh, yeah -- I'm still ovulating regularly, though having only occasional periods; my hormones are at pre-menopausal levels, and my gynecologist says this may well go on **with the occasional possibility of pregnancy** for the rest of my life. So now you know about those old ladies having babies in the Bible!

My fasting blood sugar has been the highest reading of the day since I first tested at home about four years ago. I read that Dawn Phenomenon is unusual with Type 2 diabetes. My post-prandials higher than I'd like but not scary.

My doctor ordered a Glucose Tolerance Test for me in April of last year, preparatory to starting me on meds. I had read that low-carbers should carb up before this test, and I asked her about it, and she said no, she wanted to see what was going with me eating the way I normally do; I said that normally it takes me two or three days to consume 75g of carbs and none of it straight sugar. This made no impression on her. I asked about it at the lab when I made the appointment and again when I went in for the test -- it was definitely a novel idea to them. So I did the test, fasting, a five-year low-carber, and the result was 199, one point shy of a diagnosis of diabetes.
I've never had a diagnosis of diabetes, but I'm taking 2000mg of metformin daily. My fasting sugars have come down some, still about 140 at best, and my A1C is 6.2 or so -- and I have cramps and diarrhea several days a week. The doctor thinks this is control -- I'm not crazy about it. Meanwhile, my triglycerides have gone up and up and up. I took Advicor (statin plus niacin), which didn't affect the triglycerides; I took Lovaza (pharmaceutical fish oil), which made my stomach hurt (stopped the drug because I have a history of bleeding ulcer), and now I'm taking Tricor. I have none of the risk factors for high triglycerides -- I don't eat carbs, I don't drink at all, I don't take HRT. The NP says that if Tricor doesn't work she's going to send me to a lipids specialist who's a cardiologist. Someone else has suggested that I should be tested for Hashimoto's thyroid disease, though -- aside from metabolic syndrome -- I don't have any symptoms of thyroid deficiency.

I also have sleep apnea and use CPAP therapy. The sleep doc says that apnea causes insulin resistance, and Mike Eades says that low-carb cures sleep apnea in a couple of weeks! So far, not so good on either cure.

Some family history -- my father was treated for hypertension from the age of 25, his mother had HPB, my younger sisters (who aren't obese) have HPB. My mother has Type 2 diabetes. Both of my parents got obese at times in their lives. My sisters have also had weight problems at times, but not as severe as mine. My dad putting himself on a diet when I was in high school. He was 40, and I don't know how much he weighed, probably at least 250; he ate one fried round steak and several fried eggs once a day, and that was it. He lost a lot of weight pretty fast and kept it off afterwards.

I looked to low carb to improve my health, and I prefer to eat this way. I feel better without grains. I don't plan to stop low-carbing. If you think I'm lying or don't know what I'm talking about, you can come follow me around and check up on me. 😊

Just as I said to Lauren this past week, I have no problem with Atkins induction for anyone, except myself. If your body can tolerate the carbohydrates that he advises on his plan, then good for you. I don't think there's anything inherently wrong with it at all.

As I've said repeatedly, it takes time to adapt to an all-meat regimen and not everyone can jump right in and get the energy they require from what they eat. I get that, really I do. You and your family have to do what you think is best. You don't have any enemies here or anyone who wants to see you fail. Everyone's trying to work out their version of a healthy diet. The proof is always in the body.

There's no need to justify your choices to any of us here.

Best regards,

Charles
RE: Zero Carb / Meat and Water - onlyabtrfly - 06-21-2008 07:11 PM

Thanks, Charles. That makes me feel so much better. I'm dying to get batteries for my OneTouch so I can post my zero carb numbers and increment of 5 carbs numbers here. You're awesome, you beefy thing you! 😊

Don't worry, I'm not one to call people liars. I believe what you tell me, but understand I'm on a computer in North Carolina and you're somewhere else. I'm not a doctor and I don't believe patients lie about what they eat.

The only thing that worries me in light of your history is that it will be difficult to gauge any progress because of your medications. For instance, if you go down to zero-carbs but you're taking metformin, that's still the same as eating carbohydrates. Yes, I know, they don't raise your blood sugar, but that's only because they bypass insulin since you take them by pill. They increase "insulin sensitivity" and mask diabetes making it appear better but it does nothing for insulin resistance and you will continue to put on weight.

You would need a doctor to help you reduce those medications as you went along to give you a more accurate view of your progress. Without carbohydrates, you should lose more water and your blood pressure should drop rapidly. I would think that blood pressure medication may potentially cause your blood pressure to drop even further than it supposed to so a doctor would want to monitor that.

I'm sure you've considered these things and I won't argue with you but those medicines are out of my league. I'm good at passing on what the research indicates we should do from a dietary perspective but when medications are involved and hormones are out of whack, it's not so simple.

Best regards,

Charles

I'm going to have think about this. I haven't heard it before. I've been taking metformin since last July and haven't had a weight gain in that time.

I've been taking the same BP drugs since before I started LC in 2001. There may have been a slight effect on my BP, but nothing remarkable, and it has been under control for a long time.

Thanks for answering. I'd love to find a doctor who understands low-carb. The docs I see don't give me any grief about LC, so it could be worse.

Sorry, I should have said "you may continue to put on weight", not "you will." There's another user here named Lynnhopes who is also using metformin so the two of you should have an interesting conversation. She's trying to come off of it.

I'm not shocked that you haven't gained any weight, or that you have even stayed the same. I think that metformin would be working directly opposite your efforts. You lost those pounds on the Bear's plan but I wonder how much more you may have lost without the metformin. That's my point.

Zelia Wrote:

It is interesting that your low-carb diet hasn't affected your blood pressure and that even the medications don't seem to affect it. Even when you lost the 5 pounds you should have seen some difference. Generally, losing weight regardless of how you do it affects blood pressure.

Zelia Wrote:

That's good. Well, as I said, it's good to have you and by all means, keep us posted when you get rid of all those things next week. I'm not so sure about coffee anymore. I don't drink it, but it seems that if you can handle it plain with full caffeine and not carbs, it may be harmless!

Regards,

Charles

Probably about as much as I lost before the metformin. My weight will vary as much as five pounds over any three-month period on LC.

LC hasn't affected my BP, losing 40 pounds the first year didn't affect my BP, let alone a five-pound shift recently. I'm not sure which meds you think don't seem to affect it -- I just took it and it's 123/78. I take every class of BP drugs to control my BP, which has gone very high (220-something/160-something) with only one drug.

**RE: Zero Carb / Meat and Water - caroline - 06-21-2008 08:49 PM**

Hi Everyone,

I DON'T KNOW HOW TO PUT PEOPLE'S SENTENCES IN QUOTES AND HAVE THE NAME SHOW UP SO I HAVE TO DO IT THIS WAY!

CHRISTINE: That was me who mentioned the warm water. But what I found is body temp. is perfect. Charles, since your body is so tuned in now, you might find it's "softer" when you drink the water this way. I found it very easy to absorb. It is true that too "hot" can also be draining. The Chinese talk a lot about "chi," and too hot and can be as aggressive as too cold. I migrated toward this way of drinking water, not b/c I suddenly read about it, but b/c when your body starts getting really clean, you can't help but do good things for it. It's like you want to baby it, so you pick what is most mild.

CHARLES: Honestly, I am a diff. person from 3 months ago. When I started this, I was a sugar addict, compulsive eater, emotional eater, etc. Since I went low carb, I haven't cheated, haven't looked back. I never would have thought it possible, but it just was. The same goes for zero carb (ISH). I have no desire to fill my body with the poison that made me feel so rotten. ONly I didn't know I felt rotten till
now that I don't. I look at baked goods, and I just see inefficiency. Why would I eat a zillion grams of sugar, when I could have a lovely meal with none--It would be like paying 70 bucks to fill a tank of gas, when I could fill the tank only paying 30 bucks. I'm not getting ripped off--so I have kind of moved beyond the emotional barrier.

FOR ANYONE: I have definitely found that as Charles mentioned, eggs seem to be a (my words-not his) caloric rip-off for me. They kind of fill me, but not really. Seems like I might as well eat gulps of air.

AS FOR TWO WEEK MINIMUM ON ZERO CARB: Charles is absolutely right about the two weeks. For this period, (and mind you, I had PMS the whole time), I felt oddly tired at times, hungry but not hungry, and sort of grumpy. I wondered if I would just be lethargic forever. But today, at the exact close of my two weeks, after flying on a plane, not getting sleep, having TOM, and broiling hot weather which always makes me feel awful (that's why I live in San Francisco), I walked for two hours in the shaded side (still hot) to a hair appointment. I feel stronger and my appetite is evening out. I didn't notice the diff. at first whether I ate a pound of meat, or a half. But it DOES work itself out. I am a woman, yet I have experienced what Charles has mentioned.

LAUREN: You mention being not part of this thread b/c you're not totally zero carb. Who cares! You have great enthusiasm, and I think you are absolutely right to be trying to find your way. That's the point of this, or we could all just stare at a book, instead of writing to each other.

AND LASTLY, YES CHARLES, I AM THRILLLLLLLED ABOUT THE TONGUE!!!

---

**RE: Zero Carb / Meat and Water** - [Clabbergirl](#) - 06-21-2008 09:00 PM

Zelia, so glad you posted. I saw that you have sleep apnea, and I wanted to make a comment. I also have sleep apnea and have been on a CPAP machine for over 3 years now. All my aunts and uncles on the maternal side of my family have sleep apnea, and I'm fairly certain my mother did before she died, although she never had it checked out. According to my sleep doctor, obesity and diabetes are not always the cause of apnea. It can come down to the shape and consistency of the tissue at the back of the throat and mouth. Three of my 6 aunts/uncles are thin and always have been, yet still maintained the same level of air pressure. I lost 50 lbs at one point on mine, and it made zero difference in my need for a machine.

I haven't read about Eades' idea that lo carb will cure apnea, but I find that hard to believe. I can tell you that in some people, their sleep apnea may be a structural thing (as in my case) - not a diet/weight issue.

I wish you luck in this zero carb endeavor. I've lost 10 lbs in 16 days with no exercise, and while that's great, my skin has also cleared significantly, and I'm feeling much more energetic and "awake". I'm not even to the true zero point yet, but I'm doing fairly well at keeping under the 10 carb/day range. It is certainly worth experimenting with.

---

**RE: Zero Carb / Meat and Water** - [caroline](#) - 06-21-2008 09:13 PM

LINDA SUE: I also think of vegetables, I had some about five days ago-- and it was a miniscule amount--like condiments. You mentioned that it's much easier this time around for you. What changed to make it more doable?

p.s. On the fiber note, 2 weeks ago, I "decided" I needed fiber. HAH! That was the end of that. I had lots
of flax seeds AND a little low glycemic fruit and I was bloated up like a pumpkin. Fiber=Yucky Bloated Stomach and Full feeling for me.

**RE: Zero Carb / Meat and Water - Vesna - 06-22-2008 07:00 AM**

Miss Christine Wrote:

... He was saying that we are the only country in the world that has cold drinks. Every where else drink their drinks either at room temperature or warm. Most other places don't even have ice.

... He told me that drinking a cold drink was really hard on the body. It cause the body to cool off internally and then it has to warm everything up again. For some people they can never get themselves warm again after drinking a cold drink, because their body just can't provide enough heat after warming the organs back up. Then for other of us, it causes our bodies to go in to overload and we make to much heat. IE hot flashes not related to hormones.

I agree with you, Miss C.

I have read recommendations to drink cold water as a weight-loss aid, precisely because it forces your body to do all that extra warming work, thus burning calories.

In other words, abuse your body because it requires energy for your body to recover from the abuse. What a harebrained idea! They might as well recommend banging your arms with a hammer as a weight-loss aid, because it will force your body to do a lot of extra work to heal all the bruises, thus burning calories.

**RE: Zero Carb / Meat and Water - LindaSue - 06-22-2008 08:39 AM**

I had something rather strange occur after going out for dinner last night. I ate a small meal before we went out because I knew we'd be eating late. I wasn't hungry at all by the time we got our food, maybe around 8:30-9:00, and I was stuffed by the time I finished eating it. We went to Carrabba's and I ordered the stuffed chicken breast (there were two of them on the plate) with mushroom sauce along with a Caesar salad and sautéed spinach. I ate half of the salad, half of the spinach and one of the chicken breasts. Well, I woke up sometime during the night feeling like I was starving. I never do that, ever. I did go back to sleep, and was fine without eating anything, but it was an odd experience for me. All I can figure is that eating all those veggie carbs and lean meat caused me to be hungry by eating them so close to bedtime. I've certainly eaten that many carbs in a day in the past but never had the nighttime hunger experience before, maybe because I always ate the carbs much earlier in the day.

Thanks Caroline, that's nice to hear. I do continue to read this thread because along with the Eades thread, it's my favorite.
I've been staying stable with meat, eggs, butter, cheese, coffee, cream and a small green salad with dinner. I finally got rid of the bran crackers thanks to LindaSue setting me straight about the net carb situation in Europe.

I'll be sticking with this and will see how it goes. I love reading about everyone's progress on this board and it gives me hope should I need to take things down to meat and water in the future.

I agree with you about the baked goods. I look at them now as something that is not really food.

I'm glad to hear that your are doing so well!

I did go back to sleep, and was fine without eating anything, but it was an odd experience for me. All I can figure is that eating all those veggie carbs and lean meat caused me to be hungry by eating them so close to bedtime. I've certainly eaten that many carbs in a day in the past but never had the nighttime hunger experience before, maybe because I always ate the carbs much earlier in the day.

Just what was the chicken stuffed with?

I suspect MSG, this happens to me often when I eat out. I some times get hungry about the time I get home although I leave the restaurant stuffed.

Charles Wrote:
The only thing that worries me in light of your history is that it will be difficult to gauge any progress because of your medications. For instance, if you go down to zero-carbs but you're taking metformin, that's still the same as eating carbohydrates. Yes, I know, they don't raise your blood sugar, but that's only because they bypass insulin since you take them by pill. They increase "insulin sensitivity" and mask diabetes making it appear better but it does nothing for insulin resistance and you will continue to put on weight.

Hi Charles -- My understanding was that metformin is considered generally okay with LC and acts by decreasing gluconeogenesis, so I refreshed my memory on this, and I thought you would appreciate this information.

Quote:  
"Dr. Bernstein's Diabetes Solution, Newly Revised and Updated, 2007, p. 239:
"Generally speaking, these agents [e.g., metformin] are natural choices for a type 2 diabetic who despite a low-carbohydrate diet cannot get his weight down or his blood sugars into normal range." My emphasis.

Quote:  
Wikipedia article on metformin
Mechanism of action

The exact mechanism of action of metformin is uncertain, despite its known therapeutic benefits. It appears to act mainly by reducing hepatic gluconeogenesis, but it also decreases absorption of glucose from the gastrointestinal tract and increases insulin sensitivity by increasing peripheral utilization of glucose.[22] Evidence suggests that increased peripheral utilization of glucose may be due to improved insulin binding to insulin receptors since metformin is not effective in patients who no longer have any residual insulin production.[23] The 'average' person with type 2 diabetes has three times the normal rate of gluconeogenesis; metformin treatment reduces this by over one third.[24]

A 2001 study showed that metformin stimulates the hepatic enzyme AMP-activated protein kinase (AMPK), which plays an important role in the metabolism of fats and glucose.[25] The molecular targets with which metformin directly interacts remain elusive.

Metformin is not metabolized, rather it is primarily excreted in the urine with an elimination half-life of 6.2 hours.[26]

Clabbergirl Wrote:
Zelia, so glad you posted. I saw that you have sleep apnea, and I wanted to make a comment. I also have sleep apnea and have been on a CPAP machine for over 3 years now. All my aunts and uncles on the maternal side of my family have sleep apnea, and I'm fairly certain my mother did before she died, although she never had it checked out. According to my sleep doctor, obesity and diabetes are not always the cause of apnea. It can come down to the shape and consistency of the tissue at the back of the throat and mouth. Three of my 6 aunts/uncles are thin and always have been, yet still maintained the same level of air pressure. I lost 50 lbs at one point on mine, and it made zero difference in my need for a machine.
My sleep problems started several years before I got so fat, so I'm pretty sure they weren't caused by obesity.

Quote:
I haven't read about Eades' idea that lo carb will cure apnea, but I find that hard to believe. I can tell you that in some people, their sleep apnea may be a structural thing (as in my case) - not a diet/weight issue. Health & Nutrition by Michael R. Eades, M.D. : "We’ve had multiple patients that were able to get off of their CPAP after a week or two on low-carb."

Quote:
I wish you luck in this zero carb endeavor. I've lost 10 lbs in 16 days with no exercise, and while that's great, my skin has also cleared significantly, and I'm feeling much more energetic and "awake". I'm not even to the true zero point yet, but I'm doing fairly well at keeping under the 10 carb/day range. It is certainly worth experimenting with.

I'm glad you're seeing improvements so fast. Thanks for the good wishes.

LindaSue Wrote:
I had something rather strange occur after going out for dinner last night. I ate a small meal before we went out because I knew we'd be eating late. I wasn't hungry at all by the time we got our food, maybe around 8:30-9:00, and I was stuffed by the time I finished eating it. We went to Carrabba's and I ordered the stuffed chicken breast (there were two of them on the plate) with mushroom sauce along with a Caesar salad and sautéed spinach. I ate half of the salad, half of the spinach and one of the chicken breasts. Well, I woke up sometime during the night feeling like I was starving. I never do that, ever. I did go back to sleep, and was fine without eating anything, but it was an odd experience for me. All I can figure is that eating all those veggie carbs and lean meat caused me to be hungry by eating them so close to bedtime. I've certainly eaten that many carbs in a day in the past but never had the nighttime hunger experience before, maybe because I always ate the carbs much earlier in the day.

Just as a guess, I would say it had more to do with the lean meat and the carbs from the vegetables. If those would have been chicken thighs, I bet the reaction might have been different. Just a guess though.

RE: Zero Carb / Meat and Water - Charles - 06-22-2008 10:19 AM

zelia Wrote:

With all due respect to the good Dr. Bernstein I disagree. The goal of metformin is to increase insulin sensitivity as stated here:

Evidence suggests that increased peripheral utilization of glucose may be due to improved insulin binding to insulin receptors since metformin is not effective in patients who no longer have any residual insulin production.[23] The 'average' person with type 2 diabetes has three times the normal rate of gluconeogenesis; metformin treatment reduces this by over one third.[24]

When investigators measure insulin resistance in humans they do so on a whole-body level which is all the existing technology allows. It's impossible to measure disparities between the responsiveness of fat
and muscle tissue. This is critical because the American Diabetes Association has recommended that diabetics eat a carbohydrate-rich diet based on the notion that this makes them more sensitive to insulin, at least temporarily. This has the effect of ameliorating the diabetes. Bierman and Brunzell first reported this effect in 1971.

What the high-carb diet and metformin both do is that they increase the sensitivity of the fat tissue cells to insulin; however, the muscle cells stay resistant. This is critical because insulin attempts to drive glucose into muscle cells allowing them to be burned for energy. However, when the muscle cells refuse, the glucose gets stored.

Only Ethan Sims of the University of Vermont performed the complicated experiments measuring insulin sensitivity in both fat cells and muscle tissue. He and his staff reported that high-carbohydrate diets had the unique ability to increase insulin sensitivity of fat cells, particularly those that were overstuffed already but they had no similar effect on the muscle tissue.

Quote: Dr. Bernstein's Diabetes Solution, Newly Revised and Updated, 2007, p. 239:
"Generally speaking, these agents [e.g., metformin] are natural choices for a type 2 diabetic who despite a low-carbohydrate diet cannot get his weight down or his blood sugars into normal range." My emphasis.

Sims studies have not been repeated in humans however it has been reproduced and repeatedly confirmed in animals. Taubes called upon the ADA to find out definitively if they can reproduce these findings in humans because this would be immense and would finally prove what most of us already know, that the ADA's recommendation has been wrong for thirty years.

I understand Dr. Bernstein's wanting to help those folks who the low-carbohydrate diet doesn't appear to work for, but I think they need to try eliminating the carbohydrates altogether and working hard to get their insulin under control by conditioning them not to expect glucose at all in their diets. This is the only way for many people.

Thanks. I get what you're saying now. I don't think my fat cells need to be any more sensitive to insulin than they already are. Next question then: is it better to lower blood sugar by taking metformin or to go on with elevated blood sugar without metformin?

I just don't see metformin lowering blood sugar. If your blood sugar is constantly elevated then hyperinsulinemia is the culprit. The only way to control that is to severely limit or remove glucose from your diet.

RE: Zero Carb / Meat and Water - zelia - 06-22-2008 12:16 PM

Charles Wrote:

If metformin increases the insulin sensitivity of fat cells, then it's driving glucose out of the blood stream, right? Doesn't this lower blood sugar?

Thanks for your patience, Charles. I'm not arguing with you; I'm just trying to clear up the muddle of information I've collected.

Drugs.com: "Metformin is an oral diabetes medicine that helps control blood sugar levels."

What Is Metformin And When Is It Used?
Athena Philis-Tsimikas, M.D., Executive Director & Chief Medical Officer, The Whittier Institute for Diabetes – Scripps Health: "One of the best effects of metformin is that in addition to lowering blood sugars, it also can promote just a little bit of weight loss. Not a lot, maybe two to three pounds. But that's in contrast to other medications for diabetes which can actually cause weight gain." My emphasis.

Metformin -- how is it used?: "Metformin hydrochloride is a type of antidiabetic medicine known as a biguanide. It works in a number of ways to decrease the amount of sugar in the blood of people with type 2 diabetes. Firstly, it reduces the amount of sugar produced by cells in the liver. Secondly, it increases the sensitivity of muscle cells to insulin. This enables the cells to remove sugar from the blood more effectively. Finally, it also delays absorption of sugar from the intestines into the bloodstream after eating. Overall, metformin reduces blood sugar levels both between and directly after meals. Metformin is used as a first line treatment of type 2 diabetes, particularly in overweight people, when diet and exercise have failed to control blood sugar levels."

Etc. My fasting blood sugar has come down in the eleven months I've been taking metformin. Maybe I shouldn't attribute that to the drug's action -- ?? Life isn't a controlled experiment. But my triglycerides have gone up and up, and metformin is supposed to reduce them.
LINDA SUE, YOU MENTION THIS:

Quote:
We went to Carrabba's and I ordered the stuffed chicken breast (there were two of them on the plate) with mushroom sauce along with a Caesar salad and sautéed spinach.

Do you think it was the mushroom sauce? Maybe like someone said, there were some not-so-clean ingredients in it (msg, flour, etc) and in addition to the lean meat and vegees, the combo made you hungry.

I was curious about how you were able to be more successful on less carbs now as opposed to when you tried it before. What's different for you this time around?

Wendyoh Wrote:

I've certainly eaten that many carbs in a day in the past but never had the nighttime hunger experience before, maybe because I always ate the carbs much earlier in the day.

Do you think there might have been some extra kind of carb hidden in the sauce/stuffing for the chicken?

The chicken was stuffed with a thin slice of prosciutto and some fontina cheese. There wasn't all that much sauce on top of the chicken but it was made with mushrooms, wine and butter or olive oil. The menu said there was lemon juice in it but I didn't taste any.

zelia Wrote:

They are making these claims because first, they know that insulin's role is to remove blood sugar and if the number is improving, that must mean that metformin is increasing sensitivity in the muscle cells as well. What is happening is that metformin is furthering the fattening process by making the fat cells more receptive to insulin. The glucose is not being moved into the muscles, but more easily into fat tissue which would normally resist such a move especially during exercise.

Zelia Wrote:
Thanks for your patience, Charles. I'm not arguing with you; I'm just trying to clear up the muddle of information I've collected.

It's okay, really. Besides, I love a good argument! 😊

Not a lot, maybe two to three pounds. But that's in contrast to other medications for diabetes which can actually cause weight gain."

It can do this because it bypasses the anticipatory insulin response associated with meals and injects its glucose directly. It used to work on insulin resistance as well as fat sensitivity but that was changed:

Metformin is often prescribed to type 2 diabetes patients in combination with rosiglitazone. This drug actively reduces insulin resistance, complementing the action of the metformin. In 2002, the two drugs were combined into a single product, Avandamet, marketed by GlaxoSmithKline. In 2005, all current stock of Avandamet was seized by the FDA and removed from the market, after inspections showed the factory where it was produced was violating Good Manufacturing Practices. The drug pair continued to be prescribed separately in the absence of Avandamet, which was available again by the end of that year.

Zelia Wrote:

I would more than likely attribute it to the dietary changes you make during the 11 months, not the drug.

This is how we know it doesn't really help with weight because if it did, your triglycerides would go down. Triglycerides are the main components of fat tissue. If your blood sugar went down, then your triglycerides should have went down with it. Normally, dietary glucose is taken up by the liver and it creates glucose phosphate which is used to bind triglycerides. If metformin works to slow down the liver's production of sugar, then that would account for a modest weight loss, but the effect wouldn't last very long.

That would also explain why your triglycerides continue to be high despite your blood sugar going lower.

In the end, it may be something you have to try for yourself. If you're going to go zero carb, then you're going to need gluconogenesis big time and you certainly don't want any drug suppressing your liver's ability to do its job.

**RE: Zero Carb / Meat and Water - LindaSue - 06-22-2008 05:34 PM**

caroline Wrote:

I'm not sure what you mean, Caroline. I never stopped eating low carb and have been eating this way since 2002. I've had ups and downs in the past couple years but nothing drastic.
I found a copycat recipe for Carrabba's Pollo Rosa Maria and the ingredients seem pretty clean to me, if a little high in vegetation:

**Carrabba's Italian Grill Pollo Rosa Maria**

**Chicken:**
4 chicken breasts, split for stuffing  
4 slices prosciutto ham  
1/2 cup Fontina cheese

**Lemon Butter:**
1/2 cup clarified butter  
3 cloves garlic  
1/2 small yellow onion, diced  
1/4 cup white wine  
4 tablespoons unsalted butter  
1/2 teaspoon white pepper  
1/2 teaspoon salt

**Topping:**
8 ounces sliced mushrooms  
1/2 cup fresh sweet basil, chopped  
Lemon Butter Recipe (above)  
1 lemon, juiced

Chicken: Open chicken breasts and place butterfly-style on grill over white-hot coals of live oak and pecan wood.

Grill 3-5 minutes per side or until cooked through. Remove from grill.

When chicken is cool enough to handle, hold breast halves together and stuff each breast with one slice of prosciutto and 1/8 cup Fontina cheese. Secure with wooden picks. Set aside in a warm place.

Lemon Butter and Topping: In a large sauté pan over medium heat, combine clarified butter, garlic, and onion and sauté until tender. Deglaze pan with white wine. Add unsalted butter, salt, and pepper.

Add mushrooms to lemon butter and sauté 1 to 2 minutes or until cooked.

Add basil and lemon juice and stir to combine. Place chicken on a serving platter and top with mushrooms in lemon-basil butter and serve.

Yields 4 servings

---

**RE: Zero Carb / Meat and Water - onlyabtrfly - 06-22-2008 06:21 PM**

LindaSue, that is my husband's all time favorite dish!! Our first visit to Carabba's was soon after we got married so it's kinda special to me. 😊

If I may, I wanted to add that the namesake of this dish is missing in this recipe. Pollo Rosa Maria=Rosemary Chicken. I've made mine many times almost exactly as listed above, but with the addition of a rosemary marinade the night previous to grilling. My marinade is simply fresh crushed
rosemary, olive oil, a squeeze of lemon juice, sea salt, and one grind of cracked black pepper. If you have the time to do that first, then follow the above recipe to the letter, be ready for a beautiful and delicious dinner. YUMMO!

RE: Zero Carb / Meat and Water - Miss Christine - 06-23-2008 04:41 AM

Well I thought I would give everyone an update on how there are going since starting zero carbs on Saturday. While I am not at zero carbs totally I am staying below 10 carbs and working my way down. In two days I have lost 4.2 pounds and I feel great. I slept really well Saturday night, however I must not have gotten enough fat in yesterday because I woke up at 3am this morning starving. I have never had that happen before. So today I am going to make sure I eat more fatty beef. Other than that I feel great. My energy level is up. Even my husband noticed. He said this morning that he can see that I am feeling better. I am so excited because I feel for the first time in a very long time that I will actually be able to get this weight off and keep it off.

RE: Zero Carb / Meat and Water - Wendyoh - 06-23-2008 04:59 AM

That's great Christine! Thanks for the update😊

RE: Zero Carb / Meat and Water - Vesna - 06-23-2008 05:41 AM

Here's my update. On Friday, Saturday and Sunday, my carb gram intake was in the teens rather than the single digits. (Oops.) This morning (Monday) I weigh two pounds more than I did Thursday through Saturday. Could that extra 20 grams -- .0220461 of 2 pounds -- be the reason?
Or (and I don't believe this one, BTW) the fact that I ate about 1800 cals/day for three days rather than about 1500? Three hundred calories is, very rough, about .05 of the 7000 calories in 2 pounds. The much-vaunted calories in calories out theory doesn't explain it, either.

Could it be the fact that I served my homemade cakes to the guests we had Sunday evening? Not a crumb of either cake touched my lips, but I retrieved them from the freezer, handled them, set them out, plated them, talked about them, asked after my guests' enjoyment of them. I was careful not to imagine eating them, trying to avoid tricking my body into thinking it was about to ingest some. Could an insulin response have caused extra fat storage overnight?

Could the universe be that cruel?

Monday morning is always a fresh start time for me. Back to diligent single-digit practice!

The fat will be helpful, but this is more a product of hyperinsulinemia. Your body knows that there is no glucose in your diet and your liver and muscles are not going to give up their glycogen because there is plenty of fat to power your muscles. Therefore, insulin got secreted in the night which woke you up to eat.

That response has to be conditioned. Keep trying to eat at set times and keep the fatty protein coming. You may have eaten enough fatty protein but your insulin just isn't conditioned enough yet.
If you do eat some carbohydrate foods, don't eat them after such an episode. Make sure to make that particular meal a zero carb meal. If you're going to eat some carbohydrates, eat them at a regular set meal where you aren't "starving" so you don't feed your hyperinsulinemia. Have fat and protein with every meal and make sure they are the centerpiece.

Great job on the weight loss and let's keep it going. Keep eating to appetite. Don't get cute once you drop 30 pounds by thinking that now you can cut calories. That's not going to be what gets you there, it will be because your cells are getting their nutrients at the proper rate.

All the best,

Charles

Wendyoh Wrote:
Can you direct to where this book is? Thanks!

You can download it here.

It's not all that long, but it was written by the great Viljamur Stefansson himself and it describes his expeditions with the Inuit and how they subsisted on the all-meat diet of the Inuit.

The second chapter, which is even more valuable, describes the year-long all-meat trial that he and Karsten Anderson performed under the care of some of the best doctors of their day. They were
constantly monitored and they overturned many of the myths that we still deal with today. Needless to say, they emerged in perfect health!

RE: Zero Carb / Meat and Water - Charles - 06-23-2008 06:48 AM

Speaking of that podcast, I would love it if some of you could give me a little help. I'm not a doctor, but I want to make sure this podcast is one of the best and accurately depicts our view of low-carb living. I'm sure I'll get a chance to explain why I don't agree with either Dr. Eades or Anthony Colpo and even why I don't buy hypoglycemia.

Now, Jimmie will ask the questions, but if there are things that you want addressed, by posting here, I'm sure Jimmy will see and we can make sure you get your questions answered. Of course, most of what I will say can probably be found somewhere on this forum, but I would hate for you to come away feeling like we didn't address something you're interested in.

RE: Zero Carb / Meat and Water - Wendyoh - 06-23-2008 06:48 AM

Thank you!

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-23-2008 06:51 AM

hahahahaha, I couldn't help but laugh at Charles' comment to Christine about getting cute at 30 pounds. Poor Christine, everyone on the 200+ thread knows I'm the 30 pound demon. I get all hopped up and freak out. This is too funny!

Wanted to share my glucose readings here for everyone's perusal. Please, everyone and anyone, tell me your thoughts.

I wanted to take my blood sugar to find out how my numbers are running during this lc woe. To guage the difference, I ate lots of carbs last night. I'd say ballpark figure of about 250-300 carbs.

Before I ate my actual dinner but after a couple of crackers I was at 100.
A half hour after eating I was at 135.
An hour later I was at 176, then retested and got 158.
Two hours after eating I was at 123, but screwed up because I took a couple of sips of Sprite right before I tested. I was sooo kicking myself. (Duh, guinea pig)

This morning fasting was 118.
Just now half hour past eating two fried eggs and 4 sausage patties was 123.

I think those carbs really smacked me last night. I felt like total crap after eating last night and still feel like crap today. I'm really freaked out by these numbers because normal is supposed to be between 80-120....But I don't know what's normal after eating and how fast it should drop back down to normal.

****YIKES*****I just realized my strips are expired. (@#)*&^!@!! Great, so now I don't even know if all this pain has been accurate!

I would love for you to address all of the above, especially the hypoglycemia part, b/c before I started measuring my blood sugar, I was convinced I had this. It turns out, I don't. My blood sugar never gets that low, the lowest I've ever seen in 67.

Would you be willing to discuss your understanding of exercise? How it requires more calories, and that you can lift weights and do high intensity cardio on VLC once you are fat adapted?

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-23-2008 07:20 AM

Sugar reading is 114 an hour past eating, so it's coming down...although I'm testing with out of date strips, lol.

In two days I have lost 4.2 pounds and I feel great.
That's super, Christine!

RE: Zero Carb / Meat and Water - caroline - 06-23-2008 07:37 AM

Miss Christine Wrote:
I slept really well Saturday night, however I must not have gotten enough fat in yesterday because I woke up at 3am this morning starving. I have never had that happen before. So today I am going to make sure I eat more fatty beef. Other than that I feel great.

Hi Christine,

I decided to try salmon yesterday, Usually, I'm not too hungry later at night. Salmon was going to be my last meal and then I ended up very hungry just a few hours later. Even though when I ate it, it really filled me up. But then I was hungry 3 hours later. This is unusual b/c my last meal always tides me over, even if it's around 5ish. The fat really does make a difference.

(Hope I figured out the quoting thing.)

onlyabtrfly Wrote:
I think those carbs really smacked me last night. I felt like total crap after eating last night and still feel like crap today. I'm really freaked out by these numbers because normal is supposed to be between 80-120....But I don't know what's normal after eating and how fast it should drop back down to normal.

AnnMarie, It's great when you see the results of going back to carbs. It's the best deterrent. Every time I eat a little too late and am starving, or do something that isn't working, I can see the results and it helps.

Charles Wrote:
Speaking of that podcast, I would love it if some of you could give me a little help. I'm not a doctor, but I want to make sure this podcast is one of the best and accurately depicts our view of low-carb living. I'm sure I'll get a chance to explain why I don't agree with either Dr. Eades or Anthony Colpo and even why I don't buy hypoglycemia.[quote]

Charles, that's so exciting that you are doing a podcast. I think one area of importance is addressing people's anxiety about "how long it takes" for the zero carb, or very low carb to "work." I think people aren't sure why they are still feeling bad after a period of time, and this discourages many from continuing.

You're probably going to talk about that anyway, but that was something I noticed that seems to be a deterrent for many and a source of doubt for sticking with the very low carb or zero carb plan.

The other thing is also that people can make doing as low-carb as possible a goal. It doesn't NOT count if you eat a little eggs, flax, etc. I think it's all good. Anything that moves people closer to health.
Good luck! You have been very inspirational to so many of us!!!!!

That's a very good point. I understand that people want weight to come off quick, but obesity is not a disease in and of itself. Obesity is only a symptom so we have to work to correct the real problem and by doing so we improve the side effect. Good point.

Caroline Wrote:

That's a very good point. Many people on this zero-carb forum think that if they don't do only meat and water that it's somehow invalid. Keeping carbohydrates below 20 grams is an amazingly effective way to do it, in my opinion. Honestly! Hyperinsulinemia is the thing that needs attention and perhaps we need an article on the "Thin man's hyperinsulinemia." Even if you're thin, but your insulin is out of whack, it must be controlled. The damage starts before insulin resistance and it starts before obesity and high blood sugar. These things are all side effects.

Okay, the quote marks work like this:

{quote=Name}all the stuff the person said....{/quote}

Note the way the beginning and the close quotes look.

You can also highlight a paragraph and use the "quote" tool. It will put the marks in for you. If you want it to say "Charles said, then you'll have to change {quote} to {quote=Charles}.

Hope this helps,

Charles

RE: Zero Carb / Meat and Water - Miss Christine - 06-23-2008 08:27 AM

Charles,
Let me see if I understand this correctly. I might have gotten enough fat yesterday, it was just my body is trying to get me to eat some carbs because it had used all the insulin up during the night? Please forgive my slowness however I want to make sure I understand so I don't eat something and make the problem worse. So at some point in time my body will get use to this and it will go away. Correct? Until then I just need to make sure my next meal is a high fat and protein one, and no carbs. Correct? At some point my body will start using the insulin that is the fat cells right? I just have to get to that point?
I didn't get up and eat anything. I finally was able to fall back to sleep and slept until 6am when I got up to get my husband off to work. By then I wasn't hungry and didn't eat until 8am when I was hungry. I ate one 6 oz hamburger with 1oz shredded cheddar cheese mixed in. I ate the whole thing however I had a hard time getting the last couple bites down. It is now 11:15 and I am hungry again. I was thinking of having some tuna with mayo.

I have found over the last couple days that I ate until full, however I can only go about 3-4 hours before I feel hungry again. I know you said you can go 5-6. Was this right off or did you work up to it?

Good luck with your podcast. When are you doing it and when will it be on?

---

**RE: Zero Carb / Meat and Water** - onlyabtrfly - 06-23-2008 08:50 AM

I was one of those people that thought if I ate 10 carbs or so what I was doing wasn't valid. Thanks for the extra nod of support, Charles.

I was also one of the people willing to give up because I was feeling so bad and didn't see why it wouldn't let up. Thanks to some long emails back and forth I now feel I know what the culprit was and is and will continue to be until I really wield some control over my hyperinsulinemia. (Thanks Christine-xo) Checking my blood sugar today and last night have really made things iron clad and concrete......and crystal clear as to why I MUST continue with as little carbs as possible for me. Since I figured I had to get rid of my outdated test strips anyway, I tested before I made the kid's lunch. My sugar was back up and I hadn't eaten a thing-but I had thought out and gotten out the kid's food for today. I just retested now that they are down for their nap and it's falling again. This proves, if nothing else, that the mere thought and action of dealing with food is enough to raise blood sugar. Amazing.

I don't know if any of you have any religious beliefs or not, but I do have a very strong faith in what I personally believe and something hit me just now that I thought was kinda interesting so I thought I would share-hope you won't mind. Have you ever heard "the devil is in the details"? I was sitting here thinking what a horrible opponent insulin truly is and I couldn't help but think of 1 Peter 5:8 which says: Be sober, be vigilant; because your adversary the devil, as a roaring lion, walketh about, seeking whom he may devour. How true is that of insulin? Food for thought at least for me, in that light, no pun intended. 😃

I totally agree. We are now living in an age of what once use to be thought of as bad is now thought of as right. While what was right is now wrong. If we look back at history we see that people ate more meat than anything else. While yes they had some veggies, it wasn't much. Sweets were around however they were limited to very special occasions. Not everyday like it is now. The main stay for most people a meat/potato type meal. Heavy on the meat.

While the mere thought about food can invoke an insulin response, there is also the Dawn phenomenon where your blood sugar is higher in the morning that when you went to bed at night that could account for the higher BG and then the lower BG sometime later. A cephalic response to food is going to increase insulin and not BG.

RE: Zero Carb / Meat and Water - Miss Christine - 06-23-2008 09:05 AM

Mac,
You used a word that I don't know. What does cephalic mean?

As I was pondering this, my thought was: is insulin the "devil" or is our adversary us who eat or they who "manufacture" the refined carbs/frankenfoods that make us so unhealthy??? Insulin acts as a protector trying to get rid of that poison as quickly as possible. It quiets down as we quit poisoning ourselves. IMHO

con

RE: Zero Carb / Meat and Water - onlyabtrfly - 06-23-2008 09:14 AM

Interesting Mac.

Well with that, why would my glucose come down, then rise without me eating anything? I've been monitoring it every hour or so just to see what was happening. It was on a steady decline after breakfast, only to shoot back up without me eating. What IS that?

RE: Zero Carb / Meat and Water - Lauren - 06-23-2008 09:15 AM

Charles Wrote:

This has been the most important idea for me. Getting the focus off calorie counting and weight loss and onto dealing with hyperinsulinemia has been a huge shift.

I chuckle at your "getting cute" comment because that is what I always do. I start to feel good and then I shift into diet mode. It has been a lot harder to let that go than I realized.

I've benefitted from the fatty meat and lowest carbs possible advice and can't hear it enough. I am an extremest and have felt that failure about not being able to eat just meat and water. Now that I'm getting some perspective, I'm settling in to this way of eating more comfortably.

I have been noticing diminished hunger lately. Some days I'm still very hungry and others, a regular meal keeps me going for hours. I'm hoping that this means that my insulin is starting to come under control.

The other thing is that I stopped weighing myself. As long as my clothes fit, I'm okay. I am too weight obsessed and I forget too easily that this about overall health and that all I need to do is eat fat and protein when hungry and the rest will work itself out.

Charles, I always like the way that you talk about how we don't have control over bodily functions like appetite. It's almost like we need to learn to follow the natural cues rather than trying to micromanage calories and grams of this and that. Anything you say about that holistic approach is a big help in making that mental shift away from the diet mentality.

---

**RE: Zero Carb / Meat and Water** - [onlyabtrfly](mailto:onlyabtrfly) - 06-23-2008 09:17 AM

Con, I wasn't making insulin the devil, just thought it was funny how I was thinking of insulin (in it's excess) as a bully and that reference came to mind.
No, what's evil is the whole world out there that trumps low carb as foolishness while it pushes frankenfoods and high fructose corn syrup at us and our children. Insulin, as you said, is needful before we make it run amock.

Miss Christine Wrote:
Charles,
Let me see if I understand this correctly. I might have gotten enough fat yesterday, it was just my body is trying to get me to eat some carbs because it had used all the insulin up during the night?

Right, but not because "it used all the insulin." Your body thought there was a possibility you would be eating in the middle of the night.

Insulin prompts us to eat.

Ms. Christine Wrote:
So at some point in time my body will get use to this and it will go away. Correct?

Your body will get used to the idea that very little or no glucose will be coming from the diet. Therefore, it doesn't have to excrete so much insulin before you eat to cover the glucose it used to get.
Ms. Christine Wrote:
Until then I just need to make sure my next meal is a high fat and protein one, and no carbs. Correct?

If you're eating zero-carb, this is not a problem. If you are eating between 0 and 20 carbs, then you should not eat those carbs when you're "starving." Eat them when you're a little hungry but not so much.

Ms. Christine Wrote:
At some point my body will start using the insulin that is the fat cells right? I just have to get to that point?

No. Your body will secrete less insulin which will allow your body to mobilize more fatty acids. This is what will shrink your fat tissue.

Ms. Christine Wrote:
I didn't get up and eat anything. I finally was able to fall back to sleep and slept until 6am when I got up to get my husband off to work. By then I wasn't hungry and didn't eat until 8am when I was hungry. I ate one 6 oz hamburger with 1oz shredded cheddar cheese mixed in. I ate the whole thing however I had a hard time getting the last couple bites down. It is now 11:15 and I am hungry again. I was thinking of having some tuna with mayo.

That's good. I'm not a fan of mayo because soy is bad news. I would much rather have you eat another hamburger, but that's okay if that's all you want.

Ms. Christine Wrote:
I have found over the last couple days that I ate until full, however I can only go about 3-4 hours before I feel hungry again. I know you said you can go 5-6. Was this right off or did you work up to it?

It was for every meal except for breakfast. I ate three eggs and some sausage or meat. Breakfast only lasted two or three hours so I eventually changed to fatty ground beef so I could get the same benefit as I did with my other meals. If I ate tuna and mayo I would be hungry in about two hours probably, depending on how much I ate. I would have to eat a lot of it to go five or six hours.

Ms. Christine Wrote:
Good luck with your podcast. When are you doing it and when will it be on?

Thanks. I'm going to do it tomorrow but I don't know when it will air!

Regards,

Charles

Way to go, Travis! Don't wait until August to start training for that triathlon though. I would encourage you to check out the exercise forum as we've been discussing interval training. Working out on a proper diet causes us to make certain changes to our training and without trying them out, you could set yourself up for disappointment.

You can certainly repeat your best performances and even exceed them but there is a way you have to go about it.

Regards,
Charles

RE: Zero Carb / Meat and Water - onlyabrtry - 06-23-2008 11:11 AM

So I've been reading about Dawn Phenomenon the past hour or so, and I'm very excited at what I'm finding. It makes a lot of sense, and if you get through all the mumbo jumbo it makes for a good concept that directly correlates with what we've been talking about in this thread.

First, most people who experience dawn phenomenon have a dump of glucose between 3 and 6 am. That is precisely when I wake each morning, and reminds me of several of Charles' comments regarding spurts of insulin causing the body to stir and look for food, etc. Second, the biggest recommendation I can find to avoid it is to eat a high fat and protein snack before bed. Again, this lines up with our discussions here. Lastly, it is said to be reversible if one makes a steady habit of eating a high fat and protein breakfast upon rising at the same time each morning. This eventually tells the insulin/glucose barrage to stop happening because it's not needed. Well we know as low carbers that this rule of thumb applies to eating in general to reduce the ill effects of insulin on our bodies.

I just had to share because I feel it's awesome to read several different medical texts and find, under all the carb nonsense, what Charles and others here have been saying all through this thread. You go, team! I'm so glad to be in on such an awesome, educated, helpful group!

If anyone has anything to add, please do-or if I've not completely grasped this as I ought, I'm glad to be given further information. I'm excited by the fact that I have a clear definition of why I cannot sleep through the night, and even better, a perfect plan for beating it. 😊
By the way, my glucose reading just now was 88. It's getting more normal as the day goes on just as Mac mentioned it might.

Thanks for the link. I found this quote extremely interesting: "Everyone, diabetic or not, exhibits some Dawn Phenomenon. It is a natural part of our bodies' circadian rhythms. Some have said it is the way our ancestors had the strength to rise and slay a wooly behemoth for breakfast."

I wonder what the rise is for someone who is normal. Mine goes up about 10 mg/dl between the time I wake up and when I eat breakfast. It usually does not go up between when I go to bed and when I just wake up.

**caroline**  - 06-23-2008 12:28 PM

Hi Linda Sue,

I can't remember where I read it, but I remembered you mentioning that when you went very low carb-close to zero-that it was challenging and that it has been easier recently.

I was aware that you were doing low-carb all along--I was just curious about your most recent experience with going closer to zero carb. It's always interesting to hear what changes for people...

---

**RE: Zero Carb / Meat and Water**  
**caroline**  - 06-23-2008 01:03 PM

Linda Sue,

I hope you weren't offended by my question. I wasn't implying that you weren't doing low carb at any time. It was more the evolution of how being able to exist on less carbs has occured. You are so helpful and welcoming with suggestions, recipes, and offering your experience to people on the forum. That's why I felt comfortable asking you.

I've learned so much from reading what everyone here writes about!

Thanks,

Caroline

I haven't really had any difficulty eating zero or nearly zero carbs. I enjoy eating this way. I did find that I had some problems when I ate until "Thanksgiving full" as Charles suggested because it was causing me to feel ill due to acid reflux. Eating more small meals has helped a lot with that. I do fine if I eat until satisfied but not overly full. For example, a half pound hamburger is enough to cause me discomfort if eaten in the evening but a quarter-pounder is fine and satisfies my hunger. If I eat a half pound burger for breakfast or lunch, it doesn't bother me so much. I still eat the whole burger in a day but I usually split it into two smaller meals instead of one large one. That way I've got something to eat about every 2-4 hours instead of struggling to wait 5 or 6 hours and putting up with the hunger.

I'm still having trouble getting back to my goal weight but I haven't determined what the problem is yet. I don't even know what I weigh right now because I haven't weighed myself in a couple weeks. I weighed 125.5 on June 4th (my last weigh-in), which is about 8 pounds above my old maintenance weight. I'll probably weigh in later this week. I don't feel like I've gained any weight but I'm not sure if I've lost any either. We shall see.

I've been eating mostly meat, a small amount of cheese, eggs every 2-3 days and veggies very sparingly. I overindulged in veggies Saturday night when we went out to eat and I was bloated and gassy all day yesterday as a result. I want to wait until those carbs have worked their way through my system before I weigh in.

I wasn't offended by your questions. Feel free to ask me anything.

RE: Zero Carb / Meat and Water - Ell.eee - 06-23-2008 06:38 PM

Hi everybody. Can another zero carb newbie join the group? I've been low carbing for 5 years since my Dr told me I was "prediabetic" and recommended I start on Metformin. I researched a bit and choose a low carb diet instead and I've done well while my brother and sister have both put on weight and are now Type 2 diabetics. Now I'm having symptoms of sweating and shaking after meals, constant hunger, and just feeling lousy. Clearly something is out of whack metabolically so I'm going to see if zero carb will help. I don't want to lose any weight - I'm 5'4, 55yrs old and weigh 105. I jog 3 miles 4 days a week. Is zero carb appropriate for maintaining weight and just trying to keep glucose levels low to prevent diabetes? Or is this hyperinsulism? Can a thin person have hyperinsulinism Charles or was that a tongue in cheek phrase in your post? Anyway my plan is to gradually take my current 30gms of carbs down to less than 10 and then zero so long as I don't start losing weight (I actually have a hard time maintaining). I'm enjoying this thread and everyone's experiences and hoping to have sucess with zero carb. By the way I'm a big Gary Taubes fan and just finished the book for the second time and will have to read it over and over to take it all in! One more question - is there a way to skip to the last unread post on the forum or do I have to remember where I left off each time - sorry I'm a computer dunce.

Given your symptoms I would search this forum for hypoglycemia or check out Jimmy's blog about his experience with reactive hypoglycemia for those long time low carbers who have lost a lot of weight to see if your experience matches.

Welcome to the forums, Ell.eee. There should be a little arrow just to the left of the subject line of threads with new posts since your last visit. Click that arrow and it will take you to the first unread post in that thread. However, there seems to be a problem with the forum that sometimes, but not always, causes messages to be marked read after a certain amount of time and for various other reasons. Most of the time I have to go by the date and time to know for sure if I've read something or not.

Well, I certainly use it to maintain my weight! You don't keep losing forever, you just get to what your body believes to be your optimal weight and believe me, you stay there unless you decide to go the starvation route, but then of course, once you begin eating properly you will go right back to that number. I hover around 156. On Sunday, I might be 155 and by Friday I might be 158 or 159, but then the very next day, I'll drop three pounds. Just eat properly and let your body handle your weight.

There is no healthy way to "maintain" your weight consciously. Weight is like body temperature and blood pressure. It's best left to the experts, your hormones!

Ell.ee Wrote:
Or is this hyperinsulinism? Can a thin person have hyperinsulinism Charles or was that a tongue in cheek phrase in your post?
No, I was serious. There are many thin people who get hungry in between meals, during the night and at all times during the day. When I was on my low-fat diet, I dreamed about food all day. I was always hungry. Hyperinsulinemia starts long before you get fat. In fact, you may not get fat so you're at a disadvantage because you don't even know there is a problem.

Ell.ee Wrote:
Anyway my plan is to gradually take my current 30gms of carbs down to less than 10 and then zero so long as I don't start losing weight (I actually have a hard time maintaining).

Just drop your carb level down a bit and see if your symptoms improve. I don't buy reactive hypoglycemia at all, which you probably know, so I think your idea is sound. Although, if you're having these symptoms now, I'm not so sure I would take them down too dramatically at one time. If you're at 30, go to 20 for a week or two and see what happens.

By the way, what are you eating when you get these shakes?

Is it every meal or just after certain foods?

Best regards and welcome,

Charles

RE: Zero Carb / Meat and Water - Ell.ee - 06-24-2008 04:57 PM

Quote:
Given your symptoms I would search this forum for hypoglycemia or check out Jimmy's blog about his experience with reactive hypoglycemia for those long time low carbers who have lost a lot of weight to see if your experience matches.

Thanks Mac! I have been following those posts, but if there is reactive hypoglycemia I think it is a symptom of hyperinsulinism not the primary problem, but I did watch that podcast and read some of Jimmy's blog - very interesting.

Thanks for the navigation tip Linda - I still haven't quite figured it out, but at least I'm finding my way!

Quote:

Thanks for the reply Charles. I eat by Dr Burnstein's 6-12-12 carb diet (6 at breakfast usually 3 cups coffee, 1 egg, 1 scoop protein powder, and 1 fatty meat, 12 at lunch, but I only eat 6 usually meat and cheese roll up, and 12 at dinner meat, salad veggies, and homemade yogurt for dessert). I also have an evening snack nuts or cheese. About 1600-1800 cals 65% fat, 30% protein, 5% carb. I also take a multivit/mineral and a fiber supplement in 12 oz water twice a day. I get slightly dizzy and shaky about
1/2 hour after all meals and snacks and it lasts about an hour to an hour and 1/2. I feel hungry even if my stomach is completely full but if I wait it out and don't eat more I'm fine until I eat again. Sure sounds like hyperinsulinism to me and I feel kinda sad that 5 years of low carb hasn't stopped this although I know my hereditary is very strong for diabetes.

This week I added 1/4 cup of coconut oil to breakfast and although I was shakey after breakfast I didn't get hungry until 4pm every day so I just waited until dinner which we eat at 5:30 when my DH gets home. Great to only have the reaction three times instead of 4. Think its OK to go down to two meals if I'm not hungry? I have been eating much more at dinner time - like 3 1/2 lb burgers instead of 2. Also cut down to 20 carbs today, and trying to emphasize fats. We'll see if it helps because I don't want any metformin and don't see any type 2 treatments that really look good out there so I think this is the best plan. The good news is I love fatty meat and protein. Sorry for the long post but I'd be happy for any thoughts and opinions you all may have to share and I'm glad to be somewhere where I won't be yelled at to increase my vegetables and "climb the carb ladder". I'm pretty sure zero carb may be the best treatment (as well as preventative) for type 2, but there doesn't seem to be any info out there on those lines - no money in it for the drug companies.

I agree. I find the suggestion that you could be low on blood sugar to be laughable. People should understand that insulin's job is to move blood sugar into cells which would reduce the serum blood sugar. However, because cells are resistant, it takes more and more insulin to perform the same task. You keep secreting all day because insulin doesn't want to be caught "unawares" as it were. You're all over it.

The shakiness comes in because each time you secrete, you get the nutrient "clear out" that mimicks hypoglycemia and your cells are primed to burn glucose. The problem is, there's not much glucose in your diet and your liver and muscles refuse to give up their glycogen because your insulin levels are high. This will take some time but it will improve if you remain steadfast.

Yes, that would be perfectly fine. Just eat when you're hungry, whenever and how ever often that is.

Oh please! 😊 I'm the king of long posts. It's great to have you with us and hopefully this will turn out to be the missing link for you. The fact that you love fatty meat gives you a leg up! I won't pick on you about the protein powder, fiber supplement, multivitamin or yogurt yet because you're new. Are you drinking water?

Actually, you'll have to describe the homemade yogurt because if you're making it yourself, you're in charge of what goes in it so that might work out okay. The bottom line is that if you get your insulin under control and you're losing weight, then all those things can stay. The fiber supplement is questionable but if you're "going" okay, then what's to argue about, right?

Regards,

Charles

**RE: Zero Carb / Meat and Water** - Miss Christine - 06-25-2008 04:45 AM

Okay Charles,

I have a question for you. My family does raw dairy. I make kefir and yogurt from the raw milk. I also mill my own wheat and make homemade whole wheat bread. My bread is simply whole wheat flour freshly milled, honey, oil, egg and yeast. While I know that the bread is out of the question while I am trying to lose weight. What are your thoughts about the kefir, yogurt and raw milk. I love smoothies. I make them with raw milk, kefir, smoothie, honey, frozen berries, and coconut oil. I haven't been doing any dairy except cheese since I started this. Could I add my smoothies back? With out any real problems? Maybe just once a week or so? I do miss my milk.

---

**RE: Zero Carb / Meat and Water** - LindaSue - 06-25-2008 06:35 AM

Miss Christine Wrote:

Only you can determine if they will cause any problems or not. It depends on whether or not your body can handle that much dairy and that many carbs. Have a smoothie and see how it affects you and go from there. Smoothies tend to be quite high in carbs for a relatively small serving so be careful.

In regard to you missing milk, I don't want to sound mean but there are high carb foods that I miss too. I know that I can't handle them any longer so I've had to learn to be happy with the foods that I can eat. I don't find that to be a hardship though because low carb food is so darn tasty. Rather than using milk, perhaps you could dilute some heavy cream with water for your smoothies. It would cut the carbs, add some fat and give them a richer taste too.

**RE: Zero Carb / Meat and Water** - zelia - 06-25-2008 09:23 AM

Charles Wrote:

I just don't see metformin lowering blood sugar. If your blood sugar is constantly elevated then hyperinsulinemia is the culprit. The only way to control that is to severely limit or remove glucose from your diet.

I did a little experiment yesterday. Well, actually, starting Monday night, I skipped my evening dose of metformin and then I skipped my morning dose yesterday, while staying zero carb all day. Yes, it's
lowering my blood sugar by 40-50 mg/dL.
(Note: I'm at the Impaired Glucose Tolerance stage, and, even without metformin, my numbers are within the range considered "in control" by the current standard of treatment.)

I can't argue with LindaSue on this one, it's true. Treat it like the Atkins diet. Get yourself to a base level of losing weight first. For instance, if you are currently losing 3 pounds a week for four straight weeks, then maybe add one of those things for one meal each day for a week. Then see how your weight loss is affected after a week. If you continue to lose weight, the new food can stay. If you stop losing or slow down unacceptably, then the new food has to go.

In light of this and Vesna's questions to me, I want to say that **everyone does not have to go zero-carb to be healthy**. I think that 20 grams of carbohydrates is a great starting place if a particular low-carb plan is not working. If you can lose weight consistently with 20 grams of carbs, you're doing fine. If you can't then you should drop those carbs down to 15 or 10. If you still aren't losing, drop them further until you do.

I don't want to create a new definition called "metabolic zero" or something like that but it's true that at 20 grams or less, most people are experiencing maximum fatty acid mobilization which is what we're after.

The immediate jump to zero carb is great if you can do it and if you have severe hyperinsulinemia, such that you can't go at least 4 hours between feedings and you can't sleep through the night and your hunger is not controlled. These are fabulous reasons to go zero-carb.

Having said that, I realize that everyone will not take to such a regimen nor will they give it sufficient time to work. Stefansson identified six months as the time before you stop craving vegetable matter and he's probably right.

Even I enjoy some sweet every now and a long then. I used to have cheese cake after a half-marathon from time to time, but cheese and I have parted ways. On Father's Day, I actually had some Mousse and didn't gain any weight that week. Therefore, I had my wife buy some of the homemade ingredients to make it at home.

She went to Whole Foods and got some Heavy Cream that was just heavy cream. Sometimes in the store they have heavy cream that has dextrose and other undesireables in it, so you have to make sure you get farm fresh or some good stuff from the specialty store.

I got some 85% Cacao unsweetened chocolate (0 grams of sugar) and used only a tablespoon (maybe less) of sugar. It was more than sweet enough for me and again, I didn't gain weight.
I don't know how often she'll make this mousse but at least if I have to have something, that might be an option. I also found that I could have 70% Cacao chocolate by Lindt. It has 5g per serving but the taste is so intense, I can't eat a serving. One serving is 4 pieces and I can take 1 piece and I'm more than good. It has 10 grams of saturated fat per serving and that may be why I responded so well to it.

My point is, I define zero carb as what you do the majority of the time. I go weeks with just meat and water and then every now and then I'll try something like a desert, or saucy meat or whatever. The very next meal I get back to work. Nothing is ever an all-or-nothing proposition.

Understand that I'm very picky though. I will stand in the store for hours examining the label of foods and often leave with nothing. I stared at chocolate for an hour in Wal-Mart trying to find the one with the purest ingredients and the least amount of sugar.

The key is establishing control over your weight, your body, and your diet. With zero-carb, if you can stick with it, you can achieve control in all these areas.

Charles

That's great. Did you notice any other symptoms? When you're getting your insulin under control you may have some periods where things get a bit shaky, but you can probably alleviate that by making sure you have food prepared and that you eat when hungry. Don't put off eating when you know you're hungry.

I'm looking forward to some great reports from you!!!

You only got maybe 12g of carbs in a tablespoon. 4 g per teaspoon. 3 teaspoons per tablespoon. 😐

If you had a Trader Joe's you could get a 17 oz. 71% Cacao bar for $3.99. Don't remember how many grams of sugar are in a serving since I stopped buying these eons ago.

TJ's also sells a package of 100 calorie 70% Cacao bars individually wrapped. My wife buys these and it's been a long time since I had one.
It is truly amazing how your sweet tooth wains on low carb after awhile. I walked away from 5 tables fully loaded with every imagineable desert on my recent cruise that they put out for one of the lunches. Something I would never have done in the old days.

RE: Zero Carb / Meat and Water - Charles - 06-25-2008 10:37 AM

MAC Wrote:

I used to absolutely hate dark chocolate. I was a milk chocolate afficionado. The 70% tastes so sweet to me I can only handle 1/4 of a serving.

RE: Zero Carb / Meat and Water - Mel - 06-25-2008 11:54 AM

I may have found a clue as to why so much insulin is secreted at meals even though they are low carb. The web page of Dave Dixon "The Spark of Reason" has a suggested reading list posted and I went looking around. In a paper of the Royal society called "Pancreatic signals control..." in section 5.(a) is the statement "Basal, prandial and stimulated insulin levels are all direct functions of the amount of white adipose tissue in the body, leaner individuals having lower levels and more obese individuals having higher levels." Could it be that I have to be lean first before I can be free of the too much insulin shakes?

There is lots more in the paper that I'm trying to wrap my mind around because like others of you, I still need to drop more pounds, I'm sort of stalled, and when I try to VLC or ZC I have big problems with the hyperinsulin shakes.

I've been experimenting with the "2 gram cure" recommended at Jenny's Low Carb Facts. This morning I started going into the fog while I made breakfast for everyone so I ate 2 gms of Sweeties (it really was hard and a leap of faith to put candy in my mouth) and then had a sausage breakfast about 15 minutes later. Well, I burst into energy and vacuumed and mopped the floors for 2 hours. Not my usual morning. I'll keep experimenting.

I don't think you have to be lean, Mel, but I'm sure you have to correct the metabolic issue first. I'm lean now but I am still very much aware of hunger pangs just like anyone else. I felt like the insulin issue was curbed as I was losing, not when I finished. There are many lean people in my office who have some serious cravings every couple of hours. The smell of chocolate chip cookies permeates our office every afternoon even though these people just ate lunch two hours ago.

Every day at noon, my stomach will growl a little because I smell the food of others as they walk near my office with their lunches. I don't usually eat until 1 or 2 and I'm not really hungry at this time, yet I still feel it. However, if I'm not at work, I don't get hungry at 12:00. This is why I argue that it's more a matter of conditioning than anything else.

Mel Wrote:

I don't argue that larger people have more circulating insulin than leaner people but I'm just not so sure about the frequency of secretions which I think is more related to conditioning.

This may help the symptoms but it only furthers the fattening process just like metformin masks the diabetes by furthering the fattening process.

When the insulin is secreted, the cells are primed to burn glucose; however there is no glucose in the diet and because of the high insulin level the liver and muscles are not releasing their stored glycogen. The candy provides the glucose that the hyperinsulinemia is craving and you only reinforce to the pancreas that it did the right thing. This is a vicious cycle and that's why it's called an addiction.

**RE: Zero Carb / Meat and Water - Mel - 06-25-2008 01:24 PM**

Charles,

I agree about the addiction. I have been trying other things: exercising through the fog, eating some zc food, doing nothing but gritting my teeth. The reason I tried the 2 gram cure is that Jenny says 2 grams is not enough to trigger more insulin release but it will raise serum blood glucose level about 10 mg/dl which will make the symptoms abate. She bases her knowledge on lots of study and self experimentation as she has been a diabetic for 10 years. I don't know her source for that stipulation about the threshold of insulin release.

Thanks for your input. I'm just trying to get from here to where you are without giving up a few of my favorite things like coffee.
Mel

Endangered Species brand Extreme Dark Chocolate is very palatable at 88% cocoa content.

RE: Zero Carb / Meat and Water - Clabbergirl - 06-25-2008 02:22 PM

I'm leaving for Disney World tomorrow, and while I've maintained under 10g of carbs for 3 weeks now (some days were less), I'm kind of hesitant to expect that in that place. I am going to try to eat lo-carb, but not as stringently. I really do feel more awake and more energetic than I have in a good while though. I've had 4 or 5 hours of sleep since Saturday and usually by mid-week if I try something like that, I'm half dead. But I really do feel so much more aware and clear. I have to attribute this to the new diet. When I return from WDW, it's back to below 10, with the goal of below 5. I really have got a lot of help and support from reading this board.

I'm still not impressed. As I've said, metformin works by furthering the fattening process. Yes, your fat cells are "more sensitive" which means that they readily store triglycerides more easily than they do when you stop taking it. Keep up the zero carb without the metformin and your blood sugar will fall. Give it some time to work. Try two or three weeks without it staying on less than 10 grams of carbs per day and then we'll talk.

Zelia, Are you taking metformin because you are diabetic? Also, what is the 40-50 mg/dl jump you see when not taking it? Is this a post-prandial rise or a fasting level? If I remember right any BG level above 120-140 mg/dl is potentially destructive to your beta cells.

I'm still at the Impaired Glucose Tolerance stage, with a strong Dawn Phenomenon, so my fasting glucose is the highest of the day. That was not the case on Tuesday, when I skipped metformin. Then, fasting was 138, which is about where it is with metformin now (having reached 180s last year), but my last post prandial of the day was 181, far above the fasting reading, which I've never seen before with myself.

The rise I noted in my post was post prandial -- i.e., with metformin, my post prandials are still "normal" (under 120, occasionally as high as 140); without metformin, I hit 181 on a 2hr post prandial of a meal that consisted of salmon and butter. (Note that 180 post prandial is considered "controlled" under the current standard of treatment, and you have hit 200 on an Oral Glucose Tolerance Test for diabetes to be diagnosed.)

I don't disagree with you. I meant that I'm not impressed with the fact that it does this in the short term. Please amend my earlier statement to "metformin does not lower blood sugar over the long term." I've always maintained as much. I agree, metformin does lower blood sugar; however it only masks the symptoms of diabetes and will appear to ameliorate the disease. This is precisely why the ADA recommends it plus a high-carb diet for diabetics. The proof is very clear. The diabetes only gets worse, it never gets better. If it did, we would all know about it, believe me.

Like all the other diabetics and pre-diabetics on this forum, I'm only interested in the long term control of blood sugar.

RE: Zero Carb / Meat and Water - **travis t** - 06-26-2008 11:43 AM

Still feeling awesome on meat, water, butter, and coffee diet. I don't know if anymore fat has come off but i feel like Jimmy Walker.
Dy-no-mite !!!
travis

RE: Zero Carb / Meat and Water - **Vesna** - 06-26-2008 06:54 PM

Just checking in to let you all know I'm still going strong on my single-digit carb plan. Most days the carb grams are in the single-digits, although some days I've gone up into the teens and a couple of times
up to 20. However the carb percentage is always solidly single digit: usually 2%, never more than 4%.

Adding eggs, high-fat/low-carb dairy products, and small amounts of leafy stuff made me feel better immediately. I'm not sure why -- whether that was from the few extra carbs or some other factor. Some mealtimes, I find myself wanting food but turned off almost to the point of revulsion by the prospect of eating meat. At those times, nibbling on a 1.5-ounce hunk of cream cheese can be terrifically satisfying. I don't understand what it means. It's not an intellectual or emotional thing; it's just body-level feeling.

I am not excluding artificial sweeteners, but in practice I'm not using them much. We make pitchers of fresh-brewed tea in the summertime, Southern-style, and sweeten with a sacharine liquid called Superose. One teaspoon = 1/4 cup sugar sweetness, and that's what we add to a 1/2 gallon pitcher. I might sip or gulp (depending on the weather!) 4 oz. to 16 oz. of this over the course of a day. That's about it for the AS in my life. THANK YOU to those who wrote to warn me against aspartame. I don't TOUCH that stuff.

I'm happy to say that my longings for sweets and impulses toward between-meal snacks have become nonexistent again, as they had last winter when I was doing a similar (but not identical) plan.

My energy level in the afternoons is much better than I can remember it being for ... gee, for years, maybe, now that I think of it.

I am not controlling calories, but I am tracking everything I eat on Fitday, and hence tracking calories. Visitors to my Fitday page can see that the range has been from around 1250 to around 2300 (with one spike to 3400), but most commonly between around 1500 to 1800. The funny thing is that at the end of the day I always feel like I've eaten about the same amount, even though looking at the records the numbers jump around a lot. At the end of the day I just feel that I've had as much to eat as I've wanted, and that feels the same, no matter how much or how little it was in absolute quantities.

The higher-calorie spike was while I was attempting just meat and water. My appetite was acute, unpleasant and insatiable during that time. Eades can say what he likes, but meat and water did not depress my appetite or lead to a lower caloric intake.

Perhaps after some months of single-digit carb practice, going meat and water would feel different to me. After all, I was coming off about a week of, shall we say, carbohydrate indulgence (craft beer, generous portions of sweets, half-servings of beans, pasta and rice) when I started meat and water in early June. Maybe I'll screw up the nerve to try it again. Maybe I can try a day, then a few days later try a few days, then a few days later try a week. That Inuit boot camp can be brutal!

No net change in weight since about June 2007. I've hovered within a few pounds of where I am right now ever since I initially lost about ten pounds in my first few months of low-carbing beginning in March 2007. Goal is about 15 pounds away. Just as it has been month after month after month, plan after plan.

That's the news!

Just out of curiosity, what do you weigh and how tall are you? It sounds as if you're at your body's regulated weight already...

That sounds great Vesna. Even though you're not losing weight, at least you know that you are eating for optimal health. It will be interesting to see if your weight naturally lowers over time.

It seems that short periods of time on ZC or VLC doesn't automatically lead to weight loss for some of us but I wonder, as we regain metabolic balance over time, if the weight issue will sort itself out as Charles says. That's what I'm hoping.

Hi everyone,

I read all 59 pages of this thread (in 2 days!!!) and wow, was it interesting and refreshing!!! I was a member of the old forum.

I've done zero-carbing on and off for the last year to year and a half. With some successes but with certain problems as well. When going back to eating veggies, fruits, nuts or even too much dairy, I don't feel so good either so always go back to zero-carbing or an all-meat diet consisting of some shellfish or organ-meats that contain some carb and sometimes, some butter.
I suspect the reason I did not do well on my last attempt at zero-carbing with only muscle meats (i.e. fatty protein) was due to a lack of salt in my diet leading to low sodium and dehydration problems. I noticed my energy always went up when adding salt to my meat. Whether it needs to be iodized or not, I'm still not sure. Right now, I use iodized seasalt.

Day 2 of all-meat and it's going REALLY well!!! I'm feeling lots of energy, bloating is better, lost 2lbs, slept like a baby (did not wake up once) and I have no cravings AT ALL for sweets. I'm feeling hungry every 5-8 hours. But not so hungry. And meat is tasting better and better. YUM!

I'm 5'7, 149lbs (in the morning, when waking up), 31 yrs old. Medium build. I gained about 15 lbs in the last 6 months and my lowest was 135lbs when eating mostly organ-meats with coconut oil, about 1 yr ago. I also fasted for 5 days (for healing purposes) at one point which probably slowed down my metabolism...not so good. I'm still proud of myself for that feat. The longest I'd ever gone before was about 30 hours. I hope to go back to low 40's. 135lbs was too thin and I didn't feel quite healthy at that weight.

I choose fatty muscle meats, mostly chuck cause they're so damn cheap and of course, FATTY! Sometimes, rib steaks and ribeyes, especially when on sale. I eat nothing else except salt sprinkled on my meat and drink a little water.

Charles, I appreciate so much the time you take to explain things to people, help them become healthier, happier and admire your dedication, your compassion and the way in which you gather the information and convey it in simple terms for everyone to clearly understand. BRAVO!

**RE: Zero Carb / Meat and Water - travis t - 06-27-2008 12:32 PM**

Hi Kristelle,

I have been eating near zero carb for a month myself and i feel awesome. I say near because most day have been virtually zero(a few spices on my meat) and a few day i have had some carbs. One of them i wrote about earlier.

One thing that i have noticed the last couple of days is that i am down to just one meal a day. I was eating three times at first, then twice now, one. Hunger doesn't seem to present itself during the day and my daily sirens song(vending machine near my office) is nonexistent. Most Days i drink 16 ozs of coffee early in the morning and one to two bottles of water during the rest of my work day. On fridays i go out at lunch to cash my paycheck(yes i get a paper check, how old school) and make a run thru starbucks for a 16 oz(grande) black coffee.(yum). Once again welcome travis

**RE: Zero Carb / Meat and Water - travis t - 06-27-2008 12:50 PM**

Kristelle
Just looked at your profile and it said your from Montreal.
We won't hold that against you(kidding).
I would love to come to the F1 race some year.
I went to all eight race that they had at Indy. Love formula one.
Go Massa.
travis
Hi Travis,

Thanks for the welcome. I'm really happy this is working out for you and I'm not that suprised either. I've experienced it firsthand on zero-carb many times. Right now, I eat about 3x daily...just listening to my hunger.

I forgot to mention that I've had a hysterectomy (ovaries + uterus removed) almost 3 years ago and as such, take bio-identical hormones, estrogen + progesterone.

I do remember that weight gain followed an increase (double the dose) in hormones. I later switched back to half that dosage but weight only continued increasing. The weight gain was actually a positive thing in the beginning, as I was too thin. But, then it just continued going up, that was during a period of much experimentation (and instability) with adding and removing different food sources. Weight only decreased temporarily during my fasting but quickly came back up thereafter.

Right now, I'm not touching my hormones. Eventually, if the weight stays still on this all-meat diet, I will probably make changes. What changes, I'm not sure but it seems progesterone increases fat retention while estrogen does the opposite...so maybe less progesterone?? We'll see...

nyteez Wrote:
Also its a great massage oil or skin moisturizer, it is a light oil (not greasy) that absorbs right into the skin, the only bad thing is you smell like coconuts all day. :O)

I'm new to low carbing and to this forum. Found this thread from one of the comments on Jimmy's blog where Charles talks about eating zero carbs.

I just would like to comment on virgin coconut oil (VCO). I have been using the Nutiva brand, but plan on trying to find the Rexall one at Walmart. I paid around $30 for my big jar of Nutiva. I put it in my morning tea along with stevia and cream. Yum! Sometimes I eat a spoonful at night before bed to stave off any hunger pangs.

I use it for a body oil after my shower, as well, and I DO NOT smell like coconuts all day. I'm sad, because I would love to, lol. The coconut smell dissipates very quickly. I'm using it for a face moisturizer, too. Love the stuff.

Erica

Welcome Erica!
I have been using the Nutiva brand, but plan on trying to find the Rexall one at Walmart. I paid around $30 for my big jar of Nutiva.

I have found the Vitamin Shoppe brand CO to be a good substitute for Nutiva and a lot cheaper. Not quite as good but pretty good.

RE: Zero Carb / Meat and Water - poo123 - 06-27-2008 06:48 PM

Hi, I have finally read the whole thread. I have made my decision and I am starting cold turkey, cold chicken and lots of beef tomorrow. I am a 38 year old mom of twins. I have done low carb on and off for the past 6 years and in those years I have lost 100lbs twice and put it back on. I think zero carbs will really help me. I do have polycystic overian syndrome (pcos) and that makes me very insulin resistant. So I believe this is the way to go for me. I am at my biggest right now at 250 and this really bothers me. I found all the posts very smart and gave me so much info it was really wonderful. I can't wait to start. I went shopping today and bought chuck steaks and large chicken legs and thighs and 2 packaged tubes of 73/27 ground beef. I love meat, and dark meat chicken and beef are my favorite so I guess I am in luck. I will have to get a new hobby because before I had my kids I was a chef, and loving food the way I do I still read cookbooks like they are novels, so I will have to find a new subject to read about. Sorry if I am babbling, but you have no idea how excited I am about this actually working.

RE: Zero Carb / Meat and Water - pennypritty1 - 06-28-2008 04:30 AM

ohhhkay... I am officially starting my zero/extremely low carb today. (whew!!!)

I was so excited when I first found this site a couple weeks ago I wanted to start then and there but couldn't. I just finished two weeks of 15 hour days (at a NEW job) and couldn't eat right let alone begin low carbing during that time. But now the summit is over, normal hours will begin and I am exhausted, but taking the plunge.

I'd been wanting to get back to low carbing so long I started procrastinating but no more! And now that I'm officially marking this down, I feel the accountability to press through--something I really need in the beginning. Once I start and push on the first couple days, I'm zoned in. But that first week, I'm determined to succeed the changeover.

Man!!! I'm excited! 😄 I can already feel like I'm breathing easier, walking more spritely and clearheaded. I will be religiously on this site to keep me pumped--all of you are so inspiring and helpful, I gain strength here.

Just as it has been month after month after month, plan after plan.

It sounds as if you're at your body's regulated weight already...

Yes, that's just the problem! How do I turn the dial down and re-regulate? Something is moving the dial around, but I can't quite get a handle on it.

Through most of 2004 and 2005, I lost weight without trying.

My baby was born in early 2004, and fat sloughed off me after that over the following year and half until by late 2005 I was 23 pounds below my pre-pregnancy weight, which was itself about 30 pounds overfat. My diet? I was supplementing our whole-foods home cooking (with plenty of meat, fat, and low-to-mid-starch veg, but also pasta, rice, potatoes and legumes) with generous portions of Baby Ruths, Taco Bell and Krispy Kreme. I wasn't following any exercise regime.

In October 2005 I took a full-time desk job. I didn't change my diet. By the summer of 2006, all the weight had returned. Now I was back to 30 pounds over.

In September 2006 I cut way down on the chocolate and pastry, cutting out second helpings and late-night snacks, and cutting the rice from my daily breakfast and lunch of dhal, rice, veg and eggs. I followed this "moderation" approach, as I called it, and lost exactly one pound over the course of six months. Maybe I would have gained more without the conscious "moderation," but I don't know. My weight had already stabilized around June 2006.

In March 2007, I went low-carb, starting with Atkins induction. Ten pounds came off over the first several weeks, leaving me about twenty pounds over. I've gained and lost another five pounds several times since then.

Now, why did I lose weight from Feb. 2004 to October 2005, although my diet was worse than it had been for several years, when I gained the weight?

Why did I gain from Oct. 2005 to June 2006, without a change in diet? (The desk job is an obvious possible culprit here.)

Why did I stop gaining in June 2006 without a change in diet or activity?

Why was there no change in weight from October 2006 to March 2007, despite a change in diet?

Now I'm at a regulated weight. But it's not an ideal regulated weight. It's not an ideal shape -- not with a 39" waist, not with a waist/height ratio that puts me at risk for diabetes.

My current amount of stored fat is not physically comfortable, and it doesn't look good on me. I've been much slimmer, and I liked it much better. It felt great. It felt normal.

I have stacks of clothes that used to fit. Now the buttons don't meet, or the zipper won't close, or it won't pull over whichever end of me I'm trying to pull it over. They're a graphic reminder that I'm not the size
and shape I was, I have to believe could be, I feel should be. What will it take to re-regulate my body back to the shape that gets into those clothes?

RE: Zero Carb / Meat and Water - Kristi31 - 06-28-2008 08:17 AM

Hey there Vesna! Glad to see you. 😊

So, I'm on day 3 of all-meat and things are going really well. Yesterday, I only ate twice, once at around 9am and later at around 2pm. Didn't feel hungry for the rest of the day although when my family ate later that night, the smells got me temporarily hungry (meat, peppers & zucchini on BBQ) but it quickly passed. I actually tried a small bite of my meat but was too full.

Slept wonderfully. Again! So, this is really good news. And my weight is going up and down, really strange. I was 147.5 yesterday AM, hovered around 151 all day, before going to bed, weighed myself at 147.5 and this morning, when i woke up, 149lbs!!!

Lastly, bloating is practically a thing of the past, what a relief!!!

Penny, I'm rooting for you. You go girl! You can do this!!!

---

RE: Zero Carb / Meat and Water - pennypritty1 - 06-28-2008 09:11 AM

Thanks, Kristelle, I'm determined to make this life change stick!!!

And on that note...

Everyone, I'd love a little help. I tend to think linear and box myself in so I know that I need help sticking through this. Fortunately, I absolutely love meat - chicken, fish, pork, turkey... all of it. I'm loving that I can just go forward with those things. But I'm looking to keep myself from getting "bored" with my selections.

Can I get some help from you all by listing your choices of other zero / extremely low carb food options to eat?

I just need to expand my mind with all the options that are really there. Psychologically when you think of a major change in your life, one of the first thoughts is almost always that you're limiting yourself or saying "NO" to something. And because of it you tend to not think about the GREAT things you can have. I want to stop thinking about the "NO" things and bombard my mind with the "YES" things--as in the zero / ELC (extremely low carb) things...

So here goes - puuleeeze add yours to this if/when you can. It'll certainly help me expand my choices and enjoy this wonderful change.

- chicken - dark meat (dark meat is my friend) 😊
- ham (loooove u)
- bacon
- turkey - dark meat
- shrimp - grilled with butter and a splash of lemon - yum
- cheddar cheese - .4 net carbs (according to the Atkins shopping guide)
- pork chops
cream cheese - 2 tbs .8 net carbs
boiled eggs - great quick snack, just some salt/pepper or slice in half, take out yokes, mix with some mayo and seasoning and you've got a very simple deviled egg...
ground turkey or beef - melt some shredded cheddar over it, season and let cool and you can pick at this like a meaty/cheesy snack...
pork rinds - for the chips I need

more please... See? I'm already ONLY thinking mostly meat--need more expansion in ideas. I'd appreciate suggestions / ideas. Thanks, everybody, in advance.

RE: Zero Carb / Meat and Water - [Wendyoh](mailto:Wendyoh) - 06-28-2008 09:12 AM

I have a thought/question for those of you who experience similarly to what Kristelle wrote above when going to zero carb. Is this weird increase on the scale when decreasing carbs actually a good sign? It seems like we read about this a lot, people either plateauing or even gaining for awhile before a sudden drop on the scale.

I have read that when fat cells are emptied, they are temporarily filled with water, which would explain the scale, as well as the change in consistency of the fat in general. For me, my fat feels really squishy and jiggly during this time. It tends to freak me out, as I am sure it does for others. But if I just wait it out, the fat cells release the water and shrink, I feel leaner and the scale reflects a loss.

Anyone else notice this?

RE: Zero Carb / Meat and Water - [Kristi31](mailto:Kristi31) - 06-28-2008 09:18 AM

Personally, my fat feels squishy especially around the abdominal region. I'm waiting it out...

pork rinds - for the chips I need

HEAVY whipping cream!!
Coconut oil

73/27 hamburger. Much fattier (which is good) than 80/20, etc.

Brie cheese (if you lose no problem, if you stall you may want to cut the dairy since it has carbs), etc.

rib-eye steaks (the fattier the better when it comes to meat)

Lard (ala the Polish Atkins - Optimal Diet)

Butter

Creme Fraiche (just bought some yesterday for the first time)

---

RE: Zero Carb / Meat and Water - pennypritty1 - 06-28-2008 09:49 AM

Thanks, MAC,

I'm curious about the coconut oil... does it taste like coconut? is it subtle? strong? How many ways do you use it? I think I remember reading someone saying they had a spoonful of it to keep hunger pangs away...?

I'm tempted to try it... but I'm not a fan of coconuts... but I certainly want to expand my options.

And what is Creme Fraiche?

---

RE: Zero Carb / Meat and Water - MAC - 06-28-2008 10:11 AM

pennypritty1 Wrote:

And what is Creme Fraiche?

Nutiva and Vitamin Shoppe Coconut oil have a very very mild coconut taste to them via MY taste buds. I eat it straight on occasion, use it in place of butter on broccoli, put it in coffee to add fat to my diet.

Creme Fraiche is richer than whipping cream and less sour than sour cream. Tastes like a mild sour cream. It is a cultured product. One can use it to make beef stroganoff, put on strawberries, etc. I am going to add it to my 73/27 hamburger to up the fat content even more as I want that slightly sour cream taste. Creme Fraiche has 1 carb per 2 Tbs. Less than sour cream but not by much.

The following link has a list of hidden carbs in foods: Hidden Carbs
RE: Zero Carb / Meat and Water - LindaSue - 06-28-2008 03:36 PM

Penny:

Pot roast
Pork shoulder roast (Boston butt)
Fish (tilapia, tuna, etc.)
Pork sausage (watch out for fillers)
ground pork
lamb

If you're going to eat lean meats such as chicken breasts, you might wrap them in bacon and top them with melted cheese or some kind of butter or mayo based sauce to boost the fat. Mix some herbs and spices into softened cream cheese and smear over your meat for flavor. I use some condiments in small amounts. I like to make a mixture of mayo and low carb BBQ sauce to put on my burgers. You could also use a little low carb ketchup and/or mustard for very little carb. You can make cheese into cheese crisps in the microwave for snacks.

RE: Zero Carb / Meat and Water - Ell.eee - 06-28-2008 03:58 PM

Hi everyone. I'm loving this site. Great inspiration and ideas. I'm still working on gradually decreasing carbs while maintaining my weight to combat hyperinsulinism. This week I'm dropping to 10 carbs. I'm finding two meals and no snacks is working for me most days. Huge breakfast at 5:30-6:30 am and huge dinner at 5:30-6:30pm. I use fitday and my calories are higher than I've ever seen them 2000-2200. I used to average 1500 so I hope this doesn't become a problem in the future, but so far I'm only up a couple of pounds. Must be the high fat content. Can't believe I'm only hungry twice a day though still shaky after meals.

Travis - I'm with you my coffee will be with me throughout this no matter what. It helps me feel good and tastes fantastic.

Mac - I'm a coconut oil newbie been using it 10 days 3to4 TBsp. It keeps me full and gives me energy but keeps me up if I have it with dinner. Any way to turn off the wakefukness effect? Will I get used to it in time and be able to have some at night?

The VLC lists are so helpful. Hey I'm so psyched I may throw in a day or two of zero carb this week and see how my body reacts.

Regards to all for a great week!

RE: Zero Carb / Meat and Water - pennypritty1 - 06-28-2008 04:26 PM

This is great, LindaSue. I do need to find a way to increase my fat intake. I reopened my fitday account - I used it years ago when I did low carb, but totally forgot about it until I saw it on your signature (thanks, LindaSue) and used that again to track my intake.

Tilapia--is it a fatty fish? I've not had that one. I probably need to go to a meat market and fish market and start stocking up--lol.

OH - and sardines are supposed to be high in fat. You could mash that with mayo, some mustard, and a
little seasoning to make deviled eggs.

I think I have a thing for deviled eggs. lol

---

**RE: Zero Carb / Meat and Water - Kristi31 - 06-28-2008 04:50 PM**

Even the fattiest fish like salmon, sardines and mackerel aren't that fatty. Fattiest are pork, beef, lamb, that kind of meat.

If one experiences some tiredness, be sure to eat enough salt. It helped me ALOT!

---

**RE: Zero Carb / Meat and Water - pennypritty1 - 06-28-2008 05:05 PM**

Kristi31 Wrote:

hmmm... I haven't had lamb in sooo long. I absolutely loooove roast pork.

Salt? Really? Thanks, Kristelle--I'll remember that. I used to eat a lot of sunflower seeds, a mixture of salted and unsalted. That'd be good to have to help with some salt.

I could use some options for drinks as well as foods. I'm definitely a water girl, but do any flavor drinks come to mind? I'm determined to not have any sodas-low carb or otherwise. And I'm not a fan of the flavor water--even when I wasn't low carbing. I just don't see the benefit to sugared water with a couple of vitamins tossed in.

---

**RE: Zero Carb / Meat and Water - Kristi31 - 06-28-2008 08:17 PM**

Today, Day 3 of my zero-carb diet, I'm still struggling to find the right balance between salt and water although I'm getting there. The first 2 days went pretty well.

If I don't eat enough salt, I get dehydrated, constipated, bloated, sinus congestion (with blocked ears), tired after meals, don't sleep well, indigestion, abdominal cramps, headaches, hives due to water pressure inside of skin (or something like that), increased cellulite (yuk!). Same thing happens to me if I take too much of it.

In trying to find what is just enough for me, I make mistakes such as the one I made today. I took too much salt! I use salt as needed, when I'm eating and starting to feel tired (but still hungry). Getting weak/tired is a clear indication to me that I need salt and right away, it takes care of it. But, sometimes, I overdo it such that I get bloated afterwards, like today.

Later, I started sweating probably in an effort to excrete the excess sodium and was a little hyperactive. I also started having really painful abdominal cramps. So, I reasoned..."probably the salt". In an effort to dilute some of it, I drank water, just enough to quench my thirst that I didn't really sense before, for some reason. An hour later, the bloating disappeared and so did the cramps. I feel fine now!
Interestingly, when I need water, I often start craving fruits. And when I need salt, I start craving nuts. I did crave fruits during the day but drank no water...I should have listened to my body.

So, right now, two things indicate to me that I need salt:
1) craving for nuts
2) as I'm eating my meat, I'm getting tired (drowsy).

And two things indicate to me that I need water:
1) craving for fruits
2) feeling bloated after a meal

I just wish there was a simpler way to do things. My body signals are still not quite up to par.

Charles, any tips, having been on this diet for quite some time, other than just eating salty when craving salty and drinking when thirsty? That just doesn't work for me.

---

So, right now, two things indicate to me that I need salt:
1) craving for nuts
2) as I'm eating my meat, I'm getting tired (drowsy).

And two things indicate to me that I need water:
1) craving for fruits
2) feeling bloated after a meal

I just wish there was a simpler way to do things. My body signals are still not quite up to par.

...  

Well, I'm glad you're sharing your experiences, Kristelle. As I'm just starting day 2, I'll have an idea of what to try if I experience those same symptoms.

pennypritty1 Wrote:

Tilapia--is it a fatty fish? I've not had that one. I probably need to go to a meat market and fish market and start stocking up

I don't know how fatty it is but I thought that having fish every now and then might keep you from being bored with your menu. The nice thing about fish is that you can drown it in melted butter. I like a little fish with my butter, LOL.

I don't know what to suggest as far as flavored drinks go. I don't think you'll find any that don't either have some hidden carbs or artificial sweeteners that you may be trying to avoid. Drink mixes like Crystal Light come to mind. They say they have no carbs but they must have some based on the ingredients. Dr. Atkins allowed people on induction to have freshly squeezed lemon juice in their water but it does have carbs. I tried lemon in my water once and didn't care for it. I prefer my water straight up.
I am on day 2 and I do have to say day 1 was fine, no problems at all. I had 1/2 lb 73/27 ground beef for breakfast at 9:00am, then didn't feel the least bit hungry until maybe 2:30 so then I just had 1/4 lb of the same beef because I was going to have dinner with the family. At 6:00pm we had dinner and all I had was 2 chicken thigh and 2 wings and I was done for the night. I was full. I went to bed at 10:30 and slept all night and woke up with the dogs at 7:00. I ate 1/2 lb of chuck steak for breakfast at 9:00 and so I am happy. I am glad to see there are 2 others just starting out too. We all can manage these first days together. I think with all the advice and support on this board its going to be ok.....

Charles, any tips, having been on this diet for quite some time, other than just eating salty when craving salty and drinking when thirsty? That just doesn't work for me.

Sorry, I've been busy with a family reunion. I'll be back in business tomorrow.

If this is day 4, then give it some time. I might just be a mini-induction. When you subtract things from your diet your body has to switch to either manufacturing things or getting it in some other way. That takes a little time.

Salt is a tough one. I used to just shake it liberally on everything but now I really just use it when I feel like something needs salt (which is probably my body telling me I need some). I do the same with water. I don't drink it indiscriminately, I just really try to drink to thirst. Plus, I never drink it during exercise.

I think we talked about this on the old forum, but the symptoms you describe sound like not enough fat, not salt. When I feel anything similar to that it's usually because I've been eating my meat too lean. Although, I didn't feel particularly energetic on Friday when I ate beef spare ribs for lunch. I think I just ate way to many and there was tons of fat!

I know that you know the importance of fat so I'll leave it at that. Other than that, I don't know what would cause you to feel like that, unless you're not eating enough food in general.

Regards,

Charles

Vesna Wrote:
My baby was born in early 2004, and fat sloughed off me after that over the following year and half until by late 2005 I was 23 pounds below my pre-pregnancy weight, which was itself about 30 pounds overfat. My diet? I was supplementing our whole-foods home cooking (with plenty of meat, fat, and low-to-mid-starch veg, but also pasta, rice, potatoes and legumes) with generous portions of Baby Ruths, Taco Bell and Krispy Kreme. I wasn't following any exercise regime.

This weight loss was definitely hormonal (as all weight loss is) and didn't matter what you were eating because those reproductive hormones were mobilizing fat as they're supposed to do after a birth.

Vesna Wrote:
In October 2005 I took a full-time desk job. I didn't change my diet. By the summer of 2006, all the weight had returned. Now I was back to 30 pounds over.

When the post-pregnancy hormones stopped mobilizing your fat, then it fell to your diet which was not optimal.

Vesna Wrote:
In September 2006 I cut way down on the chocolate and pastry, cutting out second helpings and late-night snacks, and cutting the rice from my daily breakfast and lunch of dhal, rice, veg and eggs. I followed this "moderation" approach, as I called it, and lost exactly one pound over the course of six months. Maybe I would have gained more without the conscious "moderation," but I don't know. My weight had already stabilized around June 2006.

That sounds right and if you would have cut the carbs further during this period you likely would have lost more.

Vesna Wrote:
In March 2007, I went low-carb, starting with Atkins induction. Ten pounds came off over the first several weeks, leaving me about twenty pounds over. I've gained and lost another five pounds several times since then.

Of course.

Vesna Wrote:
Now, why did I lose weight from Feb. 2004 to October 2005, although my diet was worse than it had been for several years, when I gained the weight?
Your reproductive hormones. The same ones that caused fat storage during pregnancy mobilized fat afterwards. There was nothing diet-wise that you could have done to stop pregnancy fat or post pregnancy weight loss.

Vesna Wrote:
Why did I gain from Oct. 2005 to June 2006, without a change in diet? (The desk job is an obvious possible culprit here.)

No, I work a desk job. As I said above, your hormones were not working to mobilize fat in spite of your bad diet.

Vesna Wrote:
Why did I stop gaining in June 2006 without a change in diet or activity?

Do I really have to answer this one again? 😐

Vesna Wrote:
Why was there no change in weight from October 2006 to March 2007, despite a change in diet?

Didn't change diet enough.

Vesna Wrote:
Now I'm at a regulated weight. But it's not an ideal regulated weight. It's not an ideal shape -- not with a 39" waist, not with a waist/height ratio that puts me at risk for diabetes.

Everyone is at equilibrium, either fat or lean. The question is, how does this change? It's all about the cells. You have to increase the flow of nutrients to the cells. That means more calories of fat and protein, not less. This will speed up the flow of nutrients and your body will release the hold it has on the fat tissue or else the flow of nutrients will be too fast. It always has to be regulated. Also you have to stay away from things that retard this flow of nutrients, and those are triglycerides made from dietary carbohydrate. They cause a small slow down that causes a very gradual weight gain over time. It's like .01 of 1%.

Vesna Wrote:
I have stacks of clothes that used to fit. Now the buttons don't meet, or the zipper won't close, or it won't pull over whichever end of me I'm trying to pull it over. They're a graphic reminder that I'm not the size and shape I was, I have to believe could be, I feel should be. What will it take to re-regulate my body back to the shape that gets into those clothes?

See above or go shopping! 😐 I feel your pain. I have the other problem. Throughout my weight loss I bought so many clothes, especially pants and I just couldn't wear them for long. Since I'm such an extremist I gave all these perfectly new-like clothes to Goodwill. I'm always scared that I'll gain some weight and these new clothes won't fit or something and then I'll have nothing to wear!

Charles
RE: Zero Carb / Meat and Water - **Kristi31** - 06-29-2008 10:11 AM

Charles,

Thank you for answering. I really don't think it's the lack of fat cause I eat PLENTY and I mean PLENTY.

This morning, had just enough salt with a little bit of water and feel great. I'm really getting a hang of this. I'm sure the hormones also affect sodium and water in my body.

RE: Zero Carb / Meat and Water - **con** - 06-29-2008 02:33 PM

Charles,

I've been doing ZC very successfully for over a month UNTIL this week. (lost 12 lbs. yeah)

My problems started last weekend when we had a heat wave here in the Bay Area. It got into the 80's (Farenheit) and I started CRAVING frozen blueberries. I WAS DREAMING ABOUT THE COOL WATERYNESS running down my throat! I resisted, but the temp. was so hot I couldn't force myself to eat MUCH fatty meat.

One day I ate eggs and yesterday I made hamburger stroganoff with cream and cheddar cheese for my son, and I gave in and today I weighed 5 LBS. more. YIPES

My ? is did I want the fruit cause of dehydration due to hot weather or due to not enough fat which I couldn't eat due to hot weather? Or salt depletion? Everythings been off since the heatwave. thanks Con

---

RE: Zero Carb / Meat and Water - **Kristi31** - 06-29-2008 04:28 PM

I was actually craving fruit like crazy today so drank some water. Even though I just had some meat with plenty of water in it and even though I wasn't thirsty. Water just didn't do it and my cravings continued...until I took some salt. That completely got rid of my cravings.

I think I understand better what's going on now and realize my fruit cravings have NOTHING to do with water but more so to do with the increase in insulin.

With decreased insulin levels (due to less carbs), potassium retention increases while sodium retention
DECREASES such that potassium becomes much too elevated relative to sodium. There is an imbalance and that creates all sorts of problems like fatigue and dehydration. To correct this balance, one needs to EITHER decrease potassium (insulin is used in the treatment of excess potassium, called hyperkalemia) or increase salt. The body may secrete insulin in an effort to bring the potassium down and this would obviously lead one to crave sugar/sweet foods. The body may also start craving salty foods like pickles.

Considering the fact that I naturally don't retain much salt (genetics) and that I am ZC, it makes much sense that I so often crave fruits and that salt helps quiet down my appetite and gives me so much energy (and relieves my constipation!).

So, to answer your question...take some salt and see if that helps. Preferably high-quality sea salt like Celtic or Paludier. Hope this helps.

RE: Zero Carb / Meat and Water - con - 06-29-2008 06:59 PM

thanks for the info Kristi, I'll try that!

RE: Zero Carb / Meat and Water - feckless - 06-29-2008 08:50 PM

hi all, a question for charles....
does your same advice apply to someone with a 20 year history of severe alcoholism and the resulting pancreas/liver damage. i'm in my 40s now, and while stopped drinking for 8 years, still suffer extreme hypoglycemia. Maybe that is a symptom of hyperinsulinism as you say, but i still have to deal with it. i can have crashes where the paramedics are called, and usually if i am spiraling, eating protein/fat doesn't do anything. my glucose tolerance tests showed my blood sugar dropping to under 30 after two hours.

i have been paleo LC for long time, mostly VLC, but my energy is still totally erratic and i still suffer massive cravings for sugar. quite frankly, i've never felt good my whole life! i was obese as a kid before i discovered booze. i am not overweight now, that is not a concern. i'm hoping the zc path will allow my body to heal and find some stability, but i want to know if i should approach this in any special way given my history.

really appreciate your input....thanks!

RE: Zero Carb / Meat and Water - Vesna - 06-30-2008 05:41 AM

When the post-pregnancy hormones stopped mobilizing your fat, then it fell to your diet which was not optimal.

It's interesting that you attribute my effortless weight drop significantly below pre-pregnancy weight completely to post-pregnancy, and that it seems you consider it unremarkable. I've never heard of that phenomenon.

This is what I usually hear about: (1) easy slide back to pre-pregnancy weight, (2) hard battle back to pre-pregnancy weight, or (3) net gain after pregnancy that took years to lose, or has never yet been lost.

What have other posters here heard of and/or experienced as far as post-pregnancy fat storage?

Has anyone else experienced or heard of effortless weight loss to significantly below pre-pregnancy weight?

**RE: Zero Carb / Meat and Water** - poo123 - 06-30-2008 06:08 AM

Hi guys, well its day 3 today and as of this morning I am down 4.2 lbs !!!! I am so happy. Yesterday I had total 1lb of chuck steak, 3 small chicken legs and 1/2 lb of 73/27 ground beef. I am still not hungry at 9:00am Monday morning. I am really happy that I have not had any shaking, or severe headaches and my energy level is really good. I have had no cravings and my family is supporting me great. My husband is lowering his carbs and my kids are starting to taste what I am having. So all around everything is wonderful.

---

**RE: Zero Carb / Meat and Water** - Angela - 06-30-2008 06:12 AM

After my son was born I dropped the pregnancy weight fairly quickly (3 months) then it began to creep back within the next 6 months. I believe it was hormonal, breast feeding and just sheer exhaustion. This was 13 years ago.

Even the unsweetened Kool-Aid mixes have maltodextrin in them but it probably doesn't amount to much by the time you mix it with 1/2 gallon of water. Be careful though. I've noticed that some flavors and brands of "unsweetened" drink mixes DO contain sugar. Wyler's brand comes to mind as well as Hawaiian Punch brand.

Con,

That's a fascinating question. In fact, I've been thinking about a similar question. The last two summers, about this time of year, I get more of a craving for sweet things than at any other time of the year. I was wondering if it was the heat or maybe I push myself a little harder during these months. I adjusted my workout schedule this year just because of this. I work out much less than last year because I became so fatigued over the summer that by the time I got to October and November, I didn't have much left.

I can only think of animals and when it's hot they decrease their activity. In fact, my dog won't even eat during the day until it cools off in the evening, or if I take him out early in the morning, he will eat. As humans, we probably need to decrease our activity during the hottest parts of the day to avoid depleting our muscle glycogen. I'm sure this is why we want fruit when it's hot.

This would probably be very normal if we hadn't messed up our bodies so much with the carbohydrates when we were younger. As long as you stick with berries and low glycemic stuff, I don't think the weight gain will last very long, but we probably need to take care not to overdo it in the heat.

The most important thing is that if you do go for something sweet, try to make sure it's the kind of thing you eat as opposed to reaching for a sweet-tasting drink because you'll get far less sugar.

Sorry I don't have any studies on this one, but those are my thoughts.

Regards,

Charles

Your is very interesting and a bit different than what others are ascribing to hypoglycemia. The problem with hypoglycemia is that it never had any evidence to support it. It was a pre-World War II prescription based on speculation that insulin possibly caused weight gain by lowering blood sugar to the point where a person would be ravenous and then overeat. It's still based on the notion that excess calories are responsible for obesity. That's the problem with it.

In your case, you say that your pancreas was damaged due to alcohol. In what way and how did they come to determine this? Better yet, what treatment did they prescribe to treat this damaged pancreas?

You're not overweight so why would you be secreting excess insulin (causing hypoglycemia)? Alcohol gets processed similar to carbohydrates in that insulin will clear the bloodstream in order to get the muscles to burn the alcohol and not burn fat until it's finished.

It's funny to me that no one describes carbohydrate metabolism in the same way because that's precisely what happens. When you eat carbohydrates, your body suspends fat burning to deal with the glucose and consequently we don't burn glucose and fatty acids simultaneously.

Based on that, I would think it would still be more related to hyperinsulinemia, except that you said your blood sugar is actually low and you have damage to your pancreas. I would imagine that excessive alcohol consumption caused your body to oversecrete insulin to deal with the alcohol but if your liver is damaged, it may not signal the pancreas to react as it's supposed to.

So the question is, does your pancreas under secrete (in which case your blood sugar would be high) or does it over secrete (which would only make blood sugar high if you are also insulin resistant)?
I'm saying that if everything is working right, the diet is proper, and a woman is young (which shouldn't
matter with a proper diet) then she should lose her weight just as every other animal in the animal
kingdom does. If she doesn't, then there's a problem. By the same token, when you're pregnant, there's
not much one can do to stop the fattening process.

I think if you examine closely and really ask a particular woman, they'll tell you that they lost some
weight initially and then begin to gain or the weight loss stopped.

Another question I would ask is whether the menstruation cycles were normal during the period that you
lost weight and also during the period that you gained weight?

carles,
you were talking about carb cravings during this part of the year.
a possibility could be that the days at this time of the year are at their longest. the more light that enters
the eye the less melatonin whe have, and melatonin is an antioxidant. The less melatonin we have places
more stress on our antioxidant pool of Glutathione. It has been shown that the less glutathione we have
the less insulin sensitive some of our cells become.
travis

This illustrates my point, in that the sex-hormones did what they were supposed to do by mobilizing
fatty acids post-pregnancy to get you back down. Then, your diet took over and that regulated your
weight over the next six months.

Many people claim that breast feeding causes women to lose weight more rapidly after a birth because it
shrinks the uterus faster. This may be, but you can easily see in this case that hormones are chiefly
responsible. My wife breast fed all our children for 14 to 18 months and she was hormonal the entire
time! 😃

travis

Not surprising to me, but many people would think that the smoking would have made her get fat since we all know that smoking makes people crave food, especially sweet stuff. The smoking plus the post-pregnancy hormonal action would produce some serious weight loss in my mind and then at some point, it would be chiefly the smoking and if the person ate a high-fat, low-carb diet along with the smoking, I would expect they would be pretty lean.

travis t Wrote:

Sorry, Travis, I don't follow this. I don't eat anything that "oxidizes" so I don't know why melatonin would help me with this. When you say the cells become "less sensitive to insulin" what do you mean?

The muscle cells or the fat cells? In either case, this would make an argument as to fattening or not fattening.

Here, we're talking about mere cravings. If I don't eat any more carbs during this time, I won't gain any weight even though my insulin levels are obviously changing (thus the cravings).

Can you quote more of the findings?

By the way, LindaSue, you'll recall that this was the time last year that I began to drink artificially-sweetened water. This was a bad move and it caused me to gain about 5 pounds over my goal weight. I seem to control my "urge for the sweet" the entire year without too much trouble, but July and August are tough months...

What have other posters here heard of and/or experienced as far as post-pregnancy fat storage?
I breastfed for 19 months, felt great, didn't have a period until a month after stopping nursing entirely, and lost NO weight. But I don't store fat on my hips and thighs, and I didn't during pregnancy either.

Quote:
Has anyone else experienced or heard of effortless weight loss to significantly below pre-pregnancy weight?
No. One of my sisters wore her pre-pregnancy jeans home from the hospital after her first child was born. Jeans were worn very tight in those days, and OBs were strict about weight control during pregnancy.

RE: Zero Carb / Meat and Water - travis t - 06-30-2008 08:25 AM

Charles,
Don't we get oxidation regardless of which fuel we use in the mitochondria. There is always a small percentage of free radical leakage and these loose radicals cause oxidation of surrounding tissues, which deplete our antioxidant pool.
As far as a lowered glutathione level being related with insulin receptors i will have to find that info since it's been a while since i read it.

travis

I've never heard this before, Charles. I have read that smoking causes insulin resistance. Do you have refs about smokers craving sweets? I smoked a lot for 35 years, and I've never had trouble with cravings or sweets. I was still smoking when I started LC and lost 40 pounds. Then it all came back when I stopped smoking. Tobacco smoke contains anti-nutrients, like other plant products. Lots of people have used smoking to control their appetite and weight.

RE: Zero Carb / Meat and Water - Erratica - 06-30-2008 11:07 AM

Charles Wrote:

Charles

Charles, I'm here to tell you that I never lost weight breast-feeding! I breastfed my daughter for over 22 months, never had a period until 1 week after completely stopping breastfeeding, and have only lost 30 pounds in the past year or two (my dd is almost 17).

Now to compound any hormonal problems from pregnancy, I had 2 c-sections, and had gestational diabetes with the 2nd child, and may have had it with the first one (he weighed in at 10#3oz, my dd weighed 9#4oz).

At this time I am 52 and in the middle of menopause (missed periods, all the usual symptoms like hot flashes and night sweats). This belly fat is refusing to budge. I was diagnosed with diabetes in February (fasting blood glucose of 277), when I went on a low carb diet. The days I 'binge' I eat maybe 100g of carbs, other days much less. I haven't done the ZC yet. My blood sugar is still high in the mornings (2 days ago it was 211 fasting). I think I have dawn syndrome. WHen I get paid next week will buy more test strips and really check my blood sugar.

Any suggestions? I'm watching everyone do the ZC diet to see how it works for them. Not sure I'm ready for just meat and water yet, but I'll do what it takes to NOT take oral meds of any kind.

travis t Wrote:

Charles, 
Don't we get oxidation regardless of which fuel we use in the mitochondria. There is always a small percentage of free radical leakage and these loose radicals cause oxidation of surrounding tissues, which deplete our antioxidant pool.
As far as a lowered glutathione level being related with insulin receptors i will have to find that info since it's been a while since i read it.

travis

Well, oxidation is a part of aging for sure, but oxidation comes much fast as a result of glycation and cross linking. Normally, when insulin is low, our bodies can clean this up with cell destruction in the normal course using insulin-growth factor. However, when insulin levels are chronically high, there is less insulin growth factor to perform this function and this is what leads to the amyloids of dementia and Alzheimer's.

Our insulin levels determine how we respond to oxidation. The Sisters of Notre Dame study revealed that they all had oxidation but some had dementia and others did not. As you can guess, the ones with high insulin developed dementia and the others did not.
Because of this and other studies, I've never been impressed with this whole "we need antioxidants" thing because it fails to address the cause of the deficiency. If the car is leaking oil, we need to fix the oil leak, not keep adding oil.

The Inuit had no phytonutrients or berries and antioxidants in their diet yet examinations of their skeletons showed no deficiencies in their diets. If you examine the food they ate, you would be hard pressed to find enough calcium in their diet. Yet, their autopsies consistently showed no calcium deficiency.

The same was found with deficiency diseases. Sailors developed scurvy by eating refined carbohydrates and the fruits helped them. However, no one develops scurvy when eating only meat despite the absence of fruit.

When we eat things that cause glycation, then we need to protect ourselves with antioxidants. When we eat properly, we may get some oxidation but our bodies seem to deal with that just fine.

**RE: Zero Carb / Meat and Water - MAC - 06-30-2008 11:28 AM**

[quote=Erratica]At this time I am 52 and in the middle of menopause (missed periods, all the usual symptoms like hot flashes and night sweats). This belly fat is refusing to budge. I was diagnosed with diabetes in February (fasting blood glucose of 277), when I went on a low carb diet. The days I 'binge' I eat maybe 100g of carbs, other days much less. I haven't done the ZC yet. My blood sugar is still high in the mornings (2 days ago it was 211 fasting). I think I have dawn syndrome. WHen I get paid next week will buy more test strips and really check my blood sugar."

Based on his last responses about cutting calories to lose weight I don't know if I want to recommend this in advance or not, but Dr. Eades has a new book coming out called the "6 Week Cure for the Middle Aged Middle in March 2009. So I am assuming his book will deal with belly fat.

**RE: Zero Carb / Meat and Water - Charles - 06-30-2008 11:33 AM**

Zelia Wrote:
I've never heard this before, Charles. I have read that smoking causes insulin resistance. Do you have refs about smokers craving sweets?

Oh, this is very common. Judith Rodin of Rockefeller University performed some good studies in the 1980s. "Weight Change Following Smoking Cessation: The Role of Food Intake and Exercise." Addictive Behaviors. 12(4):303-317.
Subjects who gained weight after cessation did not consume more calories but ate somewhat less protein and significantly more carbohydrate than quitters whose weights did not change. Percentage of calories as sugar, in particular, was increased. Regardless of weight change, subjects who stopped smoking showed increased preference for sweet taste. Subjects who gained weight engaged in significantly less aerobic activity than those who did not.

Zelia Wrote:
I smoked a lot for 35 years, and I've never had trouble with cravings or sweets. I was still smoking when I started LC and lost 40 pounds. Then it all came back when I stopped smoking. Tobacco smoke contains anti-nutrients, like other plant products. Lots of people have used smoking to control their appetite and weight.

So you lost 40 pounds on a low-carb diet, but you had no cravings for sweets? Did you get fat eating vegetables? Low-carb, by definition, means that you obviously cut down on sugars and you lost weight.

The cravings reportably happen when people stop smoking, not when they're smoking. Smokers tend to weigh, on average, six to ten pounds less than nonsmokers. When they quit, studies show that they will invariably gain weight. One in ten will gain over thirty pounds.

Smoking has been associated with insulin resistance but one cannot infer cause from an association.

The common belief is that ex-smokers gain because they eat more once they quit. Rodin's study showed that this increased eating only lasts about two or three weeks. After a month they eat no more than they would have had they continued to smoke. The excess in calories is not enough to explain the weight gain. Smokers also tend to be less active than nonsmokers so differences in physical activity also do not explain the weight change.

Erratica Wrote:
Charles, I'm here to tell you that I never lost weight breast-feeding! I breastfed my daughter for over 22 months, never had a period until 1 week after completely stopping breastfeeding, and have only lost 30 pounds in the past year or two (my dd is almost 17).

Now to compound any hormonal problems from pregnancy, I had 2 c-sections, and had gestational diabetes with the 2nd child, and may have had it with the first one (he weighed in at 10#3oz, my dd weighed 9#4oz).

Okay, so this says that your hormones that should have been shrinking your weight were suppressed by insulin since you mention gestational diabetes. Insulin can trump the action of any other hormone.

I'm not saying that every woman will lose after their pregnancy, I'm saying that all are supposed to. Human beings don't fatten for no reason. It may seem that way but there's just no way.

You don't have to go this low, but certainly any of these plans should be a good start and a powerful alternative to what you're doing now. I always recommend Atkins induction for everyone to start with. Try it and see if you're losing weight during the two weeks. If you are, stay with it. If you're not, then drop the carbohydrates further and see what happens.

Zero-carb is not a "plan" per se; it's just a solution to return our bodies to biological zero. I'm not arguing that everyone needs to do this, regardless of the benefit.

Okay, but what mechanism would cause thigh fat to be mobilized by breastfeeding? It is hormonal as I've been saying all along. Insulin is the chief hormone and it trumps all others. My point was that hormones attempt to return the female body to its pre-pregnancy condition after birth. It will be successful unless there is some other problem that doesn't allow this to happen. If someone is diabetic or close to it, then obviously insulin will trump the action of the sex hormones and they will stay fat regardless of whether they breastfeed or not; their uterus notwithstanding.

RE: Zero Carb / Meat and Water - feckless - 06-30-2008 11:50 AM

Charles Wrote:
In your case, you say that your pancreas was damaged due to alcohol. In what way and how did they come to determine this? Better yet, what treatment did they prescribe to treat this damaged pancreas?

You're not overweight so why would you be secreting excess insulin (causing hypoglycemia)? Alcohol gets processed similar to carbohydrates in that insulin will clear the bloodstream in order to get the muscles to burn the alcohol and not burn fat until it's finished.

It's funny to me that no one describes carbohydrate metabolism in the same way because that's precisely what happens. When you eat carbohydrates, your body suspends fat burning to deal with the glucose and consequently we don't burn glucose and fatty acids simultaneously.

Based on that, I would think it would still be more related to hyperinsulinemia, except that you said your blood sugar is actually low and you have damage to your pancreas. I would imagine that excessive
alcohol consumption caused your body to oversecrete insulin to deal with the alcohol but if your liver is
damaged, it may not signal the pancreas to react as it's supposed to.

So the question is, does your pancrease under secrete (in which case your blood sugar would be high) or
does it over secrete (which would only make blood sugar high if you are also insulin resistant)?

Hi charles...my blood sugar has never tested high, but has tested very low as i mentioned. the doc's say
the hypoglycemia IS the evidence that the pancreas is functioning abnormally after years of conditioning
from the alcohol abuse. they say diet is the only treatment right now but prescribe the usual grain based
diet. they are very concerned my chol. is 300 but my HDL/TRIG are fine (i have to fight off statins each
visit!). they did a diabetes test (H1ac?!?) which was in range. i am on thyroid meds for low thyroid too. as
for being thin, i am a fat thin person, no muscle.

does that help?!

RE: Zero Carb / Meat and Water - zelia - 06-30-2008 12:06 PM

Charles Wrote:
So you lost 40 pounds on a low-carb diet, but you had no cravings for sweets?

Yes, that's exactly right, Charles. I told you before that I don't crave sweets and never have. I've been
reading low-carb boards for a long time, and I've never experienced that drive to eat sugar that so many
struggle with. I dislike the cooked grass flavor of refined sugar and have always avoided eating very
sugary things. My husband and my daughter thought I was ridiculous for rejecting things as tasting too
sugary. I don't care for honey or syrups or jam or sticky stuff. I've always preferred savories -- nuts,
pickles, olives.

Charles Wrote:

Carbs are sugars, but they aren't necessarily sweets. I stopped eating grains, fruits, and starchy
vegetables. The only things I've missed are Premium saltines, and, during the first few months, I missed
golden raisins, which are very sugary and make a nice snack with cheddar. I learned this from my first
reducing diet from a doctor.

You're right and I should have used the word "sugars" not "sweets" but the research I was referring to
addressed sweets because that's a common finding. The real point is that ex-smokers who gain weight
invariably eat more carbohydrates not more fats. For me, saltines, golden raisins and cheese might as
well be the same as sweet potato pie because they would affect my body in a similar fashion! 😊
Charles,
Something i learned being around car racing is that when the car is in a very good balance any adjustments from that point have a large effect. A well tuned body(very sensitive to all hormones) can lead you experience things that you might not have caught before. Therefore my example of more light(summer)= less melatonin(part of the general antioxidant pool)= more use of glutathione to mop up free radicals that we always produce regardless of fuel mix(leaking oil) = less insulin sensitivity = a slight slowdown of fuel = slight craving for sweet.

I still have not had a chance to look for the connection between glutathione status and loss of insulin sensitivity. Meat is a great source of cysteine that we use to make glutathione
Huge dose of antioxidants are not needed if we are not commiting dietary sin.

Zelia's abstract Wrote:
Gestational weight gain was the strongest determinant of postpartum weight and fat mass change, which supports the premise that biological mechanisms are aimed at restoring prepregnancy body weight and composition.

Again, if you're eating a proper human diet, then "biological mechanisms" will return you to your pre-pregnancy weight unless there is some problem that inhibits this from happening. High insulin will do it!
We have to be more concerned with providing proper metabolic fuel, not just concerned with body fat as Taubes' research showed.

I don't doubt that you're correct. I just wanted to understand the mechanism, that's all. Modern nutrition seems to suggest that we have to scour the globe looking for the latest nutrient or antioxidant just in case we have some sort of deficiency. This is based on the premise that we only get all nutrients from food.

My point is that we just can't analyze food to determine whether or not the body has what it needs. We don't understand enough about what the body is able to synthesize or what cofactors in food lead to synthesis of other nutrients inside our bodies.

I know that our bodies can raise or lower our iron levels to protect us in case we're over fortified in a particular nutrient or to protect us from a deadly combination that might become toxic. We do more harm than good sometimes trying to provide what we believe to be a "missing" nutrient. Look how many of us drink orange juice to get our vitamin C not realizing that the sugar prevents us from absorbing that vitamin C. I'm sure there are many more examples that are just as valid and aptly demonstrate the folly of our thinking. The recent news on the venerable multivitamin comes to mind...

**RE: Zero Carb / Meat and Water - pennypritty1 - 06-30-2008 02:06 PM**

Well, I'm on day 3 and doing pretty okay today.

Although I have an urge for some "munchies"... By this time of the day, I want something to munch on. Since I'm still at work, I'm unable to satisfy the urge, as absolutely everything around me is high carb/junk food.

I'll just drink some more water, suck it up and wait 'til I get home and eat some more beef. 😐

**RE: Zero Carb / Meat and Water - jeepifer - 06-30-2008 03:25 PM**

I've been reading this thread with a lot of interest. Recently found out I have reactive hypoglycemia (thanks, Jimmy and Dr. Berkowitz). My levels vary from a low of 78 to a high of 113 so far. I realize this isn't too far off-kilter yet, so I'm grateful I know about it now.

So, thinking about giving zero carb a real shot, maybe for the month of July to start. I have a few questions, if you all don't mind. I've been checking around, reading the posts as much as I can, so I hope I don't sound a complete noob. 😚

How much do I eat? Especially the first few days (weeks?) when my body is changing over and all that, what is really a hunger signal vs. cravings vs. old habits? I know I should eat a little every 2 hours or so, but is that 1 egg or 3 oz meat or 10 shrimp or ? Any suggestions would be helpful. This has been a steep
learning curve for me, between the blood sugar 101 and the mis-information out there about low fat!

Also (and feel free to think I'm weird 😃) but can I put mayo or mustard or both on my meats? I read somewhere (LindaSue, maybe) that some people use spices. I'd love to know which ones are best. I don't have anything in my cabinet with added sugar, that's for sure.

What's your take on vitamin waters? Kirkland Signature has some excellent ones, zero carb (so I figure 1 per bottle), sweetened with Splenda. Will the sweetener raise my blood sugars or cause cravings?

I can't remember what else I was going to ask, so I'll leave it for now and chime in again when I remember. I need more fat to aid my memory!

-- Jenn

p.s. picked up a beef round tip roast and top loin steaks at Costco. I was very disappointed -- the only fattier ground beef they had was already in patties, at 78%. I'll have to hit my local stupidmarkets and see what they have. (BTW, don't suggest Wal-Mart. I never shop there. Thx. 😊)

RE: Zero Carb / Meat and Water - jeepifer - 06-30-2008 03:29 PM

Ah, also... I know butter, cheese (I'm assuming hard like cheddar, swiss, etc.) and coconut oil are allowed. What about mayo, heavy cream, and cream cheese? Just take it light and count the carbs (keeping under 5 a day)?

RE: Zero Carb / Meat and Water - Valcan - 06-30-2008 05:20 PM

I did it!

I finally got caught up reading this thread. It took me three days but I did it. I am also on day three of zero carb (meat and water).

Here is my story:

I am a Canadian living in the province of Alberta. I Catholic and am proud to be able to live my faith everyday as part of my job. Where I live, Catholic schools are publicly funded by the provincial government. I am married and we have one fifteen year old daughter (she is wonderful teenager - I used to think that was an oxymoron), 3 cats and 1 dog.

At the beginning of June 2007 I was 5'3" and 275 lbs. I felt like I was going to die. I had been successful on low carb (Carb Addicts Diet) in 2000 but once I fell off that wagon I continued to slide downwards (and upwards on the scale). I would try every "quick loss" fix I could and usually I would be able to stick with it for less than a week before the cravings got the better of me. In June 2007 I decided to do Atkins (I had dabbled unsuccessfully before) and went to the grocery store to buy lots of meat. While standing in the checkout I saw a women's magazine with a cover story for a diet that was faster than gastric surgery. I grabbed the magazine and that night I joined the diet that shall not be named (A.K.A. The Double-wide Russian Bride Die - DWRBD). I joined a wonderful group of American educators and with their support I dropped 60 lbs in 3 months.

Things began to smell a bit fishy at the DWRBD site and our group created our own site and jumped
ship the first week of October. I was now down 75 lbs in all. I immediately started to add fat back into my diet to try to stop the rate of hair loss I started to experience. I then went on a quest from then to now trying to find something that I can live with and will work for me. I have tried: G.I., carb cycling, calorie cycling, very low carb, zero carb (yes I did try this a few months ago), Somersize, Atkins Induction, Groves, and a few others I have forgotten. My weight bounced around like crazy but I am down another 25 lbs since October making my total weight loss 100 lbs in a year. A lot of that weight was lost during the several times I have done the Atkins Fat Fast. I also have relied heavily on support from my online teacher group and this forum. I am now stuck again and had a mini carb feast on the last day of school (June 27) that I am still recovering from. I am good at staying on track and do not normally eat carbs. I indulged at Christmas, Easter and then twice in June. I have been part of a few threads on this site but I am still trying to find my way.

One of my biggest downfalls in the last two months has been Greek Salad. It is the only veggies I would allow myself (I would eat zero carb for breakfast and lunch and then meat and Greek salad for dinner). This caused my weight to see-saw and I could not drop at a steady pace. I also have a tendency to overdo it with cheese and cream. I hope to add these back in on maintenance.

I have been working out with a group for the last 3 months with a personal trainer twice a week. She does a mixture of strength, cardio and yoga. For the summer I will have a session with her once a week. I am also playing around with high intensity interval training (HIIT), more specifically Tabata (4 minutes of very intense exercise). My goal is to do a Tabata every second day. I just finished my second one. I am also doing Oxycise everyday and adding in swimming, biking and hiking for enjoyment. It is amazing and what is fun now with 100 less pounds to lug around.

Like I said, I am in day 3 of zero carb. I have cut out eggs, cheese and AS. I feel good and have energy. I had tons of questions but I think most have been answered by the time I read through the entire thread. I have had a very stressful year at work due to some unusual circumstances and think that part of my lack of weight loss may have been due to stress and lack of sleep (What is your opinion on that, Charles?)

Charles - I have so much respect for you and your opinions. I have learned so much from you over the past few months. Thank-you for giving of yourself so unselfishly to others.

Vesna and Kristelle - Nice to see you over here! Small low carb world, huh?

Lauren - Thanks for starting this thread.

Con and Travis - You are doing awesome, thanks for the inspiration

Linda Sue - You are an awesome part of these forum also. Thank-you for all the support you offer others. I have been one of your biggest fans.

Mac - I love your posts, you are very insightful.

Everyone Else - Thanks for "putting yourself out there" and sharing your information. I have learned something from each and everyone of you.

Sorry for the long post but after three days of reading, I feel like I know so much about all of you that I guess i just wanted to get caught up and let you know about me.

I would love to jump aboard and try zero carb with all of you. Now that I am on summer holidays, I am
hopeful that I will be able to see this through and not switch diets again. I am committing to a mixture of carbs under ten and zero carb for July. I think if I commit only to zero carb, I may waiver and quit. With the option to go up to ten carbs a day, I think this will give me a psychological crutch that I need right now. I am rather ashamed of how often I have changed my low carb plan over the last several months. I feel like I keep jumping from one bandwagon to another. I really just want to stay put for awhile and settle in.

Val

RE: Zero Carb / Meat and Water - Vesna - 06-30-2008 05:28 PM

Charles Wrote:
Vesna Wrote:
It's interesting that you attribute my effortless weight drop significantly below pre-pregnancy weight completely to post-pregnancy, and that it seems you consider it unremarkable. I've never heard of that phenomenon.

This is what I usually hear about: (1) easy slide back to pre-pregnancy weight, (2) hard battle back to pre-pregnancy weight, or (3) net gain after pregnancy that took years to lose, or has never yet been lost.

When there is a problem, these things happen; however, many women go right back to where they were. I have a few attorneys in my office who didn't even wait six weeks to return! That's the part I found to be odd.

I'm saying that if everything is working right, the diet is proper, and a woman is young (which shouldn't matter with a proper diet) then she should lose her weight just as every other animal in the animal kingdom does. If she doesn't, then there's a problem. By the same token, when you're pregnant, there's not much one can do to stop the fattening process.

I think if you examine closely and really ask a particular woman, they'll tell you that they lost some weight initially and then begin to gain or the weight loss stopped.

Another question I would ask is whether the menstruation cycles were normal during the period that you lost weight and also during the period that you gained weight?

Charles,

Yes, normal cycles.

Overall, I don't get how your response connects to what I was pointing out.

The experience I related is not a typical post-pregnancy experience. The common experience is that post-pregnancy weight change period is a few months or so. I was back to my pre-pregnancy weight after a few months, predictably.

But then I kept losing for more than a year, until I was more than twenty pounds under my pre-pregnancy weight, and less than ten pounds away from optimum. That's what's uncommon. In fact, the timeline is stretched out so far, that it seems farfetched to me to connect it all to the pregnancy.

It seems you're dismissing the change to a sedentary work life out of hand -- that the pregnancy-related
hormonal environment that caused weight loss just happened to wear off exactly around the time I started sitting around eating chocolate instead of running around eating chocolate, by complete coincidence.

**RE: Zero Carb / Meat and Water - Kristi31 - 06-30-2008 08:30 PM**

On day 5 and I admit I CHEATED!!! Had some blueberries, lots. First 4 days, just meat and water. Today was really awful but I know why...and I know why I've probably been struggling with LC-ZC all this time (> 1 yr).

I skipped my hormone dose 2 nights ago and day 4 went very well BUT took my dose yesterday night and wadda ya know?! Bloating's back, abdominal aches, swollen legs and feet, hives, back pain, cravings for sweets and fatigue after meals, like MAJOR fatigue accompanied by disorientation, increased heart rate. All the symptoms of hyponatremia despite eating much salt. So, right away, it occurred to me that it might be the hormones.

Interestingly, I take my hormones once daily, at night before I go to bed and my symptoms always get better by the time I take my next dose. Morning is the worst and early evening, things improve and I don't get tired after eating...COINCIDENCE? NOT!

I know that sex hormones affect sodium. Since I suffer from low sodium and more so, when taking hormones, it only makes sense to look at the part of the equation that may exacerbate sodium loss. Well, everything seems to point to progesterone and I shouldn't be surprised. Progesterone is a diuretic, whereas estrogen increases sodium retention. Progesterone, BAD (for me), estrogen, GOOD. Progesterone pushes water into cells, so much so that my skin cells become engorged leading to hives, edema, etc. Interestingly, estrogen also inhibits lipase while progesterone tends to do the opposite so if I take estrogen only, fat mobilization will be greater although low insulin will be the predominant factor.

So, I'm dropping the progesterone and only taking estrogen, a tad lower because progesterone inhibits estrogen action to a certain extent so don't quite need to take as much.

Estrogen will help on two fronts:
1) weight loss 2) hyponatremia

Before finding out all this, I was almost ready to give up, part of the reason why I ate blueberries. But I don't give up so easily. 😊

So this is my story today. I'm still going to salt my meat but just enough. Stupid sodium!!! Argh...

p.s.: I'm feeling great right now, licked a little salt off my finger and took some estrogen...life is good, just keep it that way, k?!

Take care all. 😊

**RE: Zero Carb / Meat and Water - poo123 - 07-01-2008 04:34 AM**

Today is day 4. Yesterday I had 1/2 ground beef and then went to the beach with my daughter. When we got hungry we went to Hardee's and I had just a plain hamburger and it was pretty good. Then some steak for supper. I got plenty of sea salt because of all the salt water jammed down my throat by 1 huge wave, my salt intake is fine for at least a week I think, haha. I am very surprised as to how well this is
going. When I have done Atkins in the past and gone on and off sometime I would get the "flu" but this time its been smooth sailing and its wonderful.

RE: Zero Carb / Meat and Water - jeepifer - 07-01-2008 05:21 AM

Started off today with a couple of little steak-lets cooked in bacon grease in the frying pan. Yum! I have slices of roast, a pork chop, and a hackamer to see me through the day. I'll probably reheat more roast for dinner.

Still a little confused about the mayo/cream cheese/etc. but carrying on...

Oh! And I see what you mean about not overeating on the fatty protein -- I ate dinner last night and enough was enough!

Fasting blood sugar this AM: 101.

Better get off to work! TTFN,

Jenn

RE: Zero Carb / Meat and Water - pennypritty1 - 07-01-2008 05:49 AM

Day 4 for me as well today.

I'm happy with how well it's going for me, too. Except I think that already I'm not eating enough. I'm not even hitting the 2000 calorie mark a day. I have gone over the 10 carb count for the past 2 days but that is also because of my intake of both half and half and splenda packets for my coffee.

I need to go food shopping this week and stock up on much more high fat meat. I'm getting tired of ground beef. lol

And I don't want boredom to cause me to lose focus. I'm loving the immediate changes in my body. When eating high carbs, I'd have some trouble breathing because I'd always feel like I was choking or my throat was closing but since I changed my lifestyle of eating, I've been breathing so easily and unrestrainedly. My scale says I lost weight but I won't check it again until the end of my second week. And then I'd like to get into the gym and at least start walking, riding and stretching. Nothing too strenuous until I see how it goes. I bet yoga would be perfect right about now, huh?

have a great day, all. smooches >>

jeepifer Wrote:
Still a little confused about the mayo/cream cheese/etc. but carrying on...

If you are doing Zero Carb/Meat and Water then you don't eat cheese as cheese has carbs. Anything with carbs or is not meat is not ingested if you are truly doing zero carb. Having said that, you have 3 reasons to do zero carb IMO. 1. You are stalled and are looking to see if eliminating carbs let's you lose again. 2. You just prefer this way of eating and think carbs are dung (Herodotus). 3. You think it is just a better way of eating and you don't care to count carbs all the time.

If you want to add a bit of cheese, mayo, etc. to zero carb as the base diet that is fine as long as you have weight to lose and are losing at an acceptable base. But this is really a zero carb, meat only diet at its core based on the reasons stated above.

hmm... then I've really been doing just extremely low carb and not zero carbs... I have a looot of weight to lose (100+) but I didn't really start this to lose it quickly... more to propel me into this lifestyle with no looking back. I needed a sort of extreme change but again, I was so impatient to do it, I did not truly prepare my kitchen.

To really be honest, I was nervous about going this extreme for fear of a heart attack or some such crazy thing. lol But even doing what I'm doing I've never felt better--no hunger pangs, no gas (tmi, I know), no strange intestinal dances going on. I'm not even experiencing the crazy migraines and irritability I first did when I did low carb years ago--but then I think that's because I'm still drinking a cup of coffee a day and I remember I completely stopped that when I first did this years ago and ohmigod I can still remember the headaches. (I just cannot stand the taste of decaf anything!)

I know I'm going to have to pull back from coffee really soon. Just water is sort of scary for me. I love water but when you're eating so much food that can be greasy, I'm scared of the possibility of clogging. Oil and water do NOT mix.
Thanks, Mac. I'm definitely extremely low carbing but I will zero carb (soon as I go food shopping) lol

I've been stalled on the same 5 lbs up/down for the last two months. Some of the up is my own fault, eating off plan because I got frustrated or was having a bad day. I need to address the emotional eating issues behind this behavior, but that's another thread. LOL

Also, as I mentioned previously, I am looking to repair my insulin receptor loss, and based on what I've read so far, giving this a month to get things going in the right direction is a good thing!

I will confess to feeling a pang of loss for the good summer veggies (some growing in my garden!) but I also know these things can be added back in the future should I desire it. I have 90 lbs. to get to my goal, so I'm in this for the long haul.

Didn't Dr. Atkins say that extreme measures are needed short-term to correct imbalances and that as our bodies regulate themselves we can incorporate more things?

Thanks for the clarification on the cheese/cream etc.

The headaches and grumpiness are probably from the caffiene withdrawal. If you are anticipating another rough time, then (IMO) I think it's great you're tackling one thing at a time. Get the wheels rolling, so to speak. Making drastic changes all at once can sometimes be too much to make it stick. I wish I were one of those people that makes up their mind and *that's it* boom, never look back. 😊
RE: Zero Carb / Meat and Water - Jenn - 07-01-2008 07:29 AM

Penny,

Don't worry about the clogging, carbs cause problems, not fat. Drink when thirsty. I quit coffee 1 yr ago and I am very happy I did. Made me too anxious, hyperactive. The first week was difficult, with terrible headaches mostly but after that, it was a breeze. I never looked back!

Day 5...I thought day 5 was yesterday, oops. So anyways, I bought some pretty fatty sirloin, much to my surprise, with a few rib steaks. Ate the sirloin this morning and feel just a little tired, even with salt sprinkled on it. But I also drank some water so I might need a little more salt. In any case, I think there is still a little too much progesterone roaming inside my body and that's what still causing a few problems although fatigue is nowhere near it was yesterday and don't feel bloated. Mom noticed how my stomach looked flatter this morning. Skin isn't dry either. Will have to wait another few days to notice significant improvement, I think. Slept very well yesterday night.

Have a good day all. Here, it's Canada Day. Woopie!!!

Charles

RE: Zero Carb / Meat and Water - Vesna - 07-01-2008 07:55 AM

Vesna Wrote:
Overall, I don't get how your response connects to what I was pointing out.

The experience I related is not a typical post-pregnancy experience. The common experience is that post-pregnancy weight change period is a few months or so. I was back to my pre-pregnancy weight after a few months, predictably.
But then I kept losing for more than a year, until I was more than twenty pounds under my pre-pregnancy weight, and less than ten pounds away from optimum. That's what's uncommon. In fact, the timeline is stretched out so far, that it seems farfetched to me to connect it all to the pregnancy.

It seems you're dismissing the change to a sedentary work life out of hand -- that the pregnancy-related hormonal environment that caused weight loss just happened to wear off exactly around the time I started sitting around eating chocolate instead of running around eating chocolate, by complete coincidence.

You're probably right. You posted a lot of information and I clearly don't know the timeline as well as you because...well, I wasn't there! 😊

The pregnancy doesn't seem to have anything to do with anything. You had a baby, you lost weight -- just as you were supposed to.

Then you kept losing weight even afterwards and that is also fine, despite your diet. We all ate a high-carb diet at some point and lost weight or stayed lean despite horrible diets. I don't think anyone will argue that this isn't a slow process. The metabolic problem that causes obesity only results in a .01 of 1 percent slow down in the movement of fatty acids through adipose tissue. That's why it takes so long for the effects to show up.

This is what accounts for the slow, steady weight gain that people experience over time. I gained 65 pounds over 14 years. If it would have happened within a year or two, I might have tried to take action. Instead, it crept up on me like it does everyone else.

At some point there was a metabolic change that caused you to lose energy and slow down. It wasn't the slow down that caused the metabolic change. I'm not going to be able to point to one thing you did that caused the problem. I'm sure it was the accumulation of events largely caused by your bad diet and only at that time did it manifest itself. You did the damage long before you saw it.

William Banting reported on this in 1864. The stuff he used to eat with impunity now caused him to become corpulent. That was the main point he wanted to get out in his "open letter."

Everyone must understand this. Even the good things that you are eating now will not immediately show up on the scale. It takes time. In fact, the food you eat today won't show up on the scale for several days. Many studies bear this out. Of course, there are some people who can eat a piece of chocolate cake and they will weigh 2 pounds more the next morning. Others will actually lose weight the next day, but then a week later, they will show a gain.

I do dismiss the change to a sedentary lifestyle because I have exactly the lifestyle you describe. I sit at a desk daily from 9 to 6 most days and I play XBox360 and even watch television some. I just don't attribute sedentary lifestyle to cause; although I do acknowledge the association.

People move less because they are unable to use the stored energy for fuel. The sedentariness is a symptom not the cause. That's my point.

I'm late to the party, but if you were breastfeeding it is possible to easily keep losing and maintain for a while after stopping. I don't know what changes, since the hormones are normalized by this point, but I started gaining about six months or so after I stopped BF. Unfortunately I didn't notice until I'd gained 40 lbs! Ack.

Also, I have to respectfully disagree with a switch to a sedentary lifestyle not having an impact. Maybe it is more of a factor with women than men, but I can pinpoint the start of my weight gain to going from a retail job to a desk job. If the only "exercise" you are doing is at work, and you suddenly stop doing it, without adjusting anything else, then it's possible to gain weight (I'd add especially if you aren't dieting or trying to lose). Wish I'd realized this at 25 instead of 38!

I've been reading this thread with a lot of interest. Recently found out I have reactive hypoglycemia (thanks, Jimmy and Dr. Berkowitz). My levels vary from a low of 78 to a high of 113 so far. I realize this isn't too far off-kilter yet, so I'm grateful I know about it now.

Welcome and it's great to have you join us. If you've read through this thread then you already know why I don't buy reactive hypoglycemia....

jeepifer Wrote:
So, thinking about giving zero carb a real shot, maybe for the month of July to start. I have a few questions, if you all don't mind. I've been checking around, reading the posts as much as I can, so I hope I don't sound a complete noob.

There are no bad questions. Bring 'em on!

Jeepifer Wrote:
How much do I eat? Especially the first few days (weeks?) when my body is changing over and all that, what is really a hunger signal vs. cravings vs. old habits? I know I should eat a little every 2 hours or so, but is that 1 egg or 3 oz meat or 10 shrimp or ? Any suggestions would be helpful. This has been a steep learning curve for me, between the blood sugar 101 and the mis-information out there about low fat!

You should always eat to appetite. When you are hungry you should eat until you are not hungry. When you are not hungry, you should not eat. This may sound obvious, but I assure you, it's not.

You should not eat every 2 hours or so. If you are trying to follow Dr. Berkowitz and Jimmy, then you should go over there and see what they recommend. If you believe your problem is more related to hyperinsulinemia (which I firmly believe it is) then zero carb can help with that because you can condition your insulin response in such a way that will promote the mobilization of fatty acids and decrease the opportunity for fat storage.
Insulin's major job is to regulate blood sugar and fat metabolism among other things. To do this, it clears the bloodstream of any usable fuel in order to allow our body to capture and eliminate dietary things that we were not adapted to consume in large amounts such as alcohol and glucose. This allows the muscles and cells to have unrestricted access to these foreign substances so they can burn them. After the food is digested, the fatty acids, amino acids, and nutrients all return to the bloodstream to power and repair our bodies.

The initial surge of insulin that clears the bloodstream causes the shaking and hypoglycemic feeling that Dr. Berkowitz is describing. Consuming carbohydrates only exacerbates the problem. It does fix the symptom temporarily but it does so by furthering the fattening process. It's a vicious cycle. To break the cycle, you have to greatly reduce or eliminate the carbohydrates and condition the insulin response.

The best mechanism to condition your body's insulin response and assist insulin with regulating blood sugar is consuming fatty protein, preferably that with a 3:1 ratio of fat to protein. Almost any protein works but you want to stay away from the leanest meat as this results in loss of energy and can be toxic if overdone.

Jeepifer Wrote:
Also (and feel free to think I'm weird 😏) but can I put mayo or mustard or both on my meats? I read somewhere (LindaSue, maybe) that some people use spices. I'd love to know which ones are best. I don't have anything in my cabinet with added sugar, that's for sure.

I don't advocate mayo because it contains soy and soy is a major health problem. Mustard is fine. Spices can be good but be careful because some spices promote an insulin response and that is what we're trying to control. Celtic sea salt and pepper are safe choices. You'd be surprised where sugar resides.

Jeepifer Wrote:
What's your take on vitamin waters? Kirkland Signature has some excellent ones, zero carb (so I figure 1 per bottle), sweetened with Splenda. Will the sweetner raise my blood sugars or cause cravings?

I'm not a fan of any additions to good ol' water. I'm certainly not a fan of Splenda and artificial sweetners. In order to be successful on a zero-carb diet, one must control the "urge for the sweet" and this is very difficult to do. I struggle with this myself, especially during the hot summer months. This is probably a natural response and if I was able to go through life without messing up my metabolism, I probably could eat seasonal fruits without a problem. However, today they cause me problems.

Any sweet-tasting thing can cause you to secrete insulin in anticipation of it and if you're hyperinsulinemic, that's a major problem because you already over secrete -- even between meals. This is a problem because anytime you are secreting insulin, you are not circulating fatty acids. We need to decrease the periods that fatty acids are not allowed to circulate and this is how we decrease the size of fat tissue.

Jeepifer Wrote:
I can't remember what else I was going to ask, so I'll leave it for now and chime in again when I remember. I need more fat to aid my memory!

Well, we're here when you think of them. Again, it's great to have you and if this is what you want to do, there are many experienced folks here to help you.

Regards,
Charles

Jenn Wrote:
p.s. picked up a beef round tip roast and top loin steaks at Costco. I was very disappointed -- the only fattier ground beef they had was already in patties, at 78%. I'll have to hit my local stupidmarkets and see what they have. (BTW, don't suggest Wal-Mart. I never shop there. Thx. 😊)

That's too bad because Wal-Mart sells some optimal food at a good price. They sell 73/27 ground beef in a roll and that is the perfect fat to protein ratio. I'm sure you can also find good fatty protein at a "stupidmarket" as you called it. Look for beef spare ribs, lamb rib chops, prime rib, beef balogna (nitrate and nitrite-free) and whole duck. Those are the best. Besides that, brisket, chuck, tenderloin, skirt steak, sirloin, veal, chicken thighs with the skin, cornish hen, mackerel, salmon, snapper, and trout are also good choices.

Wish I'd realized this at 25 instead of 38!

That just means that your diet was wrong. Exercise may mask the symptom of weight gain, but it's difficult to call it a "cause." For instance, if you are eating carbohydrates, then exercising would slow your weight gain because your body is moving more glucose to your cells. That's like applying a bandaid. That doesn't account for why you were putting on weight in the first place.

If your diet is proper, then you will not gain weight despite a lack of exercise. In fact, many people here do no exercise and have dropped an impressive number of pounds. When you increase energy expenditure, your body will respond by prompting you for more energy consumption. By the same token, if you starve yourself, you'll experience an energy slow down within a relatively short time. We see it in this country every January to the end of February.

It's the same thing for any animal in the animal kingdom. No creature fattens for no reason and no creature has to be in constant motion to keep their weight in check.

RE: Zero Carb / Meat and Water - jeepifer - 07-01-2008 08:57 AM

I won't quote all the great info above, but thanks! It is more than possible the issue *is* hyperinsulinemia (whew, that's a mouthful to type!). I'll have to do more digging and reading on this.

Charles Wrote:

There are many recipes floating around. Check out LindaSue's area and I bet you'll find a few. I just don't have anything to put it on! 😊

Jenn Wrote:
Do you consider Stevia then to be an AS? Of course, putting stevia in plain water is a bit... er, strange. But for sake of clarification. LOL

Stevia would seem to be the better choice but as the article points out, the problem with these all-natural sweeteners is that we are now isolating these things from the plant they grew on and we're consuming them at levels much higher than they naturally appear in nature. This is bound to show up somewhere. Moreover, we don't know that much about sweeteners in general as far as their long-term effects. We all thought hydrogenated oils were safe and healty twenty years ago and we see what happened with that.

Fruits were good once upon a time as well, but now we consume fructose at unnatural levels. I read somewhere that it takes eating 60 apples to consume the same amount of sugar that one gets from one can of regular soda.

Jenn Wrote:
What about nitrate/nitrite-free hot dogs or bacon? I wouldn't consider them more processed than balogna. Thoughts?

I think that would be fine but you'll have to experiment and see. If you are losing while eating them, they stay. If you gain weight or your weight loss slows or stalls, then you might try eliminating them. The key is to establish a base level of losing weight by eating fatty protein and water. If you are going to experiment, then maybe add the new food to one meal per day for a week. Then you can see what effect the new food has.

Jenn Wrote:

It's probably the bone and I think they are more fatty. I love the short ribs as well. For lunch today, I have one big spare rib and three short ribs. I'm wondering if I'll be able to eat all of it! 😊

RE: Zero Carb / Meat and Water - pennypritty1 - 07-01-2008 09:27 AM

Apparently I'm not savvy enough to do the quoting you guys do so effortlessly, so ... 😒

I had no idea mayo had any soy in it!!! And here I thought mayo was a safe use because it's high in fat... sigh... (I loove may) ungh!!! (mental headslap)

As for the Celtic sea salt, I use sea salt but don't have specifically Celtic. But then like Jenn, I'll be doing my search for supplies as well. I love netrition.com and there are many other health sites from where I can order and probably, Celtic is in the "stupidmarket" **I loooove that!!!** I have one of those, too, Jenn!

I'd really prefer to find a reputable meat market near me. Of course there are lots of meat markets around, but I need a good, safe one that I know provides quality foods. So, onto googling I go...!
Far as not having to actually exercise while losing, I'm almost saddened to hear that. I literally just joined a gym to work out along with my low/extreme low carb switchup. LOOL

Of course I'm a true believer in that weight training will help me reshape my glob of a body 😊 as I lose, so while disappointed, I'm not too broken up and the gym won't go unused (again). It just lightens the gym pressure for me--which in turns makes this a Yay!! moment.

I know my message sounds all over the emotional scale but I'm just so glad (overall) to have a forum to pour all this out to. My family still looks at me like they're just waiting for me any day now to snatch the proverbial sugar-laden lollipop from the baby knowing I am now a lowcarber again. They don't understand. While it looks like I just plopped down and said I'm lowcarbing again, it wasn't that quick or easy a decision. This has been something I'd been debating, pulling apart, thinking long and hard as well as reading up on for quite a while. I have an awesome arsenal of recipes, cookbooks, Blaine's low carb cooking DVDs and even some low carb energy magazines from subscriptions that I've continued to purchase to prepare for that major life change.

I'm determined to change my mind and keep saying life change because if I start saying diet, I know me-the diet will end. Even though society has taken a downturn towards low carb saying it was a fad and that it's over, there are still soooo many people and testimonials that are still going on that testify to the success and healthy living this life change brings and I'm glad to be in the number!

...well, back to work!

smooches >>

Not all mayos use soybean oil. Some use canola oil. You just have to check the ingredient list to find out. I think they even have organic mayonaise which I guess means the eggs in it are organic.

But then if it has canola oil in it, it has PUFAs and then we can get into a whole discussion about MUFAs and PUFAs and SFAs.

I call 'em that cuz they push all the junk food to the masses. Stupid. Where are the deep discounts on MY items, darn it?

Of course, I need to get more savvy about expiration sales and such. I've been spoiled shopping at Costco. 😁

pennypritty1 Wrote:
I'd really prefer to find a reputable meat market near me. Of course there are lots of meat markets around, but I need a good, safe one that I know provides quality foods. So, onto googling I go...!

I find the meats at Costco to be of pretty good quality. Charles likes Wal-Mart ( 😮) and if you have a local butcher shop, stop by and ask them about giving you fattier cuts of meat and ground meat. Maybe they'll give you a discount! I'm sure others have more to add.

pennypritty1 Wrote:
I know my message sounds all over the emotional scale but I'm just so glad (overall) to have a forum to pour all this out to. My family still looks at me like they're just waiting for me any day now to snatch the proverbial sugar-laden lollipop from the baby knowing I am now a lowcarber again. They don't understand. While it looks like I just plopped down and said I'm lowcarbing again, it wasn't that quick or easy a decision. This has been something I'd been debating, pulling apart, thinking long and hard as well as reading up on for quite a while. I have an awesome arsenal of recipes, cookbooks, Blaine's low carb cooking DVDs and even some low carb energy magazines from subscriptions that I've continued to purchase to prepare for that major life change.

Oh, I feel ya... :::hugs:::

pennypritty1 Wrote:
I'm determined to change my mind and keep saying life change because if I start saying diet, I know me-the diet will end. Even though society has taken a downturn towards low carb saying it was a fad and that it's over, there are still sooo many people and testimonials that are still going on that testify to the success and healthy living this life change brings and I'm glad to be in the number!

For those of us that have health issues (that would be me, LOL) this needs to be a life change. It's so great that the folks here can give support and advice.

pennypritty1 Wrote:
As for the Celtic sea salt, I use sea salt but don't have specifically Celtic.

Penny, you don't have to use Celtic sea salt in order to eat this way. Charles just happens to like that kind of salt. I use regular non-iodized table salt and always have done. The thing you have to watch out for with iodized salt is that they sometimes add sugar to it. Check the labels.

Here's a link to a nearly fool-proof homemade mayonnaise recipe that you can make with any oil you choose: [http://www.genaw.com/lowcarb/neanderthin_mayo.html](http://www.genaw.com/lowcarb/neanderthin_mayo.html)

pennypritty1 Wrote:
Far as not having to actually exercise while losing, I'm almost saddened to hear that. I literally just joined a gym to work out along with my low/extreme low carb switchup.

Charles never said that exercise is harmful or that we shouldn't do it for reasons other than weight loss. Going to the gym will probably make you feel and look better. I recently started doing Callanetics twice a week again after stopping them for many months. I like how they make me feel and they help tone up my body. They help me feel younger and not so much like the old lady that I am.

LOL--I didn't mean to imply he said it was harmful, I'm just saying I could've saved two-years of my life not paying for a gym when I'm going to lose weight anyway in this lifestyle. But like you said, the gym is still my favorite place because I like to weight train. It makes me feel really good.

That was just a little humor gone bad. lol

I'm googling Callanetics. I've always wanted to try gyrotonics myself with the machine. It's supposed to be a wonderful toning and stretching workout, but I can't find them in my area which is crazy because pretty much everything is in New York City--so... back to googling.

You do realize we newbies are hanging on to our low-carb guru's every word and considering it gospel right? I just want to do it right and I know you've gone through what I'm working towards so I'm pretty
much absorbing most everything you write or suggest and taking it literally (I'm pretty literal and try to loosen that up as much as possible.)

jeepifer Wrote:
That sounds yummy! How do you cook the spare ribs? I do short ribs on the Foreman, just like any other. Although, I did my steaks in the frying pan with bacon grease, and OH MY! were they good.

-- Jenn

I just stuck them in the convection oven this morning and they were really good. I couldn't eat very much of my lunch at all which was a surprise. It's the fat and it really satiated me quick. I could only eat two of the short ribs, which is strange for me.

RE: Zero Carb / Meat and Water - Charles - 07-01-2008 11:48 AM

jeepifer Wrote:
As for the Celtic sea salt, I use sea salt but don't have specifically Celtic. But then like Jenn, I'll be doing my search for supplies as well. I love netrition.com and there are many other health sites from where I can order and probably, Celtic is in the "stupidmarket" **I loooove that!!!** I have one of those, too, Jenn!

LindaSue is right, it doesn't have to be Celtic sea salt. The Weston Price people love Celtic sea salt and that was the first one I tried. When I was at Whole Foods last week, I saw that there were many varieties of "sea salt", some that were different colors and had different nutrients. The thing was that they were all minimally processed and that was the kicker for me. I bought a nice salt grinder from IKEA and I just twist and shake it!

No one has to shop at Wal-Mart, but since they are all over this country, I found it easy to identify products and make recommendations using their stuff because people can easily go out and find it. I don't mean to suggest that they are the only ones who have something or that they are even the best. I also enjoy Costco but I don't always like the big portions they give. Sometimes I just want some cheap steaks, not some big ol' roast! I also hate that they don't take Visa. It's either a bank card or American Express in North Carolina. Is it that way everywhere?

Many people say that they can't afford to eat low-carb because of the expense of meat and things like that. For this reason, I highlight stuff I get at Wal-Mart to show that it is affordable and easy. I'm not a fan of variety. I think variety is what got most of us in trouble in the first place.
When losing weight, I think it's valuable to establish a small group of foods from which one eats regularly. Additions to a diet should be made sparingly in order to account for any changes in weight, energy level, concentration, etc.

Some folks can eat eggs or eat cheese but many cannot. Some may find that they can eat cheese and eggs and lose 100 pounds. However, they may stall after 120 pounds and then the cheese and eggs will have to go in order to proceed any further. Be prepared for these types of things but don't be afraid to strike any food that doesn't work for you.

Oh, and exercise because you enjoy it, not because you think it's going to help you lose weight faster. It may cause you to gain weight in some cases but we discuss this over in the exercise forum. 😔

Let nothing keep you from your goal!

It won't refrigerate into clumps. It will harden back to the same state it was in before it melted. At least that is my experience. I put mine to close to the crockpot. It melted and then rehardened when taken away from the crockpot.
Charles Wrote:

Oh, next time I'm in the IKEA area, I am *so* gonna get one of these. Or add it to my birthday list! I have "fine" ground sea salt from Whole Foods (their 365 house brand). I've never tried the colored varieties, but that might be an interesting change. Somehow I just assumed it was some form of coloring, but different minerals makes sense.

Charles Wrote:

Yes on the bankcard or AmEx. I don't mind the big portions because I'll slice, cut and freeze what I can't use in 2-3 days. Or cook up a whole huge roast, and again, freeze for later use. A little time on the front end saves me time later, I guess.

The downside is they don't carry every available selection. I know they have the short ribs, but I don't think I've seen the spare ribs. Or maybe since I wasn't specifically looking, I missed them. Will have to check!

At any rate, I find for me that 1. being informed, 2. being prepared, and 3. planning ahead are all necessary for me to succeed.

For example, today DH wanted to meet me for lunch. BUT since I hadn't thought ahead to figure out where we could go so I could get a steak or hackamer or something, I declined and ate my pork chop since that was the safest bet and I wasn't prepared.

It doesn't have to be expensive to eat this way. I have pretty good luck finding the fatty ground beef marked down to .99 pound just about every week or every other week and it's even nicer than the Wal-Mart ground beef. I just bought about 11 pounds of it today and made pile of patties. If I can manage to get by on a budget of about $50 per week for groceries (food as well as everything else) to feed me and my husband (who doesn't necessarily eat low carb), anyone can do it. We haven't gone hungry yet and my freezer is always full of meat and other stuff that I bought on sale. It takes a bit of work and planning but it can be done.

jeepifer Wrote:

Some people use the mild (not extra virgin) kind of olive oil or peanut oil to make mayo. I just used cheap vegetable oil when I made it but I can't afford the expensive stuff.

jeepifer Wrote:

I have "10 in 10" and "Super Callanetics". Go ahead and dust them off. I think you'll enjoy them. It will be a while before I can get back to doing Super Callanetics. They're enhanced versions of the routines in regular Callanetics and much harder. I sometimes mix a few of the Super exercises into my "10 in 10" session just to make it more of a challenge.

This is huge and I'm glad you mentioned it. This can make the difference every time. I am not against fast food either. I can always go to a restaurant and order a big hamburger and eat it without the bun. Those burgers are probably leaner than what I would like but they would get me through lunch if necessary.

feckless Wrote:
sorry to bump my own post charles, but i think it got lost in the shuffle and i really would like your guidance before i enter into meat/water as i am going against all of my docs and am afraid of having severe blood sugar crashes!
feckless Wrote:
Charles Wrote:
In your case, you say that your pancreas was damaged due to alcohol. In what way and how did they come to determine this? Better yet, what treatment did they prescribe to treat this damaged pancreas?

You're not overweight so why would you be secreting excess insulin (causing hypoglycemia)? Alcohol gets processed similar to carbohydrates in that insulin will clear the bloodstream in order to get the muscles to burn the alcohol and not burn fat until it's finished.

It's funny to me that no one describes carbohydrate metabolism in the same way because that's precisely what happens. When you eat carbohydrates, your body suspends fat burning to deal with the glucose and consequently we don't burn glucose and fatty acids simultaneously.

Based on that, I would think it would still be more related to hyperinsulinemia, except that you said your blood sugar is actually low and you have damage to your pancreas. I would imagine that excessive alcohol consumption caused your body to oversecrete insulin to deal with the alcohol but if your liver is damaged, it may not signal the pancreas to react as it's supposed to.

So the question is, does your pancreas under secrete (in which case your blood sugar would be high) or does it over secrete (which would only make blood sugar high if you are also insulin resistant)?

Hi charles...my blood sugar has never tested high, but has tested very low as i mentioned. the doc's say the hypoglycemia IS the evidence that the pancreas is functioning abnormally after years of conditioning from the alcohol abuse. they say diet is the only treatment right now but prescribe the usual grain based diet. they are very concerned my chol. is 300 but my HDL/TRIG are fine (i have to fight off statins each visit!). they did a diabetes test (H1ac?!?) which was in range. i am on thyroid meds for low thyroid too. as for being thin, i am a fat thin person, no muscle.

does that help?!

That's okay. I must have missed your reply post. I had to go back and re-read all that you wrote. Okay, when does your blood sugar show that it's low? In other words, is this from doing a fasting glucose test?

When do you have your crashes and how often does this occur? Is it right before you are going to eat or do they just come at random times?

It shouldn't surprise us that your blood sugar is low during a fasting test because it's more than likely due to hunger. Are you ravenous during the test? By the same token, when folks with pre-diabetes take fasting glucose tests, their tests can oftentimes appear normal because it's a fasting test. That doesn't tell us anything about what it is before they eat. We should expect that the number will be lower for a fasting test.
Are you able to test your numbers prior to meals?

When you have to call the paramedics, is this because you waited too long to eat?

What do you eat and drink now on your Paleo plan?

How long can you go between meals before you're hungry again?

I think zero-carb can work based on what I think you're going to answer me, but I want you to answer anyway. It's going to be a matter of conditioning your insulin response. You will more than likely have to set regular meal times and just not deviate much from those times in order to keep your blood sugar steady. If you are hypersecreting every couple of hours, then you might have to use a low glycemic fruit or salad until you get the response better conditioned.

There's nothing wrong with a very low-carb diet until you get this under control and then you can always lower the carbohydrates as you go along.

Let's see what you answer first.

Charles

**RE: Zero Carb / Meat and Water** - poo123 - 07-01-2008 02:18 PM

Hi guys, today I was at Sam's Club and picked up some big packages of chicken thighs with skin and chicken legs and the packages were only 5 and 6 dollars. And there were 16-18 in each pack. I use the chicken along with the beef for a taste variety. This meat and water way of eating is really doing wonders for my self esteem. I am able to stick with this, no cheating, no cravings and I feel really good. I told myself when I started this that I am doing this to live better so all other foods are not an option. I like it just this way because if I have too many options then I want more options. Just meat is just meat no other food and that give me a break, in not having to decide what's for dinner, and snacks and what is allowed. And I am doing really well with fixing things for the rest of the family. No tasting, I get my husband to do it and the kids are enjoying the chicken legs way too much. So all in all its a good thing...

That doesn't tell us anything about what it is before they eat. We should expect that the number will be lower for a fasting test.

I am questioning if I am pre-diabetic or not these days. Close or there is my guess. My fasting BG was 118 in January with my blood tests. BUT I was doing low carb for over a month by then. But then my meter tells me it gets that high upon rising some days after being up an hour. Not usually at that level anymore via my meter but I don't check my BG as often since I eat very low carb (< 10g/day). So my pre-prandial and 1 hr and 2 hr post-prandial BG levels are pretty much the same. Which is what Dr. Bernstein is all about with BG.

I have read that someone who low carbs sees a rise in their fasting BG over time. Mine seems to hover in the high 90s or low 100s either pre-prandially or post prandially. I did a home version of a GTT (70 g white rice right after getting up in the morning) after having carbo loaded for three days (> 150g carbs per day for three days) a couple of months ago (big mistake as I have never gotten back to the weight I was right before doing the test - now getting closer but no cigar) and my 1 hour PP BG soared to 175 mg/dl and my two hour PP BG was around 130 for that home test. Carb adapted or not those are not particularly great numbers.

GTT BG readings are a much better test than Fasting BGs anyway as you are right that they really can't tell you how glucose impaired you are.

Which is why Jimmy is getting a GTT soon. Fasting BG levels are the last thing to tell you anything. The barn door is already closed.

---

RE: Zero Carb / Meat and Water - feckless - 07-01-2008 02:41 PM

Thanks Charles, see my answers in blue below....

Charles Wrote:

When do you have your crashes and how often does this occur? Is it right before you are going to eat or do they just come at random times?

during 3 hour GTT, drinking whatever it is they give you drink before hand, my BS stays in the normal range for about 1.5 hours, then plummets to under 30. i do not feel ravenous, i feel manic, almost high, mentally out of it. i never feel what i would call normal organic hunger or fullness. it is either craving all the time, even when i know i have already eaten plenty, or a sort manic high which is when i know a
crash is coming.

Are you able to test your numbers prior to meals?
when i had a monitor i was normal before meals, but that was years ago. in a couple weeks they are going to implant a chip in me which will monitor my BS every 5 minutes!

When you have to call the paramedics, is this because you waited too long to eat?
other people call them, as i have passed out/become very disoriented at work, or in my neighbors house. it was not because i had not eaten, i had eaten and sometimes keep eating frantically. but i keep on crashing anyway. usually only concentrated sugar brings relief. but when i include fruit or caffeine regularly in my diet, it will make attacks more likely. but they can come even when i am being very strict with my VLC diet.

What do you eat and drink now on your Paleo plan?
fatty meat, butter, green veg, sometimes cream/sour cream, green salad with olive oil/vinegar, very few nuts.

How long can you go between meals before you're hungry again?
I always feel craving, i wouldn't call it hunger. i don't think i feel normal hunger at this time. but i can sometimes go 4-5 hours before starting to feel manic.

I think zero-carb can work based on what i think you're going to answer me, but i want you to answer anyway. It's going to be a matter of conditioning your insulin response. You will more than likely have to set regular meal times and just not deviate much from those times in order to keep your blood sugar steady. agreed, and when i do need to resort to a sugar to avoid a major crash, what would be best and how much?

There's nothing wrong with a very low-carb diet until you get this under control and then you can always lower the carbohydrates as you go along.

Let's see what you answer first.

Charles

i should also note that when i eat a high fat/moderate to low protein meal, i become extremely lethargic and my heart rate rises significantly. my system feel really overburdened. i realize i may have to ride this out. i tried ZC once for two weeks and this never eased. i had to stop because i couldn't function in my life.

Thanks again Charles!

This is an interesting question. I lost 45 lbs on a vegan diet over 7 months or so and I was doing cardio
and weight lifting the whole time. My current weight is about the same as when I stopped exercising 7
months ago. I have a desk job and don't do squat for exercise at the moment. I really haven't gained a
pound doing low carb these last 7 months. I've had small ups and downs of 5 lbs or so but I now weigh
the same now as then with no exercise. I haven't exercised squat in the last 7 months and have not
gained any weight. So no exercise and weight gain? Not by my example.

Which reminds me I need to get in 20 minutes of some cardio starting today. I promised myself I would get back to exercising again July 1.

P.S. I had this same discussion in the old forum with Charles. I gained a lot of weight when going to college and so did my brother (and I commuted to college). Hitting the books does not make for a lot of time for exercise. However, can I say the inactivity caused the weight gain? Not really as who knows how much stress I was under or what my diet was like? Or if I ate the same as I did before even though I was less active. Too many variables w/o any documentation.

RE: Zero Carb / Meat and Water - poo123 - 07-01-2008 04:07 PM

uggh, I just had 3 small chicken thighs with skin and I am stuffed. Today I had 1/4 lb ground beef for breakfast, small hamburger with bacon from Wendy's and now the thighs, and water and unsweet tea. I could not eat another bite, but if I was doing some carbs I could have had so much more. This is really COOL !!!

RE: Zero Carb / Meat and Water - jeepifer - 07-01-2008 04:34 PM

Around 3pm or so this afternoon, I was yawning and felt tired. It passed after about an hour, but is there something that causes this? I think I read that feeling tired and lack of energy is normal at first as your body starts to try to switch over. Just wondering. I've felt great otherwise!

My blood glucose first thing this morning was 101, and at 2:30, 1/2 hour after eating my pork chop, it was 98. That's all I've taken so far today...

RE: Zero Carb / Meat and Water - jeepifer - 07-01-2008 04:49 PM

How do you cook the thighs?

And yeah, I agree, I was asking how I know I'm not hungry. Dayum, I know! Woot!

RE: Zero Carb / Meat and Water - jeepifer - 07-01-2008 04:50 PM

What about pork? In my shopping excursion today there were pork ribs and tenderloin and such. I thought pork was (or can be) pretty fatty.

I came home with lots of ground beef, 2 cornish hens, some chicken thighs, and beef spare ribs (but the shorter kind).
Hi,

I had a great zero carb day today. Pork belly strips for breakfast, rib-eye for lunch and will have chicken thighs again for dinner. My hunger has dropped a lot and my cravings are gone. I have dropped most of the weight from my bad eating last week. Once I have zero carbed for two weeks, I would like to try adding egg yolks back in to my diet to see what happens. I love ground beef scrambled fried with egg yolks.

It is so much easier to follow this WOE when so many others are doing it also. When you feel that you are the only one it is so much more difficult. I would have to say that the online support has been the number one reason that I have lost 100 lbs. When I first tried low carbing ten years ago, it was a lonely process and without the support, it was so easy to fall back into the "norm" of carby food.

Poo -I have a Nuwave Oven and it is wonderful for cooking any kind of meat you want. It has racks that you put your food on so that the fat drips off. Instead I put the meat in a pan and put the pan on the rack so that none of the fat drops off. I did chicken thighs last night and they came out perfect. I dipped the chicken into the drippings, it was yummy. At lunch today I did a frozen steak in 25 minutes. It was pink, juicy and tender. The temps have been in the 90's here so it is nice to cook meals with something that does not heat up the house. If you go to the "Foods and Recipes" thread, there is a photo and discussion about this oven.

Jeepifer - Try roasted pork belly, it is so good and satisfying. Lots of nice fat on it. You can cook it so that the fat is still squishy or keep cooking until the fat is crispy.

Val

Jeepifer I just throw the thighs in a baking pan sprinkle with some s&p and bake for 45 min at 425. Thats it the skin gets nice and brown but not really crispy so the fat stays in and its great. I do that with my chicken legs too. With my chuck steak I cook them with butter on the stovetop with some garlic and some red wine vinegar. It sure is tasty..

Pork is fine. Just make sure it is fatty. My cousin was married to a hog farmer from Iowa. This goes back 25 years now. They bred pigs for leaness. That is what the low fat movement has wrought. Can't even get some decent fatty meat anymore.
I'm back to just meat and feeling pretty good. Had ribeye tonight WITHOUT salt and no problemo! Maybe the change in hormones is already helping but it's too soon to say.

It's so cool that we're in this all together and that we have Charles to kind of guide us through. Thanks Charlie....Charlie's Angels...hehe! 😊

I was actually part of another group on Yahoo dealing with ketosis, etc. and they kicked me out for arguing with the owner on certain points. For example, she states that protein in excess of what your body needs for amino acids ALWAYS converts to glucose or that muscles can only adapt to ketones if protein is kept to a minimum such that there is no surplus glucose from protein keeping the muscles glucose-dependent. She also says that when blood glucose rises, insulin starts to kick in, whether the glucose comes from protein, fat or carbs. I disagreed, laid my arguments on the table but she seemed to take offense and so, I got kicked out. She and her co-owner thought I wanted to take control of the group. In the end, I was just trying to provoke discussion so that other members could see both sides and share their personal view or what they learnt through research. Interestingly, the owner never substantiated her claims with research, just said she had a Ph.D in nutrition and did lots of research and self-experimentation with measuring BG and such.

We also argued about muscle and liver glycogen stores. Do these always stay full? What's the deal with that?

And glucose from fat? Does glycerol convert back to glucose for the body's needs? I know there is very little glycerol coming from our diet due to lower (or no) carbs but dietary fats provide glycerol, don't they? and that's why we still have triglycerides in our blood, even on zero-carb? right?

Some argue that fat provides glucose (from glycerol) for those cells that rely on glucose entirely like red cells or kidney (??), then if this is not enough, glycogen stores are used up and if these are still not enough, then protein conversion to glucose kicks in. Also, when zero-carbing (or very-low carbing) do our muscles run on free fatty acids because it seems that some people who follow the zero-carb approach exercise and their ketones from before exercising stay the same after, clearly showing that ketones are not being used by muscles. Some also say that muscles will only run on ketones if protein is kept to a minimum (to avoid glucose conversion, which seems strange to me) and carbs to a minimum as well.

Charles, can you clear this up and provide some studies, as you always do? 😊I'm really curious. People keep insisting on protein conversion to glucose. True or false? To me, it seems false. The conversion of glucose from fat also seems suboptimal as only 10% of it can convert.

Here is what I think: glucose from the blood gets sent to cells for immediate use. Then, when cells need more energy and if no glucose is provided in the form of carbs, fatty acids begin to mobilize with ketones as a by-product but because some organs like the brain still functions on glucose (and needs lots) and cannot rely on ketones (or FFA) yet for energy, liver and muscle glycogen stores are used up and exhausted. Then, when brain still requires much glucose, protein becomes the next best source of glucose and it is critical at this moment to eat enough protein so as to not lose muscle mass. Eventually, within 1-2 weeks, the brain starts adapting to ketones and glucose requirements go from 100g to 40g daily or something like that. Muscles run on fatty acids. Protein continues to provide the much needed glucose for those parts that need it. But what happens if protein stops coming in? Does the glucose come from lean mass or fat? I would think lean mass and this probably would result in much slower metabolism, less toned body, weaker energy since muscles are being wasted away. And weight loss obviously. I remember reading about Stefansson having to live off fat only for about 10 days and feeling
satisfied hunger-wise but weak and sleepy.

So, Charlie, what's your take?

Sabrina 😊

Wow, congrats on the loss! I first did low carb in 1999, and I know what you mean about no one having heard of it or understanding it.

Of course, very few people truly "understand" it now. 😊 I agree the support is the main reason I haven't given up!

How do I cook it? In the oven? I'm really learning here! And thanks, I will look for that next time I'm out. Is it something a regular grocery would carry or just a butcher?

RE: Zero Carb / Meat and Water - Kristi31 - 07-01-2008 05:42 PM

Valcan,

yes, this is a small world and I'm so glad you're doing well. 😊 Keep it up and don't give up, you're one of us now, a Charlie's angel...we'll have to make up extra angels on top of those three plus some extra boy bodyguards. What a crew we have!! Our mission: to convert everyone one else to zero-carb and make this world better for everyone. 😊

RE: Zero Carb / Meat and Water - Ell.eee - 07-01-2008 05:58 PM
Good success on 3 days of 10 carbs or less down from the 20 I ate last week and the 30 I've been eating for the last 5 years. It's been easy so far but I think I'll have a big problem going down to zero as it will trim out my bit of dairy which I really like. I may hold at 10 for a couple of weeks and see if my post meal shakiness resolves any at that level.

Two big changes so far: 1. I'm only eating twice a day - I can't believe it if I wait out the hungry, shakys for the hour or so after eating I simply don't get hungry for about 10 hours! I eat a big fatty breakfast and dinner and that's it even gave up my evening snack and I never thought I'd be able to do that. Does this mean my hyperinsulinism is improving? 2. The last two days I just felt like exercising more and extended my 3 mile jog to 3.5 miles and wished I had more time to keep going! Very odd for me. However I still find the first mile to be very hard - why is the first mile the worst? My muscles ache, I feel exhausted and then it clears strange.

Anyway I'm hopeful these changes represent an improvement in my insulin levels and maybe it's not too late to avoid medication.

Thanks for the cooking tips everyone. The high fat is new to me and I feel more at home with skinless chicken breasts - but no more and I need any cooking tips for high fat that I can get.

11111

RE: Zero Carb / Meat and Water - Valcan - 07-01-2008 11:10 PM

Hi,

Jeepifer - You have the right Nuwave Oven and that is a great price! I read a lot or reviews before I decided to buy mine. I have wasted a lot of money on kitchen gadgets over the years and try to be careful. With zero carb I often use mine three times a day. I love not having the grease splatters all over the place.

Pork Belly is also called side pork. Asian markets usually carry it if you can not find it in your grocery store. If it is sliced, it looks like bacon (sliced pork belly is really just uncured bacon). I like buying a big slab of it and slow roasting it in the oven:

1 kg slab of pork belly
With a very sharp knife, score through the skin in 1/2 inch intervals (don't go through to the meat - just through the skin and a bit of the fat) in a cross-hatch pattern. Place on a rack in a roasting pan. Roast at 300F for about 2 hours. Turn up the heat to 400 F and roast for an additional half hour or so, or until the skin and fat are golden brown and puffed up. Remove from the oven and let stand for 10 minutes before slicing. You can add any kind of seasoning you like. I like just salt and pepper. The layer of fat is so yummy.

Kristelle - Boy bodyguards! Sounds interesting! Great to connect with you on here.

Ell.eee - I know what you mean about exercise. Tonight I walked to the firewords (I have always driven) and on the way back, I actually ran most of the way home. I hate running but I just couldn't seem to help myself. Weird now that I think back on it.
Today was day four in a row of ZC and I feel great. Thanks for all the support and information.

Val

**RE: Zero Carb / Meat and Water - jeepifer - 07-02-2008 02:38 AM**

Val, thanks! Sounds yummy can't wait to try it!

Can't sleep. Been restless with odd/bad dreams all night. Ugh! Not usual for me. Wondering if it's from my body switching fuels?

Interesting. I do mine for 2 hours at 350. The flesh is marvelously tender and the skin is scrumptious and crispy. However a lot of fat collects in the pan. I save it for cooking, and it's sooo delicious. However, your post makes me wonder if more fat would stay in the meat if I cooked at a higher temp for a shorter time. Thoughts?

Body In Motion New York NY USA
Center for Movement New York NY USA

Wow, you leave the forum to get back to work and it fills up with tons more info.

Thanks, LindaSue. I did google after I wrote this yesterday and saw some of these studios as well. I'm going to look into them.

**RE: Zero Carb / Meat and Water - poo123 - 07-02-2008 06:28 AM**

vesna, these still is fat in the pan but like you said to re use it, that's great. Also the skin is brown but not really crispy so lots of fat stays in it. You could brush it with butter if you wanted to. I also take the thighs, remove the bone flatten it out and put some butter and some spices in the center close it up and hold it together with a toothpick. I put them in a roasting pan or sometimes I put them in a cupcake tin
and cook them skin side up at 425 for about 45 min and they are delicious. Filled with butter and flavor, I used to put them over rice or potato but plain old butter filled chicken it great. Give it a shot....

RE: Zero Carb / Meat and Water - poo123 - 07-02-2008 06:42 AM

Day 5
Down 5.6 lbs in 4 days I am a happy girl. I am glad I have extra energy to play with the kids. No cravings and I am still not hungry at 9:30 am after eating 3 chicken thighs last night. Things are going so well. Glad you are all here

RE: Zero Carb / Meat and Water - jeepifer - 07-02-2008 07:58 AM

Congratulations, Jenn. I've looked at my scale but I'm scared to take it seriously... I'm only on day 5 and I know water's probably the first thing to go but I'm not looking back so I'll wait the scale thingie out. lol

(chicken at heart)

Anyway, I do find that I'm constantly thirsty these days. Between drinking and running back and forth
from the ladies' room, I barely have time to do anything else. lol

Has anyone else experienced a greater thirst in the beginning of their xlc walk?

RE: Zero Carb / Meat and Water - poo123 - 07-02-2008 09:00 AM

Oh, I did forget that you could put some ham in with the chicken and butter and if you are not doing 0 carbs you could also add some cheese. I know I love it, hope you give it a try...

Penny, my thirst is not really bad but I do know if I have the feeling to go the bathroom I had better get there ASAP !!!!!

Good luck to you all...

RE: Zero Carb / Meat and Water - jeepifer - 07-02-2008 09:12 AM

I know Charles uses Celtic sea-salt and pepper. For those of us that want a bit of spice here or there, I was looking into beneficial spices.

Charles, if you get a chance, can you comment on the "benefits" of each spice as they've said below, as to whether or not it's a good thing? I'm still a little confused about how the insulin receptor/response thing works and the last thing I want to do is use something that's going to set me back.

Cinnamon is a potent inducer of insulin sensitivity and the addition of as little as one gram a day to the diet can reduce the blood glucose levels of diabetics by a staggering 30 percent. It does this by enhancing the enzymes that increase insulin receptor sensitivity and inhibiting those enzymes with the opposite action.

Cinnamon has the added benefit of lowering the abnormal lipid levels commonly found in diabetics and reducing oxidative stress caused by lipid oxidation in these patients.

Fenugreek is also highly effective at modulating glucose metabolism and can lower the blood glucose levels of diabetics by up to 45 percent. This spice both increases insulin receptor sensitivity and normalizes the imbalanced blood lipid levels of diabetics. The fiber contained in fenugreek also lowers the GI of a meal, thus modulating the post-prandial blood glucose levels by slowing the absorption of high GI foods.

Ginger and caper increase sensitivity to insulin, and caper mimics the effects of insulin (Jenn's note -- I'm guessing this *isn't* a good thing?). Garlic and coriander are also insulin mimics, while coriander enhances insulin secretion.

The thought of adding a little garlic powder to the buttery chicken thighs has me drooling. Literally! 😋

RE: Zero Carb / Meat and Water - Charles - 07-02-2008 09:43 AM

during 3 hour GTT, drinking whatever it is they give you drink before hand, my BS stays in the normal range for about 1.5 hours, then plummets to under 30. i do not feel ravenous, i feel manic, almost high, mentally out of it. i never feel what i would call normal organic hunger or fullness. it is either craving all the time, even when i know i have already eaten plenty, or a sort manic high which is when i know a
crash is coming.

So the glucose makes your bloodsugar hit the normal range and then insulin comes and pushes it into your cells and then it goes too low. The liver is supposed to signal the pancreas to shut off insulin once blood sugar is stabilized and yours doesn't seem to do this.

when i had a monitor i was normal before meals, but that was years ago. in a couple weeks they are going to implant a chip in me which will monitor my BS every 5 minutes!

I would imagine this will help a great deal.

other people call them, as i have passed out/become very disoriented at work, or in my neighbors house. it was not because i had not eaten, i had eaten and sometimes keep eating frantically, but i keep on crashing anyway. usually only concentrated sugar brings relief. but when i include fruit or caffeine regularly in my diet, it will make attacks more likely. but they can come even when i am being very strict with my VLC diet.

Yes, your insulin is just not being shut off when it's supposed to. It's not surprising that the fruit would make attacks more likely because this is the essence of hyperinsulinemia. Caffeine is another story and I'm not sure how it works. It seems to work like adrenaline in that it comes to mobilize fat, but insulin would override this feature, especially when there is nothing to stop the secretion. I'm not sure if you oversecrete insulin or if you just don't get the signal to shut insulin off.

fatty meat, butter, green veg, sometimes cream/sour cream, green salad with olive oil/vinegar, very few nuts.

I think it would be helpful to keep with this and perhaps you can try lowering the amounts of the carbohydrates really slowly. I wouldn't jump to zero-carb today, but I might just try to remove the nuts and the higher glycemic stuff. Then, if you find that the blood sugar is too low, then you can condition yourself to respond to a lower glycemic thing such as some fruit or something natural as opposed to a refined sugar. Again, you want to take it slow and keep the carbohydrates around 25 to 30 for a few weeks. Then, you might go to 25 or 20 and if you get manic, try something less sweet to see if you respond. I would bet that you could control it easier over time; but I'm speculating.

agreed, and when i do need to resort to a sugar to avoid a major crash, what would be best and how much?

What do you use now?

i should also note that when i eat a high fat/moderate to low protein meal, i become extremely lethargic and my heart rate rises significantly. my system feel really overburdened. i realize i may have to ride this out. i tried ZC once for two weeks and this never eased. i had to stop because i couldn't function in my life.

Describe this meal in detail.

We're getting there. I just don't want you to hurt yourself. This is a tough one for sure, but hopefully you can get to a place where you can lower the amount of sugar it takes to stabilize your blood sugar. It seems you have to play the part of your liver in some ways and this may be something that can't be fixed because it's hard to say whether you're oversecreting or you're just not shutting off secretion. That makes a big difference in my mind.
Remind me where you are weight-wise as well, please.

Regards,

Charles

Vesna Wrote:
You have exactly the lifestyle I describe? You must have me mixed up with some other poster named Vesna -- the one who runs marathons and lifts weights twice a week! 😁

Actually, I only run half-marathons, but yes, I am rather sedentary. When I walk to my office, old ladies in tennis shoes pass me on all sides. I only run two days a week. I run long distance on Sundays, depending on where I am in my schedule, and sprints on Wednesdays.

I have a race this Friday, so last Sunday I only ran 5 miles. This morning, I went out and ran about eight 100-meter sprints, and I will not lift this Thursday. My point is, my activity level does not account for the many calories I eat or explain my weight maintenance. This morning's workout only reflected .2 on the scale and my weight routine on Monday didn't account for any change; in fact, I think I went up some. Exercise just doesn't account for weight loss or weight gain. Exercise is a symptom of whether or not you have surplus energy that you want to expend or you don't. If you choose not to exercise despite your increased energy, you'll expend it somewhere.

If your diet is correct, then lack of exercising will not show up on your scale.

Vesna Wrote:
Can't the causal arrow fly either way, depending on the person and the situation?
In my case the sedentariness was brought on by a job offer, not a change in energy availability.

I'm sorry, I just don't think so and studies consistently show this not to be the case. Now, you can argue an association in which case I would agree with you. During Desert Shield/Storm, when I was in the Navy, we did a nine-month deployment to Saudi Arabia. Our unit did far less physical activity than we did for the 8 months prior to. We usually did physical training, in formation, three days a week, but we couldn't because of where we were. We could not workout on our own or go running because of the dangers. We were relatively sedentary compared to our other deployments but we all didn't get fat as a result.
If your diet is bad, it may take walking 4 miles a day or it may take running marathons to remain thin. I get that. However, that is an indication that the diet is wrong, that's all. If your diet is correct, you will not require exercise to maintain a lean body just as it takes no effort to maintain blood pressure or body temperature.

The same is true for tigers in circus cages. If you feed them their natural diet of meat, they can get up and perform miraculous feats without any warmup and without any period of exercise. You can make the same argument for Alaskan sled dogs. They sit in their kennels half the year eating meat and then when it's time, they can pull the Eskimos all across the tundra on long, arduous trips without any warmup or conditioning program.

The same is true for man.

Interestingly, the owner never substantiated her claims with research, just said she had a Ph.D in nutrition and did lots of research and self-experimentation with measuring BG and such.

Jimmy, did you get that? .....

Sabrina Wrote:

We also argued about muscle and liver glycogen stores. Do these always stay full? What's the deal with that?

When a person is fat-adapted, they do stay full and the body keeps it that way through a process called glycogen-sparing. The muscles are prevented from burning glucose and they run on fatty acids (the true best fuel for the body) and in effect, spare the muscle glycogen. However, intense, anaerobic exercise will deplete muscle glycogen stores so therefore we shouldn't (and don't due to practicality) operate at such intensities for very long. For this reason, most "experts" advocate a high-carb diet for exercise. However, what needs to be changed are training methods and philosophies that work with this supposed limitation as opposed to using it as a reason to use carbohydrates.

Sabrina Wrote:

And glucose from fat? Does glycerol convert back to glucose for the body's needs? I know there is very little glycerol coming from our diet due to lower (or no) carbs but dietary fats provide glycerol, don't they? and that's why we still have triglycerides in our blood, even on zero-carb? right?

The missing ingredient here are ketones. Ketones supply the energy for tissues that normally use glucose. Ketones are made from fat. The tissues that can only use glucose get them from gluconogensis (from protein) but this doesn't happen very long because it is inefficient. Francis Benedict's famous starvation studies showed that during fasting, after about 7 days, our bodies rely totally on protein, fat and ketones and don't use any glucose. "Fat will supply 85 percent of our energy needs and protein the rest via gluconogenesis." Benedict, F. G. W. R. Miles, P. Roth and H. M. Smith. 1919 *Human Vitality and Efficiency Under Prolonged Restricted Diet*, Washington, D.C.; Carnegie Institution of Washington.
Sabrina Wrote: When zero-carbing (or very-low carbing) do our muscles run on free fatty acids because it seems that some people who follow the zero-carb approach exercise and their ketones from before exercising stay the same after, clearly showing that ketones are not being used by muscles. Some also say that muscles will only run on ketones if protein is kept to a minimum (to avoid glucose conversion, which seems strange to me) and carbs to a minimum as well.

Muscles run on free fatty acids and this is the best fuel for the body. As Dr. Groves explains:

Quote:
Fatty acids are transported into the mitochondria as completely intact molecules. Glucose, on the other hand, can be transported only after it has been broken down first into pyruvate by the process of glycolysis. This is then used anaerobically to produce energy with lactate as a by-product.

The by-products of the energy-production process when fatty acids are used are carbon dioxide and water, both of which are easily excreted. But when glucose is used, the lactic acid produced in the conversion process can build up in muscle cells and make them ache. It is this that is the cause of the aching muscles or pain involved in strenuous exercise - 'the wall' as athletes call it. This 'wall' severely limits an athlete's performance.

Sabrina Wrote: Charles, can you clear this up and provide some studies, as you always do? 😊I'm really curious. People keep insisting on protein conversion to glucose. True or false? To me, it seems false. The conversion of glucose from fat also seems suboptimal as only 10% of it can convert.

You're right. Actually, gluconogenesis is only used to stabilize blood sugar. Once blood sugar is stabilized, the liver will shut down production of glucose. If this were not true, I would be very fat indeed because I only eat fat and protein. We've known since 1956 with a publication of papers by Vincent Dole at Rockefellar University; Robert Gordon at the National Institutes of Health, and Sigfrid Laurell of the University of Lund in Sweden. The muscles run from the circulating fatty acids which rises and falls in relation to the need for fuel.

Sabrina Wrote: Here is what I think: glucose from the blood gets sent to cells for immediate use. Then, when cells need more energy and if no glucose is provided in the form of carbs, fatty acids begin to mobilize with ketones as a by-product but because some organs like the brain still functions on glucose (and needs lots) and cannot rely on ketones (or FFA) yet for energy, liver and muscle glycogen stores are used up and exhausted.

The body will burn carbohydrates for fuel only as long as blood sugar is elevated and the reserve supply of carbohydrates stored as glycogen in the liver and muscles is not being depleted. As these carbohydrate reserves become tapped, or if there is a sudden demand for more energy, then the flow of fatty acids from the fat tissue into the circulation accelerates to take up the slack. A significant portion of the carbohydrates and fats we consume will be stored as fat in our fat cells before being used as fuel. This stored fat, in the form of fatty acids, will provide 50 to 70 percent of all the energy we expend over the course of a day. As Albert Renold described it, "This is the major site of active regulation of energy storage and mobilization, one of the primary control mechanisms responsible for the survival of any given organism."

This discovery in 1956 proved that fat was not just a trash can where fatty acids sit, but an active
participant in metabolism. In fact, fat never sits still. Fatty acids and all nutrients go through the bloodstream and are offered to every muscle, tissue and cell. The stream of nutrients changes direction in response to energy needs all over the body. When insulin is high, the fatty acids go into adipose tissue so the muscles can have unrestricted access to the glucose in order to burn it (read: eliminate it). Once the meal is digested, the fatty acids, amino acids and nutrients return and they provide the fuel and repair we need.

After this, we have to understand the Krebs and the Randall cycles which demonstrate what happens when we eat a fat or a carbohydrate meal. I've posted on these cycles many times so do a search on the site and you're sure to find them. Taubes mentions them in Chapter 22.

Sabrina Wrote:
But what happens if protein stops coming in? Does the glucose come from lean mass or fat? I would think lean mass and this probably would result in much slower metabolism, less toned body, weaker energy since muscles are being wasted away. And weight loss obviously. I remember reading about Stefansson having to live off fat only for about 10 days and feeling satisfied hunger-wise but weak and sleepy.

The body gets protein from your lean muscle mass in this case. This will make you weak and you'll lose weight alright, but you'll look emaciated. If you meant "Stefansson having to live off of lean protein" then you would be correct. Living off fat is what we all do. The question becomes, why does fat get stored for long periods and we're unable to use that fat, despite it's large presence? Knowing the answer is why people come here for support in implementing it.

Regards,
Charles

Ell.eee Wrote:
Two big changes so far: 1. I'm only eating twice a day - I can't believe it if I wait out the hungry, shakys for the hour or so after eating I simply don't get hungry for about 10 hours! I eat a big fatty breakfast and dinner and that's it even gave up my evening snack and I never thought I'd be able to do that. Does this mean my hyperinsulinism is improving?

Absolutely and this is why I don't buy hypoglycemia. You ate so you were able to wait out the craving. This should improve over time such that you don't get the craving.

Ell.eee Wrote:
2. The last two days I just felt like exercising more and extended my 3 mile jog to 3.5 miles and wished I had more time to keep going! Very odd for me. However I still find the first mile to be very hard - why is the first mile the worst? My muscles ache, I feel exhausted and then it clears strange.

This is what I remember as well. I generally feel a bit tired at first, but once I start lifting or running, I discover that I have this almost endless energy supply that is long-lasting. It's an amazing feeling that I wish everyone could experience. It's different than the carb-blowout I used to have.

Ell.eee Wrote:
Anyway I'm hopeful these changes represent an improvement in my insulin levels and maybe it's not too late to avoid medication.

You're on the road to recovery!

Ell.eee Wrote:
Thanks for the cooking tips everyone. The high fat is new to me and I feel more at home with skinless chicken breasts - but no more and I need any cooking tips for high fat that I can get.

Pretty soon you'll discover how truly nasty skinless chicken breasts actually are! You'll be like Neo in the Matrix, you'll use your taste buds for the first time!

poo123 Wrote:
Day 5
Down 5.6 lbs in 4 days I am a happy girl. I am glad I have extra energy to play with the kids. No cravings and I am still not hungry at 9:30 am after eating 3 chicken thighs last night. Things are going so well. Glad you are all here

Sounds fantastic! You all make me appreciate chicken more. We all grown in my house when chicken thighs are on the menu. We usually talk ourselves into Golden Corral like we did last night. Looking at the way you make chicken thighs makes me want to eat them today. Don't get me wrong, I enjoy them, but I much prefer beef.

Congrats,
Charles

pennypritty1 Wrote:
Has anyone else experienced a greater thirst in the beginning of their xlc walk?[/color]

You will have that, but make sure to only drink when you're thirsty. Don't just drink just to drink or you'll dilute your electrolytes and feel like crap. Don't be afraid of water, but just don't guzzle just for the sake of trying to make your 8 glasses of water. We humans are used to going a little bit without water during the course of a day!

jeepifer Wrote:
Charles, if you get a chance, can you comment on the "benefits" of each spice as they've said below, as to whether or not it's a good thing? I'm still a little confused about how the insulin receptor/response thing works and the last thing I want to do is use something that's going to set me back.

I'm not familiar with all of them, unfortunately. The main rule of thumb is this. If there is some spice or ingredient that you use that would just make you sick if you couldn't have it, that's probably one to avoid. One that makes you crave it. You should be able to take or leave any food or condiment in your diet. If you can't live without it, that's a sign that it probably shouldn't be there on a regular basis.

RE: Zero Carb / Meat and Water - feckless - 07-02-2008 01:02 PM

thank you charles...new info you requested in purple...

Charles Wrote:

Yes, your insulin is just not being shut off when it's supposed to. It's not surprising that the fruit would make attacks more likely because this is the essence of hyperinsulinemia. Caffeine is another story and I'm not sure how it works. It seems to work like adrenaline in that it comes to mobilize fat, but insulin would override this feature, especially when there is nothing to stop the secretion. I'm not sure if you oversecrete insulin or if you just don't get the signal to shut insulin off.

fatty meat, butter, green veg, sometimes cream/sour cream, green salad with olive oil/vinegar, very few nuts.

I think it would be helpful to keep with this and perhaps you can try lowering the amounts of the carbohydrates really slowly. I wouldn't jump to zero-carb today, but I might just try to remove the nuts and the higher glycemic stuff. Then, if you find that the blood sugar is too low, then you can condition yourself to respond to a lower glycemic thing such as some fruit or something natural as opposed to a refined sugar. Again, you want to take it slow and keep the carbohydrates around 25 to 30 for a few weeks. Then, you might go to 25 or 20 and if you get manic, try something less sweet to see if you respond. I would bet that you could control it easier over time; but I'm speculating.

agreed, and when i do need to resort to a sugar to avoid a major crash, what would be best and how much?

What do you use now?
i try to eat something protein/fat but if i still feel i am spiraling down, i have to go for the honey or candy. it's hard to tell when i have done enough to stop the crash because i always feel craving, am never sure where my BS is at and i can't let it the crash get away from me.

i should also note that when i eat a high fat/moderate to low protein meal, i become extremely lethargic and my heart rate rises significantly. my system feel really overburdened. i realize i may have to ride this out. i tried ZC once for two weeks and this never eased. i had to stop because i couldn't function in my life.

Describe this meal in detail.
20% fat burger sometimes with some broccoli or asperagus smothered in butter. it has been suggested my liver can't handle too much fat at one time. if my liver is sluggish/damaged that might be why it isn't regulating insulin properly too. should i try to treat the liver somehow, or just try to get lower and lower carb and let time heal it...or is it permanent?! maybe i have to eat smaller amounts more often, but i know that is not the goal.
Remind me where you are weight-wise as well, please.
i am 5'7" and weigh 130, but i have a lot of fat on me, very little muscle, have a very hard time putting muscle on.
Regards,

Charles

pennypritty1 Wrote:
Valcan Wrote:
...I have a Nuwave Oven and it is wonderful for cooking any kind of meat you want...
Val

Val, does the nuwave oven brown the skin as well? I imagine not but never hurts to ask anyways.

It browns very nicely. I love making chicken wings in the Nuwave. They are brown and crispy like the ones you deep fry. It is not fast like a microwave but it does reduce about 25% of the time things would take in an oven. I am making a big beef roast in there tonight.

It makes excellent dry meat (jerky without the seasoning) which I eat with a soft butter dip. I am staying away from that and will try it again when I reintroduce butter to my diet.

Val

RE: Zero Carb / Meat and Water - Charles - 07-02-2008 01:37 PM

i try to eat something protein/fat but if i still feel i am spiraling down, i have to go for the honey or candy. it's hard to tell when i have done enough to stop the crash because i always feel craving, am never sure where my BS is at and i can't let it the crash get away from me.

Perhaps this chip will help us with this part. This is the hardest for me, I can't really recommend anything here because I don't know what this is like.

20% fat burger sometimes with some broccoli or asparagus smothered in butter. it has been suggested my liver can't handle too much fat at one time. if my liver is sluggish/damaged that might be why it isn't regulating insulin properly too. should i try to treat the liver somehow, or just try to get lower and lower carb and let time heal it...or is it permanent?! maybe i have to eat smaller amounts more often, but i know that is not the goal.

That's the part I wish I knew. People say to drop the fat for everything so we can discount that. What you're eating doesn't look too bad, but if you can slowly get to where you're eating that 20% fatty ground beef without the brocoli and asparagus, that might tone down the insulin release over time; but I worry about those shaky moments because you would have to endure some of those before it gets better.

The thing is, it doesn't sound like gradually reducing would be any worse than it is right now. Eating the honey and candy can only make matters worse over the long term because they only increase fat storage.
and make insulin worse.

i am 5'7" and weigh 130, but i have a lot of fat on me, very little muscle, have a very hard time putting muscle on.

Do you lift weights? Some weight lifting, using Slow Burn principles would help with the muscle issues. You would want to reduce the carbohydrates and keep them there in order to expose more lean muscle. You probably have about 12 pounds to lose, I think, and this diet plus some weights would probably be about right.

The thing is that you should reduce your carbohydrates slowly and try to get accustomed to a regular eating pattern. This chip will help tremendously because then you could spot the blood sugar number and perhaps we can get some low-glycemic carbs in you before you get low enough to crash.

What do you think?

RE: Zero Carb / Meat and Water - poo123 - 07-02-2008 01:54 PM

Charles, I too love beef, I usually make the chicken thighs with ham, butter and some cheese for my husband and kids. Now for myself I just leave out the cheese. I bet if you wanted to add some ground beef instead of the ham in the chicken thigh roll ups you would have a whole new taste sensation....Now that I think about it, it really does sound tasty with beef too.. haha I may try it later this week....

Do you lift weights?
yes, i do the slow burn! but my energy is so bad....i do it maybe once every 10-14 days. i feel that if the energy is not there i should not force it. but that's not too far off from what they recommend anyway!
still, my body doesn't make muscle easily. my neurologist thinks my addictions may have resulted in mitochondrial myopathy. if my energy improves, i will work out more. i would love to shave 12 pounds of fat off me!

The thing is that you should reduce your carbohydrates slowly and try to get accustomed to a regular eating pattern. This chip will help tremendously because then you could spot the blood sugar number and perhaps we can get some low-glycemic carbs in you before you get low enough to crash.

What do you think?

i think you are supercool to be so helpful. i will work on getting the carbs down slowly. as for regular meals, how far do you think i should space them to begin with? should i gradually move them further apart? unfortunately, the chip will not tell me in the moment what is going on, it just records a whole week of readings for the doc to analyze. i will keep a detailed food log and see when my blood sugar is getting low. the doc is gonna be upset when she sees what i am eating, but oh well, i'll still have the data.

i also suspect my armour thyroid med dumps my blood sugar in the morning, because i have severe
cravings after i take it. salt also makes me crave sugar. how did something so simple as food get so complicated??!!

RE: Zero Carb / Meat and Water - pootti - 07-02-2008 03:01 PM

Hi Charles and company!

As yall can see I'm new to this thread and have been reading it with avid attention over the last 2 days. I have finally caught up with all 75 pages of posts.
I have a comment and a couple of questions if you don't mind me asking?

First the comment:

RE: People feeling tired especially when first starting very low carb or zero carb. Could that possibly be caused by a reduction in potassium due to the diuretic effect that early lc has on the body? If so, one way to test this hypothesis would be to have some NoSalt brand potassium chloride salt substitute available. You could sprinkle a large pinch (around 1/4 tsp) in an 8oz glass of water and observe what happens about 20-30 minutes after consuming it. Drink the water as close to one go round as possible. If I am right about this, you should feel a resurgence of energy and also have a brief cessation of thirst. If I'm wrong about this, it should not mess anyone up too badly. The exception would be if you are taking any medications that have a potassium sparing effect such as some blood pressure medicines.

Now for the questions:

1. Do any of you have baseline and 3 month/6 month etc studies that show your lipid profiles/liver/kidney profiles following the zero carb woe that would be helpful?

2. Has everyone experienced a weight loss following the zero carb woe or have some gained? I think I read of at least one recent poster who has had a temporary 2lb gain. Are there others?

3. Charles, my understanding about the Inuit Indians lack of Beriberri or Scurvy or any other disease is that they did indeed eat all parts of seal/walae and fish/seafood. This included all organs including stomach with their contents. It's my understanding that by eating the rumen (inner lining) of the stomach and some of it's contents of seals especially they got nutrients and vitamins such as Vitamin C from the animal as a result of them eating the areas of the animal where actual nutrients were being produced and digested. Likewise with calcium, my understanding was they gnawed the ends of the bones (epiphyses I think?) and ingested calcium that way as well as cooked bone broths using the bones. They also cracked the bone and ate marrow and I wanna think they may have even ground the bone and consumed it. My memory on this is very sketchy though, it's been a long time ago. So wouldn't the lack of these practices in our lifestyle be causally connected to experiencing vitamin/mineral deficiencies with zero carb nutrition? Or am I working with faulty logic here?

Thanks in advance for this information everyone! Great thread and very thought provoking to say the least!

I have tried doing the Banta diet before and result was not very pleasant. I would eat fat up around the 80% mark with moderate to high protein and very low to know carbohydrate and I would have terrible adrenalin rushes with profuse sweating, heart palpitations, nausea, dumping, shaking. At the time, another very knowledgeable poster who was a med tech and had done tireless research on diabetes, blood sugar control and the role of insulin in our body told me that there was some evidence in new studies coming out that deep ketogenic states can encourage adrenalin surges (much like power surges) due to an excess secretion of the cortisol hormone. So where as one might not notice a dramatic shift in blood sugar due to insulin resistance of the cells, you would still have an underlying insulin surge going on. Does anyone know about this? Could someone point me towards the studies that talk about this? I've googled and googled and haven't been able to come up with much. TIA! Keep up the great information.

RE: Zero Carb / Meat and Water - Kristi31 - 07-02-2008 03:04 PM

Thanks CHARLES for answering all my questions. You confirmed what I thought.
Today was not so good, again! I ate some rib steak today and crashed almost immediately after. Actually, I tend to fall asleep as I eat and the more I eat, the more I get tired. It's almost like falling into a coma and then I sleep for 2-3 hours. Feels like I haven't slept in days! It's really strange. And my meat has plenty of fat, believe you me! So, nothing do with "rabbit starvation".

A change in hormones hasn't really made a difference, after all. Or maybe I'm just being too impatient. BUT, thinking back to when this problem first started, it was when I started eating my meat raw. Maybe there is something to eating raw meat that doesn't agree with me but I'd find that strange, why? Is there more water in raw meat which would dilute electrolytes and cause problems? Or more minerals than my body needs, an excess? The former seems more likely. I have a strong suspicion my problem has to do with water and electrolytes.

I know people who cook their meat and eat more or less like me (protein+ fat, very low carb or no carbs) never have this problem. Some who have tried eating raw meat have actually experienced similar problems. So, perhaps it's the "RAW" thing.

You may ask yourself, why RAW? Seems like it's more healthy for the body for various reasons, but in the end, eating protein+fat, cooked (not overcooked obviously) or not shouldn't make much of a difference, I think. I hope!

So, I ate some meat 30 mins ago and cooked it rare. It was delicious. Wow! So much better than raw. So much flavour. And the smell...No problems to speak of yet. Hopefully, this will solve this neverending problem I have for GOOD!

I did eat 2 (small!) apples today because I was just tired of dealing with this and kind of rebelled. But then I regretted it...I go through these from time to time when things aren't working out how I expect them to happen...I go right to sweets and then hate myself for doing that.

So, it's back to fatty meats only, cooked meat, that is. 😊

---

RE: Zero Carb / Meat and Water - feckless - 07-02-2008 03:22 PM

i eat 3-4 times a day. i would probably need to eat at least every 4 hours to keep crashes at bay, and might be more comfortable if i ate every 3 hours as i can't eat too much fat at one time without the accelerated heart rate problem (and i get so sleepy from eating) -see i pass out from not eating...and from eating!

Charles Wrote:
Okay, you're making my red flag meter go crazy. You have thyroid medication also? I don't know that the food is complicated but we sure are! How long have you been taking the thyroid medication and how long have you had the crashes?

i have been on thyroid for 20 years or so. i was dumb at the time and took it because the doc told me too. now i can't get off. i've tried to go off very slowly a couple times and the results were disastrous (my tsh went through the roof and i went a little crazy). i was only subclinically low when i went on. i complained about low energy a lot, but didn't know anything about diet then. the docs diagnosed me with a bunch of bullcrap stuff like chronic fatigue and MVP and hypothyroid and hypotension when the truth is i was just unhealthy because of the drinking! although, i was obese and binging as a kid, so maybe there was some BS problem earlier that was undiagnosed. anyway, the thyroid meds never
helped the energy situation and now i'm stuck on them for life.

i think the bad BS crashes started, oddly enough, after i cut my drinking down from 20 drinks most nights to 2-3 drinks just occasionally. that was in 1993. i think my body was somehow adapted to run on alcohol! sorry i'm such a difficult case! believe me, it ain't no fun and i appreciate the help!

RE: Zero Carb / Meat and Water - usmaid - 07-02-2008 03:22 PM

I've been following along for a few weeks now (I actually posted my info 3 weeks ago but no one really responded) but I took the zero carb challenge and for the last 3 weeks I have lost zero lbs. I only have 10-15 to lose so I'm not looking for HUGE numbers but something would be nice. I was having a protein shake with flax in the morning (replaced that with half lb hamburger patty), another half lb patty at lunch and then 6-10 oz of steak, or two chicken thigh/legs or 8 oz fish for dinner. I drink only water. I even stopped chewing gum when I saw it had 2g carbs! The hamburger is 80/20 so I add 1T of butter to it. I started FitDay today and I'm at 3700 cal for today!! I know we're not suppose to pay attention to that but could that be the problem? I'll be honest- I have cheated.... with extra meat or I'll get a cheeseburger if we're out (it's hard to get a cheeseburger cooked even a little rare anymore). But that's it in 3 weeks. Anyone have any ideas?

I lost 100 lbs 6 years ago counting calories and managed to keep it off until 2 years ago when I quit smoking. Then put on 10. Since changing to low carb, I've put on another 5 (which I expected)

Any suggestions will be appreciated
Beth

Hi Beth,

I wish I had a suggestion but my experience was similar to yours. I had about 8 pounds to lose but gained 2-3. I wasn't even eating near 3700 calories. I'm still eating VLC but not only meat and water. It seems that for some of us, weight loss does not follow ZC. I don't buy that we are at our ideal weight as
some suggest. I think that there is a missing part of the puzzle. I've been trying to be patient and consistent with my VLC diet but up to now, the scale has only moved slightly up and stayed there. Sorry I can't be of help.

---

**RE: Zero Carb / Meat and Water - usmaid - 07-02-2008 04:57 PM**

Thanks Lauren-
I was just wondering if I was doing something wrong or should be doing something else. I strength train 3xweek and do some kind of cardio 3xweek plus walk 1.25 miles to work 3-4 days a week. I was bored with calorie restriction and so excited about LC. I actually started Metabolic Solution back in Feb (that's when I gained the 5 lbs) switched to Atkins Induction end of March and went serious zero carbs 3 weeks ago......NOTHING! I'm 52 yrs old, 5'5" and 165 lbs. Not my idea of "ideal" body weight!

Anyone have any ideas? If I lost 1 lb a month I'd be happy!

Thanks
Beth

Me too Beth. I've been low carbing since January and zero carbing for about 3 months and haven't lost one pound. I suspect adrenal fatigue in my case. I'm just waiting for my adrenals to rest or heal or whatever they need to do. I'm thinking it may take me years to recover and maybe I won't lose weight until then. But that's OK.

[/quote]

Deanna- Thanks for the info. how do you stay motivated? I just keep plugging away. Should I lower calories? Should I lower fat? According to FitDay, today I had 68% fat- 2500 calories. I can't help but wonder about that (maybe just old school thinking). I'd have to say that today was "typical". Not a heavy day by any means. Charles and others here always seem to be telling people they need to eat more meat, more fat and they're dropping lbs. why not us? There has to be an answer or I at least need a plan.

Thanks for the info
Beth

For those with 8-10 lbs to lose. Are you all taking your measurements? Often you will hear people say that doing LC they may weigh 5-10 lbs more than they did previously but are actually smaller now. Particularly, if they are working out.

Angela2 Wrote:

I have not but I can tell from the way clothes are fitting that I'm not going in the right direction. No big changes- clothes still fit but just not as well. Some one told me that 10 lbs is a size. At this point I'd have to agree.
Beth

Hi Everyone,

Today is day five of zero carb (actually I did have one carb today - a clove of garlic). I made a blade roast in my Nuwave Oven and it turned out fabulous. Brown and crispy of the outside and still pink in the middle (the way I like it). I dipped the beef in roasted garlic mashed into butter. This is the first time I have done a roast in the Nuwave and it will not be the last. There was lots of fat on the roast which made it extra yummy. I love beef fat!

Angela,

Clothes fit the same for me too.

Beth,

I think about calories too but something deep inside me screams out to NOT go back to calorie restriction. I'd rather weigh more than I want and not be hungry. I still hope that as my hyperinsulinemia lessens, I will eventually be able to drop a few pounds.

RE: Zero Carb / Meat and Water - Angela2 - 07-02-2008 08:49 PM

I dropped a size, but I loss 18lbs. I too have about 10 more to loose. My weight has only dropped 3 lbs in the last 9 weeks but some of my clothes appear to be be a bit looser. And sure enough a few inches have left.
Good Luck to you both!

RE: Zero Carb / Meat and Water - Vesna - 07-03-2008 06:51 AM

Let's put it this way.

Let's say my ideal amount of stored fat weighs x pounds.

I currently store x + 15 pounds of fat.

When I started low-carbing in March 2007, that amount was x + 25.

By the summer of 2007, the amount had been reduced to x + 15.

Since then, the amount has almost always been (x + 15) ± 2. It has occasionally gone as low as x - 11 and (once only) as high as x + 22.

The highs occurred during times of slacking off.

The lows occurred during periods of being "on plan." However, fat storage returned to x +15 despite continuing on plan.

Since January of 2008, I've spent significant stretches of time on variations of: below 20g, meat and water, no AS, no coffee, single-digit carbing, no processed meats, no processed foods whatsoever, low-
calorie (below 1300).

None of these variations have led to a departure from $(x + 15) \pm 2$.

A note on measurements and clothing: no changes there, either.

Here is a question from a forum participant and an answer from Gary Taubes on another website. I have a post with all the questions and answers on this forum.

"I have been living on a low carb diet since being diagnosed with T2 diabetes 6 years ago. I have lost over 160 lbs and have the disease in very tight control with a usual A1c at 5% or close to it. I am still 30 lbs overweight at 5 ft tall & cannot lose any more no matter how low I cut carbs. I see no way around counting calories to lose these last pounds but my calorie needs are so low that I am intensely hungry all the time which is defeating me. What do you suggest?"

Taubes answer:

All I can do here is speculate, as I have no clinical experience treating people with carbohydrate-restricted diets, I'm just an investigative reporter with a somewhat obsessive interest in the subject. That said, between 1956 and 1972, the British physician Robert Kemp prescribed carbohydrate-restricted diets to almost 1,500 patients. He concluded that a small proportion, particularly the most obese and those who had been obese the longest, often failed to lose weight on the diets even though they faithfully
followed them. It is possible that if you were heavy for a long time, your fat tissue has accumulated chronic damage and so you're just stuck with those 30 pounds, and little or nothing you can do will change that.

Another possibility -- and this is really speculation, because as I've said I'm not a doctor -- is that the diet actually works best when it is a high calorie diet with a lot of fat. The idea is that we consciously or subconsciously try to restrict calories on the diet and so our body still thinks it's in starvation mode, even with the absence of carbohydrates, and holds on to the fat. I have no idea if this is the case -- it's the kind of thing that, in an ideal world, would be studied by obesity researchers.

Beth

My clothes fit the same also. What keeps me motivated is the acid reflux and IBS I get when I eat carbs!

I weaned myself off coffee about 3 weeks ago and now I have to take a nap everyday. Before, if I felt sleepy during the day I would have coffee. Without it, I'm sleeping alot. I take this as a sign that I need alot of resting to do. Unfortunately, I still have to teach 3 Turbo Kick classes a week and that is definately too much for me. I feel so tired, that I am unable to walk my dogs everyday. In fact, I started putting on the weight when I increased my classes from 2 to 3. I'm getting up the nerve to get rid of one of those classes.

Every once in a while, I want a salad so I have a small one. 2 days ago, I realized I wasn't enjoying my decaf and cream so I stopped that. So now just meat, eggs maybe once a week and that occasional salad.

I just keep telling myself that I'm in recovery and to just get out of the way and let my body do what it needs to do.

Deanna

**RE: Zero Carb / Meat and Water - Clabbergirl - 07-03-2008 07:38 AM**

Well I'm back from Disney World, and if I wasn't convinced that ZC and LC was a good way to eat before the trip, I certainly am convinced of it now.

The first day there, I managed to stay fairly low on carbs, maybe 15g. On the second day, I tossed all notion of low carb out the window and ate whatever I wanted in great amounts! Potatoes, breads, croissants, you-name-it. Forgot about the turkey legs and went straight for the Mickey Mouse ice cream. 😊I had forgotten in the 2 weeks prior of LC just how uncomfortable a bloated stomach is, and how
sluggish and foggy I could feel. The worst was probably low energy and the stomach bloat - my
waistband would hardly close after the meal and would stay that way for hours, when going into the
meal I had extra room! Waking up the next morning after a big carb-heavy dinner was almost like
having a hangover. Anyone ever felt like that?

I don't know if I gained while I was gone - I didn't bother to check the scales. My clothes don't feel
different, but I ate so many carbs and calories, I'm guessing I probably gained some of the 10 lbs I lost
back. Big deal though - I believe anything I gained will leave again soon enough.

Anyway, I'm back at home, back into my routine, and already on Day 2 of a high fat/high protein/super
low carb diet. I'm feeling tired and craving bread like mad, but I'm coping by staying busy and focusing
on my goal mentally because I know this rough spot is temporary. In a couple of days I will feel like I
did before I went on vacation - better all around. I'm still eating cheese and eggs, and I'm going to
continue this as long as I lose and feel good. If and when I reach the wall, I'll experiment with cutting
them out of my diet completely. The eggs do not fill me up near as much as meat or cheese, but I love
eggs and they're so portable and versatile.

I ran by the store last night to stock up on hamburger patties and eggs - fried them/boiled them for
ready-to-eat meals while I started the mass of laundry we accrued while gone. It really isn't as hard as I
tried to make it, preparing I mean. I am so glad for this website, and the support of everyone here.

You can find it here: Taubes answers questions
Hey gang, day 3 here. Feeling very tired. Enjoyed my steak this morning, and made another for lunch.

I ate lunch yesterday (4 small spare ribs), then about 3 hours later, ate more "lunch" (3 more small ribs). But didn't feel like eating the rest of the evening. Wasn't ravenous this morning, either. 6 oz of steak, and I'm good.

But very tired. I know this is normal until my body figures out what's going on. I get off work early and may take a nap if I can before picking up the kids. 😴

Charles, you need to come down here and run the Peachtree. Too late this year, it's tomorrow morning.

There may be hormones and other things in our factory system beef, but I'm with you. I'd rather feel good WHILE I'm living. I'm also good with the fact that eating generally available meat might mean less time in the nursing home. My great granny lived to 106 and she had just sold the farm 2 years prior to her death.

Hey Penny, I don't use a/c either - it makes me feel bad. People are amazed that I can do that. I'm amazed at their $400 monthly electricity bills!!!

I thought about buying a NuWave, but since I'm such a cheapskate, I ordered a book of low carb, crockpot recipes. I've used the book (bought used for $7 on amazon) a couple of times and the results were good. But most of the time, I just throw it in the fryin' pan and enjoy.

Let us know what you think of the NuWave. I've heard stuff, but won't taint your "life experience" with it.

Take care, Kitty

**RE: Zero Carb / Meat and Water - con - 07-03-2008 08:49 AM**

Hey everyone,
Thanks for the website Mac.
Just wanted to update my husband's progress. He started doing sorta low carb(SLC) approximately 2 weeks ago to rid himself of 'extreme gas production' in his stomach for which he was taking Alka Seltzer every night. After 2 days of SLC WOE he doesn't take Alka Seltzer any more. YEAH FOR ALL CONCERNED!

Now the next problem----he kinda complained to ME (me who has only lost 30 lbs. in 6 months) that he lost another 10 pounds!!!!!!!!!!!!!!!!! (btw : this is a 70 yr. old man who has NEVER in his life dieted.) That makes -22 lbs. in TWO WEEKS!#$&%

He's worried that he's losing too much too fast. He only has 30 more to lose-not that he is concerned about his weight, he only cares about the gas and arthritic knees. (I also told him LC would help his arthritic knees.)

Sort'a LC=because he still insists on eating corn tortillas, bread, apples, and small amts. potato and isn't crazy about nice fatty meat... "sigh" :>)

Worst thing about it all is that I now feel responsible for his success or failure with this WOE. Maybe I should have let him keep burping?

**RE: Zero Carb / Meat and Water - Charles - 07-03-2008 08:54 AM**

pooti Wrote:
First the comment:

RE: People feeling tired especially when first starting very low carb or zero carb. Could that possibly be caused by a reduction in potassium due to the diuretic effect that early lc has on the body?

Could be, but I think it has more to do with the body's changeover from not having to deal with glucose and the well-known adaptation period that all must go through. Dr. Stephen Phinney's studies on cyclists also bear this out and show that it doesn't matter who you are or what type of condition you're in, this adaptation period will happen and it's anywhere from two weeks to two months. I don't take any supplements whatsoever. I endured the first two weeks and woke up one day and felt as good as I ever felt.

Our bodies attempt to anticipate what we're planning to do and insulin is secreted in anticipation of our meals. Now that there is no glucose (or much less than before) the insulin secretions are felt more acutely since the role of insulin is to remove all nutrients from the bloodstream allowing the muscles the opportunity to deal with the glucose. Many think they are experiencing hypoglycemia during this time because it's a powerful reaction. However, research shows that it's really hyperinsulinemia and it takes time for the body to become conditioned to secrete less insulin and mobilize fat for longer periods of time. This is an adjustment and it takes some time.
Pooti Wrote:
1. Do any of you have baseline and 3 month/6 month etc studies that show your lipid profiles/liver/kidney profiles following the zero carb woe that would be helpful?

I don't. On the old forum, people used to share their lipid profiles all the time. When I had my carbs at about 20-30 per day, I had a profile done and my HDL went up and my triglycerides plummeted. My LDL also predictably went up and this scared my doctor who wanted to put me on a statin. I haven't seen the doctor since. I'm not at all worried about my lipid profile and the only thing necessary to know about it is whether your HDL is high and your triglycerides are low. If you have these two things, you're following a low-carb diet properly and you can expect your health to only improve.

Pooti Wrote:
2. Has everyone experienced a weight loss following the zero carb woe or have some gained? I think I read of at least one recent poster who has had a temporary 2lb gain. Are there others?

Just go back a few pages on this thread. People have been reporting losing weight over the last couple of weeks. Some of these new folks are losing like gangbusters. My friend, Con, is in her 60s and she is ready to start modeling bathing suits, I think! 😊

Quote:
3. Charles, my understanding about the Inuit Indians lack of Beriberri or Scurvy or any other disease is that they did indeed eat all parts of seal/whale and fish/seafood. This included all organs including stomach with their contents. [...] So wouldn't the lack of these practices in our lifestyle be causally connected to experiencing vitamin/mineral deficiencies with zero carb nutrition? Or am I working with faulty logic here?

No need to speculate. If you read through this thread, you'll see that I have provided a copy of Stefansson's book where he addresses this and much more, including the famous Bellevue experiment from the 1920s which silenced all the veggie pushers.

The Inuit ate seal meat only part of the year. The major tenet of their diet was actually young Caribou. Because this animal was young, they did not have tough food to eat. Many speculated that their lack of dental caries was due to the strong teeth brought about by crushing bones and the like. Stefansson says their food was actually very soft. They did nibble on bones as did many so-called primitive peoples, but there's more.

An analysis of Inuit food would show that they did not get enough calcium from their diets. However, Dr. Horton analyzed the remains of Inuit Eskimos (not Indians) and found that they had no calcium deficiencies which directly challenges the notion that we only get these minerals through our diet.

In fact, it appears we have a baseline of nutrients and we either enhance them with our diets or we cause our bodies to lose nutrients by eating carbohydrates. Moreover, meat contains all of the essential amino acids and they do so in ratios that maximize their utility to humans. To reach the same amount with wheat, a 176 pound male would have to stuff himself with 3.3 pounds of wheat bread per day! Meat is a particularly concentrated source of vitamins A and E and the entire complex of B vitamins. Vitamins D and B12 are only found in animals products, although we usually get sufficient vitamin D from sunlight when carbs are not in the equation.

Folks on mixed diets and higher carbohydrate plans should be more concerned about deficiency diseases than us.
Vitamin C has long been the point of contention. It is contained in animal foods in such small quantities that nutritionists have considered it insufficient for good health. James Lindt only demonstrated that scurvy is a diet deficiency that can be cured by the addition of fruits and vegetables. This doesn't necessarily imply that lack of vitamin C is caused by lack of fruits and vegetables.

Sailors on sailing ships carried processed and easily digestible carbohydrates (to avoid mice from eating them) and they developed scurvy. The prisoners in the Phillipine prison developed scurvy eating white rice. Van Itallie of Columbia University testified before the Mc Govern committee that "there is an increased need for vitamins when more carbohydrate in the diet is consumed."

Julie Will and Tim Byers of the Centers for Disease Control and the University of Colorado both said that it was "biologically plausible and empirically evidence that high blood sugar and/or high levels of insulin work to increase the body's requirement for vitamin C.

Moreover, University of Massachusetts nutritionist John Cunningham informs us that vitamin C and sugar take the same pathway. Glucose usually wins the race when insulin levels are high. Thus, drinking a glass of orange juice with 26 grams of sugar means that we will not absorb the vitamin C from the orange juice. However, when we remove sugar from the diet, we find that our vitamin C levels are just fine.

Stefansson argued these things back in the 1920s. Many suppose the Inuit were somehow genetically adapted to their high-fat diets and thus could enjoy good health. However, this doesn't explain Stefansson and the members of his expeditions who were represented by many races and nationalities.

Fortunately, we don't have to live as the Inuit lived. Stefansson and Karsten Anderson undertook the all-meat trial in the 1920s at Bellevue and this experiment is much more valuable to us than the Inuit. They ate two pounds of broiled sirloin per day with the fat. This broke down to 3/4 of their calories coming from fat, even though the diet appears to be high in protein. Many people try to do high-protein diets eating lean meat and report feeling miserable. That's a shame because a little knowledge goes a long way.

Dr. DuBois reported on the findings as follows:

"The only dramatic part of the study was the surprisingly undramatic nature of the findings. Both men were in good physical condition at the end of the observation. There was no subjective or objective evidence of any loss of physical or mental vigor. Stefansson lost six pounds over the course of the year and Anderson lost three. (They were not fat to begin with.) Anderson's blood pressure dropped from 140/80 to 120/80. Stefansson's stayed low throughout, 105/70." (My blood pressure is 105/62)

The researchers did not detect any evidenec of kidney damage or diminished function and vitamin deficiencies did not appear, nor did mineral deficiencies although the diet contained only a quarter of the calcium usually found in mixed diets and the acidic nature of a meat-rich diet was supposed to increase calcium excretion and so deplete the body of calcium. Stefansson began the experiment with mild gingivitis but this cleared up entirely after the meat diet was taken.

As DuBois said in 1946 in the New York Times:

Dr. DuBois Wrote:
"Mr. Stefansson makes the mixed-diet technicians and the nuts and fruits addicts look terribly silly. A great many dire predictions faded into nothingness. Quite evidently, we must revise some of our textbook statements."
Unfortunately, the textbook statements would go unrevised!

RE: Zero Carb / Meat and Water - usmaid - 07-03-2008 08:54 AM

[quote=Vesna]
Let's put it this way.

Let's say my ideal amount of stored fat weighs x pounds.

But who or what determines "ideal" weight? And isn't there a way to change that? As I said earlier, I'm 5'5" and 165lbs- hardly ideal. I guess I can't help thinking there has to be something to do. More calories, less calories, more fat, less fat.....Charles keeps saying to add things in to try and if you continue to loose it stays. How can one experiment if you're not loosing to begin with? It's sooooo confusing and frustrating!!

RE: Zero Carb / Meat and Water - Charles - 07-03-2008 08:57 AM

Kristi31 Wrote:
So, it's back to fatty meats only, cooked meat, that is. 😊

Well, the Inuit very rarely ate raw meat. In fact, there are not too many cultures that did eat raw meat. Dr. Groves reports that even vegetables need to be cooked in order to release their nutrients. This raw and natural stuff has to go!

Glad you're feeling better!

feckless Wrote:
i eat 3-4 times a day. i would probably need to eat at least every 4 hours to keep crashes at bay, and might be more comfortable if i ate every 3 hours as i can't eat too much fat at one time without the accelerated heartrate problem (and i get so sleepy from eating) -see i pass out from not eating...and from eating!

Oh dear. Honestly, I don't know how zero-carb could be any worse than what you're enduring now. I mean, really. You could crash whether or not you eat so why not? Removing the carbohydrates slowly can't hurt and the medications would also have to be lowered slowly. The bottom line is that you'll have some days and events that are very tough to endure, but I think that if you can bear with them long enough, you can improve the situation on the other side. That's a tough thing to write, but that's just how I see it. I wouldn't blame you for not trying it, that's for sure.

Feckless Wrote:
i think the bad BS crashes started, oddly enough, after i cut my drinking down from 20 drinks most nights to 2-3 drinks just ocassionally. that was in 1993. i think my body was somehow adapted to run on alcohol! sorry i'm such a difficult case! believe me, it ain't no fun and i appreciate the help! [/color]

I think you're right. Alcohol is processed identically to carbohydrates so I don't see any difference. Stopping carbohydrates should feel as familiar to you as stopping alcohol. It will likely be just as painful but just as necessary.

I wish I had a better way, but that's how it appears to me.

Regards,

Charles

**RE: Zero Carb / Meat and Water - con - 07-03-2008 09:10 AM**

Hey Mac,
You're exactly right. He was trying to eat "healthy" so lots of bananas for potassium, sandwiches with healthy whole grain breads, lots of Jamba Juices, lots of cokes( healthier than wine & beer), a pastry or two daily for when he felt tired. In Chinese restaurants he would drive the waiters mad trying to find sugar for his green tea.
He finally gave up his beloved bananas and Jamba Juices. Also no more outright sugar or pastries.

con
usmaid Wrote:
I've been following along for a few weeks now (I actually posted my info 3 weeks ago but no one really responded) but I took the zero carb challenge and for the last 3 weeks I have lost zero lbs. I only have 10-15 to lose so I'm not looking for HUGE numbers but something would be nice. I was having a protein shake with flax in the morning (replaced that with half lb hamburger patty), another half lb patty at lunch and then 6-10 oz of steak, or two chicken thigh/legs or 8 oz fish for dinner. I drink only water. I even stopped chewing gum when I saw it had 2g carbs! The hamburger is 80/20 so I add 1T of butter to it. I started FitDay today and I'm at 3700 cal for today!! I know we're not suppose to pay attention to that but could that be the problem? I'll be honest- I have cheated.... with extra meat or I'll get a cheeseburger if we're out (it's hard to get a cheeseburger cooked even alittle rare anymore). But that's it in 3 weeks. Anyone have any ideas?

I apologize for not seeing your post. Let me say, and that goes for anyone, if you put my name in your post and I don't respond to you, send me a PM and let me know you've written. I don't spend all day on this thing and it's easy for me to miss what you've written. I'm not saying you put my name on your post, but I just want to put that out there.

How tall are you and what do you weigh?

You said you want to lose 10 or 15, so that means you are close and you could just be where you're going to be. Minor tweaks at this level can help, like removing cheese and dairy. That was huge for me. I also took eggs out of my diet and lost 5 pounds within a week. Other than that, your menu looks pretty good.

Try to remain eating cleanly for a week or two and let's see what happens. When you're this close, it doesn't take much to derail you. Are you getting 5 or 6 hours out of your meals?

Regards,
Charles

Vesna Wrote:
Let's put it this way.
Let's say my ideal amount of stored fat weighs x pounds.

But who or what determines "ideal" weight?

I do, of course. Who else? I'm basing it on where I tipped the scale years ago when I felt comfortable in my body and looked good in a wide variety of clothes.

Notice, I didn't say ideal weight. I said ideal amount of stored fat.

usmaid Wrote:
And isn't there a way to change that?

For what purpose?

usmaid Wrote:
I guess I can't help thinking there has to be something to do. More calories, less calories, more fat, less fat.....Charles keeps saying to add things in to try and if you continue to lose it stays. How can one experiment if you're not losing to begin with? It's sooooo confusing and frustrating!!

I'm totally with you on that! Whenever I hear, "You just didn't stick with [whatever] long enough," I'm reminded of the famous definition of insanity: doing the same thing and expecting different results. (That is what the low-fat people do, after all.)

Me too Beth. I've been low carbing since January and zero carbing for about 3 months and haven't lost one pound. I suspect adrenal fatigue in my case. I'm just waiting for my adrenals to rest or heal or whatever they need to do. I'm thinking it may take me years to recover and maybe I won't lose weight until then. But that's OK.

Deanna

Okay, and what are you eating and how much? Give me the rundown again, how tall, how much do you weigh, etc.

RE: Zero Carb / Meat and Water - Charles - 07-03-2008 09:22 AM

deedum Wrote:
I weaned myself off coffee about 3 weeks ago and now I have to take a nap everyday. Before, if I felt sleepy during the day I would have coffee. Without it, I'm sleeping a lot. I take this as a sign that I need a lot of resting to do. Unfortunately, I still have to teach 3 Turbo Kick classes a week and that is definitely too much for me. I feel so tired, that I am unable to walk my dogs everyday. In fact, I started putting on the weight when I increased my classes from 2 to 3. I'm getting up the nerve to get rid of one of those classes.

Every once in a while, I want a salad so I have a small one. 2 days ago, I realized I wasn't enjoying my decaf and cream so I stopped that. So now just meat, eggs maybe once a week and that occasional salad.

I just keep telling myself that I'm in recovery and to just get out of the way and let my body do what it needs to do.

Deanna

See, these are the things that amaze me. When you say that you've been zero-carbing for weeks, and then you post about coffee, cream and salad that makes me wonder. If you're going to do zero-carb, you have to do it and give it some time to work. You have to be consistent and stay out of your body's way.

You can't think that because you eat cleanly for two days that you're now going to drop 5 pounds based
on that. We're talking about conditioning and insulin control. That takes time and it takes consistency. When you load yourself up just once with some carbs or some substance, it takes a few days for the effects of that to show up. I don't know how caffeine works. For Travis, it works great. For others, not so much. Some people are addicted to it and others can take or leave it. If you can't live without it, you're addicted to it. Once you quit drinking it, you have to allow a couple of weeks for the effects to show up.

When you quit smoking, it's well documented that these folks put on weight after they stop, especially if they don't go zero-carb with a bunch of fat right away.

Please don't eat for weight loss, eat for health and the weight may be a part of it. What would you do otherwise, just eat unhealthy because there's no use?

I know it's hard to do things right for a while and not see results, but you can't view it that way. Each day you eat right, you are becoming healthier. Obesity is one of many symptoms we want to avoid. If you have none of the others, consider yourself fortunate!

**RE: Zero Carb / Meat and Water** - **travis t** - 07-03-2008 10:12 AM

Meat and coffee diet still working awesome. My wife is starting to be interested in zero carb for herself. We have eliminated almost all wheat and corn products from our house. My wife has not bought bread in about a month(which is amazing in itself). My three girls still love eating white rice with everything, but they are chinese and i am not one hundred percent sure about zero carb for children yet. They are very lean and are performing well in school and gymnastics. We for the most part feed them meat, butter, rice, whole milk, drinkable yogurt, and some fruit.

kittyatlanta Wrote:
Charles, you need to come down here and run the Peachtree. Too late this year, it's tomorrow morning.

There may be hormones and other things in our factory system beef, but I'm with you. I'd rather feel good WHILE I'm living. I'm also good with the fact that eating generally available meat might mean less time in the nursing home. My great granny lived to 106 and she had just sold the farm 2 years prior to her death.

I may try to do it next year. My wife brought up the idea this year but it was too late. I understand that the race sells out in hours. All of that fuss for a 10k? Amazing!

I think the grass-fed folks have a good point in that this meat has more nutrients and the animals are healthier, it just means I have to eat more of the feedlot variety which I'm more than happy to do!

One-hundred six is nothing to sneeze at. My great-granny lived until 94 and I'm trying very hard to follow right behind her! That gives me about 54 more years to try to get in the Peachtree!

RE: Zero Carb / Meat and Water - pooti - 07-03-2008 10:59 AM

Charles thanks for answering my questions so thoroughly and informatively. I downloaded the Steffanson file and will start reading it this weekend. 😊

It's very intriguing. I don't know if I'm cut out to do zero carb but I can certainly do very low carb with little effort (<10 day). I would do just about anything to figure out why I am stuck at my weight and to get rid of the fatty liver disease. For the last two days I've thrown caution to the winds and have been eating to appetite with tons of fat. I've been averaging between 73 - 75% fat and taken my calories up from 1400-1700/day to over 2300-3400/day! :eek: Carbs have been right at 20/day net (fiber only).

I had gained 14 lbs in about 10 days from being sick with bronchitis/cold and taking cough drops (sugar free), SF Tussin DM, Advair, Flonase, Loratidine, Cozaar, Prevacid. I went from trying the 5 little meals per day (God I hate that! Always hungry. Always eating...) to eating whatever I could put in my mouth and keep down cuz of lack of breath - usually chicken broth with noodles (hence the quick weight gain I'm sure). But now I'm better and want to get back on track and quit being self-indulgent and self-destructive. My T2 doesn't magically go away just because I'm sick...dangit.

So the result is that I went from 272.6 on July 1 to this morning 267.4 and I know that is all water weight. But dayum, being able to eat over 2000-3000 cals/day??? Seems too good to be true. So far no funny buzzing/adrenaline surges.
I will try to post the past couple of days for you to look at out of MasterCook:

**7.1.08:**

**Daily Totals:** Grams Fat 179 C 28 Fib 8 Prot 122 Cals 2201
% of Cals Fat 73% Carbs 5% Protein 22%

**Brekky:**
24 oz Decaf Coffee
2 Eggs, fried
1 Tbsp Butter, unsalted
2 oz Mushrooms
1 tsp Carlson's Fish Oil

**Lunch:**
3.2 oz Salmon, canned
1 Egg, boiled
2 c Romaine Lettuce
1/2 c Cucumber
3/8 c Red Bell Pepper
1/8 c Onion
2-1/2 Tbsp Vinaigrette
1 Tbsp Olive Oil

**Dinner:**
2c Romaine Lettuce
1/2 c Cucumber
1/8 c Red Bell Pepper
2 oz Blue Cheese
1 Tbsp Butter, unsalted
8 oz 80/20 Ground Meat, raw measure

**Bedtime Snack:** STARVING!
1 oz Mozzarella
.25 oz Porkrinds

And here's today so far as planned:

**Daily Totals:**
Grams Fat 133 Carbs 14 Fiber 4 Protein 101 Total Calories 1694
% of Cals Fat 72% Carbs 3% Protein 24%

**Brekky:**
24 oz Decaf Coffee
3 Eggs, fried
1 tsp Butter, unsalted
3.5 oz Beef, ground 80/20 pan fried
1 tsp Carlson's Fish Oil

**Lunch:**
3 oz Salmon, canned
3 Tbsp Mayo, Homemade with olive oil
1 Tbsp Mustard
1 Egg, hardboiled  
1/2 oz Porkskins  
1/2 c. Cucumber  

Dinner:  
2c Romaine Lettuce  
1/4 c Cucumber  
1/8 c Red Bell Pepper  
1/8 c Onion  
3 Tbsp Vinaigrette  
1 oz Blue Cheese  
2 Tbsp Butter, unsalted  
4 oz Arm Roast

**RE: Zero Carb / Meat and Water - jeepifer - 07-03-2008 11:00 AM**

Had an awesome lunch! Not sure if the fat was high enough, though. We went to a mongolian grill place where you select a bowl full of food and they stir-fry it for you. I got their sirloin and pork, loaded up with olive and garlic oil, and a bit of ginger and pepper. They only had table salt or season salt, and since most season salts have sugar, I stayed away. It was great and I am very full. So glad to know I *can* eat out and make a great choice!

con Wrote:  
Just wanted to update my husband's progress. He started doing sorta low carb(SLC) approximately 2 weeks ago to rid himself of 'extreme gas production' in his stomach for which he was taking Alka Seltzer every night. After 2 days of SLC WOE he doesn't take Alka Seltzer any more. YEAH FOR ALL CONCERNED!

Now the next problem----he kinda complained to ME (me who has only lost 30 lbs. in 6 months) that he lost another 10 pounds!!!!!!!!!!!!!!!!!!! (btw : this is a 70 yr. old man who has NEVER in his life dieted.) That makes -22 lbs. in TWO WEEKS!#@&%  

He's worried that he's losing too much too fast. He only has 30 more to lose-not that he is concerned about his weight, he only cares about the gas and arthritic knees. (I also told him LC would help his arthritic knees.)

Sort'a LC= because he still insists on eating corn tortillas, bread, apples, and small amts. potato and isn't crazy about nice fatty meat... "sigh" :>

Worst thing about it all is that I now feel responsible for his success or failure with this WOE. Maybe I should have let him keep burping?  
con

That's hilarious. Shame on you actually helping your husband get healthy! You just can't win! 😞

I have people in my life who think I should gain some weight. If only it were that easy.....

Thanks for the response, Charles. For the last 2 weeks I've done only meat and water with an added 1 slice of cheese 2times. I'm 52 yrs old, 5'5" and 165 lbs. I'd like to lose 10-15 lbs. I'm going to keep at it. Just want to make sure I'm doing it right or all that I can.

I was adding 1 tablespoon of butter to my 80/20 hamburger but I'll drop that too. I usually eat 1/2 lb hamburger at 6 am. Then another one or two 1 pm. By the time I get home at 5- I'm hungry. I usually have a good size steak or 2 leg/thigh chicken. If I have the chicken, I'm hungry again by 8 so I'll open a can of chicken. Other then the butter, I've only used seasoned salt, and garlic pepper for seasonings. If we go out for dinner (usually 1-2x week) I'll order a cheeseburger-no bun. That would be my only "cheat" or carb in 2 weeks.

I just started keeping track on FitDay and the calories scared me. Again I just wanted to be sure I was doing all I could be doing.

Thanks again for responding.
Beth

RE: Zero Carb / Meat and Water - Valcan - 07-03-2008 11:13 AM

Hi,

I had left over roast beef for breakfast and was not too hungry at lunch but was going out for the afternoon so I thought I better have something. I fried a few jumbo shrimp in chicken fat. They were so good but I could only eat three and had to give the rest to my daughter.

I have a question for you Charles. I am trying to keep my fat up and eat enough because I do not want my calories to drop too low. I am having a hard time getting my head around the possibility of skipping meals and ending up with a low calorie total at the end of the day. Is it alright to have lower calories if you are eating to hunger and just not hungry? Today is day six of zero carb so maybe the lack of hunger is just part of the adjustment period. Thanks for your input, I am so glad I have someone to go to with all my questions.

Val

More calories, less calories, more fat, less fat.....Charles keeps saying to add things in to try and if you continue to lose it stays. How can one experiment if you're not loosing to begin with? It's sooooo confusing and frustrating!!

That's exactly the point. Body weight is regulated by your body not your head. You can't increase or decrease your stature without doing more harm than good. This is the part no one seems to want to understand. All you can do is provide the correct raw materials and your body will respond to it in myriad ways, most of which we don't understand. Hunger tells you how much to eat and satiety tells you when you've had enough. You can't make yourself hungry or make yourself not be hungry. You have no control over that. So why would you think you should control the number of calories you consume?

Obesity is just a symptom. Eating zero-carb takes care of the problem. Unfortunately, we have no way of knowing which symptom your body is interested in fixing first. We also have no way of knowing if the damage done was too extensive as to reverse it, as Gary Taubes answered on the site MAC provided. We also can't see the changes that are happening to you on the inside.

We know that HDL goes up and triglycerides go down but we don't get to see the increased cell destruction that happens as a result of insulin being lowered. We don't get a report of how many AGE's or cross-linked cells were spared this month as compared to last month. This would be helpful but we don't have it.

All we can do is eat for health and trust our bodies to work it all out. There's really nothing else to be done. If you give up eating healthily because you're frustrated, you only make matters worse for yourself. At some point, the choice has to be made to just eat for health.

I respectfully disagree. I'm asking you to shift your paradigm here. If you're only eating zero-carb to lose weight, then you're missing the boat entirely. I'm saying that this is the most healthy way to eat. I frankly don't care if you lose weight or not. I care that you reduce your risk for dying of some disease of civilization. Not too many of us die from being too fat. We die because of the cellular damage we do through a bad diet.

What would you do otherwise, eat a bunch of carbohydrates and just say "to Hell with it all?" I don't really get what the converse is to all of this. Tell me a better alternative.

I just don't like the "starving" at bedtime thing. That indicates that the carbohydrates may still be a little high for your insulin levels. I know it's less than 10, but you shouldn't be starving at bedtime. As Gary Taubes said, the studies show that this diet works best with high fat and high calories. You're finding that out.

Nice job! The only way to know if you got enough fat was your energy level and how full you got with the meal. If the meal is high in fat, you don't usually need to eat that much of it and you're full. You also can go 5 or 6 hours afterwards before being hungry. Most leaner portions of meat cause me to eat a bunch of them.

I can eat two small 73/27 hamburger patties and be in good shape. However, I need three chicken leg and thigh portions to get full. I need about 14 ounces of a ribeye steak to get full, but I can eat a 12-ounce piece of prime rib and I'm good.

You're welcome. What you're doing sounds pretty good, actually. The cheese may hurt, but you didn't
eat that much of it. I hate to be so personal, but have you encountered menopause yet? If not, are you regular? You don't have to answer these questions online but you should think about them and decide whether everything is fine in this area.

I've often mentioned homeostasis and we can't only talk diet without making sure everything else is working properly. If you eat zero-carb for a good amount of time without good results, then you want to check that other systems in your body are also working properly. If they are not, that's probably the culprit.

Hormones are the driver of this whole shootin' match.

Beth Wrote:
I just started keeping track on FitDay and the calories scared me. Again I just wanted to be sure I was doing all I could be doing.

The butter is not that big of a deal. Don't be afraid of the calories. If they freak you out, quit using FitDay. I want you to just eat until you are full. I want you to eat when you are hungry and do not eat if you are not hungry. Try it for a week without the cheese and let's see what happens.

Regards,
Charles

Okay, this is why you mustn't use FitDay and these calculators because they are going to mess you up. You must not be concerned about totals. It's only about your hunger. If you are not hungry, you should not eat. That's a great thing. That means your body is running off of your stored fat as it's supposed to. Hunger comes when your long-term fuel supply is faltering.

By the same token, don't go on a fast either. You don't want to be losing muscle and that's why it's important to get good fatty protein. Having said that, it doesn't mean you have to eat three times a day if you don't feel like it. Twice a day is just fine. Some can probably eat once a day and do just fine. The only caviat here is that the meal must be good fatty protein with no carbohydrates and you'll continue to not feel hunger.

Zero-carb is very much like fasting. In fact, it's identical from a metabolic standpoint. Why? Because your body can't tell (nor does it care) if the fat and protein it needs comes inside the body or outside the body. It will get what it needs regardless. You just don't want it eating your muscles to survive so we provide adequate protein through the diet.
I say all that to stress, **only eat when you are hungry. Do not eat when you are not hungry.** If you do, then you are participating in an overfeeding experiment. That means you'll gain a few pounds and quickly lose those pounds when you stop eating.

**RE: Zero Carb / Meat and Water - Kristi31 - 07-03-2008 11:55 AM**

Charles Wrote:
Well, the Inuit very rarely ate raw meat. In fact, there are not too many cultures that did eat raw meat. Dr. Groves reports that even vegetables need to be cooked in order to release their nutrients. This raw and natural stuff has to go!

Glad you're feeling better!

Charles,

Thanks! 😊

There is a big difference between veggies and meat as the former contain cellulose. Heat breaks down cellulose and allows the body to have access to the nutrients inside those plant cells.

I think for most our history, humans ate raw but I'm also not convinced that there is much difference between cooked and raw, in terms of health when carbs are substantially reduced.

I actually had some raw meat this AM and liked it BETTER, much to my surprise. What's going on with my taste buds??

Did alot of searching RE:iodine and although meat contains some, it seems I do much better when adding iodized salt to my meat. Sea salt without iodine isn't quite as effective, actually quite ineffective. Iodine gives me back energy and doesn't get me all sleepy when I eat. It also regulates thyroid and could explain why I've actually gained weight on zero-carb after losing so much for many months. Mild hypothyroidism? Perhaps...

So, we'll see how that goes.

Hi guys, today is day 6 for me and I think I am doing really well. Today I had 1/2 lb of chuck steak for breakfast at 7:00am then had the other 1/2 lb chuck steak cooked with butter for lunch at 2:00. I am full all the time and have no feeling that I need to eat. I LOVE it. I am drinking water but not to excess and
the trips to the ladies room has really dropped off. I will weigh myself on Saturday to see the total. Most
days I am only eating twice a day breakfast and dinner, but today I was working so I had a small
"snack", I will most likely have dinner during the fireworks tonight. My husband keeps looking at my
meals compared to his meals and he is a little jealous that I get the steak and he gets all the other stuff in
the house. I guess he wants it all, but the meat is MINE!!!!!!..hahaha

RE: Zero Carb / Meat and Water - Dwayne - 07-03-2008 12:20 PM

I have been finally finished reading through all of these messages. Wow you all are some
active posters! I have found this to be a great source of information, and I am strongly leaning
towards joining the 0 carb way. I started a low carb diet on Monday this week and have already
seen some results. I have to say this seems like such an open group here I really like the
"keep eliminating and find what works for you" mentality. It is nice to see such an open group
of people.

I started my own little "blog" to keep myself honest and chart my progress. It has my
background info. I am not going to re-post my large background in trying to lose weight, but
most of it is kept there. What is important is the now.

Currently I am at 332.5 and that is down from 335 on Monday, also I am a 32 year old male.
Already losing weight! I have been eating < 25 carbs a day and plan on decreasing that. I am
going to keep the cheese and eggs for now and see how rapid my weightloss keeps up. After
reading this thread I have realized that I need to give up diet coke/coke zero. I have to say I
am addicted to these and it is going to be hard. Currently I am weaning myself off of them and
trying to get down to just 2 a day and 1 starbucks coffee. Next week is going to be just the
morning coffee and hopefully I can get rid of it all.

Anyway feels like my post is getting too long so I will just say hello once again, and it is nice to
see such a great group of people.

Dwayne

"snack", I will most likely have dinner during the fireworks tonight. My husband keeps looking at my
meals compared to his meals and he is a little jealous that I get the steak and he gets all the other stuff in
the house. I guess he wants it all, but the meat is MINE!!!!!!..hahaha

Sounds great, Pooti!

Welcome Dwayne,
As i work my way along the path of what works and what doesn't i think that my top rules are.
1. protein of animal origin (no plant proteins)
2. fats as saturated as possible (i know it sounds scary)
3. Butter and salt are good
4. fiber and fructose are dreadful for us
5. artificial anything is bad (its not nice to fool your brain)
6. coffee is my friend.

Quote:
See, these are the things that amaze me. When you say that you've been zero-carbing for weeks, and then you post about coffee, cream and salad that makes me wonder. If you're going to do zero-carb, you have to do it and give it some time to work. You have to be consistent and stay out of your body's way.

You can't think that because you eat cleanly for two days that you're now going to drop 5 pounds based on that. We're talking about conditioning and insulin control. That takes time and it takes consistency. When you load yourself up just once with some carbs or some substance, it takes a few days for the effects of that to show up. I don't know how caffeine works. For Travis, it works great. For others, not so much. Some people are addicted to it and others can take or leave it. If you can't live without it, you're addicted to it. Once you quit drinking it, you have to allow a couple of weeks for the effects to show up.
Thanks Charles for that thorough spanking, it hurt so good!😊

After I wrote and read my post I thought to myself, "I think I'm in denial about doing zero-carb" and I've been flinching ever since waiting for you to pounce!

Does this mean I can't even have my daily, one square of Lindt 85% chocolate? (Now I'm actually ducking under my computer).

**RE: Zero Carb / Meat and Water - deedum - 07-03-2008 01:51 PM**

Quote:
Zero-carb is very much like fasting. In fact, it's identical from a metabolic standpoint. Why? Because your body can't tell (nor does it care) if the fat and protein it needs comes inside the body or outside the body. It will get what it needs regardless. You just don't want it eating your muscles to survive so we provide adequate protein through the diet.

Ok, I know you've said this before Charles, zero-carb is very much like fasting, but for some reason I didn't get it until now! Duh!

I was considering doing intermitent fasting but I just couldn't go more than 4 hours during the day without eating (except at night I go about 13 hours). After Charles spanked me in that earlier post I now see that if I stop eating the little bit of carbs I was eating before (occasional salad, cream in the decaf, 1 oz. cheese, 85% chocolate) I don't have to do intermitent fasting! Gawd, I'm one stubborn (or dense) woman.

BTW, Charles, you asked how tall and how much I weigh: 5' and 130 lbs. I'm very muscular and I weighed 120 to 124 last year right before I gained.

Besides the carbs I listed above, I eat 3 to 4x a day: 73/27 ground beef, rib eye, chuck, sirloin steak. Occasional eggs cooked in butter. All to appetite. I don't weigh or measure food.

Deanna

Charles Wrote:
You're welcome. What you're doing sounds pretty good, actually. The cheese may hurt, but you didn't eat that much of it. I hate to be so personal, but have you encountered menopause yet? If not, are you regular? You don't have to answer these questions online but you should think about them and decide whether everything is fine in this area.

I don't mind answering any questions. I appreciate you answering mine! I just want to get it right. I've been post (yippee!) menopausal for about 7 years. They think me cutting to 1000 cal/day and losing 100lbs back in 2001 stopped things. I see my doc regularly and everythings fine. I took HRT's for 2 yrs but have stopped that, too about 1 yr ago.

I understand the eating for health part. And I know that it's healthy but it sure makes it easier in the beginning to "see" some progress, too. After all, I can't look inside and "see" healthier insides. Fortunately, I've never had any medical problems that will be resolved by this WOE. I've always had tons of energy and I sleep great. My great grandmother lived to be 97 and my grandmother lives alone and travels at 92. I was also blessed with a HUGE appetite and a love for all foodsHence my strong desire to see some "fruits of my labors".-I couldn't resist that one!

Thanks Everyone

And HAPPY 4TH!!
Beth

This is very important. Since you had menopause naturally, you may not be able to go down as low as you want to because the sex hormones regulate this. If you were taking an HRT, I would advise you to go back to the doctor and see if you could get another one that altered the estrogen/progesterone/testosterone balance. Sometimes it's just a matter of finding the right one for your body. This can cause you to gain weight if you have the wrong one.

Since you stopped taking it two years ago, that surely isn't the culprit, but you can't discount the effects of menopause.

Regards,

Charles

Hey Penny, I don't use a/c either - it makes me feel bad. People are amazed that I can do that. I'm amazed at their $400 monthly electricity bills!!!

I thought about buying a NuWave, but since I'm such a cheapskate, I ordered a book of low carb, crockpot recipes. I've used the book (bought used for $7 on amazon) a couple of times and the results were good. But most of the time, I just throw it in the fryin' pan and enjoy.

Let us know what you think of the NuWave. I've heard stuff, but won't taint your "life experience" with it.

Take care, Kitty

LOL--thanks, Kitty. I'm sure there are as many negative experiences with things as there are positive. I certainly do plan to buy the nuwave but alas, it is not in my budget just yet. I'm only just setting up a budget and it's telling me "not now" lol

But I do look forward to adding my joy to the list of happy nuwave cookers.

I do the amazon marketplace purchasing thing as well. Amazon is a great place.

Wow—that just stopped me in my tracks! MY eating tracks, I mean.

Thanks for putting that out there, Charles. I'm sitting here trying to get through my pork roast and I am NOT really hungry for it. My hunger pangs stopped a little bit ago. I'm not hungry very often now but I'm afraid I'm not getting enough fat in and I don't want to stall so early in the this low carb way of eating.

But I'm putting the rest of this roast pork away ... right now!

**RE: Zero Carb / Meat and Water** - [Valcan](#) - 07-03-2008 05:59 PM

Charles Wrote:

Valcan Wrote:

I have a question for you Charles. I am trying to keep my fat up and eat enough because I do not want my calories to drop too low. I am having a hard time getting my head around the possibility of skipping meals and ending up with a low calorie total at the end of the day. Is it alright to have lower calories if you are eating to hunger and just not hungry? Today is day six of zero carb so maybe the lack of hunger is just part of the adjustment period. Thanks for your input, I am so glad I have someone to go to with all my questions.

Val

Okay, this is why you mustn't use FitDay and these calculators because they are going to mess you up. You must not be concerned about totals. It's only about your hunger. If you are not hungry, you should not eat. That's a great thing. That means your body is running off of your stored fat as it's supposed to. Hunger comes when your long-term fuel supply is faltering.

By the same token, don't go on a fast either. You don't want to be losing muscle and that's why it's important to get good fatty protein. Having said that, it doesn't mean you have to eat three times a day if you don't feel like it. Twice a day is just fine. Some can probably eat once a day and do just fine. The only caviat here is that the meal must be good fatty protein with no carbohydrates and you'll continue to not feel hunger.

Zero-carb is very much like fasting. In fact, it's identical from a metabolic standpoint. Why? Because your body can't tell (nor does it care) if the fat and protein it needs comes inside the body or outside the body. It will get what it needs regardless. You just don't want it eating your muscles to survive so we provide adequate protein through the diet.

I say all that to stress, **only eat when you are hungry. Do not eat when you are not hungry.** If you do, then you are participating in an overfeeding experiment. That means you'll gain a few pounds and quickly lose those pounds when you stop eating.

Thanks for the reassurance. I am a KK survivor so I am paranoid about having calories dip too low now. When I did KK, I ate to hunger. The problem was I was rarely hungry so I didn't eat enough. I never want to have to handuls of hair come out in the shower again. When I do eat, I always eat fatty meat so I guess I should just relax a little. After I got home this afternoon, I ended up being hungry so I ate two chicken thighs. I am not sure if I will eat dinner tonight or not. I guess my tummy will tell me.

Charles - Do you ever use condiments like garlic, vinegar, fish sauce or soy sauce? I don't have a craving for them, I just love to cook and thought that these might add some variety to my meals (after
only six days, I have not adapted to the lack of variety but I am sure I will in time).

Today I went to see my butcher. I got some beef fat that I am rendering down right now, some pork hocks, Korean cross-cut ribs, prime rib steak, chicken wings, rouladen beef (to make dry meat) and ground beef. I think I have enough meat to last a month! My hubby works away from home and he left today for a 21 day shift. He is a carb eater (he eats what he wants and still maintains a healthy weight and a muscular physique). He is living in our RV while working so I gave him everything carby from the fridge and washed it all down inside. It looks like a different fridge tonight. Meat and a few standard condiments. I threw out all my Frankenfood lc sauces. I never use them anyway. Now I just have to make sure I don't buy them again.

Val

Charles Wrote:
feckless Wrote:
i eat 3-4 times a day. i would probably need to eat at least every 4 hours to keep crashes at bay, and might be more comfortable if i ate every 3 hours as i can't eat too much fat at one time without the accelerated heartrate problem (and i get so sleepy from eating) -see i pass out from not eating...and from eating!

Oh dear. Honestly, I don't know how zero-carb could be any worse than what you're enduring now. I mean, really. You could crash whether or not you eat so why not? Removing the carbohydrates slowly can't hurt and the medications would also have to be lowered slowly. The bottom line is that you'll have some days and events that are very tough to endure, but I think that if you can bear with them long enough, you can improve the situation on the other side. That's a tough thing to write, but that's just how I see it. I wouldn't blame you for not trying it, that's for sure.

Feckless Wrote:
i think the bad BS crashes started, oddly enough, after i cut my drinking down from 20 drinks most nights to 2-3 drinks just occasionally. that was in 1993. i think my body was somehow adapted to run on alcohol! sorry i'm such a difficult case! believe me, it ain't no fun and i appreciate the help! [/color]

I think you're right. Alcohol is processed identically to carbohydrates so I don't see any difference. Stopping carbohydrates should feel as familiar to you as stopping alcohol. It will likely be just as painful but just as necessary.

I wish I had a better way, but that's how it appears to me.

Regards,

Charles

i just want to thank you again charles...i think you are right, my body is going to have a particularly difficult time adapting to running on fat because it was conditioned to run on alcohol for 20+ years. this is a problem for a LOT of recovering addicts. and, of course, they deal by eating sugar because they don't know any better. well, since LC and VLC has not led to any real relief for me, i am going to slowly work into ZC and give it a go.....
LindaSue Wrote:
weirdstuffinmydesk Wrote:
Hey Charles,

So the only seasoning you use is sea salt? I saw you mention Celtic Sea Salt, is plain sea salt okay? How come iodized won't work or shouldn't be used?
I just use regular un-iodized table salt. I wasn't aware that there can be any problems eating regular salt. I don't buy iodized salt because I don't like the taste and I don't need the iodine anyway. I hope that table salt isn't harmful in some way because I can't afford to buy sea salt.

LindaSue, I don't know if you have a Sam's near you, but they have Sea Salt in a "disposable" grinder for less than 4.00.

Just lurking.

RE: Zero Carb / Meat and Water - Vesna - 07-04-2008 05:34 AM

Charles Wrote:
Vesna Wrote:
I'm totally with you on that! Whenever I hear, "You just didn't stick with [whatever] long enough," I'm reminded of the famous definition of insanity: doing the same thing and expecting different results. (That is what the low-fat people do, after all.)

I respectfully disagree. I'm asking you to shift your paradigm here. If you're only eating zero-carb to lose weight, then you're missing the boat entirely. I'm saying that this is the most healthy way to eat. I frankly don't care if you lose weight or not. I care that you reduce your risk for dying of some disease of civilization. Not too many of us die from being too fat. We die because of the cellular damage we do through a bad diet.

Can't I have both? Can't I want both good health and weight loss? I am fortunate in that my health is excellent. I live on wholesome, homemade whole foods low in carbs because I believe they're the best for my health and I feel best eating this way. And for other reasons close to my heart about politics, economy, and how humans should interrelate. (Local, sustainable, self-reliant, traditional cooking skills, low-impact, family farming, and other stuff is all in this grab bag.)

In addition, I'm pining to be slimmer, feel more comfortable, look better and wear more interesting clothes. I want my outward appearance to match the me I feel myself to be. There are about 15 pounds of surplus body fat that stand in the way of my being able to do that. I don't believe those few pounds have an impact on my health. I want them gone for other reasons.

I'm sure there are plenty of others who can relate to that, however many pounds are involved. Maybe this is a bigger issue for women.

While I am firmly convinced that some variation of a whole foods low-carb diet rich in natural fats and based on animal foods is the most healthful diet for humans, I'm not convinced that zero-carb is the sine
qua non for everyone. So, yes, I'm going all the way to single-digit-carbing as a weight-loss effort. I'm sure I'm not the only one here.

Charles Wrote:
What would you do otherwise, eat a bunch of carbohyrates and just say "to Hell with it all?" I don't really get what the converse is to all of this. Tell me a better alternative.

In informal logic, this is known as a "false dilemma." Zero carbs on one side; "to Hell with it all" on the other, as if these were the only choices.

RE: Zero Carb / Meat and Water - poo123 - 07-04-2008 05:53 AM

Today is day 7 and I do have to say this has been a great week. I have lost weight, which is my first and foremost goal of this way of eating. I feel great and I want that to continue. This has been much better on me than when I would do an Atkins induction. I think going "cold turkey" off the carbs was better for me than dropping slowly from 20 down to 0. I had no cravings, "flu" like stuff and no headaches, so I am relieved that week 1 is done. I really am hoping for some amazing weight loss from this but even if it is very slow I will stick with it because I really do feel much better. My hot flashes have been much less by the the end of the week, my mood is much better, I am not STARVING after 2 hours eating, no headaches and I am sleeping thru the night instead of waking up and going to the fridge just to stare into it and tell myself NO GO BACK TO BED, then lay in bed thinking Boy, oh Boy am I hungry. For me this really is the way to go.

RE: Zero Carb / Meat and Water - LindaSue - 07-04-2008 07:50 AM

LCMama Wrote:
LindaSue, I don't know if you have a Sam's near you, but they have Sea Salt in a "disposable" grinder for less than 4.00.

I'm sure that there's one around here somewhere but then that $4.00 grinder would cost $4.00 plus the cost of a membership and the extra gas to drive there. I don't need to buy food in bulk and actually save a lot more money by shopping the sales and getting triple coupons at regular grocery stores. Anyway, there's a good chance that Wal-Mart would probably have the same grinder for the same price. Thanks for the tip.

RE: Zero Carb / Meat and Water - Kristi31 - 07-04-2008 08:00 AM

I'm back to just (raw) meat and doing fine. I ditched the salt (terrible, painful bloating) and I am taking a kelp supplement instead to provide with the much needed iodine.

...change that to JUST iodine, kelp contains too much sodium and other stuff I don't really need.

RE: Zero Carb / Meat and Water - LCMama - 07-04-2008 05:38 PM

Val

I don't use any of those. I just normally rely on salt and pepper. You have to understand that I also don't
cook, so I'm really only responsible for breakfast and lunch. My wife is good about respecting my
wishes though. However, for the fourth of July ribs, she did use a rub that has smoked paprika, salt,
pepper, and garlic.

The rest of my family had some sauce by Newman, which we picked out of the store simply because it
didn't have high fructose corn syrup in it and only 2 grams of sugar per serving. My wife and oldest son
ate that, but my daughter, younger son and I passed on the saucy ribs.

Charles, thanks for the info on grass fed vs grain fed beef. I'm in the group of people who can't afford the grass fed. I"m barely hanging on with the grocery store meat! 🙃

You're welcome. You know, it's funny you say that. After my race yesterday morning, there was this lady who was walking around passing out information sheets about the evils of factory farming on the environment. You know that I was the last person who wanted to hear about her little crusade.

She gave me the paper (I thought it was advertising a race like most flyers we receive after a race) and I skimmed through it. I turned to her and said, "so, you don't think we should eat any meat and become vegetarians?" She said, definitely, and how it was so much better for environment. Essentially, she wants to save the environment and slowly kill all the people. I countered that all those vegetables, especially the corn, should be fed to the cattle so we can have more healthy beef for everyone. Our grain gets spread all over the world and all we've done is made more people ill.

Needless to say we agreed to disagree, but I stand firmly by what I've written many times. I agree that grass-fed beef is better for the environment and that it has more nutrients than feed-lot beef. However, the difference can be overcome by eating more of the cheaper, better tasting, fattier feedlot beef. Moreover, they are able to feed far more people than the grass-fed beef farmers can. Because of the benefit to feeding more people healthier food, I am a feedlot beef advocate and I encourage everyone to buy the cheapest, fattier beef possible and watch your health improve.
If you are visiting or live in the Raleigh-Durham area, I'll be at the Golden Corral in RTP tomorrow for our low-carb meetup dinner. You can best believe I'll be enjoying some good ol' feed lot meat with my friends. Hope to see as many of you as possible there.

Regards,

Charles

**RE: Zero Carb / Meat and Water - poo123 - 07-05-2008 07:08 AM**

Well today is day 8 and my total weight loss for the 7 days was 7.6 lbs. I am very very happy with that amount. Last night when I was watching the fireworks I thought these are for me too because I did something that I have not done in a while and that is loose weight and feel better. Fireworks now have a whole new meaning for me!!!

244.0 start
236.4 current
?? goal

I like that I have to change my numbers !!!

---

**RE: Zero Carb / Meat and Water - Clabbergirl - 07-05-2008 08:39 AM**

I've been wondering about something that I'm hoping Charles or others can clear up. If high fat/high protein is the most efficient way to lose fat (among its other benefits), how does one explain the low-fat/high protein diet most body builders use to cut before a competition? If this has been covered before, my apologies. I don't recall seeing it before, and I saw some kind of bodybuilding comp on tv that made me wonder about this.

---

**RE: Zero Carb / Meat and Water - poo123 - 07-05-2008 03:20 PM**

Well my husband finally decided to go for it. Starting tomorrow he is zero carbs just like me. He looked at how much weight I lost and how happy I was and how I was not craving stuff and he decided to get on the bandwagon. I am very happy and proud of him for the decision. He needs to lose around 50-75 lbs, he thinks he only needs to lose 25 lbs. I guess his mirror lies to him too !!!! So tonight he asked for his favorite so he is getting his pasta and garlic bread and milk meal for the last carbs. And while cooking all this I have no desire to taste or to eat it at all. Actually the garlic bread smells not so good to me. I think thats cool. And I have convinced him this will save us money in the long run and only buying healthy foods for our kids will be much cheaper and easier too. So everybody wins!!!
RE: Zero Carb / Meat and Water - LindaSue - 07-05-2008 05:11 PM

That's great, Poo. It will be nice having your husband's support.

RE: Zero Carb / Meat and Water - Valcan - 07-05-2008 08:49 PM

Hi Everyone!

I hope you are enjoying your holiday weekend.

I just completed day eight of zero carb. I didn't think I would last a week and here I am heading into week two, no problem.

June was a rough month for me with two cheat days (yes days, not meals) and lots of Greek salad. My body could not handle the extra carbs and after my last cheat day (which was June 27), my weight soared up 15 lbs! I know most of it was the water I stored after eating carbs but it is still scary to see the scale go so high. Yikes! After a week of zero carb, I have lost 12 of those pounds and am only three pounds from my one year weight on June 9. I hope to drop the other three pounds by the end of next week. After that I will be able to see if zero carbs will help me lose weight.

I have been following the advice of not drinking too much water. After the first three days, my thirst diminished. Now, I find myself blocked up so today I am drinking extra water to try to alleviate this problem. It has been four days since my last "big event" so I think I am due soon. I had this trouble last year on KK and I do not want to do through it again. If the water does not work, I may have to eat some veggies to help me along. I am surprised this happened considering how much fat I eat.

Any suggestions would be appreciated.

Val

RE: Zero Carb / Meat and Water - pooti - 07-06-2008 06:31 AM

Val try taking magnesium citrate pills (tablets). You get them in the supplement section. You slowly increase them until you go potty. Magnesium works the best for me when I have the odd time or two that I have to deal with that. Good luck!

RE: Zero Carb / Meat and Water - poo123 - 07-06-2008 07:06 AM

Well today is the day for my husband to begin. He was not all that thrilled so I did alter his diet. I said he could eat, meat like me, along with eggs and cheese. That made him very happy. This morning he ate 5 sausages and said if he could eat these all the time he could do it. Well he did buy the sausages, and was so excited to help with the shopping for the diet that I didn't have the heart to tell him he could not eat them because they contained corn syrup. I let him have them and he has quite a few left (he bought 3 packages) but when they are gone I will tell him and then show him what to buy if he does want to help with the shopping. His favorite thing he is looking forward to is when I cook some ground beef, then add eggs and cheese for a big beefy scrambled eggs. I had him write down his start weight, and I think he was a tad surprise at how much that was, because he never gets on a scale. This let him see he not only has to lose 25 lbs but a few more. I am so thankful that he is doing this because I want our family
around for a long time and being overweight helps no one. The weight and how he feels does affect the 
family because he sleeps all the time and does no physical stuff with the kids, just games and computer. 
This will make the kids have more fun with dad too. I am really happy he is doing this for himself and 
the family. Together we can do it.

RE: Zero Carb / Meat and Water - cbmarie - 07-06-2008 07:08 AM

Valcan, I use SmoothMove Tea by Traditional Medicinals. It has senna in it which some say is habit 
forming, but I found it works extremely well. I only use it once in a great while; maybe I need 
something once a month. I would usually drink a big mug of it in the evening and by the next afternoon, 
everything would be back to normal. I never had cramping or any "out of control" urges to go. This is 
just another option to try if you need it.

I have been trying to do zero carb and am having a terrible time with it. I know it is a good way to go, but 
my brain wants variety. I will start induction again today and take it one step at a time. Right now my 
favorite food is porksteak. It has plenty of fat and flavor. Really good stuff.

RE: Zero Carb / Meat and Water - Vesna - 07-06-2008 08:42 AM

Smooth Move has never let me down! I only use it a few times a year, maybe, only when necessary. I 
steep the bag in the mug for a longer time than recommended -- until it's cooled down enough to drink. 
Then I squeeze out the bag into the mug. So I guess I make it strong. I drink it in the evening, then the 
next morning ... a smooth move, shall we say. I only have the one mug. That's all it takes.

RE: Zero Carb / Meat and Water - Charles - 07-06-2008 10:11 AM

Vesna Wrote:
Can't I have both? Can't I want both good health and weight loss?

There's no difference. Your body regulates weight loss, not your brain or your eyes. If you rely on your 
brain and your eyes, then you will impact your health as our Kimkins brothers and sisters found out. 
You're either healthy or you're not. If you're healthy, your body will regulate your weight. Eat your 
whole foods as you described and be healthy. Why all the questions for me?

Are you just saying that you disagree with me? Stand in line. I'm not trying to convince anyone of 
anything. I did it this way and I'm helping others achieve the same for themselves. If it doesn't work for 
you, go find something that does. If you don't agree with zero-carb, then you can go and find millions of 
people who agree with you.

Many people would love to be 15 pounds away from what they think is their ideal weight. Only your 
body knows whether or not you have 15 pounds to lose. You may not have any weight to lose. Your 
answer may be found in a gym or through some activity that gives you what you desire.

Regards,

Charles

I've been wondering about something that I'm hoping Charles or others can clear up. If high fat/high protein is the most efficient way to lose fat (among its other benefits), how does one explain the low-fat/high protein diet most body builders use to cut before a competition? If this has been covered before, my apologies. I don't recall seeing it before, and I saw some kind of bodybuilding comp on tv that made me wonder about this.

It's a low-carbohydrate diet as well. There is no "recipe" if you will. It's simply to cut out those refined and easily digestible carbohydrates and your body will have no reason to store fat, period. This results in the "cut".

The low-fat, high-fat issue comes into play when you're talking about energy levels, sense of well being, and optimum efficiency among other things. Low-fat, high-protein can only be tolerated for a short time because ammonia will build-up in the blood and make you sick.

Their idea of low-fat really isn't as low-fat as you might think. Some of the leanest pieces of meat still have fat present, and depending on how much you eat, you still get the fat. The ratios that people keep touting are largely irrelevent. Quantity is most important as far as fat is concerned, not the percentage.

RE: Zero Carb / Meat and Water - caroline - 07-06-2008 10:20 AM

I'm finding that zero carb is the BEST way to maintain health, encourage lean muscle (I'm 40 years old, do less exercise than ever and am seeing MORE results than when I was in my 20's.)

If I eat vegetables or cheese, it is a psychological padding for feelings. I know this works the best. So any detour from this way of eating, and my progress declines. Charles, you appear to have the goal of optimal health. Yes, it "tastes good" to eat those other things, but your health is first priority. Period. This is how I think and I was 360 degrees away not more than four months ago with a lifetime eating disorder. I am empowered by feeling freedom, not by "treats." The ultimate hedonism is living with optimal health.

Don't run out and take a bunch of supplements unless you have some pain. You also haven't been eating as much if I remember correctly, so you just may not have to go. Wait it out some and see what happens. Granted, if you're having bloating or stomach cramps then by all means, take something to get things moving. Just don't take a bunch of fiber which could make things worse.
Don't panic.

Charles

I can't add anything to this. You are exactly correct. It does take time to come to this and that's what Stefansson and his friends found out as well. If people can last about six weeks, there's a chance they'll make it. If they can last until six months, then they were likely to remain on meat-only and not go back. Even those who went back after six months, voluntarily chose to return to meat later on because they are very much aware of the health changes.

Well said.

Charles

I have to concur with Charles that it takes some time to adjust to zero carb or even VLC. I have been low carbing for 7 months now and my desire for sugary things and even vegetables has wained to the point that I don't care if I eat them or not. E.g., my son and wife really like Dip-n-Dots ice cream. Last night before my wife tossed away the other half of what she hadn't eaten I had one small spoonful of it. Tasted ok but I had no desire to eat any more of it. In fact food doesn't taste the same as it used to before I went LC and lost the sweet tooth. To me these days, I eat to live, not live to eat. Quite a turn around.

P.S. Taubes had the following reply in the question and answer post:

What is your choice as a recommended sweetener for diabetics?

I'm afraid to say this question I can't answer. I will say that my research suggests that fructose is particularly noxious -- even if it has no immediate effect on blood sugar levels and insulin -- and so fructose alone or sucrose, which is half fructose, would be particularly bad choices.

As for the non-caloric sweeteners, I simply haven't done enough research to make any informed statement. I do believe on a fundamental level that the single healthiest thing to do might be to lose the sweet tooth entirely. In other words, treat the cravings for sweets like cravings for any other addictive substance and try to break it, even if it takes years of effort and many, many, many, many attempts before you succeed.

P.P.S. I think by extension this could be applied to any carb at all since your body does not require carbs to function.

RE: Zero Carb / Meat and Water - caroline - 07-06-2008 12:50 PM

This is a great point--it seems that there's a lot of focus on low-carb treats. Recipe after recipe of how you can have your treats on low carb. The rationale for many people is "it doesn't affect my blood sugar." If it doesn't affect your blood sugar, then why do you need it? Addiction, plain and simple.

This is especially powerful. It may take years of effort and many, many attempts before we succeed. This can't be overstated enough!
What do you do if you inadvertently have taken too much fiber? I was unfortunately away from home and had nothing around me that I could eat to maintain my lc except pecans and I fear I ate way too many to keep hunger pangs at bay.

And now I'm suffering greatly. My stomach's blown up and I am extremely uncomfortable... I imagine pecans have a bit of fiber in them? If not, they have something! Because I feel horrible. 😞

Well today is my 7 day mark of reducing carbs. I am a little frustrated, but I am eliminating things gradually so I guess slow is what I should expect. This weekend I didn't cheat at all, and was never hungry. This week I am eliminating carbonated diet drinks. I think I am going to try to get as close to 0 as I can manage this week with the goal of going 0-5 the week after. Since my first weigh in was flawed I don't know if I have lost 3 pounds or 7, but I guess it is still a loss. I have to say it is disheartening to lose soo little when I weight so much. I am used to the beginning being much easier.

Anyway, still plugging along with 0 cheats so far, now to start refining my induction down to my 0 carb. =)

I'm not sure if there's anything you can do if you're sensitive to fiber. Taking a laxative would just add more fiber and might make you feel worse. I've tried taking laxatives a couple of times over the years and they've never helped me at all. I even took a double dose of EX-LAX once and it had no effect.

Dwayne, can you post an example of what you eat per day along with the amounts? Maybe we can spot something that could be a problem. How many carbs are you currently eating per day?

If you did lose 7 pounds this past week, that's nothing to sneeze at. If you only lost 3 pounds, that's not so bad either but I agree that it's typical for someone your size to lose more than that in the beginning.

Well, I got through the night.

I don't know what it was but it wasn't the conventional sufferings of a fiber overdose. Not trying to be too TMI (too much info) but I didn't spend my night in the bathroom. I more or less burped my way
through the night. LOOL

NOT attractive, I know but because of the bloated stomach and sort of constricted throat, I couldn't really sleep well so I am very tired...

...and will NOT do that again! I'll keep my pecan intake to a bare minimum and just drink water until I can get to the nearest fat/protein possible.

However, I'm not seeing any major changes in my weight--the scale goes back and forth between 5 and 10 pounds loss/gain. But I am eating a lot of dairy to supplement my low carbing. I just can't seem to eat enough fat or meat. I get full too quickly on it. And then I worry I'm not eating enough calories. I'm nowhere near 2000/day calories now - more like 1500 and that kind of worries me. I don't have any energy during the day eating only that much. 😞

It's probably best to eliminate them altogether. I would recommend beef jerky or pork rinds before I mess with nuts. I know those things are processed, but I think they are much better than nuts.

Getting full on fat and meat is the point. The dairy is slowing you down. I don't eat any dairy. Who said that you have to eat 2,000 calories per day? You have to lose these notions to get this under control. It's all about your hunger, not some arbitrary number that was based on a starvation diet study performed 50 years ago on middle-aged men who were conscientious objectors to the war!

Just eat that pork roast when you get hungry and eat until you are full then stop. Don't eat anything when you are not hungry. That's the only way. Don't worry about the number of calories. They are irrelevant to what you are trying to do. Dairy has carbohydrates and these are likely causing you to oversecrete insulin which means you are storing fat for longer periods of time. Going a long time between meals is evidence that your body is running off of its stored fat. You want these periods to be long. Allow your body to regulate your weight, not your mind.

Regards,

Charles

Sheesh!

Charles!

This is truly a different mindset than I ever thought. And to be honest--I have NO IDEA where I got the 2000 caloric intake info from. It's just one of those nonsensical things you always knew and just accepted as truth...?

Probably from the low fat, high carb world... a world that encouraged me to cheat in every possible way--and keep me hungry. I'm not used to be so full all the time. lol

Anyway, thank you, Charles. This makes me feel much better.

But what about the tiredness? Does that ever go away? I'm thinking yes, from your marathon pic/avatar...?

RE: Zero Carb / Meat and Water - Valcan - 07-07-2008 10:08 AM

Hi Everyone,

Today is day ten of zero carb. My weight seems to be stuck again so I am not adding in things (eggs, dairy) until I lose a few more lbs. My system problems corrected themselves with the addition of the extra water. Thanks of the other ideas. I tired the magnesium and tea last year on KK. The magnesium made me nauseous and the tea gave me horrible cramps and was very violent for me (not smooth at all).

Yesterday I had to take my DD to camp and we stopped to eat at a restaurant. After questioning the owner for several minutes about the menu, I finally ordered plain chicken wings. He must have lied to me about what he put on them because I did not have a good reaction. Gas, cramps, bloating, etc. I will never stop in that restaurant again. The scale was up 3 lbs today but I know that is temporary and not fat. I rarely go to restaurants for this very reason. I only trust my own cooking these days.

I made some dry meat last night (jerky with no seasoning expect salt and pepper. I will have that for a meal today dipped in lard (I usually use butter). When I first starting teaching, I was in a fly-in in the far north of Saskatchewan, Canada, near the Northwest Territories border. The aboriginal people there had only been settled in a community for 30 years. Prior to this they were nomadic. They still hunted caribou and made use of all parts to the animal. Huge sheets of meat were sliced thinly and hung on wood racks
over the wood stove in their houses. They would eat this dry meat with lard and salt. They had a great way of slicing the meat. Thankfully I was brave enough to try some (this is in the 80's so I had never heard of low carb - low fat was rage for weight loss) and learned to love it. The caribou is a very lean animal so the dipping in fat was a really good idea. Unfortunately, the people there did not eat only a traditionally diet. They ate their caribou and fish with processed junk that they could buy from the grocery store in town. Pop, chips, sugar, flour and chocolate were the largest sellers. Obesity, cancer and diabetes were and continue to be a growing problem them. I wish I knew then what I know now.

Val

Yes, it's one of those things we've heard so many times, not to mention the fact that it's listed on the label of every package of food we buy! Two-thousand calories was the level they thought was good to avoid the effects of those poor guys in the starvation studies who got so depressed and hungry that some of them began cutting off limbs and just going whacko.

They would steal food and do all sorts of things. The experts think that if you eat at least 2,000, then you can avoid all that. Of course, to lose weight, they say you must create a calorie deficit. Well, that brings you close to Keys' starvation diet and all the psycho problems that went along with it. Not to mention the fact that it never resulted in long term weight loss in study after study.

Pennypritty1 Wrote:

Oh, yes, obviously. Matter of fact, there are two attorneys in my office who are currently on a three-week induction experiment. They were both very tired during their first week. I just spoke to one of them this morning and she says that the tiredness went away and now she feels great. She has no cravings and she's not hungry. She also lost 3 pounds last week.

The key is to eat that fatty protein and water and don't give in to carbs. Work though the fatigue and one of these days you'll wake up and feel better than you have in a long time. Again, just eat when you're hungry and don't worry about calories, either too many or not enough. Listen to your body and just do what it says.

**RE: Zero Carb / Meat and Water - pennypritty1 - 07-07-2008 12:00 PM**

I took a sip of a diet coke today and gaaag!!!

I'm so happy! It's only been little over a week since I literally stopped drinking sodas and while I wasn't a fan of diet soft drinks, I could tolerate it. Now??

*I CAN'T STAND THEM!!! I'M SOOOO HAPPY!* That is a huge hurdle for me. Sodas were a mainstay in my pre-low carb days. I'm happy to report I'm tossing the remainder of the dregs down the sink and dancing out of the kitchen.

laa laa laa laa!!!
don't want to take another iron pill until she (my doctor) gives me an iron supplement alternative. I don't talk with her about low carbing--she is adamantly against it and only thinks low fat is the way.

Has anyone gone through something to this extent? A reaction like this to any kind of supplement? I'm angry with myself about the crackers but they really did stop the pains immediately but I would much prefer a low carb alternative should anything like this happen again!

---

**RE: Zero Carb / Meat and Water - rozi - 07-08-2008 09:46 AM**

Penny are you sure you need iron? If you are eating enough red meat there should be no need. Perhaps your lack of energy has another source. Be sure your Dr checks levels before prescribing iron. It is hard on the tummy.

Have your vitamin D levels checked. It is crucial to have enough Vit D, and this is one of the leading causes of low energy, as well as a whole host of other issues.

Maybe Charles or someone that's done this for a long time can speak to whether a supplement is needed with zero carb? I know living in a northern climate, and not getting much (if any) sun exposure, I *have* to take one daily.

---

**RE: Zero Carb / Meat and Water - Charles - 07-08-2008 09:56 AM**

I don't take any supplements of any sort. She's just getting started on this lifestyle and the tiredness is just something you have to endure until your body adapts to not having to deal with glucose. There's no easy way through it but if you try to take shortcuts, you only prolong the process. Eat real fat and protein and things should clear up shortly. It's amazing how it happens. You just wake up one day and it's as if you just had the best sleep of your life!

---

**RE: Zero Carb / Meat and Water - pennypritty1 - 07-08-2008 10:19 AM**

rozi Wrote:
Penny are you sure you need iron?

Hmm... I'm making an appointment to get tested to see if I can stop taking them, Rozi. My energy wasn't much increased taking them but I certainly had to eat a lot of bread to just tolerate the iron supplements. And all of this was before lowcarbing. So it's quite possible I can stop--I really hope so. I am trying to eat more red meat.

jeepifer Wrote:

pennypritty1 Wrote:
rozi Wrote:
Penny are you sure you need iron?

Hmm... I'm making an appointment to get tested to see if I can stop taking them, Rozi. My energy wasn't much increased taking them but I certainly had to eat a lot of bread to just tolerate the iron supplements. And all of this was before lowcarbing. So it's quite possible I can stop--I really hope so. I am trying to eat more red meat.

jeepifer Wrote:
Have your vitamin D levels checked. It is crucial to have enough Vit D, and this is one of the leading causes of low energy, as well as a whole host of other issues.

Vitamin D levels checked? They have tests for that??? wow--I'll ask about that as well. Thanks, jeepifer!

Charles Wrote:

Make sure you get the right vitamin D tested. You want to be tested for D3 levels not D2 levels.

I don't take any supplements of any sort. She's just getting started on this lifestyle and the tiredness is just something you have to endure until your body adapts to not having to deal with glucose. There's no easy way through it but if you try to take shortcuts, you only prolong the process. Eat real fat and protein and things should clear up shortly. It's amazing how it happens. You just wake up one day and it's as if you just had the best sleep of your life!

I'm looking forward to that too. I know the switch takes time and just to stick it out, but I am *so* tired! I've been checking in at the gym (to get my insurance reimbursement) and just reading a book. How embarrassing! 😳

RE: Zero Carb / Meat and Water - Charles - 07-08-2008 10:37 AM

Vitamin D is lowered by eating foods such as grains that require the body to expend Vitamin D to process them. When you don't eat these foods, you'll find that your vitamin D levels rise. It's not about consuming all these nutrients. It's more about protecting your body's store of nutrients so that they are not needlessly expended.
Deficiency diseases are not caused by failing to eat certain nutrients. You get them by consuming foods that sap the nutrients. We learned this in the famous the prisoner study where the inmates were eating brown rice. One day, they ran out and started serving the prisoners white rice and they developed scurvy.

People used to take flour, bread, white rice and sugar on sailing ships because they could be transported easily without fear of spoilage and rat infestation. However, the sailors developed deficiency diseases while eating this food.

Those old-school nutritionists such as Robert McCarrison, who touted the vitamin theory we hold on to so dearly never seemed to recognize that those isolated populations he studied not only ate whole foods, they also consumed no refined carbohydrates. The nutritionists of his era had no way of knowing that meat contains all of the essential amino acids and they do so in a ratio that maximizes their utility to humans. Meat is a concentrated source of vitamins A, E, and the entire complex of B vitamins. Vitamins D and B12 are ONLY found in animal products so even if you can't get enough from the sun, just eat some good ol' meat and you should have plenty of vitamin D.

How long have you been at it?

My two "patients" in my office, they were on it for 7 days and they felt fine after day 8. They were pretty tired before that.

????

I mean good grief!!! How do you know all this, Charles?

This is incredible!!! ARE you a doctor? Can I make an appointment? If I knew you when I'd first started low carbing years ago, I'd still be living strong in it and well into my goals and more!

RE: Zero Carb / Meat and Water - rozi - 07-08-2008 11:04 AM

I think you may find that D is an exception to your theory Charles. It is the one vitamin that we were not meant to get from food, but from sunshine. But then men or the precursors of such were meant to be out in the sunshine for much of the time, as well as originating in Africa where there is a lot of sunshine I understand. Now that we are indoors most of the time, and often wearing clothing and sunscreen we do need to supplement with D. We do get a small amount from fish and eggs, but not enough unless you take cod liver oil.

RE: Zero Carb / Meat and Water - jeepifer - 07-08-2008 11:09 AM

I guess my concern is that if you are already deficient, you wouldn't get the dosages needed to bring your supply back up. Once in a healthy range, then yes, with no dietary needs to deplete it, you'd be fine.

RE: Zero Carb / Meat and Water - Charles - 07-08-2008 11:09 AM

No, I'm not doctor. I'm an avid reader and Taubes book, Good Calories/Bad Calories changed my life. Most of the stuff I tell you can probably be found in that book somewhere. I'm also very fortunate in that I have Gary Taubes' e-mail. I try not to abuse it but if I have a burning question, he always writes back.

From what I've read, most of the stuff we're dealing with doesn't require doctors. We've made this all too technical. Look at most societies and they went through a nutrition transition where they abandoned their historical diets and started consuming refined carbohydrates. The diseases all appeared within 70 years from the first bite. It has happened so many times I can't tell you.

By the same token, when any of those people went back to their high-fat and protein diets, they invariably recovered their health. Unfortunately, it doesn't happen for every one of them, but a good 75-80 percent recover.

What is a disease of civilization? Any one of them that isolated populations don't get until they start eating like us. It starts with teeth and fertility problems and before long, there is diabetes, cancer and everything in between. If you don't believe it, go find out who has the highest chance of getting heart disease and cancer: Diabetics. How do you get diabetes?

RE: Zero Carb / Meat and Water - Charles - 07-08-2008 11:15 AM

jeepifer Wrote:
I guess my concern is that if you are already deficient, you wouldn't get the dosages needed to bring your supply back up. Once in a healthy range, then yes, with no dietary needs to deplete it, you'd be fine.

But those dosages in food are all you need. The problem with supplements is that we don't know what our absorption rate is with them and it's well known that we absorb the most nutrients directly from food because it has co-factors that aid in absorption which the supplements don't have. More often than not, the supplement is made from some real food item anyway.

Not only that, but as you become healthy, you would need to reduce the dosages to keep your body from excreting some other nutrient that conflicts with the supplement as a protective measure. When you get your nutrients solely from food, your body automatically adjusts its absorption to match what it needs.

It works much like your diet. Your body has to regulate its nutrient level and it will let you know. If you are low on sodium, you'll crave salty foods. If you are are low on anything, I'm sure your appetite will let you know.

I strongly disagree with this. Vitamin D and B12 are found in animal protein (and sunshine of course) I
don't think you have to be outdoors all that long to get enough vitamin D. You can't just analyze food to determine whether or not you are getting enough.

The Inuit diet never showed enough calcium yet an examination of their remains showed that they had plenty of calcium.

Getting too much of a nutrient is just as bad if not worse than not getting enough.

RE: Zero Carb / Meat and Water - Dwayne - 07-09-2008 06:08 AM

Well good news today, I am down to 329.8 (yes my scale is way too accurate) which I believe is 6.2 or 5.2 pounds down! Last night I had some sugar free candy which I imagine is a huge no no and was rewarded by barely being in ketosis this morning. Well at least now I know how that affects me. I have had a headache until this morning. I have given up everything diet except my one morning coffee. It is hard for me to pinpoint the headache as coming from diet coke caffeine withdrawl, aspartame or induction flu. One thing I do know is that my headache went through the night and this morning when I had my coffee it is gone. So I may end up having to go cold turkey if caffeine is going to do that to me the rest of the day. At least I know I am losing weight the way I am eating and that is exciting. Last night I made fajitas for my wife and son. It turned out really well! I had bought a cast iron skillet last week and used some basic spices and my family loved it too (I made them some tortillas.) I was a smidge bad and had about 1 Tbsp of salsa and 2Tbsp of guacamole. However it was soooo good. =)

Anyway hope you are all having a great day. I hope this switching to 95% water goes better for me today. I feel good this morning at least, but that may be the weightloss talking.

RE: Zero Carb / Meat and Water - LindaSue - 07-09-2008 06:15 AM

That's great news, Dwayne. I can tell you for sure that quitting diet cola can cause headaches. For me the withdrawal headache lasts no more than a day or two whether it's from cola or coffee.

RE: Zero Carb / Meat and Water - Charles - 07-09-2008 07:49 AM

Great job, Dwayne!

RE: Zero Carb / Meat and Water - jeepifer - 07-09-2008 08:27 AM

Now for the post of shame... 😞

I ate dinner out with the in-laws last night. I won't go into it, but long story short I *thought* I could eat a little meat. There must've been some hidden sugar(s) in/on the stuff, cuz I had mad cravings and ended up eating a whole heck of a lot more, not just meat.

Anyhow, moving on... I know my blood sugar went nuts (got the headache to prove it) and I'm sure my stomach isn't too happy with me. What other damage did I do? I'm assuming it will take a couple of days for this junk to clear my system. Did I reset the clock to day 1, or can my body recover faster?

I was just seeing a light at the end of the tunnel, one week gone and feeling better. Now what? 😞

Okay, take a deep breath! Did you do it? Okay, now relax. It usually takes a couple of days to see any result from the food you ate. All food gets stored in fat tissue first, and then it's added to your long term food supply.

The question is what it will do to your insulin levels. You may experience more cravings than usual for the next two days before meals. As long as you ignore them and stay the course, then there should be minimal harm. Your body does not like to be caught off guard so it will likely overcompensate for a couple of days by secreting a little extra insulin prior to meals.

Make sure you eat plenty of fat and protein and if you do eat some amount of carbohydrates, lower them for the next couple of days. By "ignore them" I don't mean go hungry. I'm just saying don't give in to them if you can help it. Make sure you eat enough so that you're full. It's much easier to fight cravings on a full stomach!

Jeepifer Wrote:
I was just seeing a light at the end of the tunnel, one week gone and feeling better. Now what? 😊

Just go right back to work and everything should be fine. Even if the scale goes up a couple of pounds, don't worry about it. Just keep eating healthy and keep living. This is all we can every do anyway!

Best regards,

Charles

RE: Zero Carb / Meat and Water - Charles - 07-09-2008 09:11 AM

By the way, I just want to say that I don't think there's such a thing as "off plan" or a "cheat" or any other thing. Zero-carb is not some diet plan. Rather, it's an attempt to return to biological zero, a reboot, if you will. I'm betting that once a person recovers their health, they will voluntarily choose to stick with it for the long term.

Granted, there will be times where you eat some saucy meat, or you indulge in chocolate or cheesecake or whatever it is, on the way to your destination. This is something that just happens. However, you will learn how this will make you feel. You will be able to make the determination as to whether that was a good idea or not. It is necessary to go through things like this to stick with zero-carb for the long term.

It's not at all about being perfect; Rather, it's about learning your body and becoming attuned to what it's trying to tell you. We all should endeavor to eat and drink cleanly the majority of the time. If you do this, then you'll get the biological feedback you need from the foods you eat. If you constantly eat badly, then those biological receptors won't work as well and they won't give you the feedback necessary to
make better choices. I think the same thing about supplements. Let your body tell you what you need, rather than sticking something in your mouth concocted in a laboratory.

This is in contradistinction to Dr. Atkins, but Gary Taubes agrees that his research reveals that the best thing to do is to remove the carbohydrates and get to the lowest weight your hormones will allow. Once there, you can experiment with different foods if you so choose but your body will be able to have a conversation with you regarding what it thought of those foods.

Just eating carbohydrates to the level of weight loss is not very good because obesity is just one of the many symptoms of the metabolic disorder of fat metabolism. Only the lucky ones get obese. Not only that, but when you're coming from a high-carb diet, just lowering carbs a little will produce weight loss, but your "biological ears" are not fine-tuned enough to provide adequate feedback.

I've learned over the past year that my body is now hypersensitive to carbohydrates. I can eat a piece of cheesecake or dark chocolate today and not notice any change TODAY. However, by the next day, all that fiber will make my digestive system go crazy. In the next couple of days I'll see some weight gain, some cravings, and probably eat more. But then, about four days out, I would lose the taste for the sweet item and then I'll be repulsed and feel really bloated. That would make me throw any remaining sweet items out and voluntarily return to my zero-carb lifestyle.

You might say, well, why not just stop with one piece or something like that? I'll tell you that I've never been able to do that. I can never eat a "single serving" or one square of chocolate. I have always been one to eat until I'm satisfied and that goes for everything. If I eat donuts, I'll eat them until I'm tired of them. My wife can keep a chocolate bar for six weeks and she'll occasionally eat a square and she's just fine. I can't seem to do that.

I only know this through error and trial. By the same token, you must go through this as well with the foods you eat. That's why I say, never view anything as a failure or as a cheat. This is all about health and your body will let you know what is healthy and what is not; but first you have to learn to listen to it. Unfortunately, sometimes the only way to do that is by eating something you probably shouldn't.

Stay strong friends!

Charles

You're not alone in this, jeepifer. I didn't bring my lunch today and went to a buffet and had what I thought was "safe" meats only (of course) and now -- within minutes of finishing -- I now have a lovely little headache. I don't feel any other symptoms yet but trust me, a headache is more than enough for me to realize I can't go back there as my backup lunch anymore...

*sigh* Obviously the only "safe" food I can really truly rely on is MY food.

Tough lesson to learn. 😞

jeepifer Wrote:
I found nutritional info on their website this morning. I was SHOCKED at the junk they inject in the meat at the manufacturer, as well as the crud they put in their "rubs" and "seasoning" -- quite the eye opener!

Like this, for what you'd *think* was plain chicken breasts (not that I eat them, but as an example):
GRILLED CHICKEN BREAST - USDA Chicken Breast, boneless, skinless, Marinade (water, vinegar, high fructose corn syrup, salt, modified tapioca starch, dehydrated garlic, soybean oil, lemon juice concentrate, dehydrated carrots, xanthan gum, dehydrated onion, onion powder, propylene glycol alginate, dehydrated red bell peppers, citric acid, color {caramel, beta carotene, carrot extractives}, spices, calcium disodium EDTA {used to protect flavor}, cottonseed oil).

or this, a freakin' "hamburger":
BURGER - 100% Ground Beef, Steak & Burger Seasoning (salt, sugar, lactose {milk}, garlic powder, spices, dehydrated onion, hydrolyzed soy protein, corn starch, dehydrated garlic, soybean oil, calcium silicate {anti-caking agent}, citric acid, dehydrated parsley, lemon juice powder {corn syrup solids, lemon juice solids, natural flavor}, natural smoke flavor, caramel color), Cheddar Cheese (pasteurized milk, cheese culture, salt, enzymes, annatto {vegetable color}, calcium chloride) OR Jack Cheese
It's *outrageous* the stuff they're allowed to put in our food! I am truly shocked and angry!

But I did eat the food.

But I did eat the food.

Yep. Same issue I had with the food at Famous Dave's Barbeque. Sugar in all the seasonings let alone the BBQ sauce. So if you get their items naked you still get sugar. Just like this place even in the darn hamburger. Not one single item on their menu does does not contain sugar either as corn syrup or dextrose.

poo123 Wrote:
Maybe I am not eating enough. I usually have 1/2 lb of steak at around noon and then 3/4 lbs of ground beef at around 8-9pm. Thats it. I do drink water and I cook all my stuff with butter. But I am really full and do not feel like eating. Should I try and eat a third meat somewhere in there?

That's close to the amount of food that I've been eating lately but it's not enough to keep me from getting hungry, even if I spread that food out into 6-8 mini meals. If you're not hungry on that amount of food, you shouldn't force yourself to eat more. I wish that I could get by only eating twice a day. Sometimes eating all day long gets to be a drag.

I wish I could even eat that much ground beef. I get tired of it quickly and it's pretty much the cheapest meat item in my area. Real glum about that.

RE: Zero Carb / Meat and Water - Charles - 07-09-2008 12:08 PM

poo123 Wrote:
Hi guys, I have been off the radar for a few days. Well I am still doing just meat and water. I have lost 7.5 lbs and I have been on it since June 28th. I was hoping to lose more weight than that.

I'm glad you're still with us. Listen, for 11 days, that's nothing to sneeze at. I think I read somewhere that 2.5 pounds of weight loss per 7 days is considered healthy. You lost quite a bit more than that.

My weight loss didn't happen overnight. It took seven months of very low-carbohydrate eating to get from 207 to 164. I started off really fast but then I had weeks where I wouldn't lose any weight. There were weeks when I went the other way as well, but the key is you have to stick with it and not make any drastic changes or you can do more harm than good. Keep in mind that it's your body that regulates the weight, not your brain. Eat to appetite, get good sleep, relax, make love, be happy! I'm serious.

My weight loss pattern usually went like this. Let's say I just broke 200. Monday thru Thursday, it would be 198. Friday thru Sunday, it might be 196. Then, Monday thru Thursday, it would be 197, then by
Sunday, it would be 194. It would stay that way for two days and then go to 192. Then, I would sit there for an entire week or two before going to 188.

You see, it was all over the map. Even now on so-called "maintenance" it's still all over the place. My so-called goal was 164, but I spent most of this year at 156-159. I've spent a few days at 162 or 163, only to be back at 159 or even 158 a couple of days later even though I didn't change a thing. I can't stress this to you all enough. Weight is regulated by your body, not your brain. It's very similar to blood pressure and body temperature. Your body knows what it's doing, you just have to stay out of the way.

pooh123 Wrote:
I am a little sad but I am still doing the diet. Maybe I am not eating enough. I usually have 1/2 lb of steak at around noon and then 3/4 lbs of ground beef at around 8-9pm. That's it. I do drink water and I cook all my stuff with butter. But I am really full and do not feel like eating. Should I try and eat a third meat somewhere in there?

NO! (Sorry to yell...) Please do not eat if you are not hungry. You are doing fine.

poo123 Wrote:
I really want to stick with this and lose some weight. And my husband is doing a very low carb version. He is having meat, with eggs and some cheese. He is doing really well to. He started on Sunday and tonight he is going to do a weight check. I hope he is happy with the numbers. We are supporting each other really well, today he even went on a bike ride with me. I was really happy he is trying so hard. Well maybe Charles can figure out why the weight has decided to stay....

Don't lose heart. And I'll tell you something else, your husband may lose more weight than you and will likely lose it faster than you. Do not be angry at him or at yourself because of it. He doesn't have the hormones that you have and he likely has more muscle which makes a big difference.

The most beautiful thing you wrote is that you went on a bike ride together. Eating for health enables you to do things like this together and that's a wonderful thing. Don't ruin it by getting competitive or by having the wrong expectations. All you can do is continue to eat healthy and provide your body with the fuel it needs. Let it do the rest. Maybe it's not saving you from obesity as fast as you would like it to, but it's simultaneously saving you from diabetes, cancer, and heart disease. Your body is really busy right now so give it a break and be happy!

Congratulations on your 7.5-pound weight loss!

Best regards,

Charles

Where did you eat this food? Just curious and surprised that they have the ingredients posted online.
At least I can't complain about not giving full disclosure! I admire them for that, at least.

MAC Wrote:
Yep. Same issue I had with the food at Famous Dave's Barbeque. Sugar in all the seasonings let alone the BBQ sauce. So if you get their items naked you still get sugar. Just like this place even in the darn
hamburger. Not one single item on their menu does does not contain sugar either as corn syrup or dextrose.

Yes, it was Famous Daves BBQ. I thought I'd have a plain burger. Hah! I used to love their food, but taking a long, hard look at the additives just killed any thought of going back there. Ever. I can't believe I let my children ingest this stuff. 😞

jeepifer Wrote:
I found nutritional info on their website this morning. I was SHOCKED at the junk they inject in the meat at the manufacturer, as well as the crud they put in their "rubs" and "seasoning" -- quite the eye opener!

I always wonder, why the hell do they put high fructose corn syrup in EVERYTHING? What does chicken need with sugar? I understand it's also a preservative. Then we have soybean oil and you know I hate soy in any form. It looks like all of the crap in the chicken breast and the burger came from the marinade and the seasonings.

I really got depressed on the Fourth of July when I was looking through the sauces for the ribs for my family. Practically all of them had HFCS in them so we ended up settling for a rub; but even most of those were terrible. Fortunately, they had a section for the local purveyors and there are some local farmers who have made rubs without all the crap. I learned that real North Carolina barbecue is not sweet, it's more vinegar-tasting so that was kind of cool.

**RE: Zero Carb / Meat and Water - poo123 - 07-09-2008 12:21 PM**

Thanks Charles and everyone else, I did need the little pep talk. Ok, I will just eat when hungry have fun and let my body do its thing. I will try not to KILL my husband when he is losing more than me (HAHA) I will stick with the program because I really like it and it does make me happy knowing I only eat twice a day and am full on that, no nibbling or snacking as before. I will go on more bike rides and start doing my weight training like before. And I will remember that I didn't put all the weight on overnight so I will not lose it overnight!! Thats my pledge and I am going to stick with it, Thanks again guys...

I wish I could even eat that much ground beef. I get tired of it quickly and it's pretty much the cheapest meat item in my area. Real glum about that. 😞

I can eat much more steak, particularly porterhouse with fat then I can ground beef. GB does seems to
fill me up more and I have tried various seasonings to no avail. Coconut oil helps but I must say I don't really enjoy ground beef much. 😞

I can eat a 16 oz porterhouse steak 2-3Xs a day! 😋 It does have the bone so the net weight is about 12oz..

Ribs are good and grilled fish with butter are tasty!!!

RE: Zero Carb / Meat and Water - jeepifer - 07-09-2008 12:30 PM

Porterhouse! Drool. So expensive, though. 😞

RE: Zero Carb / Meat and Water - travis t - 07-09-2008 12:36 PM

Charles you wonder why they put high fructose corn syrup in everything. According to GCBC page 393, Taubes wrote that fructose is converted to glycerol phosphate at a better rate than glucose. More glycerol phosphate = more fat locked into adipose tissue = less fuel for body tissues = quicker hunger = more food sales for them. I don't think that this has been done by accident.

Well, I try really hard not to be a conspiracy theorist, but it's hard to ignore it when it pops up so many places. Honestly, I don't believe it's a conspiracy. I think that would give them too much credit.

I do believe that nutrition in this country is a religion. It just is. These people truly believe that people are fat because they eat too much and move too little. They think HFCS is safe for diabetics because it doesn't raise their blood sugar, it goes straight to the liver. The diabetes web site says that it's a myth that diabetics got the disease from eating too much sugar and that they should be allowed to eat carbohydrates just like everyone else. They also say that everyone with high insulin levels don't get fat (which is true -- only the lucky ones get fat) so insulin is not the problem.

As totally retarded as these ideas are, you can find religions that make claims just as fantastic yet people buy them hook, line and sinker because they believe them. When belief is involved, reason and science are tossed from the window!

I don't quite understand this... Am I lucky to be overweight, instead of diabetic? I know I'm probably borderline pre-diabetic, which is why I am trying to get my glucose/insulin under control w/ zero carb.

jeepifer Wrote:

Yes, I believe you are. The same metabolic disorder of fat metabolism that leads to high insulin also causes obesity, Syndrome X (AKA Metabolic Syndrome) diabetes, cancer, hypertension, heart disease, dementia, Alzheimer's and accelerates the aging process. On this forum, we refer to these diseases as the diseases of civilization.

All of these diseases are symptoms of the metabolic disorder. We know this because diabetics have the highest risk of getting cancer and heart disease than those without diabetes. I can be more specific on an individual disease if you would like.

In the late 1980s, the medical establishment via Gerald Reaven and his discovery of metabolic syndrome (formerly called Syndrome X) finally realized that these diseases may be related although they still seem to be unsure of the cause. They know that chronically-high insulin levels has been implicated in each one of these diseases yet they are so specialized, they are unable to put it all together.

They know that high insulin levels are common to all of these diseases but they still consider each to be a separate disease so they are unable to get to the cause. Do you ever notice that they tell you to exercise and lose weight to lower your risk for each of them? They are busy looking for a drug to lower insulin rather than telling the public to cut out the carbohydrates.

Epidemiology shows us quite clearly that when new civilizations increase their consumption of refined carbohydrates to 70 pounds of sugar per person, per annum, these diseases begin showing up. Once one appears, they all follow closely behind usually within one or two generations.

jeepifer Wrote:
Porterhouse! Drool. So expensive, though.

Just bought some New York steaks on sale last week as well as some rib eye steaks. 4th of July all the groceries put these on sale for around $4.00/lb. Not cheap but not the usual $9-$10/lb.

A New York steak is just the large portion of a porterhouse. I actually prefer rib eyes as they are fattier.

I just ordered Reaven's book today from Amazon as well as McCleary's Brain Trust. Will see if it has anything interesting in it. A lot cheaper than his text book on syndrome X at $120.

That should be good. Taubes says that Reaven is pretty upset because he feels that in GCBC he came across as supporting the alternative hypothesis. He's concerned about his reputation! Someone needs to tell him that his work supports the hypothesis and it's not necessary that he does!

RE: Zero Carb / Meat and Water - jeepifer - 07-09-2008 01:18 PM

No one in my family is diabetic. But we all have high blood pressure. I developed mine at 28, before the worst of my weight gain. So I'm the 3rd generation, and it is progressing with me. Yikes.

So, first came hypertension, then obesity, and will continue on to diabetes if I don't get my act together. Wow. And scary.

I think I will go get myself a nice steak for dinner. My kids are getting homemade hamburgers, sans bun of course. 😊

Taubes really outed some of these researchers in his book. They could not make the connection between carbs and what they found. Or as he says they couldn't come out and say it publicly for fear of losing their reputations.

Generally yes, although it's not always so neat. Many thin people get diabetes and some obese people never get diabetes. However, many thin people in seemingly good physical condition get heart attacks and cancer every day. However, people in isolated populations that don't eat refined carbohydrates do not get any of these things. I forgot to add dental problems such as crowded teeth, gingivitis, etc, to our list. These actually show up first and are usually passed from the first generation parents to the children (as is the traits for all of these things).

Jeepifer Wrote:

RE: Zero Carb / Meat and Water - jeepifer - 07-09-2008 01:24 PM

Question for you:

I see a new doc on Friday. Should I ask for a glucose tolerance test with insulin levels? Would this tell me anything I don't suspect already? I have mixed feelings about an "official" diagnosis.

I think I pretty much *know* what's going on, and I need to see her to go over my blood pressure meds anyway, since my BP's been rising and I have to get those numbers down. What moron of a doctor put me on a drug that is *known* to raise blood glucose levels over time? Sheesh. I should have a red flag on my file called Metabolic Syndrome. Why do I as a layperson know this, and my doctor doesn't???

As you said, they treat one symptom at a time without regard to the whole. She was thinking "get that BP down" but the drug will lead me towards diabetes faster. Oh well, when that happens we'll just do meds for that too, right?

No. No. No. I am in this to get healthy and get off of as many medications as possible, thanks.
RE: Zero Carb / Meat and Water - Charles - 07-09-2008 01:29 PM

By the way, I should add that I have to go home and speak to my children today about my biological father (the m----f---- who didn't raise me). I learned at our family reunion last week that he has diabetes. Well, when he went home, he had a heart attack. Today, he's being fitted for a pacemaker. If you saw him, you would think he is a little overweight, but you probably wouldn't call him fat by any means. Most people in my extended family didn't understand how I could eat an all-meat diet. However, they couldn't deny how I looked.

My Aunt is 70 years old and looks fabulous. She believes she looks this way because she doesn't eat fat. Upon closer inspection, I found out that she doesn't eat sweets....

RE: Zero Carb / Meat and Water - Charles - 07-09-2008 01:49 PM

jeepifer Wrote:

You might if it will ease your mind. The thing about the fasting test is that it may say that your blood sugar is normal. It's really quite irrelevant what happens to your blood sugar after a fasting test because in the real world, the blood sugar is what it is. The relevant question is how much insulin does it take to push glucose into your cells and lower the blood sugar. In other words, how insulin resistant are you? The damage has already been done by the time your blood sugar is abnormally high and by the time that test tells you anything.

If it does show something, then the situation is quite a bit worse than the test results show. If it shows nothing, you can't relax because the test was a fasting test. Jimmy just had a better test after a low-carb meal and I think he'll come back and tell you that his insulin was skyrocketing an hour after he ate a low-carb meal.

Insulin clears the bloodstream of any and all nutrients and makes you hungry compelling you to eat again. This is not hypoglycemia. This is too much insulin (hyperinsulinemia). The hypersecretion increases the time that fatty acids stay in fat tissue rendering them unable to circulate. To shrink fat tissue, you have to decrease the time that fatty acids stay trapped. You can do this in two ways. First, you have to slow the creation of triglycerides via glucose phosphate (by severely restricting dietary carbohydrate); and second, you have to find a way to increase the time fatty acids are mobile and decrease the time they are stored. You do this by eating when hungry and not eating when you're not hungry. You want to live off of stored fat for longer periods which conditions your pancreas to secrete less insulin.

Jeepifer Wrote:

Simply because of specialization. She's trying to be the best doctor she can in her specialty and she probably doesn't have much time to keep up on the latest in about 12 other relevant disciplines. Has your blood pressure changed since you've been zero-carbing? I noticed that mine went down rapidly after I began eating properly.
Jeepifer Wrote:
As you said, they treat one symptom at a time without regard to the whole. She was thinking "get that BP down" but the drug will lead me towards diabetes faster. Oh well, when that happens we'll just do meds for that too, right?

Actually, they are all concerned about heart disease. That's the number one killer so everything is geared towards that. Based on this, they'll tell you that your cholesterol is too high and you need a low-fat diet, statins, and blood pressure medication because that nasty fat and cholesterol (the deadly duo) will clog your arteries and lead to heart disease. If you have your lipid profile done, come back and share it with us (if you want to) and we'll know exactly where you are.

Jeepifer Wrote:
No. No. No. I am in this to get healthy and get off of as many medications as possible, thanks.

It's nice to have these tests for comparison if you're worried about it. My last doctor visit involved my lipid profile. I was standing in front of her after losing 46 pounds, my blood pressure was 105/60 (much like it is today), my triglycerides were low and my HDL was high. This lady only looked at my big, puffy LDL and my total cholesterol and decided I needed a drug (she didn't understand that large puffy stuff was good. I asked her to treat the patient standing in front of her, not the piece of paper. She was unable to do that so that's the last time I saw her.

I hope your visit is better!

Regards,

Charles

I read a story a couple of years ago in the Chicago tribune about Kraft foods and Phillip morris trading information about brain chemistry. Marlboros and oreo cookies, what a combo.

Okay, Travis, when I read stuff like this, I tend to agree with you:

*Studies on Oreos and other snack foods suggest that the same brain chemicals that create the rush of narcotics also keep people coming back for sugary treats.*

*The controversy over the American diet in recent years has centered on how much obese consumers are stuffing into their mouths. But the root of our overeating lies not in our stomachs, but in our brains.*

*Moments after a person eats an Oreo or any other sweet, the brain's pleasure centers release opiatelike compounds--chemical cousins of morphine. The result bears similarities to addiction, though many researchers say it is more like turning on a built-in craving.*

*Such work supports the controversial notion that our eating habits stem from brute physiology as well as free choice.*
Even though I figured some of these companies must know or suspect this, especially since they employ researchers and scientists to know, I wondered how it would impact them in light of the religious fervor that the obesity epidemic generates.

For instance, now they are saying that the problem originates in the brain (which it doesn't, but it surely affects the brain -- it starts with insulin and insulin regulates fat metabolism which is connected to the brain via the central nervous system). This fits with the dogma that obese people lack the willpower to stop overeating and being sedentary. If it affects the brain, then the obese really have no choice but to overeat because they are addicted to sugar. That's kind of what we're saying in the end, that sugar is an addiction and it compels you to eat more and more of it by placing you in a vicious cycle that leads to all the diseases of civilization.

That's powerful stuff but the snackfood industry will fight this really hard and I'm sure they'll marshal many experts of their own to lessen their liability. However, when you link them to Phillip Morris, who people already hate because of their cancer sticks, now you're on to something! It's not at all hard for anyone to believe that these guys are hiding stuff.

Great information, Travis! Wow!

Remember that a 'standard' GTT requires a 3 day carb load of 150g of carbs for each of three days prior to the test to normalize the values obtained. If they can do this like Jimmy's without the carb load you would be better off as those carbs are going to cause weight gain. The 'standard' GTT is to give you 75 g of a glucose syrup. Much better the way Jimmy's doctor did it with a low carb meal. But then Jimmy's symptoms may be different than your own and he is going to a well known low carb doctor.

**RE: Zero Carb / Meat and Water - Valcan - 07-09-2008 02:32 PM**

Valcan Wrote:
This post is by me on July 5 after eight days of zero carb:

June was a rough month for me with two cheat days (yes days, not meals) and lots of Greek salad. My body could not handle the extra carbs and after my last cheat day (which was June 27), my weight soared up 15 lbs! I know most of it was the water I stored after eating carbs but it is still scary to see the scale go so high. Yikes! After a week of zero carb, I have lost 12 of those pounds and am only three pounds from my one year weight on June 9. I hope to drop the other three pounds by the end of next week. After that I will be able to see if zero carbs will help me lose weight.

Today is July 9, day 13 of zero carb. In the last four days I have gained six pounds. WTF? I had some chicken wings at a restaurant on Sunday night that I thought were zero carb but I had cramps from them. Is this the result of the chicken wings? Six pounds though, it does not make sense. Since that meal, I have not ingested any carbs - just fatty meat and water. This is one of the reasons I jump around to different ways of eating. Charles, is this temporary? Is it normal to see an increase? How in the world is my body storing fat without insulin? I am confused and very discouraged.
On a different note, I received a call last night from the Alberta Cancer Society. They were doing a survey about the healthy habits of people who live in Alberta. Questions included ones that asked if I ate healthy - i.e. lots of grains, vegetables, fruit and low fat. I was more than happy to do the survey and answered every question. By the end of the survey, the woman knew what kind of diet I was eating and how much weight I had lost. I also convinced her to read GCBC and check out the Taubes Berkeley lecture online. Too bad she was a woman doing a job doing telephone surveys and not someone in the higher ranks of the Canadian Cancer Association.

Is it normal to see an increase? How in the world is my body storing fat without insulin? I am confused and very discouraged.

The real question was what was in the sauce? I just looked at sauces from Buffalo Wild Wings for a friend of mine today and practically every sauce had high fructose corn syrup among other things and at least 2 grams of sugar per serving. That could cause problems. Plus, were those wings fried or breaded?

Six pounds sounds kind of high, but I've gone up pretty high myself at times after eating the wrong things. I'm sure it's temporary, just keep on your fatty meat and water and you'll be fine. Stay out of restaurants. Above all, take a deep breath and relax. Cortisol can account for 10 pounds so you have to relax and stay the course.

Insulin is always present. Just because you're eating fatty protein and water, that doesn't mean that you're not secreting insulin. This happens before the first bite. This is based on how you've eaten in the past. You have to consistently eat fatty protein and water for a long period of time to get your pancreas conditioned to secrete less. If you keep switching around, you'll keep your pancreas confused and it will continue to hypersecrete. Eight days is good, but it can take up to two months to become fat-adapted. As a matter of fact, Stefansson said it took six months to determine whether a person adapted to an all-meat diet.

I'm not trying to scare you but it takes time. Think about health, not weight loss.

It's not the amount of sugar that does us in, it's the presence of sugar and how much we crave food. If you watch someone else eat or think about food, that can cause you to secrete insulin. The longer you have been obese, the worse this is. This is the evil of hyperinsulinemia. Whenever you feel a little hungry, that's insulin prompting you to eat. Check out Chapter 24 of GCBC. Pavlov and Le Magnen were all over this.

All people secrete before meals, but those with this condition secrete more and also they secrete more often. All the time that chronic insulin levels are present, you will continue to store fatty acids and they will not be in your circulation. The time the fatty acids are out of circulation is more important than even the amount of sugar you eat sometimes.
Hang in there,

Charles

Pavlov and Le Magnen were all over this.

All people secrete before meals, but those with this condition secrete more and also they secrete more often. All the time that chronic insulin levels are present, you will continue to store fatty acids and they will not be in your circulation. The time the fatty acids are out of circulation is more important than even the amount of sugar you eat sometimes.

Hang in there,
Charles

Thanks Charles. The wings were confusing, I asked the owner if they had any flour or sugar and he assured me that there was none. I ordered them plain without hot sauce. They looked seasoned but not floured and they did not taste sweet so I thought I was okay. I do not go to restaurants for this very reason but I was out of town and figured I could find something safe if I asked lots of questions.

I have given up on weight loss at this point in time and have committed to eating healthy and maintaining for the next year. The stress of stalling and not being able to drop has gotten to me over the last while so I thought I should take a break from weight loss. The pounds up freaked me out because I would like to maintain, now I feel I need to lose again before I start maintaining. I guess I am also disappointed that after cutting out cheese, eggs and AS I am not seeing a downward trend. Maybe if I relax and stay the course, my body will start to let go and the scale will go down without me even trying.

Again, Charles, thanks for the encouragement.

Val

Here is what Jimmy said in his "A Whole Lot Less of Moore, More or Less" thread:

"Well, I got the results and quite frankly I'm not surprised. I'll give a full report this weekend when I get back home (I'm in NYC today), but my suspicions about the insulin were confirmed and something baffling happened. Although my blood sugar remained steady within 13 points throughout the test (between 78-90 including the fasting and rise after the meal--which there wasn't much of), my insulin dropped from the lower 4s to 13 in just 30 minutes after eating...and it remained elevated for nearly 3 hours! EEEEK! I'll have more to share in my blog post about this since I'm using my iPhone to type this. We've got some rather peculiar methods for dealing with this that I'll share too. See ya!"

We await the definition of "peculiar methods".

**RE: Zero Carb / Meat and Water - poo123 - 07-09-2008 05:10 PM**

Valcan,
Charles gave me some great advice on page 90 of this thread, he cheered me up because I was down in the dumps about not losing weight as fast as I wanted. I am sticking with it because I feel so much better eating this way meat and water only. I hope you stick with it too, I have to keep telling myself every diet has its ups and downs and I just have to go with the flow.

---

**RE: Zero Carb / Meat and Water - Ell.eee - 07-09-2008 05:33 PM**

Hi everybody. Thought I'd check in with my week three report as I gradually lower carbs trying to get hyperinsulinism and "prediabetes" (my Dr's word) in check. I don't post much. I feel a little out of sync as I'm not doing zero carb and I'm skinny with no weight to lose. I guess I'm one of those Charles talks about who have the metabolic problems without the symptom of obesity or weight gain.
Anyway I tried for 10 carbs last week, but didn't quite make it. Fitday gives me 13 for the week, so I'm trying again this week. No change in the shakes and hunger after eating (sounds a little like Jimmy - 30-60 minutes after eating I'm shakey and hungry though full) but when I wait it out I'm fine for hours.
Good news is 2 meals a day is working great - no hunger once I wait out my insulin surge(I guess that's what it is). And I only have to be strong twice a day rather than 3 or 4 times. And the increase in energy continues. I find myself continuing to jog a little further, do some chair exercise at work, and take on some physical chores just because I feel like doing it! As I've cut the carbs from 30 to 20 to 10 I've gained 2 pounds. I think it may be my body eagerly grabbing the fats it is now getting and I'm trying to learn to listen to it.
So the goal this week is maintain the VLC>10 and imagine my body healing itself internally.

Also what is the deal with all these Docs. Mine wrote prescriptions for pravachol - a statin, HRT, metformin, and fosamax. I threw them all away. I think I'm safer without them.
RE: Zero Carb / Meat and Water - **Mel** - 07-09-2008 06:41 PM

I'm another one that suffers what feels like low blood sugar between meals and I've tried lots of the ideas I found here. What is working for me is to increase my fat eating and decrease the amount of protein while still eating VLC. I think I was eating more protein than I needed and it was being converted to glucose therefore triggering more insulin release. That's just my best guess. I can tolerate heavy cream so I drink 100 gm, mixed with some water, over ice for lunch. I save the 50-60 grams of protein per day limit to have at dinner which is my biggest meal. So far, it has been an improvement. BTW, for breakfast, I've been having either cream over ice or an egg omelet using 1 whole egg and 3 additional yolks, some cream and about a tablespoon of butter, topped with sour cream, yum. Since starting this a few days ago, I finally saw a new low number on the scales this morning. It hadn't budged in about a month.

I think I pretty much *know* what's going on, and I need to see her to go over my blood pressure meds anyway, since my BP's been rising and I have to get those numbers down. What moron of a doctor put me on a drug that is *known* to raise blood glucose levels over time? Sheesh. I should have a red flag on my file called Metabolic Syndrome. Why do I as a layperson know this, and my doctor doesn't????

As you said, they treat one symptom at a time without regard to the whole. She was thinking "get that BP down" but the drug will lead me towards diabetes faster. Oh well, when that happens we'll just do meds for that too, right?

Can I ask just what medication that moron of a doctor put you on that is *known* to raise blood glucose levels? I just got put on a new drug for blood pressure that I know little to nothing about. It is called Labetalol and is a alpha and beta blocker. I keep quitting my meds because I have a reaction to them,
they make me cough, not a little but so hard that I can't sleep or even lay down and keep gagging and vomiting. So far this one hasn't done that, thank goodness. I really do need a medication that I can take I think since low carbing or losing weight hasn't lowered the numbers for me.

RE: Zero Carb / Meat and Water - jeepifer - 07-09-2008 08:19 PM

The one that's at issue is part of the thiazide family, a diuretic. Here's a really good article written by a (now) retired doc about the class of drugs:
Do thiazide diuretics cause "benign" diabetes?

RE: Zero Carb / Meat and Water - jeepifer - 07-09-2008 08:22 PM

I take two medications: triamterene/hydrochlorothiazide (tradename Maxzide) and lisinopril. They took me off lisinopril in March because my creatinine levels were rising (not good for the kidneys!) but I'm back on it temporarily as my BP is back up and needed to come down.

How's the alpha/beta blocker working for you? I'm trying to have some recommendations handy for when I see my new doc Friday.

That's where I got the idea. At my level of overweight, I just don't trust their recommended level of carbs. The high fat really ups my energy and I find I can't sit still, I figure that's good. I think, just as Charles has said repeatedly, that if you supply "plenty" of fuel to your cells they will relax and give up hoarded energy. That's what it feels like.

RE: Zero Carb / Meat and Water - waywardsister - 07-09-2008 09:47 PM

Just finished reading this whole thread! Not all at once, though I could have since I find this topic so fascinating.

I'm not new to all meat/fat - I go on and off it. I would like to stay on it, or at least <20, bc I've noticed that's when I feel my absolute best. I'm celiac - well, not dx'ed bc why have a biopsy? I tested via
Enterolab as gluten and casein intolerant, but lately I've been struggling with dairy. Ugh. I do believe it's an addiction (and the proteins can and do act as opiates in the body). Anyway, I'm going off dairy AGAIN with the exception of butter, which causes no problems for me. My diet's been a bit shoddy lately due to pure laziness regarding cooking (schedule's been a bit crazy, but hey, health should be a priority regardless). So thought I'd go back to basics.

Left to my own devices, I prefer eating meat and fat and condiments - mustard, mayo (I can get soy-free mayo, or I make my own), some veggie condiments like sauerkraut. I don't think I have blood sugar/insulin problems, as I can go hours and hours without eating even if I do carbs. Regardless, I prefer to keep them low bc I think it's just a more natural way to eat, at least the majority of the time. I've found that I want veggies and fruit less and less - the most I want is a little lemon juice on my steak, mainly bc I like sour flavours esp. with fat.

For now, I would like to go to biological zero and stay there for a bit. I have shed the majority of my excess body fat, just 5-10lbs left over, but I'm more interested in feeling good and doing what I think is best for my body. I'm also interested in seeing how a longer-term meat/fat diet suits me. So at the moment, I'm aiming for <20 (bc I know I'll get carbs from mayo, eggs etc). I'm so happy to have found this thread! Can I do biological zero at <20?

Charles, I've read (and still read) a ton of stuff about LC and VLC, etc etc, but I have to say that you have a knack for explaining the details in clear, plain language. Thank you - it's refreshing! It's a challenge for me, reading studies, bc I get all caught up in the terminology and my eyes glaze over. Thanks for taking the time to lay things out plainly.

On a happy food note, I found hot dogs today with a natural sheep casing! Some nitrates, yes, but other than that all full of good stuff. I'm in Canada, and I've noticed that we don't have HFCS in everything like you do in the States (it's not even in our pop) I spent a week in DC last year, and I couldn't believe the crap that was in things like rotisserie chicken! Just insane.

I'm very lucky to live in a city that has about a million farmer's markets with a variety of meat available (game as well as regular ol' beef, chicken etc), a butcher that sells me lard and duck fat, and pretty much whatever I want (bones, organs when available), and tons of ethnic markets and delis. I am not so lucky in that us city folk are apparently willing to pay premiums for just about everything 😒I like supporting farmers though, and since I'm just feeding myself and my three cats (all raw fed), it's not too bad.

Looking forward to keeping up with all your news and progress! We all have such different challenges, and to me that's what helps us all learn and makes things so interesting.

RE: Zero Carb / Meat and Water - Dwayne - 07-10-2008 05:24 AM

Hey guys and gals, I weighed in this morning and of course I went up a pound. I think it is just normal variance/water retention. I feel sooo much better without the diet drinks. My afternoon headaches have gone away. I am still having my morning coffee, but I think I will be able to wean myself off of that. I may try getting it Monday, Wednesday, Friday next week and then try to keep getting it down. Last night I had a big cobb salad and had more carbs than I probably should have. It had a little avocado and about 3 cherry tomatoes on it. So lettuce, cheese, dressing and all it was probably 10-12 carbs. =/ I still don't feel too bad, but I think I may try to go down to two meals a day. I am seldom hungry until I eat which usually means I could wait.

Oh and I had a doctor (the last time I went low carb) who tried to put me on some blood pressure/cholesterol drugs and I just told her no. She asked why I wouldn't take the drugs and I told her
because I had just lost 60 pounds from our last visit and wanted to see what more weight did. She looked at her chart and said, "Wow you did lose 60 pounds!" I can't believe she didn't check that out before attempting to prescribe the drugs. Well I only have about 12 more months before my wife forces me onto the drugs. She is being fairly understanding for being an ER doc herself. She wants it under control but thinks I should try to do it my way first. =)

Hope you all are having a great day.

Do you know why the Optimal Diet wants you to stay out of ketosis? I tried to find the reason on the website but must be missing something. I've been doing a modified version of this too (and also don't trust the recommended carb levels)- more fat, minimum protein and less than 20 carbs. I just wondered if he has a good reason for recommending against ketosis?

If you go to that site and I think click on the protein link, I believe he says something about protein
metabolism being hard on the body compared to glucose metabolism and thus wants to avoid gluconeogenesis.

RE: Zero Carb / Meat and Water - Copmagnt - 07-10-2008 06:03 AM

I am now zero carb to try and jump start myself again. I have hit a stall and I want this to keep working.

How's the alpha/beta blocker working for you? I'm trying to have some recommendations handy for when I see my new doc Friday.

Really too soon to tell, I've just been on it a week, and it has slowed my heart rate by about 10 beats per minute, but hasn't had more that about 10 points affect lowering my BP. My body fights mightily to keep it(my BP) up! I wish I understood I also wish I knew if the high blood pressure or the meds were worse for my body. Since my Mother and my oldest sister both died from total renal failure because of HBP and my next two older sisters have had strokes I do worry about it. Needless to say they were all being medicated!!

Again, Charles, thanks for the encouragement.

Val

Well, this is very wise on your part. I hate to sound like a drone, but I really believe you just need to stay the course and avoid any drastic changes in your diet. It just takes time for our bodies to adjust to different fuels in different amounts. Remember that our ancestors did not enjoy much variety in their diets. Everyone ate what was local to their location and that was it. There was no supermarket or daily special. Trouble only began when the traders came through with their refined and easily digestible carbohydrates.

I was down 2.2 pounds today. I didn't do anything special yesterday. I ran some sprints yesterday morning, but I had 3/4 pound of ground beef for breakfast, about 5 country-style pork ribs for lunch and 2 chicken leg quarters for dinner, and water throughout the day. However, yesterday, I was up 2.8 pounds largely because I went to a Chinese buffet the night before and had some real sugary Asian ribs.
The sauce must have been 95% sugar. I only ate a couple, but I was up 2.8 the next morning. I just went back to my normal foods for a day and lost those pounds.

I'm just trying to say that it happens like this sometimes. Just keep to your routine the majority of the time and things should be fine. However, when you've got a lot to lose, you have to play it a little closer to the vest, that's all.

Regards,

Charles

Lauren Wrote:
So what do you think this means for Jimmy? Will it be a matter of him cleaning up his diet or is there something more he can/should do?

I've never changed my opinion for Jimmy and don't worry, I tell him so when I see him. He needs to join us over here on zero-carb and stay there consistently in order to lose whatever his hormones will allow him to lose. He has to ditch all those products and keep it clean, period. Will he ever become as lean as he wants? I'm not so sure since he's been obese most of his life, but I think he can certainly get to a very nice weight and that coupled with his weight training should make for a handsome young man.

Losing 200 pounds of weight is amazing in its own right and most people would be very happy with such a result, if that's all he's able to achieve!

Ell.eee Wrote:
Good news is 2 meals a day is working great - no hunger once I wait out my insulin surge (I guess that's what it is). And I only have to be strong twice a day rather than 3 or 4 times. And the increase in energy continues. I find myself continuing to jog a little further, do some chair exercise at work, and take on some physical chores just because I feel like doing it! As I've cut the carbs from 30 to 20 to 10 I've gained 2 pounds. I think it may be my body eagerly grabbing the fats it is now getting and I'm trying to learn to listen to it.

So the goal this week is maintain the VLC>10 and imagine my body healing itself internally.

Also what is the deal with all these Docs. Mine wrote prescriptions for pravachol - a statin, HRT, metformin, and fosamax. I threw them all away. I think I'm safer without them.

This is fantastic news. I wish you would post more because I love good news! 😊 I like that you are noticing the cues from your whole body not just the scale. If you get a little hungry or gain a little weight when increasing physical activity, that too is a sign that your body is working correctly. I experience my greatest energy surges sometimes when my weight is a little higher than what I think it should be.

In addition to what Ell.eee has found, people should look for things such as the quality of their hair, maybe it's a little shinier or has more vitality; or perhaps hair loss may have stopped. Perhaps your libido has improved, or your skin tone, decreased acne, you sleep better, you urinate more despite not drinking more water. You may feel a bit tired at times, but once you get up and get going you find that you have more energy than you thought you had.

Sugar gives you that instant surge but then declines shortly after. The energy we get is a slow burning type of energy that is long lasting, but it's not so obvious at first. It takes time to get used to this and to realize how much energy you actually have. When I race I typically feel tired at the starting line, but once I start running, I have a big reservoir of energy at my disposal!

When I did my sprints Wednesday morning, I was awesome (if I say so myself) and I was very surprised. I was a little peeved about the 2.8 pound gain and I was also a bit tired because I got up so early, so I didn't expect much at the track. Let me tell you, I breezed through my workout and far exceeded my expectations. I got back and jumped on the scale before I hit the shower, and I lost a whopping .2. However, the next morning, I was down 2.2, so it was all a matter of just staying the course and doing what I was supposed to.

No matter how many times I prove this to myself, I'm still amazed when it happens.

Oh, and yes, doctors are totally following some script. They see X and they prescribe Y. I don't think they treat patients. I think they treat scenarios and test results. They have not been trained to think critically and search for certain variables that could change the entire equation. I really think it's a product of specialization.

Regards,

Charles

Absolutely you can. The fact that you felt the difference for yourself at <20 proves the point. Each time I lowerd my level, I felt better. Sometimes, going up is the only way to show a person how good it was at the lower carb level. Unfortunately, I've had to learn that the hard way as well.

waywardsister Wrote:

Great news, Dwayne. Just think if you didn't have the cobb salad, you would have probably been down a pound or two. Remember that we are hyperphagic beings. We store fat in the daytime and we burn them at night. If you eat carbohydrates late, those will likely have no choice but to be stored. Salad doesn't contain many, but all carbohydrates cause us to retain more water than we ordinarily would so if you do eat salads, I would try to eat them earlier in the day and just stick with fat and protein for dinner if possible.

That's where I got the idea. At my level of overweight, I just don't trust their recommended level of carbs. The high fat really ups my energy and I find I can't sit still, I figure that's good. I think, just as Charles has said repeatedly, that if you supply "plenty" of fuel to your cells they will relax and give up hoarded energy. That's what it feels like.

Do you know why the Optimal Diet wants you to stay out of ketosis? I tried to find the reason on the website but must be missing something. I've been doing a modified version of this too (and also don't trust the recommended carb levels)- more fat, minimum protein and less than 20 carbs. I just wondered if he has a good reason for recommending against ketosis?

Yes, I do sort of know why. Dr JK thinks too many ketones aren't good for your brain, some are necessary but not a flood. I could not follow the science so I don't know. At least now, when I feel I'm not in ketosis, I don't fret about it. If I run across the thread about it, I'll post it. I spend a lot of time on that blog these days.

**RE: Zero Carb / Meat and Water** - Charles - 07-10-2008 09:27 AM

I think they're afraid of keto-adaptation because of the intense flu-like symptoms that people experience. It's one of those things that has to be endured. Another reason people get ketosis is when they consume too much lean protein because it's a precursor to hyperammonemia, which is a build-up of ammonia in the blood which can cause lethargia and even death in a short time. The Optimal diet is concerned with high fat as they should be. I don't think there is such a think as a high-protein diet, but people keep insisting on labeling certain eating plans as such.
The ketosis that most are afraid of is the kind where ketones get wasted in the urine and the body. A person who is keto-adapted uses ketones efficiently and therefore show no waste. I do not show positive on those strips even though I eat zero carbohydrates. Even if I were to eat 20 grams of carbohydrates today I would still not show positive.

RE: Zero Carb / Meat and Water - jeepifer - 07-10-2008 10:38 AM

So the ketones present initially are because our body hasn't adapted fully to running on them yet, and when it has, we won't show anything on those stupid sticks? Uck. WTH didn't anyone tell me this before? 🙄

RE: Zero Carb / Meat and Water - Dwayne - 07-10-2008 11:06 AM

Charles Wrote:
Great news, Dwayne. Just think if you didn't have the cobb salad, you would have probably been down a pound or two. Remember that we are hyperphagic beings. We store fat in the daytime and we burn them at night. If you eat carbohydrates late, those will likely have no choice but to be stored. Salad doesn't contain many, but all carbohydrates cause us to retain more water than we ordinarily would so if you do eat salads, I would try to eat them earlier in the day and just stick with fat and protein for dinner if possible.

Yeah I should have known better than to eat that salad. I know the pound will come off with a good clean day behind me. So far I haven't eaten lunch and it doesn't look like I will. I am just not hungry. I feel like I already have more energy and cleaned up the office today to work off some excess. I may go to the gym tonight if I can squeeze away after dinner. My wife's schedule is later in the evening and it is a bit frustrating not being able to build a consistent routine.

That's right. I always smile when I see people so preoccupied with them. They think they are evidence of
"fat-burning." It's just waste and a sign that there are not many sources of glucose present in the diet so the body begins converting fatty acids to ketones. All evolutionary systems in the body tend to overcompensate and this one is no different.

Some tend to stay around 20-30 grams of carb per day and this unfortunately puts them right on the cusp of ketosis especially if they eat leaner meats. Staying right on the edge seems uncomfortable in my opinion because you never really go one way or the other. It's best to just bite the bullet and get yourself keto-adapted so you experience the beauty of an all-fat metabolism as it was designed to be.

Just make sure you don't overdo it. It's easy to do once you begin experiencing this new energy. You are right to skip the meals if you're not hungry. The fact that you're living off of your stored fat is proof that things are working. When you do eat, make sure you always include some protein so that your body doesn't go after that new muscle you're creating at the gym.

Remember, don't allow yourself to be depleted at the gym. Stop before you get wore out. Only exercise if you feel like you literally have "energy to burn." Never make yourself go workout when you don't feel like it because this does more harm than good over the long term.

I used to despise conspiracy theoreys also but now i have to admit that i believe some are true. Any time there is big money involved the concern for safety goes out the window.
I read a story a couple of years ago in the Chicago tribune about Kraft foods and Phillip morris trading information about brain chemistry. Marlboros and oreo cookies, what a combo.

Okay, Travis, when I read stuff like this, I tend to agree with you:

*Studies on Oreo's and other snack foods suggest that the same brain chemicals that create the rush of narcotics also keep people coming back for sugary treats.*

*The controversy over the American diet in recent years has centered on how much obese consumers are stuffing into their mouths. But the root of our overeating lies not in our stomachs, but in our brains.*

*Moments after a person eats an Oreo or any other sweet, the brain's pleasure centers release opiatelike...*
compounds--chemical cousins of morphine. The result bears similarities to addiction, though many researchers say it is more like turning on a built-in craving.

Such work supports the controversial notion that our eating habits stem from brute physiology as well as free choice.

Even though I figured some of these companies must know or suspect this, especially since they employ researchers and scientists to know, I wondered how it would impact them in light of the religious fervor that the obesity epidemic generates.

For instance, now they are saying that the problem originates in the brain (which it doesn't, but it surely affects the brain -- it starts with insulin and insulin regulates fat metabolism which is connected to the brain via the central nervous system). This fits with the dogma that obese people lack the willpower to stop overeating and being sedentary. If it affects the brain, then the obese really have no choice but to overeat because they are addicted to sugar. That's kind of what we're saying in the end, that sugar is an addiction and it compels you to eat more and more of it by placing you in a vicious cycle that leads to all the diseases of civilization.

That's powerful stuff but the snackfood industry will fight this really hard and I'm sure they'll marshal many experts of their own to lessen their liability. However, when you link them to Phillip Morris, who people already hate because of their cancer sticks, now you're on to something! It's not at all hard for anyone to believe that these guys are hiding stuff.

Great information, Travis! Wow!

I read in USA Today that Nestle owns Jenny Craig, one company sells the poison and the other charges $100 to take the result off. Must be some kind of hedge strategy.
Scott

RE: Zero Carb / Meat and Water - Ell.eee - 07-10-2008 02:18 PM

Oh my gosh I just ate beef back ribs for the first time in my life. Wow fatty, flavorful and delicious. I won't be able to afford them too often usually stick to the 73/27 ground beef I learned about here or cheap bacon or sausage and these are new to me too. I feel like I've been deprived my whole life eating skinless chicken breasts and 99% lean ground turkey - I just didn't know it. Now what do I do with all this extra lean meat in my freezer? I have to eat it. Maybe drown it in butter or bacon fat? Sorry for the silly post but I know you guys may best appreciate what a huge surprise and pleasure it is to find a whole new category of food at age 55! And DH says he loves my "new style" of cooking.

You could do that, but you could also eat it alongside the fattier stuff. For instance, if you have some chicken breast, cook some bacon along with it and use a lot of the fat. Cook some ground turkey with some 73/27 so you can make use of the fat. The fats that come naturally in beef, pork and poultry are superior to what you get from dairy creams.

Enjoy!

Charles

**RE: Zero Carb / Meat and Water - Dwayne - 07-11-2008 05:49 AM**

Well I just updated my little weight ticker with my morning weigh in. You can actually see my starting weigh now! That was a little mental mini goal I guess. I am at 328 as of this morning and very excited. Finally another little jog of movement. The lasagna poppers I made last night were not so good so back to the drawing board. Anyway, we walked the little guy last night so that was my exercise. A nice loop of the neighborhood. I feel great again today and I hope it keeps going. My wife is not happy with the very fatty cooking, but I think I may start using lean meats and adding bacon and what not for myself on them and leaving them off of hers. She is worried about my acute triglyceride spikes. Does that make sense Charles? I told her low carb makes tri go down, but she said that increasing spikes throughout the day could be bad for building up plaque in the ol veins regardless of the long term measurements. As a side not her father just recently had 3 stints put in and has been on Atkins maintenance for 5 years. 10 years ago he had a cath down and no blockages. She says she knows there are lots of other factors for him, and she is glad about his atkins diet and the health benefits of it, but that she wishes for him and me that we would eat lower fat/healthier fat meats and oils.

Anyway just curious. At the end of the day she wants what is best for us and doesn't care how I lose the weight since it will cause more health issues than not losing the weight. I think she wants to make sure I don't pump her and the baby up with high fat meals as well all the time since I am the primary cook of the house.

Charles,
You are right about the ketosis. Every time I let my carbs creep back, I end up with the cravings and difficulty staying on course. Just eating fattier meats and not worrying about doing any counting is by far the easiest!

RE: Zero Carb / Meat and Water - Clabbergirl - 07-11-2008 06:21 AM

I felt like updating today. After doing lo-carb/zero carb for 16 days and losing 10 lbs, not to mention feeling better and ridding myself of gastrointestinal issues, I went on vacation to Disney World and made up for all those carbs I hadn't been eating. I went back to ZC eating afterward, but struggled to resist the cravings in that beginning system carb purse that can be so difficult for us, and carb-loaded, shall we say, over the July 4th weekend. Sigh.

I've been ZC for 4 days now, and am finally beginning to feel less 'seduced' by the loaf of bread my family uses, or the cupcakes that are on the counter waiting for my daughter's weekend birthday party. It has been especially hard this week to avoid carbs, and the only way I've managed is to keep myself super busy, and/or to drink diet cokes when I'm desperate. I realize the party may be difficult, with a cake and all, but I feel better on near-ZC (around 10 carbs or less per day so far).

I don't know how much I gained while eating at WDW, or the carb-loading this past weekend, but I weighed today and I'm back where I was before the trip. I can accept that positively because it's better than a gain, and I have lost inches. My stomach is no longer distended and bloat - something I have been mystified by for over a year, and something every doctor I've mentioned it to has balked at as just excess fat. When you go up one pant size after eating a normal sized meal? Hardly.

So back where I was, and determined to keep going with this. I've got a fridge full of ground beef, hamburger patties, bacon, and sausage. Still doing cheese, eggs, and cream, but time will tell if those need to leave.

RE: Zero Carb / Meat and Water - Dwayne - 07-11-2008 06:28 AM

Congrats on getting back to it. There is hardly a person out there that is not going to get caught up in life from time to time and stray off of plan for a little while. The important thing is knowing that regardless you are going to get back on the horse and keep plowing along. I know my greatest weight loss successes always come when I am able to refocus myself periodically. It lets me know I am in it for the long haul. Of course my last cheat period lasted through a move, a job change and my wedding! =) I am sure it will melt back off for you.
How was Disney? Ironically I lived in Orlando for 3 years(still have a house there) and have never been.

No. There is no such thing as a "triglyceride spike." She is trying to scare you, I'm sorry to say. Triglyceride is a term that means three fatty acid molecules (tri) attached to one glucose molecule (glyceride). Triglycerides are formed when you eat carbohydrates, not fats. That is the way the body deals with dietary carbohydrates. They are broken down upon digestion and the glucose goes to the fat tissue where it is assembled into triglycerides. This is what is inside your fat tissue at all times during the day. They don't just sit there, but they keep getting assembled, disassembled, and reassembled each time the fatty acids pass through your fat tissue. If you are eating zero carb, you are not making ANY triglycerides because you are not making any glycerol phosphate which is the necessary ingredient to make triglycerides.

If there is any "spike" it's when you eat carbohydrates such as pastas, salads, fruits, etc.

Lean meats will sap your energy and cause ammonia to build up in your blood stream. If she really wants you to have a chance to do it your way, she has to back off and allow this process to work. Eating lean meats and lasagna will only make this worse for you, not better. Oils should be avoided, unless you're talking about coconut oil, extra virgin olive oil, lard, or butter. I would avoid all of them, personally. Just use the natural fats that come with the meats that you should be eating.

Dwayne Wrote:
I told her low carb makes tri go down, but she said that increasing spikes throughout the day could be bad for building up plaque in the ol veins regardless of the long term measurements.

You are exactly right. If she's concerned about you making triglycerides, then you should avoid any and all carbohydrates. Have your blood work done in three months and if your triglycerides are higher in three months, then you can do it her way. If they are down (which they will be if you eat as I'm saying) then she should back off.

Dwayne Wrote:

I can assure you, without knowing him, that if he did Atkins as written in the book, he did not receive heart disease from eating according to Atkins. He most likely had atherosclerosis prior to his Atkins diet. I've been at this long enough to know that everyone who says they're "doing Atkins" is not doing Atkins. Most people have not read the book nor do it as the good doctor proposed.

Moreover, Atkins can sometimes provide a false sense of security. The carb level that one uses to maintain their weight is not necessarily the carb level for optimum health. The metabolic disorder that causes obesity also manifests itself in other ways that don't result in weight gain at all for many people. Because of that, the symptom (obesity) should not be the gauge by which one determines whether their diet is in fact healthy.

You've been losing weight and noting improvement by eating high fat without the so-called healthy oils. Why would you change?

Dwayne Wrote:
Anyway just curious. At the end of the day she wants what is best for us and doesn't care how I lose the weight since it will cause more health issues than not losing the weight. I think she wants to make sure I don't pump her and the baby up with high fat meals as well all the time since I am the primary cook of the house.

She obviously does care or wouldn't urge you to eat unhealthy lean meats and harmful oils. As I said earlier, have a lipid profile done in three months and continue to eat as instructed for the three month period. Once you get the results, you will have proof whether what I'm saying is true or not.

I'll include myself in this challenge along with your wife. If your triglycerides and HDL don't improve in three months, I won't give you any more advice either and will publically declare myself to be wrong, and even send your wife an e-mail letting her know how correct she was.

Best regards,

Charles

I realize the party may be difficult, with a cake and all, but I feel better on near-ZC (around 10 carbs or less per day so far).

Once again, I have to tell you, please, don't be so hard on yourself. What you experienced is the absolute best way to convince yourself that zero-carb works and is necessary. There's only so much I can write
and you may or not believe what I say. When you experience it for yourself, you find that you need no more convincing or studies or anything else.

Think about it: You lost 10 pounds in 16 days of eating zero-carb. You went to Disney and returned to carbs, but now you feel so awful that you have voluntarily returned to zero-carbs. Just think if you have been on zero-carb for 90 days and lost 60 pounds...This may happen several more times to you before it's over and I'm telling that it's fine.

Travis and Gary Taubes both presented us with evidence that sugar is an addiction. When we say sugar, we're talking about all products made from sugar, flour, rice, grains, or plants of any kind. That includes those precious fruits and vegetables everyone thinks are so great for us. Your body interprets all these things as sugar and acts accordingly.

Gary Taubes Wrote:
Whether the addiction is in the brain or the body or both, the idea that sugar and other easily digestible carbohydrates are addictive also implies that the addiction can be overcome with sufficient time, effort, and motivation.

Dr. James Sidbury, Jr Wrote:
"After a year to eighteen months, the appetite is normalized and the craving for sweets is lost."

Because we're talking about an addiction, we have to have compassion and remember all those celebrities who are constantly in and out of rehab. These things take time and effort to overcome. Living without starches, flour, and sugar will be more difficult for some than others but it's also possible that we will all be thinner and healthier for our efforts. Whether we're thinner or not is a bit beyond our control but certainly we can make the choice to be healthy regardless.

Regards,
Charles

**RE: Zero Carb / Meat and Water** - jeepifer - 07-11-2008 08:50 AM

You know how I've been worried about my blood pressure? I've had several weeks of high readings, and was going to ask for a medication adjustment. Well, OMG, it was so freakin' LOW this morning I must've looked like a nutcase! I mean, 107/70 low. Not my usual ballpark of 135-140/90-105.

So I have to "monitor" it for the next month, then go back in with my readings. Sheesh. 😳

Could it be the zero carb bringing it down? I've only really been back to ZC for a couple of days. If so, it's a good thing, but still. I hate looking dumb. 😏

---

**RE: Zero Carb / Meat and Water** - jeepifer - 07-11-2008 08:55 AM

Speaking of triglycerides, I had a blood lipid panel done this morning, so I am looking forward to seeing the results.

She was perplexed because my last fasting panel a year ago, my triglycerides were 238. I had a lipid panel, *not* fasting, done in Feb. and my tris were 116. She says, "That's odd, because a non-fasting panel you'd expect your tris to be higher during the day. That's why we like fasting panels."
I'm sitting there thinking, Well, Duh... I eat low carb. Hahahahahaha!

**RE: Zero Carb / Meat and Water - Charles - 07-11-2008 09:01 AM**

Mine happened quickly. It's always 105/62. I would be very shocked if you needed blood pressure medication with ZC. You may want to reduce that medication real soon or it could go too low along with the medication.

**RE: Zero Carb / Meat and Water - poo123 - 07-11-2008 09:53 AM**

Well here I am at day 14 and still at 236. I am still doing zero carb and FEEL GREAT !!!!! I am sleeping perfect and not sweating and the hot flashes have nearly gone away. No headaches and my moods are "normal" for a mom of twins !! I am eating twice a day and very happy about that. My husband is down 7 lbs in 5 days and I have not KILLED him yet so that is a good thing. He is doing low carb but mostly trying to eat the same meat at me. He trying to get used to fatty meats to go all the way like me. So I guess this update is to say everything is GREAT !!!!

**RE: Zero Carb / Meat and Water - waywardsister - 07-11-2008 11:45 AM**

Ell.eee Wrote:
Now what do I do with all this extra lean meat in my freezer? I have to eat it. Maybe drown it in butter or bacon fat?

Wrap bacon around it, and cook it that way! Everything really is better with bacon.

While I tend to agree that animal fats are better than dairy fats (still an animal fat, but you know what I mean), you can make some really nice butter sauces to dip or coat your lean meat. Heck, or your fatty meat, if you're so inclined - I make a sauce for lamb with pan juices and melted butter and some concentrated mint sauce (basically mint and a bit of vinegar). Lemon or lime butter (if you 'do' lemon/lime), herbs mixed with pan juice and melted butter...all good! ETA: you could do this with any fat, like lard, duck fat, etc. Doesn't have to be butter)

Or...'bread' that lean meat in crushed pork rinds (seriously, it's good and doesn't taste like, say, chicken breaded in pork) and fry it up in lard. Oh mama. Spice accordingly, however you like it. Or, slice it up and stir-fry in lard, and try some Asian or Middle Eastern spices.
If you do dairy, there's always bearnaise sauce or cheese sauces (lotsa fatty French sauces out there) - but that's my dairy addict talking 😁 Hush, dairy addict.

Great is good! Please don't kill your husband, there's been too much of that going around lately.... 😁

Don't forget to look for those other cues that this is all working besides the scale. Check out your husband's hair, libido, teeth, lack of gas, skin complexion, less acne (if he had it), less body odor in general, especially the underarm variety -- You know, I don't use those deodorants (antiperspirants) with aluminum in them and they actually work. Those would have never worked in the old days....

Guys don't notice these things about their wives (or at least we don't always say) so you might ask after a while and see if he's noticed any changes in you. Measuring is also good if you're so inclined. I have noticed that clothes fit much looser despite no change in the scale. It isn't always good. I was so happy to get down to a 30-inch waist; but now, I can wear a 29 in most jeans and a 28 in most shorts. The problem is, they are few and far between. I practically can't shop at Macy's anymore. They always have sales!

Losing weight is a two-edged sword. It's great, but it can be expensive especially if you have to dress nice for work. It certainly forces you to strongly consider changing your diet plan...

Have a great weekend,
Charles

**RE: Zero Carb / Meat and Water - nyteez - 07-11-2008 03:59 PM**

Hi Everybody! I have been reading "theBears" All Meat thread over on some other forum. It is LONG! I
am only on page 110 of over 300! It is a fascinating thread. It really backs up the zero carb WOE. I got the link to it from Jimmys blog. I have been eating zero carb for quite a while now. I have no problem with it all, no cravings for carbs ever. I did go away for 4th of July and was in a weird food situation so I had to eat salads (better than nothing!) and had some asparagus w/ steak one night. I felt terrible! Gassy & bloated! Then in the morning the counter was full of pastries, artisan fresh baked scones & bagels! I didn't even think about having any of that and I was starving! I am at the point where I would rather go hungry than eat bread. I had stomach pains the whole weekend, I could not wait to get home and have a big fatty ribeye! That weekend just proved to me that I need to just stick to meat. I feel so much better only eating meat & fat.

I am not losing as fast as I think I should be, but I am OK with that because I do see other benefits. Like clearer skin, no puffy skin or ankles, my body shape has changed, it is more defined, not chubby, I have lost inches and no brain fog! I did go away for 4th of July and was in a weird food situation so I had to eat salads (better than nothing!) and had some asparagus w/ steak one night. I felt terrible! Gassy & bloated! I also haven't been able to run like I usually do for the past 5 weeks, due to all the smoke. I live in N calif, just 5 miles from some huge fires. I started lifting weights though and have already noticed a difference in my arms.

RE: Zero Carb / Meat and Water - Kristi31 - 07-11-2008 04:29 PM

Haven't posted in awhile but I'm back on track and feeling pretty good...but only after I figured out my hormones were keeping my from reaping all the benefits associated with a zero-carb diet.

For those who don't know, I've had a hysterectomy (almost 3 years) so need to take hormones, namely estrogen (i.e. estradiol) and progesterone.

I finally came to the conclusion that I was taking way too much estrogen and most, if not all of the symptoms I was experiencing were due to that. To name a few, bloating, indigestion, swelling in ankles and feet, distended stomach, lethargy, hair thinning, body hair loss, loss of libido, dry skin, constipation, sinus problems, hives. Too many!!! I also GAINED weight, about 15-20lbs in a few months. Despite being 100% committed to zero-carb for many months at a time, no cheats. Estrogen was just causing too much water retention and all the other problems that go with that AND more...probably having some effect on the thyroid, on fat metabolism, etc.

I now realize how important it is to have both enough of progesterone and estrogen to balance each other's effects. They work in opposition. Too much or too little of one and you're screwed. And when that comes from outside sources (i.e. not your body like ovaries or testicles), nothing about your diet can solve the problem until you figure out the right dosage for you.

So...I lowered estrogen and kept progesterone the same. For the first 3 days, I actually took no estrogen at all since it takes some time for all the estrogen to leave my body. In a matter of hours, thing were already starting to improve until I realized I needed to add back in some estrogen. I'm taking a little estrogen now and may increase it a little more, if need be, depending on how I feel and physical symptoms. But, I'm practically there. I feel it. I'm also losing 1lb a day since a couple of days. Stomach is flatter, I feel more relaxed, have more energy.

I have to go eat (some fatty wild arctic char)...take care everyone, best of luck and have a great week...zero-carb is the way to go!!! but sometimes, you just need to tweek a few things as well to make it work optimally, as I've learnt.

RE: Zero Carb / Meat and Water - Clabbergirl - 07-11-2008 04:49 PM
My husband just got results of his latest blood test, and while his cholesterol was 227, his triglycerides were above 500. The doctor told him to eat 'no sugar, no carbs' and come back in a month. I was impressed. But she also wrote him an Rx for Tricore...and said to fill it asap too. She didn't provide him with any diet plans or suggestions, but at least she didn't give him the low-fat and lose weight garbage.

I wish I'd been able to talk to the doctor for more in depth info about the diet she suggested (my husband's not one for details). But it gives me hope nonetheless that maybe the message is getting through even in small town America.

RE: Zero Carb / Meat and Water - Ell.eee - 07-11-2008 06:31 PM

Hey waywardsister Thankyou so much for the recipe ideas for my stocked freezer of lean meats. I'm definitely going to try the pan sauces and the crushed pork rinds. I've never tried a pork rind in any form but it sounds great. And I agree anything tastes better wrapped in bacon. Thanks again.

Sounds good to me, nyteez! However you get there is the correct way to do it. With each experience you'll only become stronger and healthier.

All the best,

Charles

RE: Zero Carb / Meat and Water - jeepifer - 07-13-2008 04:59 AM

Hi gang. Day 4 here, feeling better. Less cravings, was able to pass on veggies, dessert, and DQ yesterday without much effort. Off to have short ribs for breakfast...

RE: Zero Carb / Meat and Water - poo123 - 07-13-2008 05:48 AM

Well today is a full 2 weeks. I am down to 234.6 from 244.0 so 9.4 lbs is good. I am having no problems with this way of life at all. I am going to start using my recumbent bike and my weight machine today and everyday so maybe the weight will move a little faster. Once I start doing the exercise I really love it. My husband is doing really well. He still likes to nibble at night during tv time so he is eating some pork rinds, pepperoni and some cheese. During his 2 meals a day he is eating the same as me, steak, ground beef or chicken thighs. He is really happy he is not hungry during the day. So all in all it been really great.
I did the exercise I said I would. I did 5 miles on the bike and I did arms and abs on the weight machine. Now off to hit the shower and plan the day with the family.

Great news!

(REmember, just don't overdo the exercise. Stop before you're totally spent. Exercise is great to shape that body but can cause problems if you deplete yourself.)

By the way, I did read Jimmy's blog post about his test results and I stand by what I told Lauren last week. This protein thing is all a ruse. Many of you have been doing zero carb for a couple of weeks now and have been losing weight despite the amount of protein you've been eating to appetite.

Yesterday, I ate 9 hamburgers during the course of the day and two cubes of chicken on a stick in the mall. Add in some water and I had about 2 1/2 pounds of meat yesterday. I lost 1.2 pounds with all that protein. Protein and fat are natural nutrients for our bodies. We need them from the diet or we start eating our own tissue to get these nutrients. Glucose can be synthesized by our bodies as needed. Since no meat-eating population has obesity problems then we can safely assume that our bodies don't convert enough protein to cause long term weight gain. Like anything, if you semi-starve yourself by cutting back, you will lose weight; however, this is not the kind of weight loss that stays over the long term.

By the same token, if I would have eaten 20 hamburgers yesterday, sure, I would have gained some weight, but it would have been gone within a day or two as I returned to eating to appetite. Overeating only means that you go longer between meals, that's all. It's a storage mechanism that enables us to plan ahead. This shouldn't be manipulated just to drop a couple of superflous pounds.

Simply put, don't try to regulate your weight by yourselves. Rely on your appetite and only eat when hungry and don't eat when you're not. If you do this, your body will regulate your weight and make you as lean as your hormones will allow. **There is simply nothing else that can be done from a dietary perspective.** No one wants to look like Ghandi, we want to look like Jack La Lanne.

Dr. Eades posted the following in the most recent comments section of his blog:
"Protein does indeed elevate insulin levels, a subject described in depth in Protein Power. Protein also elevates glucagon (insulin’s counter-regulatory hormone) levels, which counters insulin’s effects."

Taubes said the same thing in a Q&A that I posted to a question about lean proteins raising insulin levels in The Insulin Index study.

Maybe somebody can comment more from Protein Power as I don't have a copy of it.

I agree that it seems unlikely that we would produce more glucose than is minimally necessary. There would seem to be no biological reason for that.

I do wonder though that if we are producing too much insulin for other reasons- if we have not been consistent enough with VLC or if we are eating too many "products"- wouldn't it be possible to gain weight even eating VLC or ZC?

Carbohydrates drive insulin and insulin drives fat. If we have too much insulin even without the carbs, wouldn't it be possible to store fat as long as our insulin levels remain elevated?

To be fair Charles, many people have dropped off of ZC either because they couldn't take it or because they didn't lose weight and sometimes even gained weight. I think this has happened with enough people that you shouldn't dismiss it.

With Jimmy, I can't help suspect all the franken-foods he eats (no offense Jimmy). Maybe they were fine while he was going from 400 to 230 because at the time, it was such an improvement from the way he had been eating. The fact that he may no longer be able to tolerate these foods may actually be a good thing. His body may be rebelling from these kinds of engineered foods.

On a completely different topic, I have been realizing that I confuse FFA's and ketones. Both are made from fat, right? Both are used for fuel, right? If you're in the mood Charles (or anyone), can you go into how, if at all, they are related?

...

I myself haven't been able to maintain the zero carbs/very low carbs only because of poor planning and I have had a few lc frankenfoods to help supplement. Meat is very expensive in my area of NYC and I have taken a dislike to eating ground meat which is unfortunately the cheapest meat I'd been able to find. However, I've not left low carbing completely and don't plan to.

I hope to plan better, shop more wisely, cook more and find a good meat market where they have more sales/specials (a friend suggested a place nearby for me to check out) to try vlc/zc again. It's been more frustrating for me - financial-wise - to continue the zero carbing. Otherwise being a meat lover in general, this way of eating is definitely for me.

Meanwhile it has been two weeks and my scale says I'm down 15 pounds. The changes are very subtle but I'm okay with that because I started this change at 285. I know that more changes are coming and they will be obvious as I continue to lose weight. But the other benefits are well worth the patience. So I'm more or less still here just reading about others and silently rooting you on.

I'm not too concerned about what Dr. Eades says these days, but please post what you found from Taubes. I can tell you that I just e-mailed this question last week and he told me that his understanding was just like mine. He provided the following:

Gary Taubes Wrote:
Hey Charles,
Short response: My understanding of gluconeogenesis is similar to yours. I would also assume that we have to be able to store some fat without carbs in the diet, because we do need some minimal level of fat for insulation, padding, and excess fuel, etc. I think the question is two-fold: one, whether we can store excess fat to begin with without carbs -- i.e., can we get overweight or obese without easily digestible carbohydrates and sugars in the diet -- and I would say no. The evidence to support it is the fact that fat accumulation is regulated by a-g-p and the amount of a-g-p in the fat tissue will be regulated, for the most part, by dietary carbohydrates. Then you have the epidemiologic evidence suggesting that you don't get obesity in cultures that didn't eat sugar and flour.

Now, if you're talking about lean protein, well that raises all sorts of things in our bodies so that wouldn't surprise me. However, I don't think we can blame lean protein for Jimmy's situation.
Lauren Wrote:

I think it's very possible to gain weight with too many "products." I dropped these things during my weight loss and I eliminated any stalling that I went through. We just don't know enough about the effects of artificial sweeteners on our bodies at this point. Because they are sweet, I believe they do keep us secreting insulin. Remember, insulin is mostly anticipatory, not just reactionary to what we've eaten. If you eat more than your body anticipates, you'll secrete more at the next meal as your body will not want to be surprised.

Lauren Wrote:
Carbohydrates drive insulin and insulin drives fat. If we have too much insulin even without the carb, wouldn't it be possible to store fat as long as our insulin levels remain elevated?

Look at you! 😊 That's exactly right. As a matter of fact, if you have hyperinsulinemia, it just doesn't take that many carbs. Just because you're eating under 20 grams, that doesn't mean you won't store some fat. It all depends on your level of insulin resistance and it all depends on your hormones. As I've said many times, you can only lose what your hormones will allow. I think this is the problem for most people who do not find success on zero-carb. I don't think they're necessarily cheating.

Lauren Wrote:
To be fair Charles, many people have dropped off of ZC either because they couldn't take it or because they didn't lose weight and sometimes even gained weight. I think this has happened with enough people that you shouldn't dismiss it.

You haven't been reading my posts lately. I have written at least three times last week that the "urge for the sweet" is an addiction. Like any addiction it takes a great deal of time and motivation to beat it. I expect people to fall off the wagon and to even give up. Why would this be any different? Stefansson didn't say that EVERYONE was able to survive on an all-meat diet. He said that if people made it six months, there was a good chance (not a guarantee) that they would remain and even voluntarily remain on it. That tells me that many were unable to do it. However, it also tells me that many WERE able to do it and he said that they were of every nationality, both women and men. I'm talking about the traders that went with him, not the Inuit.

Lauren Wrote:

The fact that he may no longer be able to tolerate these foods may actually be a good thing. His body may be rebelling from these kinds of engineered foods.

I said as much when I posted to you about this last week. Hogsfan was the first, I saw, to mention this, but it's just highly possible that he's close to the weight that his hormones will allow and that's as far as he's going to go. As I just posted from Taubes, it may depend on how long the obesity has lasted. He's been obese all his life so he may not achieve the leanness he desires but he'll be healthier for his efforts. Everyone should take note because it's possible this may be someone else's experience. It's much more important to eat for health and let the weight fall where it may.
On a completely different topic, I have been realizing that I confuse FFA's and ketones. Both are made from fat, right? Both are used for fuel, right? If you're in the mood Charles (or anyone), can you go into how, if at all, they are related?

Free fatty acids are fat. Ketones are made from fat. Ketones are not fuel per se, they are used for those cells and tissues that can normally use glucose such as the brain, eyes and a few others. Fat can supply up to 75 percent of our energy needs, and we'll make very little glucose when there are no carbohydrates in our diets.

It's not correct to say that we burn ketones for fuel in lieu of carbohydrates. Carbohydrates are only burned to eliminate them. They are processed similar to the way our bodies handle free fatty acids and that's why people think carbs are used for fuel since our body gets to them first when they are available. When fatty acids are used for fuel, the cells are prevented from burning glucose and they only burn fatty acids.

This is another reason I don't believe excess protein converts enough for fat storage. If there was enough glucose from protein, we would make glucose phosphate from it and store it as triglycerides. The fact that triglycerides still fall despite eating tons of protein, this is proof that we are not making triglycerides out of those glucose molecules which are converted from protein. There has to be triglycerides before there is fat storage.

Triglycerides are our bodies way to handle glucose molecules. Glucose must be converted to fat (read: used with fat) in order for our bodies to process it. It can't just go to the mitochondria as glucose. It has to be converted pyruvate via a process called glycolysis. Our mitochondria were clearly designed to burn fat. This proves to you that we were not designed for dietary glucose. We've adapted a mechanism to deal with glucose but too much and we get ill.

Regards,

Charles

That's what I have been telling people...usually right before they switch to some screwed up plan because they aren't losing weight fast enough. ::sigh::

Sure, I would like to lose at least 20 more pounds, but weight loss is SECONDARY to health. All I have to do is take my blood pressure to remember why I am low carbing....it is sure nice not having to worry about having a stroke at any second 😋

That's perfectly fine. I'm not a "numbers" guy. It really doesn't matter to me, in the grand scheme of things, how many people find success with zero-carb. That doesn't change my view of what the science says. Just because everyone can't do it doesn't mean it doesn't work. I've always presented it as something to try and I provide examples from my own life where helpful. I don't get any brownie points for how many people succeed and how many don't.

I'm only here to help. If only a few people are able to achieve what I have then I'm very happy. In fact, I know of many who have. As I've said many times, when I put people in my personal peer group on a low-carb diet, I start with Atkins Induction. I think it's very sound. If they don't have any problems losing weight, I tell them to stick with that. If they are losing slowly or are unable to lose, we drop the carbohydrates further until they can lose weight.

Even Steffanson, as the end of his book, said that this was not for everyone and in fact, he questioned why a person would want to do it if they don't have to. I chose to do it because Gary Taubes' research loudly suggested to me that this was way to go. I had a hard time wrapping my mind around it at first, but after several months, it has become second nature.

Just like you, I've tried certain things like cheeses and sweets, but I noticed quickly what they did to me and I was fortunate to have the resolve to leave them behind and stay "clean." For me, it's all about health and that's all that matters. In my own family, only my myself and my middle son are zero-carbers. My wife, oldest son and daughter have the occasional sweet thing, but mostly they eat meat as well.

For those who can, stay strong. For others, find what works and do it for the rest of your lives!

Taubes said the following. I had this laid out in my Insulin Index thread.

"In fact in my post 'Taubes answers questions' he addresses that specific study.

Insulin Index

In some follow-up reading, I ran into the concept of the insulin index, which purports to index the insulin response of foods. This index appears to indicate that certain protein rich foods (like beef and fish) may actually have more impact on insulin than certain carbohydrate foods. This is counter-intuitive based on the science that Gary writes about. I would be interested to know whether Gary has any comments about this index.

It's always been known that protein stimulates an insulin response, because some of the amino acids in the protein are converted to glucose. The assumption has always been that this effect is small compared to that of carbohydrates, and that it is muted because it takes considerably longer to digest protein from meat, for instance, than does glucose from high glycemic index carbohydrates. Moreover, protein also stimulates secretion from the pancreas of a hormone called glucagon, which is not the case with carbohydrates. Glucagon works opposite insulin on the fat tissue itself and so would be expected to mute or counteract entirely any fat accumulation stimulated by the insulin.

Another factor to keep in mind is that the paper cited most often as evidence for the insulin secretion in response to meat and fish -- a 1997 paper in the American Journal of Clinical Nutrition titled "An insulin index of foods: the insulin demand generated by 1000-kJ portions of common foods" -- used extremely lean steaks and whitefish for the measurement. The fish was roughly 90 percent calories protein and 10 percent fat and the meat was 70-30. The more interesting question, and the one more relevant to the arguments in the book, is what happens when the meat and fish are more in the neighborhood of 70 percent or even 80 percent fat by calories. That hasn't been addressed. In short, the assumption that our insulin is primarily regulated by the carbohydrates in the diet is a reasonable one and will tell us most of what we need to know when it comes to fat accumulation and chronic disease."

Eades said he laid all this out in Protein Power in detail. I would like someone to expand on this if there is anything of significance. I don't own that book so I can't look it up.

---

**RE: Zero Carb / Meat and Water** - **poo123** - **07-14-2008 05:01 AM**

Well today I did 6 miles on the bike but not weights. I think I am going to stick with the bike for a while before I add some weights. I really enjoy riding much more than weights. Which is better on a zero carb should I do the weights instead? I will switch to whatever ever is better. Thanks for the input...

**RE: Zero Carb / Meat and Water** - **Dwayne** - **07-14-2008 05:21 AM**

No change in weight this morning which is good (326.6 so down almost 10 pounds.) I hate it when I seesaw upwards. This morning I had an egg and three sausage patties. For the last 3-4 days I have only eaten breakfast and dinner. I have been impressed with not needing the food.

Yesterday I cleaned the our two cars out. Had a nifty little spotbot we purchased to clean up pet messes. Turns out it is great to shampoo car floor mats and floors. It worked like a charm and she is very happy with her vehicle this morning. It was quite a workout since it was hot here yesterday.
Last night I check my keto level and it was as high as possible. I am glad about that since I have cut so much out of my diet to get there. I am going to continue eating the way I have been. I need to keep the losing up and adding things to see when it stops seems counter productive until I plateau for awhile. Then I will change it up so that I can reset myself and get past the plateau.

The last time I low carbed I plateaued every two weeks which became quite frustrating. The only bright part of that was after it broke I just woke up 3-5 pounds lighter and moved on. I really hope I can get to 20 pounds lost in the each of my first two months. That would put me close to where I was before my last major slip up period. Realistically I only lose 10 pounds a month max so I need to keep that in perspective.

Anyway, hope everyone is having a great day.

RE: Zero Carb / Meat and Water - LindaSue - 07-14-2008 07:04 AM

MAC, I have a copy of the original Protein Power book but I'm not sure what to look under to find the part that Dr. Mike is referring to. I found the page where he shows the relationship of various foods/types of diets on insulin and glucagon but it's a very short section. He shows a chart comparing varying ratios of protein, fat and carbs and how much insulin is produced compared to glucagon for each ratio. Under protein, the amount of insulin is the same as the amount of glucagon produced so they cancel each other out. Fat is completely neutral and has no affect on either. Carbs produce lots of insulin and no glucagon. Then he shows that high carb/low protein produces lots of insulin and a tiny bit of glucagon and high protein/low carb produces minimal insulin and slightly less glucagon than insulin but pretty close to equal amounts.

Carbs produce lots of insulin and no glucagon. Then he shows that high carb/low protein produces lots of insulin and a tiny bit of glucagon and high protein/low carb produces minimal insulin and slightly less glucagon than insulin but pretty close to equal amounts.

Thanks Linda. I will read it when I get my copy. I just ordered a used copy today off of Amazon.

RE: Zero Carb / Meat and Water - Charles - 07-14-2008 07:41 AM

MAC Wrote:
used extremely lean steaks and whitefish for the measurement. The fish was roughly 90 percent calories protein and 10 percent fat and the meat was 70-30. The more interesting question, and the one more relevant to the arguments in the book, is what happens when the meat and fish are more in the neighborhood of 70 percent or even 80 percent fat by calories. That hasn't been addressed. In short, the assumption that our insulin is primarily regulated by the carbohydrates in the diet is a reasonable one
and will tell us most of what we need to know when it comes to fat accumulation and chronic disease."

I'm with Gary Taubes here. The fact that these studies were performed with lean protein doesn't tell us what we're really trying to know. Even if lean protein does raise insulin levels to that degree, one could only consume such a diet for a few days before they would run into trouble so any fat accumulation number would only be speculative because we all know the effects of rabbit starvation.

Saying that consuming excess lean protein raises insulin enough to where it causes fat storage is the equivalent of arguing that a high protein/high fat diet leads to calcium loss and liver damage. The initial numbers are one thing but we know if someone continues on it the studies consistantly show that the adherents never show any such damage.

I think the same is true here. Someone may note some temporal reading but over the long term I don't think they would hold up. Everyone continues to cite this 150g glucose "need" for the brain. However, we know that if we get the carbohydrates low enough or eliminate them, we don't need even this much -- and of course after 7 days of fasting, we need none at all. There are too many variables and most of them are not static. This is a homeostatic system so we have to expect that any change will affect the entire organism and force a corresponding compensation.

We do know that Jimmy is not eating lean protein. He eats fatty protein and low-carb products and vegetables.

---

RE: Zero Carb / Meat and Water - zelia - 07-14-2008 07:56 AM

Charles,
The lean meat was 70/30. You recommend 73/27 ground beef as fatty meat, though it's leaner than 73/30. Please clarify.

---

RE: Zero Carb / Meat and Water - jeepifer - 07-14-2008 08:00 AM

My first thought was that eating lean protein without upping the fat is not a good thing. 😢

Day 6 here. Was having serious "munchie" cravings yesterday. I wanted french fries or potato chips in the worst way. For the salt, maybe?

I ended up with pork rinds and some sour cream. Satisfied the crunch craving, hopefully in the least damaging way possible. 😊

BTW, the scale is down to 208.8, my lowest weight in 3 years! That's over 7 lbs. since I started ZC the beginning of July. Not bad considering I ate some junk for a few days around the 4th and had to wrestle to get the cravings away again.

---

No in the case Taubes is citing, it is 70 % protein, 30 % fat. For the way we designate hamburger it should have been 30/70 in relation to 73/27.

RE: Zero Carb / Meat and Water - KimPossible - 07-14-2008 08:02 AM

I am going to have to go back and catch up (again 😊) but wanted to share that since attempting to do zero carb (not at "zero" but way lower than I've ever been--under 20 definitely and under 10 many days) I have lost 11 lbs (175 to 164). I know some of that is water...but not all of it. I am looking forward to continuing--it is an easy way to eat and most of my cravings have gone. 😊

Way to go Kim! See, all things are KimPossible!!!! 😊

RE: Zero Carb / Meat and Water - Charles - 07-14-2008 08:14 AM

Hmmm. I thought this over after I posted, and I was confused.

Taubes said 70% of calories from protein and 30% of calories from fat. The ground beef designation means 73% lean and 27% fat (243 cal/100g), which amounts to 61 cal/pro and 243 cal/fat or 20% cal from protein and 80% cal from fat.

70% of calories from protein and 30% from fat is extremely lean. The leanest ground beef in the USDA database is 95% lean/5% fat and it still has 34% of calories from fat.
As readers of this thread know, I'm not the greatest Dr. Eades fan but I never discount the entire person just because they have a view I don't agree with. Along those lines, he wrote a fantastic article today about anti-glycation effects and aging. The end of it was of great interest to those following the zero-carb path:

Dr. Eades Wrote:
Granted, this study was a rat study, and I’m not a big fan of extrapolating rat studies to human studies. But, rat mitochondria aren’t that different from ours so it’s a little easier to make the leap of faith. So, I would recommend for a long and healthy life that you ketonate (keep carbs severely restricted, even more than that which allows weight loss) as much as possible. Let those ketones do the job of blood sugar, keeping your blood sugar low. Lower sugar, lower AGEs, Lower AGEs, longer life
(Parens mine)

70% of calories from protein and 30% from fat is extremely lean. The leanest ground beef in the USDA database is 95% lean/5% fat and it still has 34% of calories from fat.

Now you have it. But the lean to fat ratio of 70/30 that Taubes was talking about was from lean meat not hamburger.

In the original study the beef was "Lean topside beef fillets bought in bulk from supermarket, trimmed and stored frozen."

RE: Zero Carb / Meat and Water - poo123 - 07-14-2008 09:05 AM

Charles, any suggestions for the exercise. Should I do cardio or should I do weight machine. And how much do you suggest/. thanks

RE: Zero Carb / Meat and Water - zelia - 07-14-2008 09:19 AM

Charles Wrote:
The ground beef we eat is 73 percent fat and 27 percent protein just like the beef spare ribs, the duck, etc. The ideal ratio is 3:1; that is, 3 parts fat, 1 part protein.

Nope, Charles, the ground beef label means 73% lean and 27% fat. The ratio of fat to lean is 1:2.7. The ratio of calories from fat to calories from protein is actually 4:1, a little more than fois gras, if you eat all the fat. If you leave the fat in the pan, you're getting 40% of calories from protein and 60% of calories from fat.

Okay. The point is, eat fatty protein and don't eat lean protein and all should be fine -- at least it is for me.

RE: Zero Carb / Meat and Water - Charles - 07-14-2008 09:31 AM

poo123 Wrote:
Charles, any suggestions for the exercise. Should I do cardio or should I do weight machine. And how much do you suggest/. thanks

The only exercise that is truly "beneficial" in my opinion is weights because you can actually get stronger and improve your ability to do everything else. Plus, you get the great body sculpting benefits which, admittedly, is partly why I do it! Free weights are the best, but machines are also just fine.

Do cardio only if you enjoy it.

For all of these things, it's important not to overdo them. Stop before you get too fatigued. At the end, you should be tired, but you should also feel like you could do another set or go another ten minutes or so if you needed to.

I lift weights on Monday and Thursday and I run Sunday and Wednesday. I find this is optimal for me and it provides plenty of rest days and doesn't become too tiresome. If you don't feel like working out, you should not. Nor should you work out if sick or injured. Rest must be scheduled just like workouts.

If you adhere to these guidelines, I think you'll enjoy exercise and you'll get maximum benefit and not get injured.

Hope this helps,

Charles

RE: Zero Carb / Meat and Water - jeepifer - 07-14-2008 09:52 AM

I'm tired just reading about working out. 😞
RE: Zero Carb / Meat and Water - Sambeziou - 07-14-2008 09:58 AM

ME too, Jeepifer! I'm gonna schedule today as a rest day! 😊

Sam

The famous quote along these lines is from Robert Hutchins who was president of the University of Chicago. He said that when he thinks about exercising he lays down until the feeling passes.

RE: Zero Carb / Meat and Water - zelia - 07-14-2008 10:38 AM

MAC Wrote:
Now you have it. But the lean to fat ratio of 70/30 that Taubes was talking about was from lean meat not hamburger.

You can get 95% lean/5% fat ground beef at supermarkets or have any cut ground to order.

MAC Wrote:
In the original study the beef was "Lean topside beef fillets bought in bulk from supermarket, trimmed and stored frozen."

The USDA database doesn't use this terminology. From googling, it seems that "topside beef fillet" is a UK and Australian usage. According to Food Standards Australia New Zealand: Online Version Beef, topside steak, raw, lean, 100g has 22.2g protein and 3.5g fat = 88.8 cal pro and 31.5 cal pro or 74% from pro and 26% from fat. But this is still too fat for the example. This is just about as lean as dressed beef can be. All meat has inseparable fat inside.

This is kind of off-topic, but I've been generally interested in this sort of question for several years. Meat was much fatter in this country when Dr. Atkins's diet was developed and his first book was published. I have an old USDA Home and Garden Bulletin, "Nutritive Value of Foods," from 1971, and the standard trim on meat at that time was 1/2" of fat. The few cuts of beef with 1/2" trim now listed in the USDA database are graded prime, which goes to restaurants, not to supermarkets. Anyhow, the diet Dr. Atkins originally published assumed much fattier meat than is now on the market.

RE: Zero Carb / Meat and Water - poo123 - 07-14-2008 11:13 AM

Thanks Charles,
I will start doing the weight machine (no gym membership but I do have a great home machine) and I will do full body every other day and if I feel like going for a bike ride I will. Diet + fitness = Alison's happy healthy life !!

I like Alison so much better than poo123! 😊 I would kind of recommend every third day for the full body, at least for the first month. It's easy to overdo it when you're just starting again with it.

Also, if you lift, take the heaviest weight you can lift about 7 times. Then go to the next exercise. Don't do three sets of 10 or whatever the conventional thing is. This will deplete your muscle glycogen unnecessarily which could cause cravings for sugar. You won't experience the muscle loss common on low-fat diets so therefore you don't have to exercise as often and you'll still get great results.

Trust me on this one.

Regards,

Charles

I agree that resistance exercise/weight lifting is the key. But I have to admit that after 10 months of
doing weights and LC, and only 6 weeks of HIIT and running, I have seen the best results ever in the cellulite on my legs in the last 6 weeks !!!

---

RE: Zero Carb / Meat and Water - **poo123** - 07-14-2008 11:59 AM

Poo123 ended up being a family nickname, but Alison is good too. Thanks for the info, I will follow it and hope to see good results, anything is better than where I am now !!!

Does that mean pictures are coming soon? 😊

You should have been doing squats (both Bulgarian split and regular), lunges, leg presses and calf raises. A good workout of these is equivalent to some serious running.

I haven't done these since high school track, but [plyometrics](http://example.com) are also an amazing workout without running. You step up and down on boxes, do leaps and bounds, and even jumping over hurdles with both feet. They used to wear me out but they were amazing. Some of the Olympic athletes swear by them.

---

RE: Zero Carb / Meat and Water - **jeepifer** - 07-14-2008 01:20 PM

I just got a couple of Callenetics DVDs. I've heard they're awesome for leaning and toning and lifting. I may take some before/after pix for my own observation, but don't plan on me sharing. 😊

Thanks for this. I'm starting back at the gym sometime this week after a few months off, and I have trouble getting out of the old 3 sets of 15, or whatever, mentality.

I'm sure you have a workout thread somewhere, and I'll hunt it down! I like doing compound moves (squats, deads etc) and I'm intrigued also by the results some are having with the Slow Burn technique - wondering about ppl's thoughts on that. I do not like to spend much time in the gym, though I enjoy lifting bc IMO, I lift smarter than many of the guys in there 😜

My goal - an unassisted pull-up. Anyway, this is about zero carb so I will find a workout thread!

Starting in earnest today with my <20. The play I directed is over now, and life once again slows to a nice, steady pace and I will no longer be tempted to grab a gluten-free slice when I'm racing around the city!! I've got 2lbs of water (carb) weight to shed, and the rest is excess body fat. Plus, I've got my complexion to clear up - it really goes to hell when I'm not eating right.

RE: Zero Carb / Meat and Water - Kristi31 - 07-14-2008 04:23 PM

This is day 7 (I think) of zero-carb. Nothing but raw fatty meats. I actually prefer raw to cooked, just got used to it, I guess. I mostly eat chuck and rib (beef).

I'm feeling pretty good, especially since lowering my estrogen dosage significantly, dropping progesterone and (very important!) giving up salt. The bloating is practically gone, my stomach is flatter and looking back, my weight increased after reintroducing salt into my diet so this could be key to getting back to a normal, more manageable weight. Pennington, in the 50's (I think) advised his patients to cut salt out of their diet as this could interfere with weight loss. He claimed, based on at least another study, that weight gain was not only due to water weight. I also think that some may be more vulnerable to salt, like women who have high estrogen levels due to dilated blood vessels, increased blood volume and water retention. I also recall reading about progesterone's tendency to relax muscles and increase blood volume so double whammy when both are high, like 1-2 weeks before our period or during pregnancy. Zero-carb (or low-carb) could also increase water retention (increase in vasopressin or anti-diuretic hormone) to offset the increased water excretion due to low insulin. Right? So imagine...

Right now, I'm feeling much better (not 100%) after my meals and had more energy today than usual so I did some weight lifting, to my suprise! I'm definently on the right track. But, I think I need to drop estrogen a little bit more to feel my best which leads to my question of the day!...

Could zero-carb have led to an increased production of sex hormones despite my ovaries being removed? Perhaps due to to less insulin, less sex-hormone binding globulin, increased fat, etc...?

If the answer is yes, then perhaps I only need a tiny amount of estrogen or even, none at all!

I'm cutting my dose in half and will now be taking 1.5mg estradiol sublingually daily. If that's still too much, then I'll go down to 1mg, then 0.5mg, then 0mg. My body is my guide. 😊

I tend to favor estrogen over progesterone for its fat burning properties (i.e. lipolysis), because I remember feeling (and looking) my best 1-2 weeks after my period when estrogen levels were moderately high to high (ovulation) and when progesterone levels were very low and because progesterone makes me sleepy. I realize progesterone and estrogen balance each other out but I'd rather go with my own experience. Maybe some testosterone in the near future but I already feel my libido going up and an increase in energy so maybe not...time will tell.

Woow--this is good to know, Charles. When I did work out, I DID three sets (12, 10, 8), gradually using heavier weights up to the third set. Going directly for the heaviest weight, and a limited number, means a shorter time in/out of the gym I just joined and still seeing great results. I've only just started getting back in to working out consistently.

The info on muscle glycogen depletion causing me sugar cravings would've driven me crazy. I'd never have thought it was because I was working out incorrectly! Awesome info to know, Charles.

**RE: Zero Carb / Meat and Water** - **Dwayne** - 07-15-2008 06:16 AM

Argh up a pound! Normal fluctuations are still frustratingly common. I still feel like I should be in a low carb free fall. =) Hopefully down 3 tomorrow. I plan on going back to the gym as well. I love working out with free weights and a few machines. The last time I lost weight I was in the gym 4 days a week doing only weight training. I think it is the best way to continue weightloss since the lean muscle helps get rid of those excess calories even when you aren't working out. Gaining lean mess for fat mass is always a good deal. Just remember when you start your weightloss will turn into inches lost for awhile sometimes which is actually better. Just a warning if you see the scale stall you are still losing fat, but gaining muscle. If you have never really done resistance training you will gain muscle quickly. It feel great (to me) and I can't wait to do it again.

Anyway, my .02 for the day, hope things are going well for you all.

---

**RE: Zero Carb / Meat and Water** - **jeepifer** - 07-15-2008 07:06 AM

I've made it a week. Whoohoo! Weight at 208 this morning, down 7 lbs. since July 1, even with my carb-fest over the holiday weekend.

I was up late last night, and early this morning. The tired feeling is going away and I feel like my energy is picking up a bit.

I need to be better prepared in my food choices, though. I ran out the door with pork rinds, a cheese spread, and some pork back ribs. It will do, but I need to emphasize the time in the morning to cook myself a few burgers or steak strips.

---

This is what people say but it hasn't been proven. We're not trying to burn "excess calories" we're trying to shrink fat tissue. Thinking this way will make you want to work hard and eat less and this will be counterproductive to your weight loss efforts. If you're not eating enough (meaning, not eating to appetite) then your body will go the starvation route and store more fat to guard against your efforts. When I see your menus, that will tell it all.

Dwayne Wrote:

This is true, but just because you gain muscle, that does not mean you should gain weight. You should still be able to lift weights and lose if your diet is correct. If it is not, then you will gain weight and your appetite will increase.

Let's see what you're eating and see if we can get the weight loss into "freefall" as you said.

Regards,
Charles

Anyhow, the diet Dr. Atkins originally published assumed much fattier meat than is now on the market.

I like to collect old cookbooks. In the photos, you can see a huge difference in the fattiness of the meat. Starting around the early 1980s, the meat starts getting leaner. Before that, it's rich and luxurious-looking. I just can't find anything in the butcher case that looks like those old photos. So sad.

I have been on vacation for the last week and a half from work and also from zero carb. I ate a lot of carb stuff over my time off, but I don't seem any worse for wear. I weighed myself last night and it was about the same as before the vacation (169). Started back with just coffee and ground beef with butter yesterday at work. I am going to see where this all leads me. I always felt my best when I was in the low 150's so maybe I will shoot for that.

travis t

That's true but you have to stay out of your body's way. Please provide some more detail on what you're eating. I know you're not quite at zero-carb yet, but there may be some things in your diet that are affecting you.

Breakfast-
Starbucks w/ Heavy Cream!
3 sausage patties
1 egg
Lunch (yes I ate a lunch)
3 Double Cheeseburgers (sans bun)
LC Ketchup

Dinner-
Crackerbarrel Chicken Tenders (grilled 6)
Side Salad with Blue Cheese
Green beans

I snuck in a diet coke yesterday and I ate 2 pieces of sugar free candy. After doing some reading I found that the Malitol syrup used in them can actually cause spikes in Insulin so they are going bye bye.

Charles Wrote:
This is what people say but it hasn't been proven. We're not trying to burn "excess calories" we're trying to shrink fat tissue. Thinking this way will make you want to work hard and eat less and this will be counterproductive to your weight loss efforts. If you're not eating enough (meaning, not eating to appetite) then your body will go the starvation route and store more fat to guard against your efforts. When I see your menus, that will tell it all.

I was just speaking about how it takes more energy for your body to "maintain" lean muscle than it does to maintain one pound of fat. I am all aboard with feeding your body what it needs. I am not a fan of calorie restriction. I have been that route before and I know that way leads you to end up skinny fat.

Charles Wrote:
This is true, but just because you gain muscle, that does not mean you should gain weight. You should still be able to lift weights and lose if your diet is correct. If it is not, then you will gain weight and your appetite will increase.

I totally agree, but I just wanted to warn people if they slow down a little as they gain muscle. I noticed that after I gained a bit of muscle mass and the gains slowed my weight loss accelerated. I just thought of it as a weight exchange of fat to muscle. Once that was over I went down quickly again in spurts. I never really "gained" fat while working out. I think the ZC/LC way is the best way to feed yourself for both maintaining and growing your lean mass while getting rid of fat. That is why I really want to get back in the gym. I miss it. =)

travis t Wrote:
I have been on vacation for the last week and a half from work and also from zero carb. I ate a lot of carb stuff over my time off, but i don't seem any worse for wear. I weighed myself last night and it was about the same as before the vacation (169). Started back with just coffee and ground beef with butter yesterday at work. I am going to see where this all leads me. I always felt my best when i was in the low 150's so maybe i will shoot for that.

travis t

Congrats on maintaining. That itself is a victory. I know I am an "all or nothing" kinda person, so if I
stuff myself with carbs, well, I *stuff* myself. Nothing like gaining 25 pounds in a month to send you screaming from the room! 🙄

Ground beef with butter. Yum! Meat. It's what's for dinner!

---

To be fair Charles, many people have dropped off of ZC either because they couldn't take it or because they didn't lose weight and sometimes even gained weight. I think this has happened with enough people that you shouldn't dismiss it.

You haven't been reading my posts lately. I have written at least three times last week that the "urge for the sweet" is an addiction. Like any addiction it takes a great deal of time and motivation to beat it. I expect people to fall off the wagon and to even give up. Why would this be any different?

I think Lauren is suggesting that there must be other factors besides addiction and the "urge for the sweet."

Why would either addiction or a sweet urge cause someone to gain weight? To not lose weight?

In my own case, when I was physically suffering (weak, lethargic, brain fog) during my meat + butter + water experiment in June, I wasn't experiencing an urge for sweets. After I added cream cheese, mayo, eggs and sour cream, I instantly felt normal instead of horrible, and these are not sweets. Also, as I posted earlier, my total fat intake didn't change when I added those items.

I felt even better after adding salad foods like lettuce, sprouts and tomatoes (I'm talking enough to dress a burger; not giant bowlfuls), and these are not sweets.

Whatever was driving my experience, it wasn't sugar addiction, sweet cravings, or rabbit starvation.

We just have to break open the box and investigate more possibilities.

Vesna Wrote:
zelia Wrote:
This is kind of off-topic, but I've been generally interested in this sort of question for several years. Meat was much fatter in this country when Dr. Atkins's diet was developed and his first book was published. I
have an old USDA Home and Garden Bulletin, "Nutritive Value of Foods," from 1971, and the standard trim on meat at that time was 1/2" of fat. The few cuts of beef with 1/2" trim now listed in the USDA database are graded prime, which goes to restaurants, not to supermarkets. Anyhow, the diet Dr. Atkins originally published assumed much fattier meat than is now on the market.

I like to collect old cookbooks. In the photos, you can see a huge difference in the fattiness of the meat. Starting around the early 1980s, the meat starts getting leaner. Before that, it's rich and luxurious-looking. I just can't find anything in the butcher case that looks like those old photos. So sad.

You reminded to look at my Betty Crocker cookbook, from 1969 (the year I was married), and the meat in there looks wonderful.

Just recently TCM showed "The Harvey Girls," Judy Garland in 1946. I hadn't seen this film for many years. There's a brief scene of a waitress serving a steak in a restaurant, and that steak was huge and looked like it was more than 50% fat.

hmmm... maybe hot sauce is what I need to get me through the ground beef. Sounds good.

---

I *love* a good, fatty steak. I wonder if I go to the local butcher shop if they'll give me a fatty trim? Hmm.

Tabasco & butter, kind of a buffalo hamburger. Dayum, that sounds great!

Yes, I agree with Vesna. I spent two weeks doing <5 carbs/day and then two weeks without cheese or eggs. I stopped drinking diet pop during this time, which made no difference one way or the other, except that I drink less overall now. I missed scrambled eggs with bacon and cream cheese. The way I make this dish, 87% of calories come from fat. I like this a couple of times a week. FYI it has .7g carb to 28.2g fat. It hasn't affected my weight loss which is nil this way and nil on zero carb. I don't eat sweets. I don't want sweets.

The only thing I see for me to do is cut back on protein, as Dr. Bernstein recommends, and I've never wanted to do.

penny
tabasco is good on anything.....except in my coffee..well my maybe...
travis t

Come on, Dwayne. You're a 335 pound man and you're telling me that you're eating to appetite on this much food? Are you serious? I'm 158 pounds today and I can eat way much more than you.

For breakfast, you ate 3 sausage patties, 1 egg and some ketchup. Today, I ate a half-pound of ground beef.

For lunch, you ate three double cheeseburgers. That's not bad, but the double-cheeseburger isn't that big.

I ate an entire rack of Carolina Style Pork Ribs. Yes, an entire rack. I ate them at a great place called, The Pit, here in Raleigh. If any of you are ever here, you must go there!!!!!!

For dinner, you ate 6 grilled chicken tenders, which are very lean breast meat with little fat. Oh, and a salad.

Last night, I ate a rack of ribs after I came from the gym.
Again, I am half your size and I ate way more food than you did. You're not going to lose that weight
eating like a tiny person. You say you're against calorie-restriction but you don't eat like it.

Don't buy into the "gain muscle lose fat because muscle weighs more" stuff. If you're gaining weight,
there is something wrong with your diet, plain and simple. I am smaller yet I can lift more weight than
when I was larger. People who get all puffy lifting weights are either muching too many carbohydrates
or steroids.

To lift weight you're going to have to eat more food, not less. If you don't want to eat more, then by all
means, don't lift weights because you'll get seriously depleted after a while. All animals in the kingdom
have this in common. When you increase activity, you have to increase energy intake. When you restrict
intake, you will eventually slow down your metabolism. It's the law of the jungle.

This way of eating does not work on decreased calories. It works on correcting the metabolic defect that
lead to the symptom. Your cells are starving on the inside because they are unable to get to the fatty
acids stored in your 335 pounds. You have to feed them and they want fat and protein. Your body has
decided that it takes this much constriction in your garden hose (fat tissue) to get the nutrients at the rate
it is getting them. If you want your body to release this constriction, you have to up the pressure. You do
that by providing more fatty protein.

Now, come on Dwayne, you've got to eat. Try to phase out the LC ketchup, the diet cokes and definitely
the malitol. If you want to get to "free-falling" you've got to eat more and cut out the cheats. Actually, if
you ate more you might find that you could handle the occasional cheat but you don't leave yourself
much room for error by eating such lean protein and low calories.

Regards,

Charles

---

I guess my problem with eating is I am so used to eating all the time (which is how I got back up) that I
am trying to only eat when I am hungry, and I am hungry so much less than I used to be eating this way.
I really didn't think I was undereating. The diet cokes and malitol are gone. I can tell I am going to be
hungry hungry tonight though. Going to go buy some beef and use my new hamburger patty press I
bought. I will throw some butter in there. =) I will work on the LC Ketchup. I may try going to vinegar
hot sauces. Have you ever been to a Remington Grill in Raleigh? I lived there for about 2 years and I
LOVED that place.

We have some friend in Chapel Hill we visted a couple of months ago. I imagine we will be back
through there in the next couple of years and I will take a look at it. What kind of barbeque sauces can
we eat? =) I know Carolina BBQ is REAL vinegary. The brown sugar and what not being in them is
what I am sooo used to.

---

**RE: Zero Carb / Meat and Water - jeepifer - 07-15-2008 12:56 PM**

You have a hamburger press? I'm jealous! I use a cookie cutter if I want them all neat, or my hands for
the sloppy ones. 😊
Vesna Wrote:
Why would either addiction or a sweet urge cause someone to gain weight? To not lose weight?

Your body does not know the difference between a banana and a snickers bar. They both have 26 grams of sugar. High insulin is the result of an addiction, period. It's not that the food is made of sugar or a confection, it's just what it is when it's broken down in your body. Don't get caught up in my use of the word "sugar." Any word ending in "ose" such as glucose, is a sugar, plain and simple. That's the point. Sure, salad has less glucose than a donut, but if your insulin is out of control, it might as well be the same thing for you, plain and simple.

Vesna Wrote:

Also, as I posted earlier, my total fat intake didn't change when I added those items.

What do these dairy products have in them that made you feel better? Was it not glucose? If you were eating more fat when you added these things then that may mean that your meat was too lean which is entirely possible as well. Everyone feels horrible for a few days when they go zero-carb. Some can stick this out until it passes, like Jeepifer did, and some give up in frustration. These symptoms are similar to what one experiences when they come off an addiction.

Vesna Wrote:
I felt even better after adding salad foods like lettuce, sprouts and tomatoes (I'm talking enough to dress a burger; not giant bowlfuls), and these are not sweets.

Yes, they are. Your body craved glucose and you provided it. Sure, you provided low-glycemic carbohydrates, but they were carbohydrates nonetheless. Don't fool yourself. When they are broken down, they are glucose. You can't get around this. What are they composed of if not glucose? What is their glycemic index number? The fact that they are on the list should prove to you that they have some glucose.

Vesna Wrote:
Whatever was driving my experience, it wasn't sugar addiction, sweet cravings, or rabbit starvation.

That's your opinion and you're entitled to it.

Vesna Wrote:
We just have to break open the box and investigate more possibilities.

Vesna, whenever something doesn't happen the way you expected it to, there must be something more to it than the obvious truth, right? As I've said to you before, if zero-carb doesn't help you, fine. Go and find something that does. It's okay, really!

Regards,

Charles
jeepifer Wrote:

Okay, see that's the issue right there. First, there is NOTHING wrong with eating all the time. I know that sounds strange but there really isn't. You didn't gain weight because you ate too much. You got fat because you ate the wrong things. Hunger is not the enemy or something you want to avoid. You want to satisfy it because that your cells telling you they need energy.

Second, the problem comes with WHAT you're eating, not how often. If you're eating carbohydrates, they will cause you to want to eat them all day long and you'll gain weight. If you're eating fatty protein, it will limit you because you'll get full. That's the only reason you should stop eating, because you're full. Once you eat this way, you should be able to go 5 or 6 hours before you're hungry again. This is very important. If you feel the need to snack during this time, that's proof that you didn't eat enough at the meal.

Dwayne Wrote:

Yes, the vineary ones are best. Stay away from the sugar-filled sweet ones. I actually prefer the spice rub than any sauce, but I don't find I have too much trouble when I eat the Carolina-style since they're not sweet.

RE: Zero Carb / Meat and Water - Kristi31 - 07-15-2008 04:03 PM

So today I'm feeling truly wonderful. I realized earlier this morning that even a low dose of estrogen (0.5mg) bothers me and I do best without. No need for hormones, at least for the present moment. My
body appears to be producing just enough.

Raw meat and water suit me just perfectly. No extra anything needed!

I am much less hungry too. Ate about 1 lb of meat today whereas I usually eat twice that amount in a day. The day isn't over but I just ate 30 mins ago.

In a nutshell, my problem was edema. Now that I have that figured out, I can hopefully go back to living normally and enjoying life AND spreading the word, like Charles, so that the rest of the world can live a healthy life. Amen! 😊

Kristi31 Wrote:
I'm feeling pretty good, especially since lowering my estrogen dosage significantly, dropping progesterone and (very important!) giving up salt. The bloating is practically gone, my stomach is flatter and looking back, my weight increased after reintroducing salt into my diet so this could be key to getting back to a normal, more manageable weight.

Hey Kristelle! Glad you're feeling good. I know you've gone through so much experimenting (from ANC and MB), and I hope this works out for you. We're all little science experiments eh?

So it feels good to be back on the wagon, so to speak. Can't wait for the slooshy bloaty feeling to go away, and for my skin to clear. I'm hungrier than usual, and I know it's from eating carby. I could eat again now, but I don't want any protein - I want some pure fat. Actually, come to think of it - I think I'm craving dairy, as opposed to fat. I could really down a ton of heavy cream right now 😊Not gonna do it! But I've been thinking about it on and off all day, and all yesterday too. Guess it's time to admit it...I really do need to stay away from dairy products, cow ones anyway. I never crave goat or sheep cheese and it can sit in my fridge for weeks. A sharp, old cheddar? Fugghetaboutit. The block is gone in a matter of days.

Anyone know any fat snacks that don't involve meat or dairy???? I downed two raw egg yolks, not helping. Too much coconut oil makes me nauseated, at least right now. I have that feeling I get when I need more fat...but this could actually be my dairy craving, since when I get this I usually go have tea with heavy cream, or cheese, or something. Argh.
Hi Everyone,

Kristelle - I hope the positive changes you are seeing are going to stick.

I am still flopping around trying to find what will work for me. Eating zero carb has caused me to gain weight and now I am stalled at a higher weight than when I started. I am not obsessing over weight loss anymore but my goal is to maintain for awhile and then start working on losing down the line somewhere. I plan to keep my carbs under ten for the next bit. I am putting ZC on hold for awhile.

Val

Hi Val,

Here is a post of mine from another thread. I too had your experience of gaining weight on ZC and you and I are not the only ones. I think that if you don't have much weight to lose, you can gain on ZC.

from the "How can women lose that last 10-15 pounds?" thread:
I am trying to eat enough protein to meet my needs (but not too much), less than 20 carbs per day (Atkins induction type salads), and enough fat to keep me satisfied, sleeping well, etc. I do try to eat light but not starve thinking that this will give my hyperinsulinimia a chance to get under control without gaining additional weight. I tried eating fatty meat to appetite and I gained weight. Perhaps this would have eventually stopped but I didn't want to gain even more weight waiting to find out. I think what I am doing now is a reasonable option. I also don't plan on eating only meat and water so I want to be able to stabilize my weight eating the way I would like to eat for life. I'm trying to be patient and consistent with this. When I go back to work in the fall, I'm going to add weights to the equation.

I'm having the weirdest of experiences in this low/low near zero carbing.

When I get hungry I get HUUUUNNNNGGREEEEE!!! I mean, my stomach hurts like a mommamia and I'm almost nauseaus needing to eat if I wait too long...

Does ANYONE else experience this weirdness? I mean the hunger when it comes on, shows no mercy!
Even when I wasn't low carbing, hunger didn't hit me like this. And usually this only happens when I've not planned (like this morning) and brought enough to eat for breakfast.

I overslept this morning and practically ran after my express bus for work. 😞...not to mention I'm really tired.

That's funny, I'm having sort of the opposite experience. I was eating breakfast this morning (I actually made *time* to do it!!!) and got 3/4 of the way thru my beef short rib w/ buffalo-mayo, and all of a sudden I felt like if I ate another bite I'd be sick. Oooop!

RE: Zero Carb / Meat and Water - Dwayne - 07-16-2008 07:46 AM

I know it when I am hungry (at least I think I do) my stomach lets me know in a big way. I am up another pound today and am very frustrated. I am going to do what I have been advised to, but it is hard to believe that a diet coke and a few sugar free candies can knock me down so hard. I guess it could just be water weight since I am so big, but it is still fairly depressing. I am not going to weigh again till Friday.

RE: Zero Carb / Meat and Water - pennypritty1 - 07-16-2008 07:49 AM

Dwayne Wrote:

Do you weigh yourself every day, Dwayne?

That would drive me crazy!!! lol

Checking my weight even once a week annoys me. It fluctuates so much for me. But where the scale
tells me one thing, my clothes are telling me another... and it's telling me NICELY that I am losing where sometimes the scale tells me I'm wasting my time.

RE: Zero Carb / Meat and Water - Kristi31 - 07-16-2008 08:23 AM

I'm hungry when I start salivating. I get this strange feeling in my mouth too which tells me "it's time to eat!".

RE: Zero Carb / Meat and Water - Sambezious - 07-16-2008 08:36 AM

Hey Dewayne!

Hang in there buddy, I know it's tough.

I don't know how everyone else feels about 'em, but I try really hard to avoid the LC carb candies. When I tried the low carb diet once before, I was not able to lose weight until I kicked the candies to the curb. I couldn't even drink the Atkin's shakes... they would stall me as well. If you have a chocolate craving, I like the Almond Bark recipe from George Stella over at stellastyle.com. The Chocoperfection bars (I like Jimmy's Raspberry bar & the Milk Chocolate) are really good and never caused me to stall. Also, I still continued to lose weight when I was having a piece of Rachel's Cheesecake (Stella, again) or Jimmy's Keylime pie. I would treat myself to one piece a day with a good size helping of whipped cream (sweetened with Liquid Splenda - zero carbs!). During the time I was eating this stuff, I still maintained only eating 20 carbs (or less) per day.

Keep an eye out for hidden carbs in everything you eat. Read the labels! Check the ingredients, even if the item shows ZERO carbs! Sometimes you'll find stuff like dextrose & corn syrup listed. A good example.... Nature's Seasoning! I love that stuff and had been using it on just about everything I cooked. Yesterday, I happen to read the label and it contains SUGAR!!! It shows ZERO carbs, but the ingredients lists sugar! What the heck! Anyway.... always read the ingredients on the label! Always!

Again, hang in there! You should be starting to lose cravings for sweets and other carby foods pretty soon. Hold your head up high and be proud of yourself for working to make yourself a healthier person. I'm on this journey right along with ya!

Sam

RE: Zero Carb / Meat and Water - LindaSue - 07-16-2008 08:37 AM

I had a very pleasant experience yesterday and I wish that every day could be like that. Around 7:00am, I had a half pound cheeseburger and I wasn't hungry again until 2:00 in the afternoon! As many of you know, that's VERY unusual for me and it was great not having to eat every couple hours. Even at 2:00 I wasn't THAT hungry but I grilled some pork steaks and decided to eat one while they were hot off the grill. I got a super deal on the steaks. They were marked down to .99 pound because they were due to expire. So, I got four big, but thin, fatty steaks for only $2.50! I'd never bought pork steaks before and I highly recommend them. These did have a big bone in them, but I've heard that the bones give meat more flavor when you cook it.
Hi Penny!

You have such a great attitude! I have no doubt that you will achieve all your weight loss goals! You go GIRL! :-) 

Sam

Yep, this happened to me about 5 days after starting strict zero-carb. I would wake up in the morning nauseous and stomach-achy and eating would alleviate it. I just figured I was still oversecreting insulin and my pancreas hadn't adjusted to my new way of eating.

Now I'm 13 days eating ZC and the stomach aches are completly gone and I go 5-6 hours between meals, no problem. In fact, yesterday I stopped eating at 3 pm because I wasn't hungry! However, I had the worst insomnia of my life (while not actually having a panic attack). I had a weird kind of fasting euphoria that lasted until 4 am. No anxiety, just very awake!

Deanna

pennypritty1 Wrote:

Hi Penny!

Sam

Hi, Sam!!!

Thanks! You too, very encouraging yourself.
And thanks for the info on those treats. I am (STILL) a chocolate lover and have been very diligent, and successful, in staying away from them. But my search is ON for those treats you mentioned. I remember the Almond Bark when I watched George Stella's shows (sigh--I miss those shows, he was so good). I'll have to google for that recipe to try it. Wait--I think its in his cookbook and I have those... I'm checking that soon as I get home from work. woohoo!

I'd been curious about Jimmy's bars but was afraid they'd taunt me back to choco-world. lol

And for me, choco-world is the world of *choc-overdose*!

😊

Deanna

woow--thanks, Deanna.

Maybe that's it... I've been getting really good with eating closer and closer to zero carbs as I can lately. I was so unprepared for that feeling this morning, I ate 3 boiled eggs (I know--not zero carb'able) but I just needed something to quell the feeling. And I ate a spoonful of cream cheese and that helped. My job has free bagels for the employees every Wednesday... I'm not even tempted anymore. I just spooned up some cream cheese and made my way out of the room.

Right now I'm ready for lunch; a plateful of fatty meats. mmm... I'm getting really hungry again. lol

**RE: Zero Carb / Meat and Water - Charles - 07-16-2008 09:16 AM**

Gary Taubes, via e-mail, advised me to look at Dr. Robert Kemp's studies between 1963 and 1973. He was a physician at Walton Hospital in Liverpool and he published three articles reporting his clinical experience with a low-carbohydrate, unrestricted-calorie diet. Kemp reported that his obese patients craved carbohydrates and they were invariably puzzled by two aspects of their condition:

First, that other people can eat just the same diet and remain thin; and, second, that they themselves were thin on the same amount and type of food which caused them to become fat.

These observations led Kemp to formulate a "working hypothesis that the degree of tolerance for carbohydrate varies from patient to patient and indeed in the same patient at different periods of life." He then translated this hypothesis into a carbohydrate-restricted, calorie unrestricted plan. This diet was the
first in his experience to produce "worthwhile results in obesity treatment."

In 1956, Kemp prescribed this diet to 1,450 overweight and obese patients. More than seven hundred (%49) lost 60% percent of their excess weight. They **averaged** 25 pounds of weight loss after a year on the diet.

Another 550 patients (38%) defaulted, which means they stopped appearing at Kemp's monthly counselling sessions.

Nearly two hundred patients (13%) failed to lose significant weight while apparently following through with the treatment. This failure suggested to Kemp that the diet may not work on everyone despite some claims by popular diet books that it could.

In all cases that have tested carb-restricted diets versus low-fat diets, the carb-restricted diets were two to three times more effective than the low-fat diets.

I put this out here today to just reinforce the notion that everyone is not going to lose weight on carb-restricted diets. The majority will. If you are doing zero-carb and you can not lose, you will probably not lose on Atkins or any other plan, although there is nothing to stop you from trying. Zero-carb is very difficult to do and Stefansson and the Bear seem to agree that it takes a good six months to lose that urge for carbohydrates of any kind. If one can make it that long, they will probably stay that way. If not, they will return to some low-carbohydrate level.

I do, however believe that these diets do much more than promote weight loss. The research shows that they also protect against the diseases of civilization; however, it's hard to tell what can happen when someone applies this late in life. As Gary Taubes explained to me via e-mail, on many cases where one has been obese for most of their life, they may lose some weight but they may not approach lean due to the hypersensitive nature of their fat tissue to insulin.

The question is, what should people do when faced with this prospect? Since these plans all promote health, I believe the best solution is to find a plan that you are comfortable with and stick to it the rest of your life. This is the best thing you can do from a dietary perspective. From there, I would get many medical tests to possibly identify any hormonal problem. If there is any other ailment that one has, they should get that corrected first as any ailment can and will affect various hormones which would impact their ability to mobilize fatty acids. The same is true for various medicines that people are taking. These can certainly affect your hormones in such a way that they can not mobilize fat as they normally would.

However, as we've discussed many times, insulin can trump any hormone and promote fat storage when other hormones want to mobilize. Moreover, because obesity is merely a symptom of the metabolic disorder, **weight loss should not be the governing factor.** Health should always be the prime factor. One should eat according to the plan that provides the greatest health advantage.

Regards,

Charles

**RE: Zero Carb / Meat and Water** - Sambeziou - 07-16-2008 09:23 AM

HI Penny!

I was a chocoholic too! I think this Chocolate Bark from George is a new recipe that may be in his new,
up and coming recipe book! Here's a link for ya!

Some folks have added unsweetened coconut and pecans to the recipe. I like it plain... without the nuts!

I, too, miss George on TV. His shows were great. BUT, at least we can see Jimmy and Christine on YouTube. :-)

Have great day!

Sam

RE: Zero Carb / Meat and Water - LindaSue - 07-16-2008 09:31 AM

I thought I'd post a photo of a pork steak that looks very much like the ones that I grilled yesterday. I found out on Wikipedia that pork steaks are cut from the shoulder (Boston butt), which explains all the nice fat in them.

RE: Zero Carb / Meat and Water - travis t - 07-16-2008 10:08 AM

To me the biggest proof that zero carbs is the best is my brain and it's cravings for sweets. Last week while on vacation I allowed carbs back in to my diet, oatmeal and eggos, potato, onions and a treat on July 4th (dairy queen malt). My brain was always thinking about where it would get more. It was subtle, but it was there. This week I'm back on track and now three days in I am not concerned at all about wanting carbs. Carbs are a slippery slope.

Thanks, Sam... AND for GS's website. I've not even been on his website since his show. Totally forgot
about it (a lot of things when I first left lowcarbing--or as I call it the "dark days")

Hmmmm... A stock pot??? I'll have to look for something like that at cooking.com. I know this is a recipe
I'll get used to very soon. 😊

RE: Zero Carb / Meat and Water - poo123 - 07-16-2008 05:25 PM

Things are going well. Not losing weight but still only eating 2 times a day. Full of energy and happy.
So all is good on zero carb

zelia Wrote:
I missed scrambled eggs with bacon and cream cheese. The way I make this dish, 87% of calories come
from fat. I like this a couple of times a week. FYI it has .7g carb to 28.2g fat.

Zelia, how do you make it? I like scrambled eggs with bacon, and also sometimes I have bacon and
cream cheese for a quick breakfast. All three together sounds awfully good, and fits in with the
guidelines of this thread as put forth in the OP and the ZC "Important Post."

Here's how I have bacon and cream cheese when I'm strapped for time.

I lay out bacon rashers (that's how they call strips in England and I just think it sounds cool!) in a
roasting pan, set the oven to 350F, and set the timer for 20 minutes. Then run around doing whatever
needs doing. Then take out bacon, drain briefly, wrap four strips (or so) loosely in a cloth napkin and
place right in my handbag. I measure out 1 to 2 ounces of cream cheese, wrap in foil or something, and
put in the handbag.

Then I drive to work.

At work, where I'm often the first one in, I break off pieces of bacon, cut off pieces of cream cheese, and
make individual bacon-cream-cheese rolls. Delicious! Fun!

Then coworkers come in and say, "Gee, what smells like bacon?" and I say, "Bacon."

Then they share their doughnuts or bagels or muffins or whatever nasty carb bombs they've brought to
help each other start the day with. And sometimes offer some to me, just to be polite, and when I say,
"No, but thank you for asking," they say, "I didn't think so!"

And that's my story. 😊

RE: Zero Carb / Meat and Water - waywardsister - 07-17-2008 05:24 AM

Vesna, I love that you carry bacon around in your purse. I don't know if you're single, but that sounds
like a great way to attract men 😊There was a TV ad here not long ago for some fast food chain - 2 gals
at a nightclub, and one of them had a bacon-double cheeseburger in her purse. She ended up surrounded
by doting men, all telling her how wonderful she smelled.

I'm still feeling the effects of my carbage - still boated and up weight, even more so due to pre-TOM,
and my body seems to be, ummm, flushing itself out. Very little appetite, food not appealing, so I'm not eating as much as I'd like to be but I know this is temporary. Drinking lots of tea with coconut milk in the meantime. I really, really want to drink more than eat at this point so I'm going with it.

I've noticed over and over that some women have trouble with zero carb. Any men ever experience the same thing, weight gain or no weight loss? Charles, don't you wish we could raise a bunch of money and do a real study on this? Personally, I'd love to do a documentary and explore this issue in real depth. Is it hormones, is it metabolic changes brought on by however many years of a SAD, or other not-ideal-for-you diet...or from previous dieting experiences (low fat, caloric restriction, cabbage soup etc)

Reading Weston Price, you see that populations were thriving on all sorts of diets (would they have been even healthier on zero carb? Who knows). It made me wonder if part of the reason ppl struggle even with low carbing is that we've been eating against our physiology since childhood, not just carby foods but industrialized foods - commodity foods, food 'products', artificial this and that, etc. I'm sure a lot of ppl would agree, esp in this thread, that a double-whammy like that has set us up for some pretty nasty physiological situations. So...could it be that weight gain, etc on zero carb is a sort of Herxheimer (sp) reaction, a 'getting worse before it gets better' kind of thing? Could it literally take years for some of us to find our way back to 'normal'?

PS: oh, that pork steak looks goooooooodd. And yes, meat is better with bone, more flavour. There's a great cookbook called "Bones" that has amazing meat recipes, even a good marrow one (Kristelle!) by a Canadian woman named Jennifer MacLagan - apparently we go to the same butcher, so I am hoping to run into her there one day 😃

RE: Zero Carb / Meat and Water - jeepifer - 07-17-2008 07:47 AM

Mmm. Bacon.

I ended up with hamburgers all day yesterday. Two patties at the ballpark (my group at work had a day out at the local minor-league baseball stadium). Gross! But covered them in mustard, so ate them and had a diet coke and water.

Dinner was with the kids at local burger chain (Culvers) with double patties, cheese, and mayo. Not bad. Filled me up.

We're going on a trip tomorrow and Saturday, so I'm planning on getting steaks this afternoon, and cooking them up to bring with (in a cooler till we get to the hotel). So at least I have backup in case where we eat out looks "iffy" -- KWIM?

RE: Zero Carb / Meat and Water - travis t - 07-17-2008 07:59 AM

I have been getting my hamburger at walmart. The 80/20 seems to be just right for the gas grill. The 73/27 catches fire to easily because there is so much drip off. Top off with salt, butter, and tabasco....yummy!

Well, there is a guy in my office who does indeed have trouble losing weight. He started at 305 and lost 60 pounds, but he can't seem to get much past his 245. It shouldn't surprise us that there are going to be some who struggle with this because in every study we've looked at, even in GCBC, it wasn't like 100% lost weight.

However, it was usually in the 65-75% range and that is so much better than the "eat less, move more" crowd. On this board, it's obviously going to seem like a higher percentage because obviously these are people who care and they've usually come here because they had trouble. The seven or eight people in my office who I help personally have no interest in participating in an online forum, partly because they are just successful.

I apologize for the length, but I'll share with you one of the attorneys who took my three-week challenge at work. This lady was slim anyway but she wanted to beat her addiction to sugar because she knew it was bad and she has extensive history of diabetes in her family.

This is the third week and she is actually slimmer (an older lady, by the way) and feeling great. She says she has completely lost her cravings and she walks by the myriad deserts in our office with ease. She basically does a little less than Atkins' induction and she's content with it.

Unknown to me until yesterday, was that she suffered from GERD, the acid reflux thing. Hers was so bad that she had to sleep only on her side with her head propped up and she couldn't eat too many things without getting sick. This "sleeping on her side" thing went on for so long and caused her such trouble that she went to a therapist for pain in her side and no one could figure out why she was having such trouble.

They did all sorts of stretches and gave her medication. One day, she found a good therapist who realized that the pain actually originated in her back, not her side. This was caused by her sleep pattern in response to the GERD. Basically, on the side on which she laid, her knee and ankle also gave her trouble and her leg grew to be shorter than the other because the muscles atrophied because of how she was forced to sleep.

Well, in the last three weeks, she has experienced a total reversal of these symptoms. She can now eat to appetite and she can sleep on her back or any position that she wants just from changing her diet. As I said, she's only lost a few pounds but she has seen such improvement in every other area of her life that she's now totally convinced to leave sugar behind.

The other lady has lost about 6 pounds, lost her cravings for sugar, and is eating at Atkins induction-level.

I think you're exactly right. I don't necessarily believe that those populations with vegetables would have been that much better off; however, even Dr. Price noted that the meat-eaters were stronger, more robust, and they tended to dominate their neighbors. Obviously, the omnivors were also much healthier than we are. Moreover, you have to read between the lines when reading Dr. Price. He was travelling with Drs. Burkitt and Trowell who were out to prove their fiber hypothesis which they stole from Peter Cleave. Dr. Price noted that these doctors wrote things that directly contradicted their observations just to get their theory out there. That means that what they observed about the meat-eaters was the minimum they cared to write. They were surely even more impressed but this would have contradicted their research. Check out a couple of these statements:

Dr. Price Wrote:
It is significant that the vegetarian groups practiced the feeding of special foods during gestation and lactation. Apparently carnivorous groups found no need to supplement the diet, as it was already rich in the factors needed for reproduction and optimum growth.

Dr. Price Wrote:
The doctors associated the emergence of diabetes with sugar consumption. High blood pressure had become more common, and could usually be reduced by cutting back on sugar. Dental caries had become more frequent. But other diseases—ischemic heart disease, constipation, hemorrhoids, varicose veins, appendicitis, thyroid problems, ulcers, arthritis, anemia and kidney stones—remained rare. Their native foodstuffs still protected them against the incursion of refined foods.

Dr. Price Wrote:
Drs. Williams and Gelfand stress that the likely culprit in the slow emergence of dental caries and diabetes is not animal fat, but refined sugar. Nevertheless, their articles form part of a collection whose editors are firmly committed to the lipid hypotheses, namely that animal products and saturated fat contribute to the Western plague of atherosclerosis, diabetes, hypertension and obesity. While Weston Price's *Nutrition and Physical Degeneration* moldered in obscurity, *Western Diseases: Their Emergence and Prevention*, edited by H.C. Trowell and D.P Burkitt received widespread recognition. Price noted that all healthy African groups had good sources of animal fat, and that the *healthiest groups consumed less, not more, of plant foods*; Burkitt and Trowell, however, postulate that the increase in Western diseases among Africans is due to a reduced consumption of plant foods containing dietary fiber. Heart researcher George Mann's work is conspicuously absent from Burkitt's *Western Diseases*. Mann studied the Masai tribes and came to the politically incorrect conclusion that their high fat diet did not predispose them to heart disease.

What you're saying about some people not finding success is what I was trying to convey yesterday by posting Dr. Kemp's results. He discovered exactly what you've described, that there is a percentage whom this will not work for. It's probably due to the years on the SAD, for sure!

waywardsister Wrote:
a 'getting worse before it gets better' kind of thing? Could it literally take years for some of us to find our way back to 'normal'?

I think this should be expected, especially when someone has been obese for most of their life. Weight loss seems to only go quick for those of us who were skinny most of our lives and only got obese during or after college, or people like Mr. Banting. However, there have obviously been many people who were fat all their lives but got the proper nutrition and now they are lean. It's difficult to generalize.
However, the science informs me that there can be no doubt that it is healthier to eat less carbohydrates rather than more and whatever we're able to accomplish with the correct diet is certainly worth it in terms of improving our chances against the diseases of civilization, which is much more important in my view.

Regards,

Charles

Oh yea, it's definitely an outlet for me to get my feelings and questions out there, and to just be able to associate with others who understand what I'm doing and why I'm doing it. And it's even helped me realize that my initial desire for this lifestyle change became more than just to look "pretty" and bikini-friendly. 😊

I was one of those who was overweight most of my life. I'm told I was a tiny, skinny little girl (don't remember that) then preteen years came and suddenly I got taller and bigger (and boy do I remember that). Food became my bff (I was introverted, extremely shy and a quite dreamer) so... the weight kept coming on. It also in a way, kept me hidden from the world (or so I thought, but another subject
altogether.)

Anyway, I'm realizing now that this life change is more than the weight loss or losing the sweet and junk food cravings. Realizing that the changes in my body--satiation, my breathing better--are a direct result of eating healthier was ONLY realized because someone else shared that this was their same result. I did not associate the breathing aspect with low/zero carbing. Like your colleague, Charles, I had great difficulty sleeping on my back because I'd always feel like I would choke and had to sleep on my side with my head slightly elevated... not anymore.

This forum is a great place for ME! If your colleagues don't need it, no problem. Like jeepifer said, they've got you directly.

hmmm... who's got the better deal...???

Anyway, I'm all the better for knowing about this site and the sharing what's going on.

Anybody feelin' the love yet?

---

RE: Zero Carb / Meat and Water - travis t - 07-17-2008 09:47 AM

what i have eaten today
4:30 am 16 oz very strong black starbucks
9:00 am half bottle of aquifina
10:30 am six quarter pound patties that i grilled last night, with a half a stick (yes half a stick) of land o lakes butter, salt, and Tabasco. Heated it in the micro........Awesome...wet...juicy...yummy.
Will eat supper this eve about 6:00 pm. I can also say there will not be a one oclock vending machine call as in days gone by.
How good do i feel eating this way...this Hoosier boy feels like he could take on the world...
travis t
p.s. got my ticket in the mail for The Scorpions concert in Chicago in aug......pump up the jam.

Man, have I been there and done that! I've torched quite a few burgers by leaving the grill (just for minute!) only to return to a 4 alarm fire! As Linda said, they looked like hockey pucks! The dog wouldn't even eat em! 😊I like the flavors that the higher fat content provides, but I think I'll fry mine up in a skillet from now on or use the 80/20 blend.

Sam

RE: Zero Carb / Meat and Water - jeepifer - 07-17-2008 11:11 AM

I seriously have to try that with my burgers! It'll have to wait, we're traveling to the Madison area for the weekend. 😃

I put some Franks Red Hot in mayo, kind of a buffala-may-o. Great with chicken and fish, and worked well for my steak too.

RE: Zero Carb / Meat and Water - Ell.eee - 07-17-2008 11:39 AM

Hi everybody. Third week of VLC<10 went very well. Good energy, sleeping well, good spirits, but I still have to fight an overwhelming feeling of hunger that comes on just after eating and lasts an hour or more. It's very tough and I'm glad I'm now eating only twice a day so the battle is on only during those times. Otherwise I'm never hungry and no real cravings. I quietly tell my pancreas to settle down a little on the insulin production and tell my brain to tell the cells they are well fed so stop asking for food! I may try zero carb for a while just to see if it will quiet the insulin response a little more, but my family is very opposed to my dropping anything else from my diet and also feel I should eat more often. The only thing that has quieted their concerns a little is that I have gained 3 pounds on VLC and they can see my energy levels are better. Phew I'm rambling! See we do need this board for support when even those who love us think our WOE is too extreme!

Meanwhile I want to thank those who post recipe and eating tips. Although I've done Burnstein for 5 years so know low carb, high fat is new to me and still feels wrong not to mention I don't know how to make good high fat choices so I love the ideas I get here. Hey fitday says my calories are up to 2000 a day - used to always be about 1500 - no wonder I've gained a bit. Now my goal is to get the 3:1 ratio of fat to protein. I don't quite have a handle on that. I'm convinced this is the healthiest way to eat for everyone, but especially for those of us fighting diabetes, high cholesterol, hyperinsulinism ect. I'm so glad to have all of you here to support each other and share.

---

RE: Zero Carb / Meat and Water - Charles - 07-17-2008 12:46 PM

I'm glad to be here with you all as welll. I didn't mean to make my colleagues sound "snooty" I was just
making the point that one cannot just rely on the success of those here to determine whether the way of eating "works" or not. Some are clearly in it for the weight loss benefit alone and I truly do understand that. I'm just saying that if we were all part of a gigantic study, you would find that 75% of us would lose tremendous weight but there would be a group that would have trouble even on zero-carb. This forum is composed chiefly of the 25% who are having trouble. If you don't believe it, check out the board statistics and you'll see that our thread is clearly the most popular thread. It has nothing to do with me, it's because people want results and they want them today. I understand that.

We have to encourage each other to always remember that this is for our health. Only the lucky ones get obese. The unlucky ones get tooth decay, hypertension, diabetes, heart disease, cancer, etc. The others pass on these traits to their children who get them.

RE: Zero Carb / Meat and Water - jeepifer - 07-17-2008 12:51 PM

Charles, do you know how quickly a carb-fest raises triglyceride levels? My tris in mid-June were 86, but last Friday were 121. A week before the last draw (July 4th and the whole weekend), I'd had a holiday pig-out without the pig. I'd finally wrestled myself back on zero carb, but I'm wondering if that raised the tri levels for my bloodwork?

RE: Zero Carb / Meat and Water - Charles - 07-17-2008 01:06 PM

jeepifer Wrote:

I'd finally wrestled myself back on zero carb, but I'm wondering if that raised the tri levels for my bloodwork?

Well, according to Schoenheimer and Rittenburg, both dietary fat and a considerable portion of the carbohydrates we consume are stored as fat -- or technically, as triglycerides -- in the fat tissue before being used for fuel by the cells. Then they get broken down into their component fatty acids, released into the bloodstream, moved to and from organs and tissues, regenerated and merged with fatty acids from the diet to reform a mixture of triglycerides in the fat cells.

Your test was a test of the ones circulating in your bloodstream so I would think it happens very quickly. I can't say in terms of time, but certainly it happens quickly. Our bodies can't deal with glucose molecules by themselves, they instantly convert them to triglycerides so they can move around along with fatty acids.

The fact that you had so many after your carb-up probably tells us quite a bit about your insulin resistance. Your insulin was unable to move them to your muscles for destruction so you stored them (which means, they continue to circulate) and that's why your number was so high.

RE: Zero Carb / Meat and Water - jeepifer - 07-17-2008 01:34 PM

Charles Wrote:
The fact that you had so many after your carb-up probably tells us quite a bit about your insulin resistance. Your insulin was unable to move them to your muscles for destruction so you stored them (which means, they continue to circulate) and that's why your number was so high.
So my insulin resistance is high, meaning it is crucial for me to keep my carbs low to minimize the little beasties roaming around in my blood (and heaven forbid, being stored). Do I have that right?

Exactly! Not only that, but you don't want to make any so your body can deal with the ones you have. When there's no glycerol phosphate, there are no triglycerides (or very little). Insulin resistance makes it harder because when insulin is high, the muscles are primed to burn them -- but in your case, they don't burn them as efficiently as they should because some of your cells have had enough. Keep the beasties low, and those cells that do will burn them as you go through the day.

I read something I found interesting in the Atkins Diabetes Revolution book. They said that if your 1 hr insulin levels during a GTT are 5 times your fasting insulin level then you have insulin resistance or > 80 IU/ml at 1 hour. Fasting insulin levels > 10 IU/ml also indicate insulin resistance. Insulin > 60 at 2 hours also indicates insulin resistance.

You should share this with Jimmy. I think his insulin level quadrupled during his GTT.

Is there hope over time that my receptors will start to repair themselves? My wish is that by the time my body has regulated itself down to my goal weight, it will also have become a little more efficient, or at least, less damaged.

Oh, that's fascinating! I might have to track that down and bring it in to my doc to see what she thinks. Of course, we're all pretty certain I'm on the Insulin Resistance (Syndrome X, Metabolic Syndrome, etc. yadda) track. I'm not sure what an "official" diagnosis will do, except monkey with my health insurance. 😜

Stop this crazy train! I want to get off! 😥

I'll be honest with you and tell you that I just don't think so. I'm more sensitive to carbohydrate now than when I started losing weight, I think. Maybe not, but it sure seems that way. If they did repair themselves, then we should be able to eat some carbohydrates and they should be disposed of normally. Instead, it seems I instantly gain weight which means that storage is happening.

For the last two years, I went to my family reunion. At each of those reunions, I tested this theory. I have this Uncle who makes the best deserts in the world. Last year, I had some of his chocolate chip and pecan cookies and piece of his pie. I gained about three pounds and I went right back to very low carb the next day. I lost the weight within the week.

This year, we had the reunion and I ate about the same. However, this year I gained about 8 pounds. It took me three weeks this time to go back to where I was. That tells me that it did not get better, it only got worse. Next year, I think I'll skip the destructive ritual because this time it took too long. I'm only talking about having some fried chicken wings on Friday night and eating 3 or 4 cookies and a piece of pie on Sunday. The rest of my weekend was zero-carb and I gained 8 pounds over that one weekend.
It's over for me. I've seen the light!

Actually it went from 4.4 fasting to 11.1 at 1 hr. So not even triple. However, as Jimmy said this was not under a glucose load. So we will never know for sure.

RE: Zero Carb / Meat and Water - **Sambeziou** - 07-17-2008 04:32 PM

Hey guys,

I must have missed the post by Charles concerning soy based mayo. Can someone enlighten me as to what is wrong with using it?? I've been using Duke's for about a year now since it has no added sugar, but I just looked and it is soy based.

Thanks!

Sam

RE: Zero Carb / Meat and Water - **travis t** - 07-17-2008 05:24 PM

Sam
I can make a bet that the soy oil used is what is called RBD oil. Refined, Bleached, and Deodorized. If just half of what Udo Erasmus says about RBD oils is true then i want them kept away from me as much as possible. Most oils on the shelf are RBD except extra virgin olive oil. One of the problems that i see in Seth Roberts Shangri La diet is that he recomends extra light olive oil and this has been RBD.

Plus soy is considered estrogenic and it is also very high in omega-6's

travis t
Hi,

I try and avoid soy products since I read about the dangers of soy in Groves' book.

Here is a link to an article by Barry Groves:

Lack of Joy with Soy

Dr. Mercola also has several articles about the dangers of soy with links to research.

Val

I bought some fancy French mayo at Whole Foods-

Delouis fils: sunflower oil, egg yolk, mustard, white wine vinegar, salt and lemon.

I assume the sunflower oil has Omega-6 but do you think it is an RDB oil?

Wow.... who da thunk it??? Soy products can be bad for ya??? I never knew about the soy based oils in mayo, I was always more worried about whether they contained sugar or not. I used to use mayo and some seasonings to make a salad dressing! Don't guess I'll be doing that much anymore.

Thanks for the info, Travis!

Sam

Still 328, going away to lexington for the weekend so I doubt I will be posting. Hopefully Monday will yield better results. This week was a bust.

Not looking to create a brand name war, but I'd love it if you could tell me what mayo you're using that's
NOT soy-based? I want to buy some mayo but not sure what to look for besides it not listing soy in its ingredients...

Any recommendations? I realize some may be locally made or even store generic, but that's fine. I just want to find a zero/lowlowcarb friendly mayo.

That's great about the people you're helping. Feels good, doesn't it? I helped my sister go gluten-free, and her fiancee went along with her - he dropped 15lbs of belly fat/inflammation. That helped convince his dad, who has Type 2, to try low carbing, and he finally got his numbers to go down, plus dropped a bunch of belly fat. His quote: "Everything my doctors told me to do was wrong!" Infuriates me to no end that they keep spewing the same info, and ppl get worse. That' why I'm so grateful for places like this - I learn so much, and can pass it on to others.

Charles Wrote:
I think you're exactly right. I don't necessarily believe that those populations with vegetables would have been that much better off

No, neither do I. Seems to me that vegetation, etc, are 'extras' as opposed to 'essentials'.

Charles Wrote:
Moreover, you have to read between the lines when reading Dr. Price. He was travelling with Drs. Burkitt and Trowell who were out to prove their fiber hypothesis which they stole from Peter Cleave. Dr. Price noted that these doctors wrote things that directly contradicted their observations just to get their theory out there. That means that what they observed about the meat-eaters was the minimum they cared to write. They were surely even more impressed but this would have contradicted their research.

Now that I didn't know! I've skimmed through NandPD, mainly looking at the pics 😊As someone who had horrible teeth as a child, that's what drew me to his work. But really, I had no idea that the fibre guys were with him. I've read through the WAPF website, but somehow this escaped me. That explains why his work caused nary a ripple. Man that peeves me off.

waywardsister Wrote:
a 'getting worse before it gets better' kind of thing? Could it literally take years for some of us to find our way back to 'normal'?

Charles Wrote:
However, the science informs me that there can be no doubt that it is healthier to eat less carbohydrates rather than more and whatever we're able to accomplish with the correct diet is certainly worth it in terms of improving our chances against the diseases of civilization, which is much more important in my view.

Agreed. Now I'm someone who has never been obese, just overweight (which happened in my early 20's), and we don't have overweight in my family other than a few of us - it's not a symptom we tend to express, nor is diabetes. Osteoporosis, dementia, vision/hearing problems, arthritis, migraines, blood clots leading to sudden death, depression/emotional/mental issues and GI cancers - that's us. I started this whole thing for weight loss, but now it's all about health. And it's amazing to me how, once you start researching, almost all of our current health concerns, the ones we take as 'normal' parts of aging, can be
directly traced to our diets. It makes me angry, but more than that it makes me passionate.

Sneaking a few carby/industrial foods in here and there lately has hammered it home even more. You mentioned before that that's the best way to learn about the health benefits of eating this way, and I agree. Sometimes that's what it takes to really feel it, rather than just know it intellectually.

I can't vouch for 100% of this, but if any one of these is true, that's enough for me!

**RE: Zero Carb / Meat and Water - waywardsister - 07-18-2008 07:42 AM**

Mayo...

In Canada, Hellman's is soy-free (made with canola). Not that I'm wild about canola either, but better than soy! Thing with soy is that is has to be fermented to get rid of the anti-nutes/natural chemicals. So while some naturally fermented soy sauce probably won't bother you, industrial soy oil probably will, at some point. I am biased against soy, can you tell? Stay far, far away if you have breast cancer or thyroid problems in your family, as they contribute to both. I agree Charles, the WAPF link is enough for me too!

It is super super easy to make mayo, it really is. I use Hellman's when I'm not feeling so DIY, or not using lots of it, and make my own other times. Homemade tastes a million times better! Plus you can jazz it up any old way you like.

Penny: that vegetarian quote is one of my all-time faves! Esp after reading The Secret Life of Plants. Even when I was vegetarian, I never quite understood the ethical argument - who decided plants were less important than, say, sheep?

Wayward sister, this reply isn't meant solely to you....

This is the most important aspect. Just as resetting one's body to biological zero hopefully can reverse obesity, I have to think the same thing about the other diseases of civilization. Just think about it: Even the smallest amounts of carbohydrates can sometimes keep people from being as lean as their bodies want to be. Imagine if there is another serious symptom that you're trying to fight off such as the stuff we may have inherited from our parents. Isn't it all the more prudent to restrict carbohydrates even more based on the possibility that you're more genetically disposed to get what someone in your family had?

Obviously the weight issue is further along than any of the other symptoms of the diseases of civilization, but eating a proper diet now provides you more of a head start than you had with your obesity. Obesity started long before you got fat and you changed in the midst of it to try and correct it. Some of these other symptoms were just getting started so doesn't it make sense to begin fighting them today?

What I learned from the dementia and Alzheimer's studies I read was that those who did not suffer from Alzheimer's also had the amyloids in their brains as well, yet they did not suffer from Alzheimer's. There was something that allowed them to fully function despite the effects of aging. They (the non-Alzheimer's sufferers) all had low insulin in common!

Just because your insulin receptors don't return to how they were when you were young doesn't mean that you can't be healthy despite their resistance to insulin as long as you stop eating those things that caused the damage in the first place!

Sorry for the sermon,

Charles

RE: Zero Carb / Meat and Water - travis t - 07-18-2008 11:42 AM

What i have eaten
4:30 am 16 oz double strong black coffee ( i start drinking as soon as i get to work)
10:15 am 1/2 pounds ribeye with salt, pepper, butter 1/4 stick, and Tabasco.
11:00 friday starbucks run for venti (20 oz) pike place roast black...yum.. this stuff is like liquid crack.
I have a bottle of aquafina that i have yet to crack open.
Supper tonight?

travis t

RE: Zero Carb / Meat and Water - Lauren - 07-18-2008 12:49 PM

I've been following a thread on another forum started by Lex who is doing an experiment altering the fat/protein content of his food. He is completely ZC, has been for years, and only eats meat (and water). I'm copying an excerpt from the thread to see what people think. I don't feel like I have enough of a grasp on the science to make a judgement about his hypothesis. Perhaps others will weigh in.

I think the gist of it is that he is saying that it takes strenuous exercise to go from using glucose as fuel to using fatty acids/ketones. Of course he only gets glucose from what his body makes from protein. I think I remember that he believes that you only make enough glucose to meet your body's needs.

LEX Wrote:
I’ve been trying to understand why Craig seemed to adapt so quickly to a Fat Based Metabolism and yet I have struggled with large swings in ketones and BG since I upped the fat content of my diet. It became very clear that even though I had been eating only meat and fat for several years, the larger amount of protein I was eating provided enough glucose to meet my body’s needs. This got me to wondering what was different about Craig’s environment and mine, and I think I’ve hit on a possible solution to the problem… he is still working, and if memory serves, his job is one that has a high level of strenuous activity. With no disrespect and an attempt at some humor, I’ll call this “The Ditch Digging Factor”.

All this is leading to a hypothesis. I believe that our muscles and liver store carbs in the form of glycogen. My low level of activity draws on these stores when I go for my walks, but there is sufficient time between these minor increases of activity to allow what glucose is manufactured from the protein I
eat to replenish these glycogen stores. This means that I’m always using glucose as my body’s preferred fuel as there is always sufficient glucose available. Since Craig is forced to do strenuous physical activity almost every day as part of his job, his glycogen stores are always depleted, so his system had no choice but to convert to using a different primary fuel – fat and ketones. Craig’s level of activity made it impossible for him to eat enough protein to make sufficient glucose to replenish reserves.

I’m in reasonable shape so I’m going to test this idea by increasing my activity enough every day to try to deplete my body’s glycogen reserves. This should have a profound effect on BG and ketones. I’m eating less than 100g of protein per day so I have less than 58g of glucose available to support the glucose driven systems and replenish glycogen stores. I’m going to start off with a slow 2 mile daily jog. This should do a number on any stored glycogen and with less than 58g of glucose available from my daily food intake, there shouldn’t be enough to fully replenish glycogen stores and my body will be forced to use ketones and fat.

The first day of added exercise has definitely shown significant changes in BG and Ketones. BG has dropped into the 70's most of the day and ketones went off the chart to the highest color patch - level 4 or above.

If I were to hazard a guess, I'm forcing my body to metabolize stored body fat as fast as possible to free the glycerol for converting to glucose. This frees a bunch of fatty acids that I'm not currently using so they're disposed of as ketones in the urine and through the lungs.

RE: Zero Carb / Meat and Water - MAC - 07-18-2008 01:16 PM

Rex should be in glucose sparing mode as he has been/is zero carbing anyway. I believe Rex's body is wasting muscle protein. He is getting fatter according to his own calculations. Saying to me he is consuming his own muscle for protein. He talks about 100g of protein yielding 58 g of glucose. Fine. What about protein replacement? Where is he getting the protein for that? He needs .8g - 1.4g per kg of lean body mass just for protein replacement. Dr. Eades says the ratio is .7g glucose per 1 g protein so maybe he is getting more glucose from protein rather than his 58% conversion ratio. He should already be fat adapted and glucose sparing. The problem is that his experiment is interesting but he is a study of 1. I need to see how this plays out more than 1 day before coming to any conclusions.

RE: Zero Carb / Meat and Water - Lauren - 07-18-2008 01:33 PM

So Mac, you think he is not eating enough protein to meet his minimal needs? Why do you think he says he is not fat adapted? I'm confused about that if he's been eating fat and protein for years. I thought that would be a done deal if he's been eating ZC for years.

RE: Zero Carb / Meat and Water - MAC - 07-18-2008 01:36 PM

Lauren Wrote:

I don't know if he is or not. I get so many different reads on how much protein is enough. Eades,
McDonald, Groves. I keep reading about differing amounts. Since he weighs 160 lbs, now 165 lbs, 100 g protein may be sufficient for him for ALL his needs. But yes, I agree with you, given he has been doing zero carb for years he should be fat adapted already. W/o him being hydrostatically weighed to determine his body fat percent accurately (skin calipers don't do it), it is impossible to know if he is wasting his muscle for protein for glucose. Sure seems that way given he has put on fat lately.

**RE: Zero Carb / Meat and Water - Lauren - 07-18-2008 02:04 PM**

Another but of confusion is the meaning of the ketone readings. There seem to be a lot of opinions about that too. With a high ketone reading, does that mean that he is metabolizing stored fat as he says or that he is wasting ketones that his muscles are unable to use?

**RE: Zero Carb / Meat and Water - travis t - 07-18-2008 02:19 PM**

**RE: Zero Carb / Meat and Water - Kristi31 - 07-18-2008 03:51 PM**

Quick message just to say that I've been rereading Gray Taubes's GCBC and suddenly, it got to me to think about something that concerns us women especially. In primitive times, women were meant to spent most of their life in either pregnancy, lactation or menopause when hormone levels are more stable (as opposed to a menstrual cycle). In either state, progesterone and estrogen were either low or high at the SAME time and balanced. Too much of one relative to the other, especially estrogen, as is the case in the first half of our cycle or end of cycle (i.e. PMS) or as often occurs during pre-menopause will therefore cause many problems that our ancestors did not have to experience. The transition to menopause was probably much smoother thanks to their diet.

This is why many women have trouble with ZC or even LC. They are experiencing hundreds of UNNATURAL cycles, too long of a premenopause. As opposed to men whose hormone levels are stable and closer to those of their ancestors...therefore, they are more successful on such a diet.

As such, I'm taking some progesterone and estrogen (sublingually) in a ratio of 50:1 which I realized is somewhere between preferable ratios of 40:1 and 80:1 for women whose ovaries no longer function. The ratio is probably in the order of 100:1 to 400:1 for premenopausal and menopausal women since their ovaries are still producing some estrogen, but almost no progesterone.
I will keep you updated on my situation, as always! Take care.

Hello everyone,

Thought I would join in on this Zero Carb thread and give an update, I posted awhile back, about trying to go Zero Carb, started off with a bang for about 3 days and did really great, then went off with a bang. Had a few setbacks to happen that put me on hold. I only get paid once a month, so when I got paid I went and stocked up on all my meats and had put them in the freezer out in the shed, so when I went to get more meats to cook my freezer had went on the blink so everything was spoiled. Then I had to make an emergency vet run with one of my rescue babies and that was not cheap at all. A few more things happened.

I finally got paid again and got back on track. I started back trying to do Zero Carb on June 20 almost a month now. I say trying because I went back to having my morning coffee with liquid Stevia French Vanilla and heavy cream and I haven't let myself give up my One Carb Ketchup as of yet. Other than those carby things it has been fatty meats and water. I am now sleeping all through the night, where before I would wake up 3 or 4 times, my head is all clear when I get up in the mornings instead of all clogged up. I am now able to go all day without feeling like I need to take a nap. I started off at 140 pounds as of this morning I weighed in at 133 pounds. Thanks to Charles and everyone who has posted on this thread, it has helped me learn so much.

pennypritty1 Wrote:
I'll check out if the Hellman's here in NY is also soy-free.

Well, I went to the store and all of the mayo brands in my area have soy... and the ones that don't have soy, have sugar in them... eesh! Sooo, I'm going to learn to make my own mayo, since you say it's easy...

I'll run over to our recipe section and see if there's one there or google for one on the net...

OH!! And I couldn't believe it but did you know that Pam and Mazola have soy in their cans ??? I bought some to try out some recipes and looked at the ingredients... I couldn't believe it. They say it's a trace but c'mon! Why at all then? I need to return it.

They're putting soy in everything!!

Hi guys,

Well today is 3 weeks for me on the zero carb path. I think I am doing great on it with no cravings, cheats or anything. I eat twice a day and feel great. I am sad that I have only lost 10 lbs in the 3 weeks. Before when I was doing Atkins 2 years ago I was losing around 5 lbs a week at a really steady clip for about 4 months. I was doing a lot of cardio by bike riding about 10 miles a day. Now I am not doing any exercise and think that is where the problem is. I am going to start bike riding again and see if more of the weight drops. I did start lifting weight but I felt really weak and tired. I stopped because after I did it
I needed to take a nap and I only lifted very little. I really love eating this way and I won't give up, I just really want the weight to start to drop I was 244.0 and now I am 234.0. I am thinking I can probably go down to 140 and be really happy so 94 lbs to go. I know it took me some time to put it on so it will take some time to take it off but I am getting annoyed. I am really glad this way of life has helped with my sleeping, eating and mood patterns and my hair has stopped falling out. So I guess the weight loss is going to be the last thing to kick in since everything else is falling into place, it will finally come but like my kids say I WANT IT NOW!!!

OH!! And I couldn't believe it but did you know that Pam and Mazola have soy in their cans ??? I bought some to try out some recipes and looked at the ingredients... I couldn't believe it. They say it's a trace but c'mon! Why at all then? I need to return it.

They're putting soy in everything!!

Here's my recipe for mayo:
http://vesnavuynovich.blogspot.com/2008/01/mayonnaise-recipe.html

I just bought a refillable oil mister from Bed, Bath, and Beyond so I wouldn't have to deal with the additives and bad oils in Pam.

RE: Zero Carb / Meat and Water - travis t - 07-19-2008 07:15 AM

update weighed on the bathroom scales before bed last night...166. Started xtra low carb in june at about 180 pounds. I'm progressing towards zero but there have been a few carbs along the way, like last week while on vacation i had quite a few servings some of them complete junk. This week back on track. Still feel awesome and i don't know if i will be truly zero carbs or not because when i eat certain items i still like a small amount of carbs like hot dogs off of the grill i still use a small spot of ketchup and tabasco. This is a big step for me because before xtra low carb i used a hot dog as a ketchup delivery vehicle and i also would drink about three to four 20 oz bottles of mt. dew (a giant load of fructose). My diet is quite different from the past and the only reason that i have been doing so well is the huge increase of fat that comes from my burgers and butter. This increase in fat and protein has allowed me to drop most of the carbs very easily and that leads to better insulin function which leads to less carbs which leads to....a good catch 22. So a true zero carb diet may be in my future but i still do have a few more questions to resolve.

travis t
travis t Wrote:

Don't you know you never put ketchup on a hot dog? Just kidding. I grew up in Chicago and they had a hard and fast rule that you NEVER EVER put ketchup on a hot dog. Yep. That Mountain Dew is addictive due to all the caffeine in it. I use to drink the diet one to no end. You have lost an amazing amount of weight considering that it seems you don't appear to have that much to lose from your pic.

Mac

that picture was taken at a triatlon in chicago five years ago. i was about 145 pounds at the time. It was the Mrs T's which was and i think still is the worlds largest at about 7000 people. it is now the accenture chicago triathlon. That picture was taken in the finishing chute and as soon as i crossed the line i walked over to my wife and told her "i think i'm going to take two weeks off" which i did, but that two teeks turned into two months which turned into two years which turned into now five years. I have a picture that was taken from behind as i was walking thru grant park back to the hotel holding my oldest daughters hand and in my other hand is a bottle of mt. dew. So i go from 145 pounds doing a triathlon to five years later at 35 pounds xtra. Goes to show you that we can fool ourselves so easily into thinking that we are doing the right thing (exercising) while still doing the wrong thing (mt dew).... cognitive dissonance.

I now have gotten the itch back to start training again with an eye for the spring triathlon season. As my 40 birthday is next month i will be in the 40-44 year age class in the next triathlon i do. How did that happen.

Thanks, Vesna. I'll try it. And check out bed, bath and beyond's site for the mister--great idea!

Y'know it's amazing how the body picks and chooses where to take the fat from first. Me? I'd have loved to see my extra stomach go first but noooo... it wants to pull away a little here, some there, almost unnoticable changes... if i didn't feel different in my clothes I'd think this wasn't working... I started this at 285, two weeks ago I was down to 270, this morning I checked, 275... you really can't trust the scale; it could really mess with you mentally if you give it power. I'm putting my scale away and I'm not touching it for about a month, just relying on the other blessings this way of life is giving me.

Of course I'd keep doing this for the clearer breathing alone. There's no greater scary than feeling like
you can't breathe.

Have a good one... it's scary hot here in NYC and I'm NOT a fan of this heat. 11 in the am and it's already a humid 90 degrees and going to be hotter. I'm doing NUTHIN' today. But sipping water or chewing on ice and watching movies in front of a fan. (no a/c)

AND checking in on this forum. it's definitely a keeper for me. 😊

RE: Zero Carb / Meat and Water - pennypritty1 - 07-19-2008 09:45 AM

Vesna,

Would it be safer to use something like Egg Beaters for the egg? I've never cooked (or eaten) raw eggs (to my knowledge anyway).

While I'm more than ready to make my own mayo, I'm sort of hesitant to even eat my own mayo because the eggs are raw in this recipe... 😐

Your odds of winning the big prize in Powerball are around 1 in 80 million. According to the egg industry, there's one salmonella outbreak for every one billion eggs sold.

I consider Egg Beaters to be nasty, de-naturalized, hyper-processed fake food. Whatever they do to Egg Beaters (including remove the contents from the naturally hygenically sealed shells) makes them less nourishing and less life-sustaining. At least, that's the way I see things.

We get eggs from free-ranging hens, preferably organic. We're aware that some producers take advantage of labels like this without actually providing a more wholesome life for the hens, and try to learn as much as possible about the companies we buy from.

Vesna

But the big question is which came first the chicken or the egg?

My money is on the chicken.

travis t

RE: Zero Carb / Meat and Water - suzanneyea - 07-19-2008 04:57 PM

wow, I spent all day reading through this thread and have learned so much. I am at my goal weight and have followed a pretty strict version of Atkins, but I am going to make a few changes after reading this and reading Charle's story and journal. I do not eat cheese and starting tomorrow I am cutting out eggs. I like eggs, but can easily live without them. I eat mostly chicken and steak everyday, but I am going to try this high fat ground beef you guys eat. The only thing I am not ready to give up is my morning coffee, that I just love.

Congratulations on being at your goal weight, suzanneyea.

How long did it take you to get there?

It's wonderful to hear about those that reached their goals. I just started in June and I've a long way to go but I don't mind. I plan to reach my goal as well. AND I still drink one cup a day myself. 😊

I was around 190 at my highest after I had my baby and he is now 5 1/2. The weight came off really fast for me, I was at goal in 6 months, but then I went under. I wanted to be 120 or 125, but I followed a strict atkins and as many will tell you, you end up thinner than you aim for, always a bit ironic. Prior to my pregnancy I fought my weight all my life, I thought about food 24-7 and tried every diet known to man and always ended up binging at night. It was a horrible way to live. Atkins has changed my life, I actually enjoy eating now. I am looking forward to making a few more changes to my diet and seeing how my body reacts.

That is very encouraging to know.

I am happy with this way of eating and the biggest challenge for me is not staying with it. My challenge is the cooking! lol

I didn't cook much and being something of a workaholic, high carbing was especially easy because every kind of hc (high carb) food is available to you no matter what time or where you are.

With this lifestyle, I have to plan, prepare and COOK... That is my biggest challenge. If I don't cook, I have to search high and low to find something to eat in a local deli or diner--which is getting harder and
more expensive. It's definitely cheaper for me to cook from home and bring lunch but I'm still getting
used this major change. I'm definitely tempted to take a cooking class to feel more comfortable in the
kitchen (I'm happier with computers-lol) but I fear the concentration would not be with lc (low carbing)
so I don't know if it would benefit me at all.

But I will keep cooking, testing, and challenging myself to practically live in my kitchen until it's second
skin in preparing my foods. So I'm redecorating my kitchen, buying convenient appliances, prettying it
up so that cooking (and my kitchen) is fun--besides essential--to this lifestyle.

sorry for the monologue. But I am happy to hear of your success... it's always encouraging.

ohh--I too always thought about food... still do. Only now I think of the lc alternatives and how/where I
can find them. 😊

---

RE: Zero Carb / Meat and Water - suzanneyea - 07-20-2008 02:50 AM

I do not do a lot of actual cooking for myself on this diet, I toss a few steaks in the broiler everyday and
I even use the disposable tin broiler pans for that (less clean up). The rest of my food was just ground
turkey or chicken (either ground or some drumsticks again in the broiler). I have been reading a lot of
Charles' posts and today I am switching to ground beef (even cheaper and that is always a good thing).
But, I always have some kind of cooked me available during the day even though I am a stay at home
mom. Like today, we go to church this morning and I will bring my ground beef, just in case we meet up
after and go to a playground or something with the kids. I can eat cold chicken anytime, love it.
Now, the cooking has come into play because I have a family to feed and apparently they do not want to
eat ground beef and steak every single day like me. So, I use a lot of the low carb recipes on them. Also,
I am in Quebec, we do not have as many of the low carb products available in our stores, like low carb
tortillas for my son, so I am kinda forced to make oppsie rolls and the such for his sandwiches. I actually
will order a lot of line for them, but I would love to have all products up here that they have in the US.
Like nitrate free bacon. Such is life in Quebec...

---

RE: Zero Carb / Meat and Water - pennypritty1 - 07-20-2008 05:43 AM

suzannewaya Wrote:

...

On my way out to church too but wanted to check in quickly... You made the oppsie rolls? I just tried
that and failed the recipe miserably!! lol

What the heck does mix until stiff mean? I think I over-mixed and they came out horrible. They were
airy and not in a good way. It was like eating nothing when I tasted it and tossed the whole thing in
disgust! The roll had absolutely NO substance. I am just no good with cooking terminology.
But I don't want to turn our zero carb/meat and water thread into a food section -lol-

I'll PM you, suzanneyea. I've always been curious about Canada. I know it's not far from us; I've just never made over there. 😊

Have a great day, everyone.

RE: Zero Carb / Meat and Water - Valcan - 07-20-2008 09:48 AM

Hi,

Alberta, Canada here (straight North of Idaho).

Suzanneyea - It sounds like your Oopsie rolls turned out right, they come out thin and kind of spongy with an eggy taste. I make mine with eggs and clarified butter. I do not make them often because I am not a big fan of them. Have you tried the cauliflower pizza dough recipe for wraps? It tastes better and is more stable. Here is a link to the recipe:

Cleochatra's Cauliflower Pizza Dough

Just make smaller rounds to make wraps.

I am still stuck with no weight loss no matter what I try. I think in my case, I need to look at limiting calories for awhile to see if that works. I am trying not to stress about losing weight but I am losing that battle too.

Val

RE: Zero Carb / Meat and Water - suzanneyea - 07-20-2008 10:20 AM

Val, How can you be stressed when you have lost 100 pounds???? You should be dancing a happy dance every morning! I am on day one of cutting even more carbs, aka Charles's style, and am liking it already, I really think the eggs were not enough in the morning. Today I had a steak for breakfast and enough ground beef at lunch to feed a small village in Africa, but I always eat a lot. In fact, do you guys ever get tired of people commenting on how much you eat? It drives me batty, every time I eat with friends it is the center of the conversation. "are you really going to eat all that?" "There is no way you can eat all that at your size!" I never comment on how much or little my friends or family eats, but I seem to be fair game.

Suzanne, congrats on being at goal weight.

Sorry if I missed it elsewhere, but what is your reason/purpose for cutting out eggs? What is your reason/purpose for considering cutting out coffee? Not weight loss, I suppose, because you're at goal. Just curious -- thanks!

RE: Zero Carb / Meat and Water - suzanneyea - 07-20-2008 12:38 PM

Just for my health, more energy. Eggs do not fill me up and I feel a bit sluggish after I eat them. I am addicted to coffee and I hate having that in my life, plus I use equal in my coffee. Also, it is just fun to play around a bit with the diet plan and see what the effects are on my body. However, I am so not ready to give up the morning coffee, I just love it way too much right now.

RE: Zero Carb / Meat and Water - Loops - 07-20-2008 02:09 PM

hi everybody -

I'm new here but have been reading through the thread with interest. I was close to zero carbs for awhile and did gain a bit of weight - but not much. I am pretty close to goal - when I first started lowcarbing/high fatting I fluctuated from 60 to 65 kilos and back again on around 20-30g carbs. When I went VLC I went up to 67 kilos and got stuck there. I am about 24/25% bodyfat according to an Omron hand-held bf monitor. I cut down on protein, added in a few vegetables and tried to make most of my food fat - this reduced my weight back down to 65 kilos but no further, despite low carbs and lots of fat.

I am 32 years old, and I play tennis/swimming, but some weeks I don't do much (this week the swimming pool is broken). I am also a recovered bulimic - high calories, high fat low carb eating cured me of that completely and immediately. I also cured eczema and acne using low carb.

Anyway, I have struggled with a big dairy addiction. Or rather, I am not sure if it is good for me, if I am just eating it because I crave it, if it has brought my weight up (I would like to be at 60 kilos, not 65), or if I would feel better/weigh less without it. I never manage to make it past a couple of days without cream/cheese. Also, I never saw a reason to give it up before - I couldn't find enough evidence through what I've read that 0 carb cheese or a bit of cream in tea/coffee should make me gain weight.

What do you all think? I am here to have a real shot at a meat only diet - well, aiming to get near there - maybe a couple of leaves of lettuce a day or a tomato. Although I have been VLC before, I was doing it with a lot of VLC dairy products and wondering if that was my problem with weight gain. I also like salt quite a bit with my meat, which is why it might not be possible for me to eat no vegetation at all as I probably need extra potassium. Also I can't give up butter because here in Chile there isn't much alternative for fats apart from mayo. Most of the cuts are leaner than they used to be.

I just remember the first time round doing Atkins I got to 60 kilos almost immediately from about 68 and the scale didn't go back up again. I did NO dairy the first time round, but I do remember feeling tired quite a lot - probably because I wasn't eating enough fat.

I am worried about eating too much protein and what that will do to me. For instance today I really BINGED on homemade beef patties. I have been very hungry the last week for some reason. I had increased my protein about a week ago and since then have been hungry a lot of the time. I'm still eating lots of fat. I'm really praying my weight doesn't start going up again but it's all in the name of
experimentation - and at least I'm not bulimic!

I have never been significantly overweight, but spent most of my life restricting calories in order to maintain a normal weight.

Thanks for listening

Loops

suzanneyea Wrote:
Val, How can you be stressed when you have lost 100 pounds????? You should be dancing a happy dance every morning!

Hi,

I know, I keep telling myself that but it isn't working. I so want to continue to lose weight. Even a pound a week would be great. I went on zero carb for just over two weeks and gained weight. I lost most of my weight on KK and I am trying hard to do lose the rest in a healthy manner. I tell myself to take a break from stressing out about my weight and to be happy with what I have lost so far but it is not working. Last summer I lost 60 pounds in three months. This summer I was hoping to lose 15 - 20 this summer when I do not have the stress of demands at work. (I have July and August off). Instead I am up in weight despite controlling my diet and exercising (no I have not lost inches). I enjoy eating zc and vlc but I wish I would get a wee bit of results. I want to hit goal because it is the healthiest place for me to be, not because I want to be "done" my diet. Even after losing 100 lbs, I am still in the obese category which is not good. I have accepted that I will have to eat like this the rest of my life. I am just frustrated because I assumed as long as I ate low carb and exercised the weight loss would slow down but continue to happen. There are so many variables and unknowns on a weight loss journey, if I knew that this was temporary and that I would start losing again in a few months, I could handle it better. Going to zc to try to get things moving and then gaining weight has really thrown me for a loop. I have no idea what to eat, what to count, what to do.

Sorry for the rant, but that actually made me feel a little better.

Val

Hey Val
Just wondering if this weight gain is a response to the muscle/bone depletion that occured on Kimkins? Your body is replenishing the bone and muscle losses that occured as part of this unhealthy WOE perhaps. If that is the case the gain would continue on ZC until balance was restored and could be thought of as a tradoff between a few more pounds and vital health. When that balance is restored only then will the body realize it's out of starvation mode and begin to release fat.

IMHO,
con

Hi Con,

I suspected that it is fall out from Kimkins, what you said makes a lot of sense. I guess I just wish I knew how long this was going to take to get back on track again. I guess I just need to be patient. It is not like I have an "end of the die" in site. Eating this way makes me feel good that is why I like it so much.

Thank you so much for your post, I feel HEAPS better. It is like you brought clarity to my mumbled up brain.

Val

Val

RE: Zero Carb / Meat and Water - [LindaSue] - 07-20-2008 04:32 PM

Welcome, Loops. I hope that zero/nearly zero carbs will work well for you.

I agree with your assessment. I believe this is what happened to me too. I gained a little weight on ZC
but I think it was in response to being so depleted from my prior low cal, low fat, low protein diet. I've
had so many other health benefits that I'm trying not to worry about the extra weight. Eating for health
makes the most sense but I share your frustration Val at not being able to make the scale move in the
other direction.

**RE: Zero Carb / Meat and Water - Daryl - 07-20-2008 07:51 PM**

Hi everyone 😊 I've been reading a little bit here and there on this thread today, and am finding it
fascinating.

---

**RE: Zero Carb / Meat and Water - ajcav062197 - 07-20-2008 08:07 PM**

Hi All. I am so glad to have found this thread (referred actually, Thank you Suzanneyea). I just finished
day 6 of zero carb plan. My only carbs have come from eggs and my 2 cups of coffee w/h.c. and
splenda. So maybe I am considered nearly zero carb. Eitherway, I am happy with the way I feel. I know
I have increased energy, stable blood sugar all day, clear headed, calm. I am happy to be able to eat
when I am hungry and love this thread for focusing on the other benifits of the woe and not just the
weight loss (although that is the main reason I started zero carb, that and simplicity).

My diet consists of ground beef, ribeye steak, chicken, pork center cut, ground turkey, tuna, butter,
coconut oil, olive oil, mayo (helmans), spicy mustard, eggs, limited nitrate free bacon, regular breakfast
sausage. The high fat meats are surely the most satifying and last the longest. (I also plan to eat salmon,
shrimp and other seafood and fish).

I have been experiencing heart burn too. Today I sipped milk of magnisesa and it helped. It's sugar-free
and effective.

My question is... I know bacon is not a staple but is it ok to eat it and breakfast sausage in as a fat? I
really look forward to the fat. I am a little concerned that I will retain water from the salt and not see a
loss. Anythoughts?

I am open to any suggestions as I am brand new to zero carb.

AJ

---

**RE: Zero Carb / Meat and Water - LindaSue - 07-21-2008 07:14 AM**

Welcome, AJ.
I think that the problem with bacon and sausage are the additives (sugar and preservatives, etc.) and not so much the sodium, although some people do seem to have issues with salt. I don't see a problem with having bacon and sausage occasionally. For me, sausage is pretty filling but bacon is not so I rarely eat it. I treat bacon as a flavoring in my cooking rather than a main dish.

Oh man, this is funny you say that. I eat more than anyone in my office! In fact, my daughter, who is at work with me today, also eats more than these grownups. The bad part is, when we go out to eat, we can't get the kid's meals as they are usually full of carbohydrates. We're going to lunch together today and she'll eat almost as much as I will. She is eleven and she is growing so all she does is eat and sleep, yet she's thin as a rail!

As Le Magnen's research and Gary Taubes's speculation suggested, that anorexia and bulimia nervosa would be the compensatory response to a physiological problem which is the inability to store calories after a meal in the energy buffer of the fat tissue.

If you were able to reverse this condition on a low-carb eating plan, then the abnormal insulin resistance was likely the culprit.

Loops Wrote:
Anyway, I have struggled with a big dairy addiction. Or rather, I am not sure if it is good for me, if I am just eating it because I crave it,

Dairy does indeed have carbohydrates. Sure, it may be zero carbs per serving, but like most things, very few of us stop at a single serving. Especially for you, if you go above a very low level of carbohydrate, that would make your overly sensitive fat metabolism begin to reject the insulin and prompt you to increase activity or purge what you ate.

Loops Wrote:

I'm really praying my weight doesn't start going up again but it's all in the name of experimentation - and at least I'm not bulimic!
I think that now you're beginning to provide better metabolic fuel and that allows you to eat more and mobilize more fatty acids, which would explain your hunger. You should be able to tell from my response thus far that I don't believe the issue is in your head and you must reject this notion as well. You're not going to be able to control your weight by calculations in your brain. You're going to have to do what is best for your body and it's telling you to eat.

The craving for protein is far different than the one for carbohydrates. Your need for potassium will only be exacerbated by eating vegetables. For you, that could be a catch-22 situation because the move vegetables you eat, the more insulin you need, which is bad for you. I would seriously consider less than 20 grams at the very maximum and see how you do with that. If you can work your way down from there, all the better. You should not need to supplement with butter and any dairy. Your meat may be low in fat from a "ratio" perspective, but it's important to eat a large amount of it to get the fat you need. Your body will excrete the extra protein and it will not be a problem.

I don't eat fatty protein exclusively. I have my fair shair of sirloin, bacon, cubed steak, etc. I find I have to eat more of these types of meat to get full, but I can get enough fat if I eat enough.

The tiredness is something that you may have to endure for a couple of weeks but eventually it will pass and my guess is that you'll settle in. I don't always "feel" like I have a ton of energy but I still manage to lift weights and run so obviously I have more than I feel like I do. This is something that you get used to. It feels foreign at first, but after a while you recognize it for what it is and you find you have long-term energy without the quick spikes you used to get from carbohydrates.

I hope this helps,

Charles

AJ

I don't see why not. Salt is not the problem. If you eat any carbohydrates and high sodium, then yes, you will retain water so therefore more salt. Lose the carbs and you'll find that your salt intake is immaterial. In fact, you'll find that you crave less salt without the carbs. Another interesting observation I've made recently is that if I have salt on my food, the more I eat of it. If you take the salt away, I don't need as much before I'm full.

My wife made this observation concerning nuts. If you give a nut-addict some unsalted nuts, they won't eat nearly as many. Interesting!

As far as the bacon, I like the Hormel uncured bacon at Wal-Mart. It is nitrate and nitrite free and doesn't seem to bother me. I like to make a few slices to have with my ground beef patties in the morning. I take the ground beef and put it in the skillet with the bacon to get some of the flavor. Then, I eat the bacon
with the ground beef. It's fantastic!

I don't always make it because it requires me to sit there by the skillet whereas my ground beef can cook while I'm in the shower or ironing my clothes and I won't burn it. When I do have it, I eat about 4 slices and 1 pound of ground beef for breakfast. This meal allows me about 5 and 1/2 hours before I get hungry for lunch.

RE: Zero Carb / Meat and Water - jeepifer - 07-21-2008 08:23 AM

I don't "feel" energetic, but I spent a good chunk of Saturday in 90 degree, humid weather hoofing around a zoo with my kids, and had NO trouble keeping up or needing to stop. That is a definite change as a result of this WOE. Even my husband commented that I was "leading the pack" most of the time.

I didn't stay zero carb (or even VLC) the whole weekend, however. Poor food choices on my part, and feeling sick and tired of plain hamburgers when eating out didn't help. I had brought some grilled steak along to eat, but when it's back at the hotel and you're not, well... I really enjoy ground beef and my own burgers, but those dried-out hockey pucks at most places are disgusting.

Struggling to get back on track today. I've beaten the cravings before, and will do it again. It's just rough.
*sigh*

I'm not worried about you, Jeepifer. That's the most interesting thing I discovered this year. Your body will keep pulling you back and one of these times, you'll finally decide that it's not worth it because you won't feel like "getting back on track" more than you feel like "going off." It just takes time for your body and mind to come to that escapable conclusion.

At Golden Corral yesterday, I could have easily talked myself into some cheesecake, but I decided I didn't want to go through the process of getting my system back on track!

What you wrote is my second biggest discovery this year. I'm just not going to feel energetic all the time, period! On Saturday, I had zero energy and I have been eating plenty of fat. However, on Sunday morning, after a little extra sleep, I had a very good workout on the track. Afterwards, I washed my car and even took my children to see The Dark Knight along with the rest of America, evidently. Last Thursday, I didn't feel like going to the gym and probably should have skipped it. However, I decided I wanted to go anyway and ended up having a great workout, I just took more rest between exercises.

The point is, going off and energy levels are things that we all have to come to grips with on zero-carb. They are both a vital part of zero-carb and better yet, neither one of them really matter! The energy is always there when we need it!

I did mine in the oven the other day because I wanted to cook up a whole package at once. 20 minutes at 350 degrees. It came out great! And, I was able to pour off some of the grease into my jar that I keep in the fridge. Very nice way to cook a bunch of bacon without babysitting the skillet!

Sounds neater too. Maybe I can ditch my apron? Nah, I better keep that around! 😊

RE: Zero Carb / Meat and Water - suzannyea - 07-21-2008 10:44 AM

I am telling you, an apron is always going to be a necessity for me! LOL I have always cooked all my meat with bacon for flavor, but my son and husband usually eat it all. Today I just made burgers on the grill for lunch I made the switch from tukey burgers to all beef. OMG!!!!!!! How was I eating those turkey burgers? I ate 4 burgers (cooked with bacon on top, but again my bacon was stolen) They were sooo good!

RE: Zero Carb / Meat and Water - Charles - 07-21-2008 11:04 AM

"Stolen bacon is sweet" -- oh, sorry, I think it was stolen waters. Oh well, I like the bacon part!

RE: Zero Carb / Meat and Water - poo123 - 07-21-2008 11:19 AM

Charles, did you catch my post on page 113? I talked about me working out and how I felt. Any thought?

RE: Zero Carb / Meat and Water - Loops - 07-21-2008 11:46 AM

Hi Charles -

thankyou for your thoughtful reply. There are a few things I must clear up though. The first is I've been doing low-carb/very-low carb for over 3 years now, most of the time with a very high percentage of fat. For the first year of that, I was eating a lot of salads, nuts, cheese, some meat, cream, had good energy, lost weight and skin/bulimia cleared up. I didn't restrict calories ever - just went with what I fancied as long as it was low carb and high fat.

The second year I stopped eating vegetables and nuts for the most part, and some fatigue and weight-gain set in. This past third year I have been experimenting with trying to keep my fat intake very high and protein low-moderate (i.e. 70g for my 65 kilos). I lost a little of the weight gain but not much. I don't find just meat satisfying - I kind of get bloatated after a meal high in just protein, and also anxious which is something I want to avoid.

Something caused the weight gain for me, and it wasn't carbs. This is why I've been trying to find out what ELSE raises insulin. This is why I keep questioning what I'm doing, because I read again and again that it is PROTEIN that raises insulin, not fat. This would explain when I dropped the salads/nuts (which had added fat), my protein intake went up a lot, which I have read can result in increased insulin output. Could this have resulted in weight gain?

As you can see, I am still playing with questions in my head. One of the inconsistencies with the 'protein impacts insulin' idea is that there are plenty of people who do lose weight eating a lot of protein.

Regarding the dairy - well, I am skeptical about the carbs in dairy. For one thing, here in Chile the label lists carbs per 100g as well as per serving. A lot of cheeses here are 1g of carb/100g. 100g of cream is 3g.

I guess I could go back to my first year diet - salads, nuts, cheese, fish, LOTS of fat - lots of cream etc. but I would like to experiment first I think with the meat way. I never did it seriously, so maybe it would actually be the be-all-end-all diet for me and I would feel amazing - won't know until I try eh?

loops

RE: Zero Carb / Meat and Water - Loops - 07-21-2008 11:55 AM

ooh -

one other thing. I was wondering why veggies would make my potassium status worse? Especially if I add some salt to my meat?
thanks

Loops

RE: Zero Carb / Meat and Water - Loops - 07-21-2008 03:11 PM

hi again -

well one thing I have noticed today is despite feeling overstuffed (overate again for lunch, if indeed there is such a thing as overeating on z/c) I have had good energy all afternoon, despite being sick with a bad cold. Still wondering why I'm feeling bloated though. Oh, and I ate at 2pm - a ton of beef, and I am STILL full at 6pm. So I guess that's good!

RE: Zero Carb / Meat and Water - ajcav062197 - 07-21-2008 03:14 PM

LindaSue Wrote:
Welcome, AJ.

I think that the problem with bacon and sausage are the additives (sugar and preservatives, etc.) and not so much the sodium, although some people do seem to have issues with salt. I don't see a problem with having bacon and sausage occasionally. For me, sausage is pretty filling but bacon is not so I rarely eat it. I treat bacon as a flavoring in my cooking rather than a main dish.

Charles Wrote:
ajcav062197 Wrote:
My question is... I know bacon is not a staple but is it ok to eat it and breakfast sausage in as a fat? I really look forward to the fat. I am a little concerned that I will retain water from the salt and not see a loss. Any thoughts?

I am open to any suggestions as I am brand new to zero carb.

AJ

I don't see why not. Salt is not the problem. If you eat any carbohydrates and high sodium, then yes, you will retain water so therefore more salt. Lose the carbs and you'll find that your salt intake is immaterial. In fact, you'll find that you crave less salt without the carbs. Another interesting observation I've made recently is that if I have salt on my food, the more I eat of it. If you take the salt away, I don't need as much before I'm full.

Thank you LindaSue, thank you Charles!!!!

I am still asking for a little hand holding here.. 😊What are the highest fat meats that in the grocery store.

Here are my guesses:
ground beef 75/25
rib eye steak
chuck roast
dark chicken meat w/ skin
dark turkey meat
pork chops (they are usually labeled assorted at my store)
bacon (as a side or garnish)
sugar free/ carb free sausage (if I am wrong please tell me) (as a side or garnish)
salmon

I am trying to build a staples shopping list. Am I missing anything? Is there a major no no on here. Sorry if I seem thick headed, just really feel like this could work for me as a lifestyle. I honestly feel so much better already 1 week!!!!!

Thank you all...

oh ps I had by first "out to eat" today.. I chose 6 oz a salmon grilled and steamed shrimp .25 oz. It was very good. And yes... I did ask the people to weigh it when I ordered. They were very helpful and understanding (even saw a little grin from one). My husband sprayed a little lemon on the shrimp 😊but i dont think it was enough to add up more than 1 carb. I will break him in.. I have been telling him for years to order me a water w/ lemon and a straw. He also put lemon in my water but I dumped it and got fresh.

---

**RE: Zero Carb / Meat and Water - poo123 - 07-21-2008 04:11 PM**

Loops, I have been on zero carbs for 3 weeks. I only eat twice a day usually noon and then again around 8:00 or 9:00pm and thats it. I go to work, work out then eat at noon so don't worry about not eating a lot. Charles set me straight on that. Keep up the good work.

---

**RE: Zero Carb / Meat and Water - Loops - 07-21-2008 05:55 PM**

hi poo123 -

yes I am used to having a well-regulated appetite these days - it really does seem to be affected more by how many calories I take in more than anything (in a low-vervlow carb environment) i.e. I eat more in one sitting I am not hungry for a long time afterwards - if I eat less I am hungry more often. Unfortunately the homeostatis extends to my bf% as well.
I was so tempted to fry up a few eggs as an after dinner snack, but I ate my son's filet mignon for tomorrow night instead. FYI, my son will only eat filet mignon for steak, so I buy a small 4 oz. portion for him cause we eat steak so much for dinner that the whole family cannot eat it or we would be broke. So, I guess I just had a $10 snack, lovely.

I don't see any "no no's" on your list. You've thought of most of the best ones. I can only think to add more pork options. Boston butt (shoulder roast) and pork picnic roasts are very fatty, probably the most fatty meats you can buy. I don't think you'll find it easy to locate a sugar and carb free sausage but I'm sure they're out there.

poo123 Wrote:
I did start lifting weight but I felt really weak and tired. I stopped because after I did it I needed to take a nap and I only lifted very little. I really love eating this way and I won't give up, I just really want the weight to start to drop I was 244.0 and now I am 234.0. I am thinking I can probably go down to 140 and be really happy so 94 lbs to go.

I caught this back on 113, Alison, but I thought you were going to begin your exercise and then you would comment on how it went. I didn't realize that you did it.

The tiredness will get better. You'll have days where you feel like you have zero energy to go with your zero carbs, but then other days, you'll be able to climb mountains. Not only that, but pretty soon you'll exercise in spite of your tiredness and you'll realize that you have way more energy than you thought you had.

I oftentimes don't feel like lifting weights, but once I get started, I find that I've not only lifted, but I set new benchmarks for myself. We have to get used to what it feels like to exist without sugar. Sugar used to give us these short-lived boosts that we associated with tons of energy. Now, we don't have the burst, but we have the power plant that actually is longer-lasting than the sugar high. It just takes some getting used to.

Regards,
Charles

Could this have resulted in weight gain?

It might have temporarily but so much more evidence suggests that it would not have endured over the long term. No all-meat cultures have a problem with obesity. Indeed, I eat copious amounts of fat and protein.

Protein does not raise insulin. It does make your blood sugar rise, but this is because of "glucose sparring" which conserves muscle glycogen for those periods of intense activity. During this period insulin is low and primes the muscles to burn fat only and prohibits them from burning glucose. This makes the glucose available for those tissues that need it and tops off the glycogen stores in the muscles.
The liver shuts off this process once blood sugar is stabilized. It may be a little higher in a fat adapted individual than in a non-fat adapted individual, but this factor alone does not contribute to fat storage.

This process cannot be compared to the effect of carbohydrates because under those conditions, insulin is high, not low. Therefore, suggesting that protein is a source of glucose that leads to fatty acid storage is quite specious because the conditions are not similar.

Loops Wrote:

I can't speak to that for everybody, but I know what they do to me and many others on this forum. As we say many times, "It's not, you are what you eat. Rather, you are what your body does with what you eat." Does dairy cause you to mobilize or store fatty acids? That's the question. If you eat dairy and don't experience weight gain, cravings, or shortened periods of satiety, then you can enjoy what you have. I don't have that experience. Maybe it's the processing of American dairy and perhaps it's better in Chile....

Loops

Because, it takes nutrients from your body to process the nutrients in vegetables. That's the part people don't quite get about vegetables. There are not that many nutrients to begin with and the most beneficial
ones can only be obtained through cooking. Moreover, one would have to eat large amounts of these
vegetables to get the equivalent amounts in meat.

Whereas meat is a potent source of the entire range of vitamins in the correct and most ideal ratios for humans.

Controlled hunger is the biggest advantage of such an eating regimen. When I eat, I can easily go from 5 to 6 hours before I'm remotely hungry again. This indicates that you are living off of the fatty acids in your circulation and you are not hypersecreting insulin. The more one can keep fatty acids in circulation, the more their fat tissue will shrink as the body will re-regulate the rate of flow for the nutrients in the circulation. If the cells and tissues are happy, then there is no need to restrict the flow through the fat tissue to create pressure. Consequently, you will not feel hunger.

Unfortunately the homeostatis extends to my bf% as well.

Now, you discovered the only reason that "calories count." They count when determining how long to go before you want to eat again. This is important for when you are planning a trip, or planning on going out on a hunt. It's nice to know that if you eat a lot, you won't have to stop for provisions -- or you'll know exactly around what time you'll need to stop. All animals have this feature and we're no different.

I thought of this the other day when I went to the movie to see *The Dark Knight*. My children and I had already eaten lunch so we were not hungry when we went into the theater. I couldn't believe how much munching on popcorn I heard throughout the movie. I wish they would ban popcorn from movies!

Weight is merely a snapshot at some point during the day and it's really worthless when you think about it. In the morning, your body will begin storing fat again and insulin will come which will prompt you to eat in the morning. Right at the changeover from burning fatty acids all night to storing a percentage of what is eaten is a good time to step on the scale, if you're curious.
Hi Charles -

thanks for the replies.

I am confused though on this nutrients issue. For instance when I look up say beef on the nutritiondata website, it definitely IS short on some nutrients. For instance, vitamin A, vitamin K, vitamin E, vitamin C, folic acid, vitamin B1, B2 and B5, copper, magnesium, calcium, manganese. Granted, it is rich in zinc, B12, B3+B6, OK in potassium (assuming no salt is added), selenium and probably chromium and the trace minerals. Interestingly liver is rich in some of the things not found in beef muscle (folic acid, B2, vitamin A).

Please note I'm really not trying to 'dis' this way of eating - quite the contrary - I would like to embrace it, but I just can't do that blindly. Especially not since I have had resolution of some health problems by taking things like magnesium supplements. Meat is very LOW in this nutrient compared to vegetables - unless you eat a lot of fish, which can be higher. Still, in order to get enough magnesium alone, I would have to eat over several kilos of ground beef a day, which I simply can't do.

Please tell me what you think. I know some of the nutrients that aren't listed on the site are indeed present in animal fats - for instance lard is rich in vitamin D, which simply has a ~ sign next to it which means they didn't measure for it.

Many thanks for your patience and time

Loops

---

**RE: Zero Carb / Meat and Water - Loops - 07-23-2008 07:45 AM**

Hi again -

I should say, that some of those nutrients can be found in other animal products. B1 is found in large amounts in pork and some types of farmed salmon, manganese in mussels, B5 in egg yolks, plenty of B2 in cheese. Vitamin C doesn't seem to be anywhere apart from raw liver. Large amounts of calcium obviously in some cheeses (although I don't believe lots of calcium does anyone much good without magnesium and vit D to absorb it), copper is extremely rich in all animal livers and also is present in significant amounts in goat cheese. Apparently the form of vitamin K they measure for is the plant one, and I have heard 'rumours' that it is present in significant amounts in pig fat.

All animal foods are rich in selenium and zinc obviously. So if you were very careful planning food, you could end up OK on everything EXCEPT for magnesium and vitamin C, but that would include eating dairy products and/or liver.

Again, just worrying - I don't want this to backfire AGAIN on me.

Vitamin C competes with glucose to get into the cells. When you go on a low-carb diet you decrease the need for vitamin C. A little goes a long way. I’m not a big fan of loading on large amounts of antioxidants because the body uses free radicals to do all kinds of things, and antioxidants don’t squelch just the ‘bad’ free radicals.(DR. Eades)

Interestingly liver is rich in some of the things not found in beef muscle (folic acid, B2, vitamin A).

I can see why this would worry you but I suggest that perhaps you're looking at this from the wrong angle. You can't just analyze food to determine the nutrient composition of a person's body. The whole notion of "balanced intake" is fraudulent, to say the least.

The Inuit's diet does not show enough calcium or sodium in it. However, when they examined the remains of these people they found that they were not deficient in any of these nutrients. The question becomes, what is it that we eat which makes our body low on these particular nutrients, not are the nutrients found in the food. It's a question of absorption. Just because carbohydrates show that they have particular nutrients in them, that doesn't mean we absorb them.

This notion was based on studies of deficiency diseases, which we've discussed at length in this thread. The bottom line is it is impossible to produce a deficiency disease eating meat. However, if you eat a diet of only refined carbohydrates, you will get deficiency diseases. Fruits and vegetables can cure scurvy, but not eating them will not cause a deficiency disease. This popular notion persists even though it dates back to James Lind's studies in 1753.
The Masai, Sumburu, Inuit, Native Americans of the Great Plain etc do not (did not) suffer from deficiency diseases yet they eat no carbohydrates. How does this happen even though they don't get those precious phytonutrients? If you follow that link you'll see that the meat-eaters still confound the experts as we speak!

Stefansson and Anderson underwent the all-meat trial in the 1920s and the nutritionists of the era said the same thing you're saying. The book, *Adventures in the Land* can be downloaded in this thread for free. Read about the arguments they made and see what happens after the year.

Quote:
"A great many dire predictions and brilliant theories faded into nothingness."

The nutritionists in the 1920s and 30s (and obviously today) didn't realize that animal foods contain all of the essential amino acids and they do so in the ratios that maximize their utility to humans. They also contain 12 of the thirteen essential vitamins in large quantities. Meat is a particularly concentrated source of vitamins A, E, and the entire complex of B vitamins. Vitamins D and B12 are only found in animals products besides the sun. Vitamin C is the only contentious point, but as I've written here many times, glucose and vitamin C take the same pathway for absorption. If glucose is present, the body will not absorb the vitamin C.

Wheat contains all of the essential amino acids as well, but to get enough of the ones that are in scarce supply a man weighing 176 pounds would have to stuff himself with 3.3 pounds of whole wheat bread a day. To reach the same level of protein, he would need only .75 pounds (340 grams) of meat.

I can't account for nutritiondata's information, but I know that no meat-eating populations suffer from malnutrition or the diseases of civilization. If you are losing magnesium and need to supplement, it must because something else you're eating causes you to lose magnesium. I take no vitamins or supplements.

Regards,

Charles

Again, just worrying - I don't want this to backfire AGAIN on me.

Loops

It's not really necessary to plan so well, either. Think about this. Before there were big supermarkets, where did the food come from? People only ate that which was indigenous to their location. If there were streams, they likely fished. If there was abundant game, they ate it. They went for centuries eating the same food and many still do today, like the Masai. Yet they do not suffer from any deficiencies. Think about that.

Boredom? That's psychological. If ground beef was all you had to eat, after a while you would learn to love it and even look forward to it, Stefansson's explorers found out.

Why would someone need to scour the earth looking for the latest and greatest nutrient? It's because carbohydrates leech these things from your body. Just eat a healthy diet and you'll find that you have every nutrient necessary and you don't have to worry about any antioxidant because you don't eat that which oxidizes!

RE: Zero Carb / Meat and Water - abnormalslc - 07-23-2008 10:29 AM

Hey Charles!
I have searched and can't seem to find info on the food allowed for Zero/near Zero carb plan.

I am on my third day of "near-zero" and am wondering what is a typical daily menu for you?

I have been stuck in a long "maintenance period" with weight fluctuations of +/- 5 pounds. Initially the stall I am sure was caused by excess carbs....not from foods that were "off-plan"...but from foods that were "on-plan"...but having too many cashews.....too much LC Ice Cream...too many strawberries....Exercise has been only walks....45 minutes or so, 3 or more times a week....I am trying to add more exercise, but having to work around caring for my 2 young daughters, limits my possibilities to only when my wife has time to watch them by herself.

I have been reading your posts for a while now...letting it "sink in" to my wee little brain....

Do you eat cold-cuts? Fish?

You most likely have posted this somewhere on this forum, so if you have a link....send it on over!

I probably do, but this thread is so long, I couldn't find it. I suppose I could search, but it drives me nuts! 😞

We're not really that structured over here. Sure, I want you to eat meat and drink water, but you can have just about any meat you can find. The processed meats should probably be lower on your list since they add so many things to them, but they're much more preferable than some veggies or grain products.

For breakfast, I like to have 73/27 ground beef patties with about three or four slices of Hormel uncured bacon.

For lunch, I tend to have either a ribeye steak, thigh or chicken leg quarters, pork steaks, beef or pork ribs.

Dinner is similar to lunch, except I don't cook it. Some of my recommended meats are:

**Beef**: brisket, short ribs, tenderloin, ground beef or chuck, corned beef brisket, prime rib, skirt steak, sirloin steak, top sirloin, veal breast, cutlet, loin and rib chop;

**Lamb**: ground, and rib chops and even lamb stew meat.

**Poultry**: practical any chicken with the skin, but preferably boneless chicken thighs, ground, cornish hen, the whole chicken, duck, whole goose, and ground turkey.

**Pork**: bacon, ground pork, kielbasa, frankfurter, loin chops, sausage, spareribs, prosciutto,

**Lunchmeat** (these have some carbs so be careful, but if you're hungry, the small amount of carbs here shouldn't be a problem):

Beef bologna, beef pastrami, pork salami

Seafood: Catfish, Halibut, Mackerel, Salmon steak, smoked salmon, smoked fish, trout.

Just because I didn't name a meat on here, that doesn't mean I wouldn't eat it. I just wouldn't eat it every day. Variety is in your mind.

**BOMBSHELL:**

If I had a lot of weight to lose, I would honestly find about three meats on this list and I would eat them and eat them exclusively (along with drinking water) until I got to where I wanted to go. This may sound odd, but this is more in line with indigenous populations. They just didn't have many food choices yet they ate these foods for hundreds of years without any disease. If the only thing for dinner is what's for dinner, you'll eat it if you're hungry enough.

It might be hard at first, but as Stefansson and his boys found out, they got used to it and even came to look forward to the same foods. During my weight loss, I ate mostly chicken and beefsteak and ground beef. Guess what? I still do, except I have added pork. I love some pork ribs and I could eat them most
days.

Regards,

Charles

See, this is the hardest thing for me to get my head around. Not intellectually -- I understand it on that level. But, I *feel* I need variety. Like, I've eaten chicken so much I'm sick of it, etc.

Now with 80 lbs. to lose, I need to take this to heart, stock up the freezer, and eat myself thin again. After all, I can always eat "x" food, in moderation, if I choose to, once I am maintaining. Right?

In a lot of ways, it comes down to immediate gratification. As a generation, we've become so accustomed to having it *now* (via credit or whatever) that it has been ingrained into our sociology. I don't need that ear of corn. I know it will make my body feel like poo for at least a day or two. But I grab it anyway, because I want to.

As you've said before, Charles, we're not perfect. The best we can do is move on, day by day. I choose not to prowl the vending machine and fill myself with needless junk, even though I want to, for no apparent reason. 😐

**RE: Zero Carb / Meat and Water - Charles - 07-23-2008 12:13 PM**

I have to tell you all about my receptionist at our office. I've mentioned her before, but today she shared her latest bloodwork with me. It's phenominal!!!!

She started eating very low carb back in October, on Halloween, to be exact. Her HDL was at 38, which is two points below the range. Her HDL was 92! I don't know what her triglycerides used to be but today they are 66. Her total cholesterol is fairly low and her ratio is outstanding. Of course, her doctor was concerned with her 108 LDL but the ratio was optimal. What a nut-job. No, I take that back. He is just ignorant. He recommended a fairly low-carb diet, but wanted her to eat sweet potatoes. You know me, I talked her out of the sweet potatoes!

She lost 25 pounds and wants to lose 14 more. However, she's addicted to diet Dr. Pepper (her own words) and probably eats a few more carbs than she should which keeps the insulin flowing and the fat...
storage. Despite the weight loss hangups, her health is fantastic. Her IBS is under control and she looks way better than she used to.

As we always say around her, it's about so much more than just weight loss!

RE: Zero Carb / Meat and Water - loops - 07-23-2008 12:44 PM

Hi Charles -

but the Masai etc. - they do/did eat liver and other organs right? And brains, organs. What I mean is, most of the carnivorous peoples ate the whole animal and boiled up the bones - is that correct? Because we DO have a physiological need for ALL the nutrients listed such as A,B,C,D,E and ALL the minerals in sufficient quantities, and I'm worried that simply eating muscle meat is not going to provide me with everything.

See the problem I have is that I HATE liver, but it does make me feel good if I can get it down. And if we can't absorb the stuff in vegetables, why do they cure scurvy?

Take another problem of mine - I'm a smoker. Yeah I'm always trying to quit - it's a tough one and I've managed to cut way down but still.... Anyway I need extra nutrients, especially vitamin C, and I'm not sure just popping a pill is going to sort me out, as vitamin C pills never cured scurvy.

RE: Zero Carb / Meat and Water - Charles - 07-23-2008 01:05 PM

jeepifer Wrote:
See, this is the hardest thing for me to get my head around. Not intellectually -- I understand it on that level. But, I *feel* I need variety. Like, I've eaten chicken so much I'm sick of it, etc.

I didn't say it would be easy, I just said that's what I did. It would be easier if all you had to eat was chicken or whatever it is that you like to eat. We feel like the more we eat something, the more we'll grow to hate it. That's only true to a point. If you know that's all there is and you're determined, it can work. It also helps when you see results. If you ate ground beef three times a day for six weeks and you could drop 4 pounds a week, that would probably motivate you more.

Jeepifer Wrote:
Now with 80 lbs. to lose, I need to take this to heart, stock up the freezer, and eat myself thin again. After all, I can always eat "x" food, in moderation, if I choose to, once I am maintaining. Right?

Generally, yes but it really depends on what "x" is. I know you know this, but for others who don't, diet is not something that you go on, get fixed, then you can eat whatever. The challenge is finding
something you will sustain for the rest of your days. I will also tell you that the way you feel about food today may be very different than what you'll once you get to where you want to go. I eat the same foods today that I did when I was on Induction. Why? Because those foods work. They are satisfying, they provide great energy to my body, and I won't gain weight from eating them. I can always turn to those foods if I ever get myself into trouble.

If you would have told me two years ago that I would be eating those foods exclusively, I might have felt differently about them.

I understand the argument about moderation but there are some things that cannot be eaten even in moderation because your body will not deal with them properly.

Jeepifer Wrote:
In a lot of ways, it comes down to immediate gratification.

This is very true and I do indeed understand the frustration. However, I'm trying to encourage the frustrated to put that energy to use and get dogmatic about this thing. My methods sound extreme but it seems to me that if you really want that instant gratification, you have to take what others might perceive as "drastic measures" to get things done. I woke up one day and didn't like what I saw in the mirror. I took that frustration and found a way to endure on a very limited diet which led to a 65-pound weight loss. Getting myself back to biological zero was a pretty drastic step.

I just got finished explaining to a lady about my diet, and she had this look on her face like, damn, this guy is serious (or maybe it was crazy). Now, this lady has some bad blood work. Her HDL is in the 30's and her triglycerides are high. She can't imagine a life of just meat and vegetables so she eats dry cereal, fruit and chicken with no skin and small portions of grains. These things are killing her because she eats no fat so her HDL continues to plummet. Her doctor wants to put her on a statin and she doesn't want to take it. She's at the crossroads. Statin or eat properly. Which will she choose? Stay tuned.

I know there are other factors that influence weight loss, but I would certainly exhaust all the dietary ones before settling with what I may not be able to change.

Jeepifer Wrote:

I expect perfection from myself, but not from others! 😞 I really mean that. I don't have a dog in yours or anyone's fight. But, I sure will root hard for you and tell you what I believe to be the honest truth!

RE: Zero Carb / Meat and Water - suzanneyea - 07-23-2008 01:07 PM

Here is my tip, buy the meat that is cheapest, which is usually the high fat ground beef. You will be eating so frickin much food you cannot afford to buy all the expensive ones. And high fat ground beef is so yummy, how can you go wrong?

RE: Zero Carb / Meat and Water - MAC - 07-23-2008 01:11 PM

Charles Wrote:

From what I have read, 50 is the minimum target for a female for HDL and 40 for a male for HDL. But her 92 HDL and her 66 for TAGs is phenomenal.

No, not all of them. Stefansson goes through this in great detail in his book, which you should read. They ate caribou mostly, but when it wasn't available, they ate seal, boiled fish, and seal -- even rabbits in the spring sometimes, but this didn't go over well. When Stefansson and Anderson did the all-meat trial, they basically ate two and a half pounds of beef sirloin each day. They only ate the cooked foods and they emerged healthy by every objective measure. This is more important to me than even the all-meat cultures. All the veggie pushers of his day predicted they would die of scurvy and all sorts of things but none of this happened.

Loops Wrote: 
Because we DO have a physiological need for ALL the nutrients listed such as A,B,C,D,E and ALL the minerals in sufficient quantities, and I'm worried that simply eating muscle meat is not going to provide me with everything.

You mean "addiction." If that's what you mean, then you certainly don't need anything in your life that is "psychological." Drugs also come from plants and they seduce you into thinking you "need" them. You do get all the essential minerals and vitamins in sufficient quantities from meat. As Gordon Pirie wrote:

Quote: 
"Don't believe the scientific facts purchased on the back of food labels."

The USDA has no idea of what we humans need on a daily basis for nutrition. If they did, don't you think Americans would be healthier on average?

Loops Wrote: 
See the problem I have is that I HATE liver, but it does make me feel good if I can get it down. And if we can't absorb the stuff in vegetables, why do they cure scurvy?

I hate liver also and I do not eat it. You do not have to eat liver to be healthy. British sailors who got scurvy ate the typical naval fare of "water gruel sweetened with sugar in the morning, fresh mutton broth, light puddings, boiled biscuit with sugar, barley and raisins, rice and currants." These were refined carbohydrates that could be carried safely on a sailing ship without worry of rat infestation. James Lind demonstrated in 1753 that he could cure it with citrus juice.

Pellagra was associated with corn-rich diets and beri-beri came from eating white rice instead of brown
in the Phillipine prison. The Japanese navy cured their outbreak of scurvy with meat and evaporated milk.

Nutritionists were able to induce scurvy in animals with refined grains and sugar. Guinea pigs got it from crushed barley and chickpeas.

Lind and the nutritionists who followed him in the study of scurvy demonstrated only that the disease is a dietary deficiency that can be cured with the addition of fresh fruits and vegetables or meat and milk. This does not necessarily imply that a lack of fresh fruits and vegetables caused the deficiency. A good doctor will tell you this as well. They don't recommend the meat option because they think you'll get fat. They don't realize that refined sugar is the enemy, not fat and protein.

Given that the Inuit and those Westerners living on their vegetable and fruit-free diet never suffered from scurvy, indicated that there must be other factors involved. Eating refined and easily digestible carbohydrates and sugar increases our need for vitamins that we would otherwise derive from animal products in sufficient quantities.

Loops Wrote:
Take another problem of mine - I'm a smoker. Yeah I'm always trying to quit - it's a tough one and I've managed to cut way down but still.... Anyway I need extra nutrients, especially vitamin C, and I'm not sure just popping a pill is going to sort me out, as vitamin C pills never cured scurvy.

That's another issue altogether. Your problem isn't nutrients, it's a healthy diet. In fact, nicotine may be the most successful weight-loss drug in history, despite its otherwise narcotic properties. Nicotene appears to induce weight loss and fat loss not by suppressing appetite (as many suppose), but by freeing up fatty acids from the fat cells and then directing them to the muscle cells, where they're taken up and oxidized, providing the body with some excess energy in the process. When smokers quit, they gain weight because their fat cells respond to the absence of nicotine by significantly increasing lipoprotein-lipase activity.

Therefore, while you smoke and also when you quit, you should definitely be on a zero-carb diet because you'll need to continue mobilizing fatty acids in place of the nicotine. People quickly gain in the three weeks after quitting because they respond to the loss of energy with carbohydrates instead of fat and protein. It all starts with a healthy diet and then you should work on quitting.

Thanks for explaining it that way. I kind of take offense when people suggest that perhaps I lost weight easy because I'm a guy and all of that. I made some serious changes. My wife still isn't 100% comfortable with the changes I've made in our family. I went about things like a drill sergeant. When I made dietary changes, that meant the grocery bill changed. We all ate what I ate and I constantly talk about these things with my children. Their eyes glaze over and they roll their eyes but they have no choice. They're a captive audience. I don't care what they eat at their friends' houses, but when they eat at my house, you can best believe it's going to be proper food.

My wife didn't always agree. She felt like they are kids and they should be able to eat certain things, or there were special occasions like when we went to friends' houses and I would politely refuse their food. She didn't like that. I was determined, however, that this was my health and I didn't give a damn who I offended. I had a goal and I needed to make changes and nothing was going to stop me.

Even today, I have no qualms about ordering off the menu or getting up and walking out until I find acceptable food. She's still in awe of what I was able to accomplish because I seriously believe she thought I went off the deep end. Whenever we meet a low-carb doctor, she always asks, is what he's doing really healthy?

I don't need any more blood work or anything else. I know how I feel, how my blood pressure is, my energy, my body temperature, my libido, my weight, my skin, my teeth, -- you name it. I know what's happening in here!

Regards,

Charles

**RE: Zero Carb / Meat and Water** - Ell.eee - 07-23-2008 02:23 PM

Charles first I want to thank you for your guidance and enthusiasm to all on this thread. Know there are many like me who read daily, absorb the advice, evaluate the evidence and make life changing decisions. I'm sure there are lots of us who are not into posting much who constantly profit from your efforts and you may not realize how many you (and all those who post!) help others. So THANK YOU! Ok so I'm done with 4 weeks of tapering carbs the last 2 at <10. Feeling good, but still having 90-120
minutes of feeling hungry and shakey immediately after meals. Is that how long it is taking the insulin to clear my system? And how does the insulin get used up if there are no carbs to process and the cells are resistant anyway? Does the body just reabsorb it? I'm trying to think of ways to get rid of it! I'm going to go zero carb for a few weeks and see if that helps, but I have a couple of questions. I have read some of "the Bear's" writings and he seems to think that women can't or won't do zero carb as well as men. He seems to think hormones and the fact that in native people's time women would have been at camp while men hunted and more apt to eat berries and leaves and nuts while waiting for fresh meat. I also see most of the studies of all meat diets were from trappers and explorers and again no women mentioned. So is there any evidence that women's needs are different than men's or that they are biologically less able to do zero carb? Just a point I've been wondering about. I see some here on this board doing well but have there been any studies on women? Either way I'm going to give it a try.

Had one lapse this week ate celery with almond butter and felt even worse after eating it and had a strong craving for more so I know the lower carb is helping. Now I'm eating just meat, 1 egg, and some dairy daily. I have 2 mugs of coffee in the am and just water the rest of the day. I do use a few spices, and have a scoop of protein powder in water just before jogging - my muscles wasted severely when I did low carb, low fat and I never want that to happen again. I've gained 3 pounds. Now I'm 106-108 at 5'4" so that's not a concern. I did no dairy for a month a while back and it didn't seem to change anything (I only do cream, cheese, and homemade yogurt) but I'll try it again. OK that's my boring story for this week. Regards to all and thanks again to all for the wisdom, advice, and good spirits always present on this thread.

RE: Zero Carb / Meat and Water - Charles - 07-23-2008 02:41 PM

Ell.eee Wrote:

Sounds like it is for you. Are you sure you eat enough at the meal? Have you tried eating just a little more meat to see if the time is different?

Quote:
And how does the insulin get used up if there are no carbs to process and the cells are resistant anyway? Does the body just reabsorb it?

That's a very good question. I know the liver shuts off the secretion and the insulin goes to the cells where it tries to take glucose with it. All the cells take it up except for the ones that are resistant. When it it ebbs sufficiently the fatty acids return.

Ell.eee Wrote:
I have read some of "the Bear's" writings and he seems to think that women can't or won't do zero carb as well as men.

He tends to speculate a little too much for my tastes sometimes. Here's what Stefansson said about it:
Stefansson Wrote:
After breakfast all the men and about half the women would go fishing, the rest of the women staying at home to keep house. About eleven o'clock we came back for a second meal of frozen fish just like the breakfast. At about four in the afternoon the working day was over and we came home to a meal of hot boiled fish.

Doesn't look like everyone stayed home to me. Plus, Dr. Price talks about women actually doing more work than the men. When the men return from the hunt, they tend to sit around for a day or two while the women are hard at work. I don't think we can generalize like that. We know that the Inuit or none of the others have genetic advantages so we can't posit that way. Stefansson speaks to the other notion here:

Stefansson Wrote:
A phase of our experiment has a relation to slimming, slenderizing, reducing, the treatment of obesity. I was "about ten pounds overweight" at the beginning of the meat diet and lost all of it. This reminds me to say that Eskimos, when still on their native meats, are never corpulent—at least I have seen none. They may be well fleshed. Some especially women, are notably heavier in middle age than when young. But they are not corpulent in our sense. When you see Eskimos in their native garments you do get the impression of fat round faces on fat round bodies, but the roundness of face is a racial peculiarity and the rest of the effect is produced by loose and puffy garments. See them striped and you do not find the abdominal protuberances and folds which are numerous at Coney Island beaches and so persuasive in arguments against nudism.

Ell.eee Wrote:
I see some here on this board doing well but have there been any studies on women? Either way I'm going to give it a try.

It's hard to find studies in general on zero carb, but GCBC has many, many studies that include women. Specifically, Donaldson and Kemp has very low-carb diets and it was the same across the board. 75% will lose weight and 25% will not, plain and simple. We tend to get more of the 25% on our board because they, of course, would require the most support.

Ell.eee Wrote:

I've gained 3 pounds. Now I'm 106-108 at 5'4" so that's not a concern.

This isn't bad. If I couldn't lose on this, the protein powder would be the first to go, followed by the dairy. I'm sure your protein powder doesn't have soy in it, but still, you shouldn't need that if you are eating fatty protein. I can guarantee you won't lose muscle on this regimen unless you aren't eating to appetite. You don't have to gorge, but you should never be hungry.

Ell.eee Wrote:

You know what I'm going to say. A month is not enough time to know anything really. Based on those severe shakes, I would give it at least three to cure that. You don't want to give your insulin anything to do if you can help it.

Regards,

Charles

RE: Zero Carb / Meat and Water - poo123 - 07-23-2008 06:55 PM

Hey guys, I am still here just really busy with work and the kids. I have been reading and everyone is doing so great. I will hit the 4 weeks of zero carbs on Sat. and I am down 11 lbs. I am sad that its not more. I started doing weights like Charles suggested and have been doing it for a few days. I am really tired but I am pushing myself to get it done and feel better. In the past when I have done low carb Atkins I would lose 20 lbs in a month usually. I guess I really screwed myself up with on and off low carb because now its not coming off. I am still doing zero carb because I do feel great and my hot flashes have all but gone. So I am really hoping that I can lose some weight because its a tad frustrating. Well I am done moaning and groaning.

---

RE: Zero Carb / Meat and Water - suzanneyea - 07-24-2008 02:43 AM
11 pounds in a month is great! When I was losing it would vary so much, some weeks I lost nothing, some weeks 4 pounds. Usually it was about 1 or 2 pounds a week. Just keep the focus on your health, not the weight loss. The weight loss is more of a side effect of a healthy diet. Plus, stressing about the numbers on the scale will not help. I guess that it easier said than done, I remember loving seeing the numbers go down too. Just stay the course and you will be fit and healthy soon enough.

I quoted all of that to make sure it gets posted a second time. I couldn't have said it ANY better!

I had the same experience. Sometimes it just zipped off and sometimes it didn't. The best part however, was that it didn't go the other way! 😊

Eleven pounds is nothing to sneeze at in 30 days. The "experts" say that 2 pounds a week is healthy weight loss. You've exceeded that in your first month. In fact, I'm willing to wager that if I made a commercial that promised 11 pounds of real fat loss in a month, I would make a million dollars and I could quit my job.

I am a 37 yeat old woman who has had a child and still has a six pack on her stomach, well, I got one as I lowered my carbs, now I follow a zero carb plan, like Charles. My body is pretty amazing if I do say so myself. I can out eat any guy at the steakhouse. I have more energy than any of the other moms I know and even better, my emotions are more calm and under control than most other woman I meet.

Oh yes, I love my 40-year old six-pack too! My son laughs at me because I can't help but lift my shirt on my way out of the gym in front of one of the big mirrors. When I was younger, I was a runner but I never had the muscle definition or six pack I have now. I can't wait until next month when I go to the beach in Virginia Beach for the Rock-n-Roll Half. I'll be out there playing frisbee with my son, shirtless on the beach!

I know, vanity is vanity, but I'm wanting every single zero-carber on this board to have the same experience, and soon!!!!

RE: Zero Carb / Meat and Water - suzanneeya - 07-24-2008 09:19 AM

I am a total show off with my body. I love walking around in my bikini top (the tushy stilll needs some work, lol) and shorts. All my life I wondered how people got such amazings bodies cause it "seemed" like I was doing all the right things, low fat and lots of excercise, and I never had a good body. So, after 30 years of hiding, I show that bad boy off. And I love saying I am 37 and had a baby and still have this kickin body.
RE: Zero Carb / Meat and Water - **jeepifer** - 07-24-2008 10:10 AM

Suzanneyea, can I be you for a day? 😊😊

RE: Zero Carb / Meat and Water - **aim in Fla*working** - 07-24-2008 12:53 PM

Hello everyone...I am so interested in a close to zero low carb lifestyle...I have fibromyalgia and low thyroid and take Armour. I had a friend ask about me over here re: water retention and my inability to stop retaining...it is sometimes as much as 6 pounds and i have lost 11 after taking a diuretic...and felt human again...I honestly think i am one of those people who have to stay very close to '0' to stay slim and not have fluid retention. However, i tried again today and my cravins were so bad i caved...I had 2 heaping teaspoons of natural peanut butter...then I felt 'fine' and even-keeled...what is with that. I have never made goal which is 125 at 5'6 and I have gradually given up on Atkins Ongoing weightloss because my cravings get so out of hand.. I got to 127 in 2001 and then cheated alot (like for a few years)and then when I hit 137 (where I am now) i tried the ongoing weightloss levels and frankly i was retaining so much fluid and craving like mad, i reinducted but i have no loss....weird. Then, I took a
waterpill and lost 4 pounds and felt better. By that I mean I felt better (less pain) ...I do not do the water pill for vanity thinness...so I would really like to be a part of this 0 carb way of eating ...I have left another site to come here for diet and weightloss strategies and input from you guys because it is not working over there...even veggies balloon me if I use Parm on them...
So...if it is alright, I would love to participate with you all.

RE: Zero Carb / Meat and Water - daveo - 07-24-2008 12:55 PM

Charles,

I just found this post this morning, because I was looking for other people doing 0 carb. I have to admit I have not read the whole thing yet, but I am making progress and look forward to joining the discussion. One question I have for you though, which has come up a few times in my reading...

I used to go to Golden Corral quite a bit years ago. I admit is has been a while, but what do they have that is friendly to a zero carb lifestyle? I seem to remember some fairly carby meatloaf, and some pot roast in sauce. What are the good menu choices there?

Thanks for this post, I am gaining valuable insight from you!

RE: Zero Carb / Meat and Water - FatGirlOnAtkins - 07-24-2008 01:09 PM

Hi, everyone! It's taken me about 4 days, but I think I've read this whole thread from start to finish. Thanks for sharing, all of you! I have learned so much and been given so much to think about. I feel like I know you all, and you're all so inspiring.

I will be 28 on Saturday, I've been following Atkins for 5 years. I got to my goal weight in after losing 70 pounds in 2003... then immediately got pregnant!! I was scared away from low-carbing while I was pregnant *kicking myself* and after another pregnancy, find that I've gained back half of what I lost. I've been off and on for a year now, and a month or so ago started to really get serious about it again.

Charles, thank you so much for all your insight. When I started reading this thread, it clicked with me that the reason I've been stalled lately on lc is because I've never put much an emphasis on FAT! I've been zero-carbing for 2 days and have already lost 2 pounds... my stall (hopefully) is over!!

But I had a question; I love eating like this... I'm not hungry, and it seems like I instantly had more energy. But I love, love, love my veggies!!! I'm not exactly sure how to get away from them, if they are what's slowing me down. I also have a severe addiction to Diet Pepsi.. I know this isn't good. Help?

Hi, FGOA (would love to know your name -- it goes against my grain to call someone by "Fat Girl" if you know what I mean!). I too love veggies, especially LC ones. All I can say is give it a real shot, and keep the goal in mind.

I know for me, if I have a "taste" of something, it sets me up to eat more. I have to cold turkey (hey, at least that's zero carb, right?) or I will cave in.

At any rate, do what works best for you, keep coming back, and know we're here to cheer you on and support you!

---

RE: Zero Carb / Meat and Water - suzanneyea - 07-24-2008 01:33 PM

I used to drink 2 2 liters of diet soda a day, so if I can quit, anyone can! You really need to start "thinking like a health nut." I have learned to treasure my body an dwat I put into it, diet soda is nothing but junk that is hurting your body. Just make a choice, just tell yourself "no more diet soda." Zero carb does have amazing results, but there are things you have to live without if you really want the results.

---

RE: Zero Carb / Meat and Water - jeepifer - 07-24-2008 01:41 PM

Home with a migraine today, which is the fallout from eating junk. *sigh*

On the bright side, found some lovely chicken quarters at Aldi -- a 5 lb. bag for $3.49. And also got 5 pounds of 73/27 ground beef for $1.79/lb. So I'm set for a few days, food-wise. Next week I want to pick up some pork steaks. They looked nice and fatty, and were $1.99/lb. in bulk.
RE: Zero Carb / Meat and Water - suzanneyea - 07-24-2008 02:03 PM

Isn't it great here? I had always been low carb, under 10, but reading Charles' posts really got me motivated. I no longer feel the need to defend my choices of being so low carb and have gone down to zero carb (almost, I still have coffee). Every where else it seems everyone's goal was to eventually eat more carbs, I never wanted to, I just love meat and have never loved fruit or veggies that much anyway. But, reading all the information about health from Charles has given me a whole new confidence in my food choices.

RE: Zero Carb / Meat and Water - aim in Fla*working - 07-24-2008 02:10 PM

that is totally how I feel..I kept trying to go up the carb ladder and everyone at the other site was telling me to do so and I kept gaining and retaining fluid and I thought I will never get thin and quit for about 3 years..now..at 137...i tried again with no losses...and fluid retention..I thought i had TOO MUCH protien..TOO MUCH FAT...and was eating low carb veggies and such and still not losing...and waking up with my eyes swollen up and puffy! I am so mad that I came home and ate 2 spoonfulls of natural peanut butter...I want this bad but old habits die hard for real! I quit smoking in November and gained maybe 4 pounds but I honestly feel it was easier to quit smoking( and I LOVEO smoking) than it is for me to not feel bloated and I feel I will never get to goal of 125! I have been told that maybe my body is happy where it is....well, my body at 137 is not good..I have a 3.5 ring finger (extremly small boned) and a 31 inch waist!! Hopefully this will get me healthier and thinner!

RE: Zero Carb / Meat and Water - poo123 - 07-24-2008 02:20 PM

Hi guys. Just wanted to stop by and say all is well. I am not so down and I am going to focus on my health and not my weight. If I lose weight I lose weight. If I am healthy that is the important part. So I am off to eat my ground beef with chopped up bacon in it. Yum, Yum. And to all who is just starting, I am at 4 weeks of zero carb. No cheating, no cravings just meat and I am feeling great, a little emotional yo-yo but feeling great. Good luck to all of you, once you start its pretty amazing.

RE: Zero Carb / Meat and Water - suzanneyea - 07-24-2008 02:21 PM

When my carbs were higher I weighed 125 to 129 and had no six pack. Now, I won't even say what I weigh, it is very low, and I am super cut. I eat a huge amount. Charles has gotten me hooked on ground beef. I buy the family size, for me.

RE: Zero Carb / Meat and Water - jeepifer - 07-24-2008 04:08 PM

aim in Fla*working Wrote:
thank you Jeepifer for the welcome! Sorry about the migraine...
So what do you eat usually for breakfast lunch and dinner...I noticed many have ground beef for breakfast...I loved browned meat in butter;p

It varies, usually something reheated from dinner leftovers. I try to cook up several gb patties or pieces of chicken at a time so I always have a choice ready. Hmm, ground beef in butter sounds great. Someone here (sorry, blanking on the name right now (still have headache, ouch) makes a butter/hot sauce mix for their meat. I mixed Franks Red Hot and mayo last week to add to my lower-fat meats, and it tasted great!
I also buy Coleman natural hot dogs and bacon -- no nitrates but the sodium is high(er). If you have issues retaining you might want to keep away from salt as much as possible, but I'm sure you know that. 😊 But they make great, quick breakfast items. I'll precook a whole package of bacon, ready for adding to a meal or eating plain.

aim in Fla*working Wrote:

Whew, you ARE tiny boned! My height is 5'3" and at my most fit I was a toned 122 but my ring size was 6. I'm hoping to get below 130, and since I'm almost 39, I figure that's a good goal. If I weigh less, well, bonus!

suzannneyea Wrote:

I'd love to be nosy and ask what you do weigh, but can you at least share your height? I'm looking for a role model. 😊😊

RE: Zero Carb / Meat and Water - aim in Fla*working - 07-24-2008 04:44 PM

what did you guys eat today? I had lamb chops for breakfast...2 heaping spoonfuls of the natural peanut butter 😊 then i had some baked chicken and dinner was a steak with a thin slice of onion..I guess the onion was too many carbs maybe..I will check my ketosis sticks...I still think I am under 10 though...I hope. We have tons of meat in now...I am happy to say. BF went shopping and got all kinds of goodies...Tomorrow I am having the other steak and eggs for breakfast and then ground beef for lunch and dinner! NO NATURAL PEANUT BUTTER!

RE: Zero Carb / Meat and Water - suzannneyea - 07-24-2008 05:52 PM

I had steak and ground veal for breakfast. Then I had some ground beef, a lot, cause I had a big dentist appointment at 1:00 and didn't know how long before I would be able to eat again. Then I had two more steaks and two chicken thighs for dinner. I am making a ton of beef jerky tomorrow! Yum.

RE: Zero Carb / Meat and Water - poo123 - 07-24-2008 05:59 PM

I had 2 chicken thighs at noon and that's it. I have some water during the day. I think I will have 2 hamburgers for supper at 10:00pm. But I have no desire to eat. So I wait until I am hungry.

RE: Zero Carb / Meat and Water - aim in Fla*working - 07-24-2008 06:16 PM

those of you who are not losing pounds, are you losing inches?

RE: Zero Carb / Meat and Water - Living_healthy - 07-24-2008 08:06 PM
I had two large patties of 73/27 beef (one at breakfast with an egg) and the other for lunch. Just finished polishing off a nice size ribeye for supper. A couple of cups of plain coffee with coconut oil this morning and water the rest of the day.

I bought some fatty beef ribs for tomorrow.

---

**RE: Zero Carb / Meat and Water** - **con** - 07-24-2008 08:26 PM

I ate pork spare ribs with all the drippings mixed with a little ranch dressing for breakfast Thursday and haven't been hungry the rest of the day. So just one meal today---it seems pork fat has a different effect on me than butter or tallow? maybe--I'm not sure.

They were so easy to prepare - I just wrapped the whole slab in aluminum foil with a rub mixture (onion, garlic powder, paprika, salt, pepper) sprinkled on top in a 250 degree oven for about 7 hrs.

---

**RE: Zero Carb / Meat and Water** - **poo123** - 07-24-2008 09:11 PM

When I sit down to eat I eat until I am full. 2 chicken thighs fill me up for the 1st part of the day and then I eat 2 hamburgers for the 2nd part of the day. Like Charles said eat only when you are hungry and do not force yourself to eat. I am doing great with this. I am actually a chef and love food very much but I have learned that I am to eat only meat and water if I am to start getting healthy. After doing this for 4 weeks, I have no cravings like I said and have no hunger. So for me this system works out great.

---

**RE: Zero Carb / Meat and Water** - **jeepifer** - 07-25-2008 12:56 AM

You hit the nail on the head. It seems like a lot of well-meaning people keep pushing everyone to
increase their carbs by climbing "the carb ladder" but I think they're missing the whole point point of the
ladder. They seem to think that we're all supposed to eventually be able to eat a bunch more carbs and
go back to eating pasta, potatoes and bread by the time we reach maintenance. It reminds me of the
mentality where you diet to lose weight then you can go back to how you were eating before but maybe
not quite as bad. The real point of Dr. Atkins' carb ladder was to gradually add carby foods in 5-gram
increments in order to determine how many carbs your body can handle not to see how many carbs you
can get away with eating. He set up the ladder so that the least problem-causing foods were on the lower
rungs and the more troublesome foods were at the top to help keep people out of trouble. He never said
that you had to do all of the rungs if you didn't want those foods and he never said that you had to
increase your carbs if you were happy at your current level. Sure, there are some people who CAN
handle quite a few carbs but, as we see all the time, there are at least as many who can't handle many
carbs at all.

I'm still doing pretty close to zero carbs but not getting a lot of results. At least I'm not gaining though
and I'm down 1 1/2 pounds from where I was a few days ago. Off and on I eat a few veggies but I regret
it every time. I had some cauliflower (very small amounts) a few times in the past week and now my
stomach is gassy and I'm constipated (sorry, TMI). I could have easily done without the veggies but I'm
trying to keep my food costs down so sometimes I have to eat the foods that I cook for my husband.
Sometimes it amazes me how little veg it takes to cause gastric problems. My body just can't handle
even a tiny bit of fiber.

Welcome aim in Fla*working, FatGirlOnAtkins, daveo and any other newcomers I may have missed.

I would think that six years would be long enough time to adapt to eating low carb instead of high carb. During most of that time I was eating more veggies and fiber than I ever did before low carb but I never made the connection between the fiber and my constipation because we're always told that fiber is what makes us "go". Now that I've seen how much different and better it feels to avoid fiber, it's hard for me to even think about going back to eating vegetables but I do miss them now and then.

All I was trying to say was that if you eat ZC or VLC you may lose the enzymes to process carbs quickly and suffer if you reintroduce too many. Which may not be many at all.

Quote:
Did you just quit cold turkey? I would love to know how you kicked the habit, because it sounds like I am about as bad as you were.

I was watching this show on TLC, I think the name was I can Make you Thin, not sure. He did this kinda hypnosis technique about picturing your favorite food and then associating it with something really gross. Well, I tried it out of the diet soda. Now, in all honesty I was probably ready to quit and this was just the motivating factor. So, I went cold turkey. I never drink anything but water now, no crystal light, nothing. If I desired an alcoholic drink, I will have one, but I never drink, like once a year maybe. You just need to make a decision, it is not willpower, but a choice you need to make.

Quote:
Suzanneeya, how long have you been at 0 carbs? Do you think that this will make my waist smaller? I need to decrease that belly fat.

I have been pretty close to zero carbs for a few years, but it wasn't until I started reading Charles' stuff(LindaSue too) that I felt 100% comfortable with zero carb. I always thought I was some kind of
freak for not wanting to eat other foods, now I see there are many of us who like the zero carb thing. So, it was just recently, like a week! I was always under 5 or 8 carbs a day, it was the eggs and occasional salad and mayo I eliminated. I still have a coffee in the morning with heavy cream and equal, but the rest of the day is meat and eggs. The first day I took out eggs I was actually kinda tired, maybe just a bad day or maybe a mini carb withdrawl, who knows.

aim in Fla*working Wrote:
I have never made goal which is 125 at 5'6 and I have gradually given up on Atkins Ongoing weightloss because my cravings get so out of hand.. [...]So...if it is alright, I would love to participate with you all.

We're glad you're here with us! I think you've hit the nail right on the head (to borrow LindaSue's term). In GCBC, we also saw this situation where a person on Blake Donaldson's very low-carb diet had the same problem. If they ate any carbohydrate, they had the water retention and gained weight. For some of us, that's the only way it will work.

I look forward to reading your updates on this. Cravings are certainly a sign of hyperinsulinemia and this way of eating should serve you well. The key is to make sure you eat fatty protein and only eat when you're hungry and don't eat when you're not. I write this a lot and I'm still discovering the power of this every day.

If a person eats fatty protein, they will be full and probably don't need to eat a whole lot of it. They can probably go 6 hours or more until they need to eat again. As long as they eat more fatty protein, they will be full without that much and continue on as if nothing happens.

However, if you add some carbohydrate to one of these meals, you will likely experience all the symptoms of food deprivation. That is what was discovered by Blackburn and Bistrian in their studies. It's an amazing thing but that is exactly how it works. In this way, zero-carb is akin to fasting because honestly, we need to understand there is no such thing as fasting. When we fast, our bodies continue to "eat" from our long-term fuel supply which is the stream of nutrients that goes through the circulation. When this is exhausted, our bodies will eat fat and protein from internal sources, such as muscle tissue. Either way, the body always eats. So whether we eat a lot or a little bit, our bodies will get what they need.

Now, we have to make sure we eat enough protein to keep our bodies from pillaging our precious muscle tissue so we don't end up looking like a low-fat dieter. We also need fat for energy so fatty protein is ideal. However, if you only eat twice a day, or you do like Sammy Davis, Jr and only eat once a day, that's perfectly fine.

However, what is not acceptable is to go about hungry. Don't do that. It's one thing if you go near food and you feel a pang or two and then you walk away and you're really not hungry. That happens to us all. But if this "pang" lasts more than a couple of minutes, you probably need to eat. Get some meat and you'll be good to go. The amount you eat should be proportional to when you want to eat again. If you only eat once a day, it should be a big meal, kind of like "Thanksgiving-full."

You don't have to follow convention and eat every 6 hours or whatever. You have to follow your own body and it's good to live off of that stored fat as you're supposed to. Insulin can keep this from
happening by making you hungry far too often and this can set you back. As I wrote yesterday, it's all about conditioning. You can re-condition yourself with time and patience.

**RE: Zero Carb / Meat and Water - suzannevea - 07-25-2008 07:26 AM**

I just finished eating a steak, but I was still hungry so I ate a huge thing of ground beef that I was planning to eat for lunch. Now, when I was on a low fat diet, this would have freaked me out, to eat so much early in the day cause it always meant I would be eating all day and go way over my "calorie limit." I used to starve myself all morning, fearing starting to eat cause it was always so hard to stop. Now, I eat when hungry. I was hungry so I ate a lot, but I know I probably will not need more food for another 6 or 7 hours, no worries.

daveo Wrote:
I used to go to Golden Corral quite a bit years ago. I admit is has been a while, but what do they have that is friendly to a zero carb lifestyle? I seem to remember some fairly carby meatloaf, and some pot roast in sauce. What are the good menu choices there?

Thanks for this post, I am gaining valuable insight from you!

Hey, Daveo, welcome to the forum. I apologize to any who have already answered these questions. I'm behind so I'm answering as I read these posts.

It really varies by location and I know this because I frequent about three or four in my area. They all tend to have grilled steak to order which is grilled fresh and available from rare to well. The salad bar has steak and chicken on it and some have sirloin wrapped in bacon. Some have beef and chicken fajita-meat. One of our locations has pork ribs (my favorite in Wake Forrest, NC) but all of them seem to have pork steak. There is some sauce, but it's not that bad.

Stay away from the Bourbon Chicken because it's really sugar-chicken. They have rotisserie chicken and barbecue chicken, the less saucy pieces, the better. Some have a Mongolian grill and they will have meat choices there. Again, watch the sauces but they are there.

Some locations have slow-cooked sirloin where they cook it like prime rib. It's very fatty and delicious. Of course, most have ham as well. There is baked fish at most of them. It's some pretty lean tilapia, but it's a nice changeup sometimes.

As you can see, they are primed and ready for the zero-carb experience!

Regards,

Charles

Charles, thank you so much for all your insight. When I started reading this thread, it clicked with me that the reason I've been stalled lately on lc is because I've never put much an emphasis on FAT! I've been zero-carbing for 2 days and have already lost 2 pounds... my stall (hopefully) is over!!

You're welcome, and congratulations!

FatGirlOnAtkins Wrote:
But I had a question; I love eating like this... I'm not hungry, and it seems like I instantly had more energy. But I love, love, love my veggies!!! I'm not exactly sure how to get away from them, if they are what's slowing me down. I also have a severe addiction to Diet Pepsi.. I know this isn't good. Help?

It just takes time. You may revert back to them from time to time but pay attention each time how your body feels and one of these times you'll get sick of having to "get back to work" after indulging in them. I'm saying that you'll make the transition on your own, probably.

The Diet Pepsi is bad as you know from reading this thread, but that's another one that will just take a little willpower and perseverance. You can do it!

Best regards,
Charles

jeepifer Wrote:
On the bright side, found some lovely chicken quarters at Aldi -- a 5 lb. bag for $3.49. And also got 5 pounds of 73/27 ground beef for $1.79/lb. So I'm set for a few days, food-wise. Next week I want to pick up some pork steaks. They looked nice and fatty, and were $1.99/lb. in bulk.

I'm constantly amazed at how cheap pork is in relation to beef. I grew up on pork, but I stopped eating it for years when I got some "religion." Well, my health has won out so I re-introduced it recently and I just love it. I have pork steaks for lunch today and I got a whole platter of them for cheap at Wal-Mart. I'm just amazed!

Hey Suzanneyea!

I love to see posts like this. Hunger is our friend and not something to be trifled with (I like that line, I heard it in a movie! 😊).
wow...this thread is active! hard to keep up with!

well I am on my 5th day of Zero/Near Zero carbs...and so far so good! I am down 5 pounds from my 10 pound regain! The first day I did have some tea...I had some free coupons that came with the bike I won! The tea has aspartame....I drank it anyway....but since then it has been ONLY WATER for me! I still think I drink the water just to be "putting something in my mouth," but I am working to drink "only when thirsty."

I looked at the prices of meat at Costco....wow! expensive...but these are large amounts...some meats were over $100! I am going to side with Charles and check out WalMart!

I had bacon for breakfast this AM...not sure what lunch will be...heading to a restaurant yet to be chosen...so we'll see...if I have to, I will sip water while the others eat, and I will grab something from the grocery store on the way back, and eat it at my desk.

When I read about 6-pack abs, and loss of "love handles" mentioned by Charles and a few others, I nearly cried. Even when I was at my low of 180 some 20 years ago, those love handles still bothered me..and I did not have a 6-pack! I am yearning for the days I will not be embarrassed to remove my shirt other than in my back yard.

Thank you Charles for all the info so far!!!

You're welcome. I read your post and got goosebumps all over. I don't know if my office became drafty or you just touched something...

When I lost weight on my low-fat diet, I did not see 6-pack abs either and I had love handles. I used to do 100 situps and even added a medicine ball at one point but it didn't happen. Once I got my diet under control, they came out and I don't do any situps.

I will tell you however, that as part of my weight workouts that I do twice a week, I do 10 reps of the Hanging Leg Raise, I do 10 reps of the Cable Core Press, and 10 reps of the Cable Tree Chopper. Yes, you read correctly, just 10 of each. You can find these three exercises on *Men's Health*.

suzanneyea said: I was watching this show on TLC, I think the name was I can Make you Thin, not sure.
He did this kinda hypnosis technique about picturing your favorite food and then associating it with something really gross. Well, I tried it out of the diet soda. Now, in all honesty I was probably ready to quit and this was just the motivating factor. So, I went cold turkey. I never drink anything but water now, no crystal light, nothing. If I desired an alcoholic drink, I will have one, but I never drink, like once a year maybe. You just need to make a decision, it is not willpower, but a choice you need to make.

Thank you for the ideas... I am going to try this. I keep telling myself I'm ready, but I'm just not sure I am. I need to do this!

I know you're right. I do get sick of the "having to get back to work" feeling. It's really not worth it to splurge a little one day to feel horrible the next. I am so going to try with the Diet Pepsi. I guess I've always felt like that's the only thing I could have and not feel guilty about having. But it's become an addiction. Thanks for the encouragement, everyone!

RE: Zero Carb / Meat and Water - aim in Fla*working - 07-25-2008 12:21 PM

Charles, thank you so much for that info...having PCOS and Fibromyalgia (with Chronic Fatigue), It was drummed into me to eat mini meals all day...so I became a grazer...so everything became and issue of WHEN COULD I EAT...i had to eat so much I was a pain in the butt...Oh wait..how will we go camping all day on a whim...AMY HAS TO EAT...will there be a refrigerator?? Do I need to bring my cooler???? I have to space out my meds from the intake of food so that it can be properly absorbed so when will I eat to take the meds...it is insane..I cannot WAIT until I can eat once or twice a day AT DINNER TIME..not have to eat IN FRONT OF MY STUDENTS because of this health issue...and be a normal person!
And maybe get to my goal weight to boot??!!??!! I am glad to be here. I really feel good about this...Like in my gut! No pun intended~
WARNING!!!! TOOl MUCH INFORMATION lies ahead....~~~
LindaSue, why do you think you are not losing more? I know this (TMI warning!!!!!!) I have severe IBS with Consto and Have been off my pills for a few days..my belly does not hurt as bad and my stomach was flatter...due to 'almost' zero carb and I have gone daily

Hopefully, that, plus zero-carb may get them for you!

Thanks again! My wife had us buy this big fancy workout machine a few years ago after she had our first child. Since it was not my decision to buy it...I don't feel guilty about not using it..😊

but...I think I can do all three of these exercises using the clothes rack in our den!

Ab

RE: Zero Carb / Meat and Water - jeepifer - 07-25-2008 12:41 PM

Gee, how come I never get the permission to buy the big fancy workout machine???

RE: Zero Carb / Meat and Water - travis t - 07-25-2008 12:44 PM

Carbs are most assuredly addictive. I have been married for almost 21 years and i have known my father in law for about 23 years. In all these years i have know him he never had a problem with soft drinks, i mean he has always drank them but it would be maybe one a day. Now everytime i see him he has a coca cola bottle in his hand and he
also is pounding down the M&M's. He is seventy and still in good health but i don't think that can last very long under that kind of assault.
Carb intake will become a run away train if we don't watch carefully.
I am being very carefull about my kids and carbs because when i was young my body seemed to be unaffected by anything that i could throw at it. Now i know that isn't true that damage done from the last 39+ years is still with me.
But i have a new dedication to the many things that i have been put here to do. My focus and determination are at very high level since going very low carb.
This Meat, butter, and coffee diet is awesome.
happy friday
travis t

RE: Zero Carb / Meat and Water - suzanneyea - 07-25-2008 12:56 PM
People always ask me what stomach excercises I do to get my 6 pack and I am like Charles, I used to do a ton of crunches and all sorts of sit ups. Now I do maybe two sets of sit ups a day. It is all my diet.

RE: Zero Carb / Meat and Water - jeepifer - 07-25-2008 01:03 PM
Suz, you and Charles should get together and do an infomercial.

RE: Zero Carb / Meat and Water - suzanneyea - 07-25-2008 01:40 PM
It is easy for me to chat zero carb here cause you all support zero carb. I refuse to talk to people who are anti zero carb. Charles has all the technical info on why it works and how it works, me I have no clue. I just have my own experience. I would be more than pleased to be a case study for Charles when he writes his book.
(Edited for a million spelling-typo errors)

RE: Zero Carb / Meat and Water - aim in Fla*working - 07-25-2008 01:41 PM
abs are made in the kitchen...
word!

RE: Zero Carb / Meat and Water - abnormalslc - 07-25-2008 01:53 PM
well...I had a nice steak and cool crisp water for lunch!
I told them..."steak only"...and still they add fried french onions on top....I removed them...and ate the steak!
mmmmm....a bit over priced...$20...but delicious!

RE: Zero Carb / Meat and Water - bracon - 07-25-2008 02:36 PM
Another woman doing Zero-Carb, with great success, yes Me.
I have been doing ZC for 6 weeks now, strictly Zero-Carb. I went from 131pds to 117.5pds, as of this morning. And believe me; this way of eating is like sculpting David!

I’m 48 yrs old, 5’5”, with two children. My main reason to start this way of eating was to eliminate my constant constipation and my heat wave.

I have suffered from constipation from as far I can remember and finally I got rid of this and feeling better everyday. For the last two years, I have been doing low carbs but I could not get myself to go over 10g of carb a day without suffering from it.

By trial and errors, and searching on the net for a solution, and mostly, for trying to understand why I could not digest Carbohydrates, I discovered the Bears, with his very controversial approach and way of living and eating. The Bears was an inspiration to me, he had a way of explaining in a simple way the why and the how and would not give a ‘bip’ about others opinion. He was and still is, his own rat’ experience.

Each of us has to find what is best and suitable for us and follow what we believe from it. Since then, I have read many books, studies and I’m convinced that Zero-Carb, for me, is the only way to go, to stay healthy.

Because some of you will ask, here is my typical day:

6am get up, have two cups of hot water, mixed with coconut oil (about 2tbsp) (I stopped drinking coffee, my decision)
11am or noon some kind of meat, usually ground beef (73-27) or a rib eye
3h30pm Bacon strips (the no sugar ones), par of rib eye again
7pm sit down dinner, meat, but mostly I eat ground beef, rib eye and bacon and the more I eat it, the more I want more.

I don’t eat dairy, eggs, fish, because I don’t feel like eating them. Water is the only drink I take during the week. I might take a glass of dry sherry on wkends.

FYI, here are the positives since I have started:
1. no more night sweat, not a single drop of it on my pillow that would wake me up all wet and cold
2. no more constipation, none what so ever and going to the bathroom once every second day, early in the morning, right after my cup of hot water mixed with coconut oil
3. sleeping better, more deeper it seems and longer
4. no more dark circles around my eyes in the morning
5. my face and skin have an oily feeling in a good way, soft to the touch and I suntan a golden color...
6. my nails don't split anymore and are getting longer by the day
7. my hair has that shine of healthy and getting also longer and thicker
8. my overall body definition is remarkable and specially around the waist area, one part that I was never able to accomplish
9. I have more energy throughout the day, once in a while, I still have to nap but it is getting better
10. my teeth have that squishy feeling, like when you eat a very fresh cheese
11. I can definitively say that I'm smaller, less fat than before
12. my appetite has completely disappeared, no more feeling of hunger

The negative effects:

No hunger so for me it is very hard to accept the fact that I don’t have to eat. I feel guilty for not eating
Don’t kill the massager here but I don’t want to loose weight anymore and I don’t know how to stop the scale from moving down again. I do understand that by feeding my body, it will adjust to itself to a healthy weight and size. And not having an appetite doesn’t help in this department. If I reintroduce dairy products, I will gain but I don’t like dairy much enough to eat it. I will find a way to stay stable.

Oh before I forget, here a quote from Charles:

‘...See, these are the things that amaze me. When you say that you've been zero-carbing for weeks, and then you post about coffee, cream and salad that makes me wonder. If you're going to do zero-carb, you have to do it and give it some time to work. You have to be consistent and stay out of your body's way. You can't think that because you eat cleanly for two days that you're now going to drop 5 pounds based on that. We're talking about conditioning and insulin control. That takes time and it takes consistency. When you load yourself up just once with some carbs or some substance, it takes a few days for the effects of that to show up. I don't know how caffeine works. For Travis, it works great. For others, not so much. Some people are addicted to it and others can take or leave it. If you can't live without it, you're addicted to it. Once you quit drinking it, you have to allow a couple of weeks for the effects to show up. When you quit smoking, it's well documented that these folks put on weight after they stop, especially if they don't go zero-carb with a bunch of fat right away. Please don't eat for weight loss, eat for health and the weight may be a part of it. What would you do otherwise, just eat unhealthy because there's no use? I know it's hard to do things right for a while and not see results, but you can't view it that way. Each day you eat right, you are becoming healthier. Obesity is one of many symptoms we want to avoid. If you have none of the others, consider yourself fortunate! ...’

Boy, I LOVE THIS MAN!

---

**RE: Zero Carb / Meat and Water - aim in Fla*working - 07-25-2008 03:57 PM**

Bracan! Thank you for sharing your input! I too have suffered from COnstipation at chronic status...once just taking laxitives daily for YEARS...i then developed BAD IBS...these last two days, although NOT at zero but very low...I have used the bathroom on my own with no pain or discomfort. My stomach is NOT tender to touch and I have been out of my meds for a week and in the past when i did not take meds, the next day it was like I was kicked with a boot in the gut! I pray this continues...at 60 bucks a month and insurance NOT covering the meds...I would love to save 720$ a year!

My best friend is : Wal-Mart... I like simple things, so this is where I get my coconut oil, in the vitamins section (drugstore section) and not in the cake and flour section of the food side.

The Rexall comes in a 16 ounce tub. It just tastes like coconut. The picture of the oil is on this tread, almost at the end of the tread.

Oh, and I almost forgot to mention that I, too, have a six packs... no big exercise but doing yoga 12 hours a week. The Zero-Carb gave me the definition, not the exercise.

RE: Zero Carb / Meat and Water - Living_healthy - 07-25-2008 07:56 PM

I use Barlean's coconut oil. Little expensive, but I think it's worth it. I mix it with plain coffee every morning. At first when I heard of this, I thought "GROSS!" But it actually tastes good. I still don't have the nerve to eat it straight from the spoon. That thought still grosses me out!

Abnormalslc, I like your signature quote (The feeling of successfully overcoming temptation is so much better than the guilt we heap upon ourselves if we "cheat.")

My goal is a six pack. Ya give me hope.

LindaSue, why do you think you are not losing more? I know this (TMI warning!!!!!!) I have severe IBS with Consto and Have been off my pills for a few days..my belly does not hurt as bad and my stomach was flatter...due to 'almost' zero carb and I have gone daily

I honestly don't know. I don't "cheat" and I never let myself go hungry. My guess is that my problem is hormones. I'm 51 years old and menopause is probably coming sometime in the next few years. Charles probably won't agree with this, but I sometimes suspect that I eat too much for my small body. I'm not eating enough to cause me to gain but too much to allow for weight loss.

suzanneyea Wrote:
It is easy for me to chat zero carb here cause you all support zero carb. I refuse to talk to people who are anti zero carb.

I've seen your posts at LCF and I can't agree with you more. For every sympathetic post over there, there are twenty more people ready to jump down your throat and tell you that you're doing something on par with Kimkins. I respect your bravery for posting about your WOE over there. I'm a very long time member of LCF so I'm very cautious about posting anything controversial when I'm there. It's a relief to come here and participate in this thread.

Welcome, bracon. You're doing great and your list of improvements is inspiring!

RE: Zero Carb / Meat and Water - Gr82bthin - 07-26-2008 09:09 AM
It's taken me 3 whole days to read this thread, but I just couldn't stop reading it! I have finally found the place where I belong. I, too, have had some success on Atkins, lost 50 pounds in a year, but have always stopped losing when I added any carbs over 20. I have to stay around 5-7 carbs to lose, and I still have another 30 pounds to go. I have been chastised by the folks on the Atkins board to the point where I will not return, rudest people I have ever known. I do frequent the LCF. I have found out a lot about my body over this past year, and love eating fatty meats. My favorite is beef ribs on the grill with a little sea salt. I could eat those every day, hey, I think I will!

Thank you, Suzanneyea and LindaSue for your insight. Suzanneyea, special thanks for leading me here and LindaSue for your wonderful recipes. Thank you, too, Charles, I am hoping that once I truly get to zero carbs I will have more energy.

**RE: Zero Carb / Meat and Water** - daveo - 07-26-2008 09:17 AM

Question for you all. BBQ is one of my hobbies. I have a couple smokers and I love smoking Ribs, Brisket, and Pork Butt. All fatty, all great. Problem is, BBQ sauce makes the BBQ for me 😊 Up till now, I have just used very little sauce, but even that is too much carb for me.

Anyone have some good suggestions for 0 carb condiments/spices that are good on hickory smoked meat?

**RE: Zero Carb / Meat and Water** - Sambezious - 07-26-2008 10:02 AM

Hey Daveo!

I'm sure this will seem tame to you if you really enjoy the BBQ sauces, but all I use on my ribs is Tony Chacere's seasoning, Salt, Pepper and just a sprinkle of garlic powder.

There are a few BBQ sauce recipes on the web that are low carb, but not zero carb.

I use this sauce from time to time. It's pretty good.

**RE: Zero Carb / Meat and Water** - LindaSue - 07-26-2008 11:45 AM

Welcome Gr82bthin.

Daveo Wrote:
Anyone have some good suggestions for 0 carb condiments/spices that are good on hickory smoked meat?

I doubt if there are any condiments or seasonings that truly have zero carbs. I think they make food more interesting so I do use them in moderation. Unless you can't tolerate any carbs at all, I don't see any harm in a little sugar free barbecue sauce or ketchup now and then. We're only talking about a couple of carbs per serving in most cases.

**RE: Zero Carb / Meat and Water** - KimPossible - 07-26-2008 01:01 PM
wow...this thread is active! hard to keep up with!

Ain't that the truth! Every so often I have to come in and catch up! It is great to see how this thread has grown! I am very excited (still) about this WOE and am glad to see others as excited as I have been!

Boredom? That's psychological. If ground beef was all you had to eat, after a while you would learn to love it and even look forward to it, Stefansson's explorers found out.

If I had a lot of weight to lose, I would honestly find about three meats on this list and I would eat them and eat them exclusively (along with drinking water) until I got to where I wanted to go.

I wanted to re-post this b/c I COMPLETELY agree and have been one to crave "variety" at various stages in my journey. I have found, truly, that no matter WHAT diet/WOE I have chosen in the past, whether it is low-fat, low-carb, Kimkins, zero-carb...that the LESS thinking I do, the better. Most days I cook a whole 5 lb roll of gbeef from WM into patties and eat them. It is easy, I don't have to worry about getting overly hungry while I have to make something (b/c I eat when truly hungry now) and there's no room for error. And it works. And I, surprisingly enough, am not bored. When I have chosen something different it is the variety I thought I would lack--for example I bought a marked down Delmonico steak from WM the other day and pan fried it in just a bit of butter to coat the pan--OMG it was soooooo good. "Just meat" isn't a boring thing b/c of so many different types of meat available. That's variety enough!!

Sometimes it just zipped off and sometimes it didn't.

This is what's been happening with me. I haven't checked lately, but so far I've lost 11 lbs...I have gained one or two back here and there--most likely due to relapsing in my diet drink habit (working on that...AGAIN) and a few extra carbs in the form of salads and veggie and beef soup (it's a weaknessLOL) here and there. But what I've found is that I could care less what the scale says day to day--I am focused on long term. I'm not obsessing over food and I'm NOT obsessing over the scale.

I refuse to talk to people who are anti zero carb.

me too. or low carb for that matter. I aim to be as knowledgable as Charles one day...but for now, unless they ask, I keep my mouth shut. LOL

Your body will keep pulling you back and one of these times, you'll finally decide that it's not worth it because you won't feel like "getting back on track" more than you feel like "going off."

It just takes time for your body and mind to come to that escapable conclusion.

I am headed to the beach for 5 days starting Monday, and in the past vacations have been very tempting for me. (it's vacation!!) I am hoping that this time will be different--hoping that the above is one of these
times for me. I'm going with other adults, as well as my kids, so the pressure will be on...I'll let you know how I fare!

---

RE: Zero Carb / Meat and Water - KimPossible - 07-26-2008 01:04 PM

side bar: took a look at your blog, Ab, and seeing the HSM3 pics--I am jealous! How fun was that!?? My kids would've loved it!

---

RE: Zero Carb / Meat and Water - pennypritty1 - 07-26-2008 02:36 PM

Well I just did a baddy... *sigh*

So much for thinking I could have just "some" low carb ice cream on a pretty summery hot day... nah!

Can't do that anymore. I had a (small) bowl -- parenthesis 'cuz I'm lying about the size of the bowl -- of the lc chocolate and I couldn't stop. I thought having a little would do me a nice treat...

... and OH BOY! **BIG OH! BIG BOY and BIG DUMMY!** I couldn't stop myself.

I had a good (yummy treat) day and a very bad carb day. *4g carbs don't mean anything when you don't STOP at the 4grams.*

This can NOT come back into **MY** house again!

OH! And remember when I'd said earlier, I got bored with ground beef? Well, what'd ya know? Now I want some and I don't have any in the house. Time to go food shopping for a couple pounds of the stuff and just get my self back on the ball...

(gotta keep reminding myself about my Miss Universe dream!!!)

UNGH!!! Mental head slap!

Font and color were changed for effect of how I feel today. (smile) Now--back to your regularly scheduled programming.

---

RE: Zero Carb / Meat and Water - KimPossible - 07-26-2008 04:01 PM

I feel your pain--I almost bought some today at the store...but swiftly averted my eyes before the deed was done. It's one of my weaknesses!

Don't worry too much about it! It's all a learning process! 😊

---

RE: Zero Carb / Meat and Water - pennypritty1 - 07-26-2008 04:41 PM
suzanneyea Wrote:
Move to Quebec, we do not have any of the low carb products, you kinda gotta eat just meat, nothing else.

hmmm.... move to Canada? is it cheaper than NY?

Sometimes I think living ANYWHERE ELSE is cheaper than the City these days. I can hardly afford to eat meat only with food prices here along with the cost of living.

RE: Zero Carb / Meat and Water - aim in Fla*working - 07-26-2008 05:06 PM

i ate about 4 cookies and had milk. I honest cannot believe it ...I was running around thinking my stomach has not been this small in a fery long time....then this. I think I am sabataging my success. I am ashamed and feel terrible and I am going to bed. I actually talked my BF into getting it. I manipulated him. It is shameful. I am ashamed. I have all kinds of meat in the house and i cannot believe i blew it.

RE: Zero Carb / Meat and Water - aim in Fla*working - 07-26-2008 05:07 PM

not to mention, my belly (IBS) hurts so bad, i had to send Bryan out for medication...Zero carb is a CURE for my disease and a way to live pain free and 4 cookies and milk took that away.

RE: Zero Carb / Meat and Water - jeepifer - 07-26-2008 05:24 PM

It's all part of the learning process. At some point, it just won't be worth knowing you'll feel like poop afterward.

I haven't reached that point yet. 😞

RE: Zero Carb / Meat and Water - Valcan - 07-26-2008 05:57 PM

Hi,
I live in a small city in Alberta and low carb products are nonexistent here too. I used to order from low carb grocery but haven't in months. I either make it homemade or I do not have it. I think we are better off without the frankenfood anyway.

The Canadian government seems to think that there is no scientific evidence that carbs can harm you so packages here can not say "low carb" or "no carb". Many companies have changed and label their products "sugar-free" instead. When I see sugar-free, I read the ingredients and 99.9% of the time I put it back on the shelf. They usually have sugar alcohols or soy - I former does not agree with me and I don't agree with the latter.

It is not cheap to live here but it is cheaper than New York.

Val
RE: Zero Carb / Meat and Water - suzanneyea - 07-27-2008 03:05 AM

My son eats a lot of low carb food that I cannot touch. Now the 10 kinds of cheese I keep in the house, not tempting to me at all as I can easily live without cheese. It is the oppsie rolls I make for him, man I could eat the whole batch! Plus, I make him all those low carb cheesecake desserts and such that are in the Atkins book and they can be VERY tempting. Especially, knowing they are low carb and are not "that bad." But, it is easier if I never even take a taste. One tiny little taste and I am off to the races and it is all gone, lol.

I hope you're feeling better today, aim...

I had an "interesting" night in result of my lc ice cream overdose - lol (TMI)

But I'm determinedly back on track today. off t'church...

Have a great day, everyone.

RE: Zero Carb / Meat and Water - Charles - 07-27-2008 06:29 AM

Wow, it took me some time to catch up. I just finished my Sunday morning track workout and figured, I'll check in with my favorite people on the planet. What do you know, there are many new people so to all of you, welcome, welcome and welcome. If I can help in any way, please drop me a line.

To those who slipped a bit, please don't look at it like that. It's all part of conditioning. One day you'll get sick and tired of having to steel up your resolve and get back to work. You'll think about it beforehand and then you'll still do it. Then, there will be a nice quiet day where it happens again but this time, you'll just say, No, and you'll walk away. You'll have slight regret, but you'll be so proud of yourself the next morning when you step on the scale.

No, LindaSue, I don't disagree with you. You may be eating too much for your small frame. I don't know the mechanism that would cause you not to lose, but it's not calories. Those hormones of yours seem to like you at the weight you are. I suspect you would have to do something entirely different to change things. Some exercise may allow you to mobilize more fat since you say you are pretty sedentary.

I'm not saying that the exercise will "cause" the weight loss, but I'm saying it may at least force your body to re-think it's equilibrium and give you the 3 to 5 pounds you're looking for. Who knows? After all, it's all about conditioning and if you conditioned your body to do something consistently, why wouldn't your body respond accordingly?

Everyone, enjoy the rest of your weekend!

Best regards,
Charles

RE: Zero Carb / Meat and Water - LindaSue - 07-27-2008 07:02 AM

Charles, except for this past week, I've been doing an hour of Callanetics twice a week for the past few months. They are very intense exercises. I would have done them this past week as well but I tried adding some Pilates the other week and they did something to my back. I'm waiting for my back to recover before resuming the Callanetics. Although Callanetics are quite strenuous, they aren't hard on the lower back and they're not at all aerobic. They work your muscles very deeply with very slow, gentle movements.

RE: Zero Carb / Meat and Water - aim in Fla*working - 07-27-2008 07:41 AM

Thanks guys for the support😊 I am back and strong and ready to do this again. I went walking 2 miles this morning..a little (a lot) slower because my knees are all jacked up from the carbs and sugar and starches of the cookies (fibromyalgia sucks) and Bryan notified me that the cookies he made he added 2 together and made bigger ones so actually I ate 8!!!!
Today I feel like i have nails in my shoulders and hips and fingers are stiff like sausages. I wish this happend BEFORE i ate the cookies and when I said no, the 'real healthy me' would come back with no pain...ah, a Sci Fi world I would love to live in....I would be thin😊
Bryan is making a LC favorite fro Linda Sues Wesite (yay Linda..my parents adore your seoul chicken!!) and I will be having steak with a pat of butter on top of it. I am back at ZERO carb again...ready to feel the thinness I woke with yesterday...
Thank you for the emails of support...I am definately in the saddle again.
Today....
I walked 2 miles...
I am cleaning the house BIG TIME!!!
so all of that will kill off some of the sugar, starch and other poisons...I am having ground beed for breakfast...lunch and a Lobel's filet mignon for supper--- 8oz! my sicks are back to nothing....yesterday morning they were blackish purple they were so dark!

RE: Zero Carb / Meat and Water - Living_healthy - 07-27-2008 08:24 AM

Well, I ate organic ham (no nitrates) this morning. Tasted great, but was too lean. Had to add 2 tablespoons of coconut oil to pick up my fats. Sometime today (I have no exact schedule) I'll eat ground beef. I had been eating ribeyes, but getting a little burned out......I never thought I would say that.

Be back later, got to hit the treadmill. Hope all of you have an "everything goes your way" day!

RE: Zero Carb / Meat and Water - Daryl - 07-27-2008 09:44 AM

I'm on page 93 (I think lol) of this thread, so still catching up.... I was pretty pumped about trying an all meat diet, but am wondering if I'm having problems with arachidonic acid. Dr Eades once wrote that it can be an issue for some folks, and it's primarily found in red meat and eggs 😐

I'm going to try an elimination diet the next couple of weeks, see if I can confirm if it's a problem for me.
RE: Zero Carb / Meat and Water - FormerDonutJunkie - 07-27-2008 11:05 AM

Living_healthy Wrote:
I use Barlean's coconut oil. Little expensive, but I think it's worth it. I mix it with plain coffee every morning. At first when I heard of this, I thought "GROSS!" But it actually tastes good. I still don't have the nerve to eat it straight from the spoon. That thought still grosses me out!

Abnormalslc, I like your signature quote (The feeling of successfully overcoming temptation is so much better than the guilt we heap upon ourselves if we "cheat.")

My goal is a six pack. Ya give me hope.

Barlean's is also my favorite coconut oil! It is indeed a little higher at around $15, but I just found it at http://www.vitacost.com for $11.16. That makes it a really good value.

Barlean's is one that I can eat direct from the spoon.

aim in Fla*working Wrote:
Hi Daryl...sorry you are having problems...I am sure someone will advise Charles maybe But, is what you are having like Gout?

Hi No, it's not gout, the symptoms I'm dealing with are primarily itching, and slightly elevated blood pressure.

Here is a link that reprints what Dr Eades said about it:

http://www.opinions3.com/arachidonic_acid.htm

Now, he has since backed away from his concern with AA, but I'm trying every avenue possible to nail this down.

I'm diabetic, and have had fantastic success with a VLC diet, going from 260 pounds in December of 2006 to 154 now, and completely getting off diabetes meds. But, the last few months, I've had the itching.... mainly on my back, shoulder blade area, but it pops up elsewhere, sometimes.

I've had my kidneys and liver checked, and have had 3 different docs tell me that all is fine, so the search for an answer continues!

RE: Zero Carb / Meat and Water - waywardsister - 07-27-2008 12:01 PM

Back after a week somewhat off track. A friend died suddenly, so was at wake and funeral and such, and not much concerned with what I ate. More concerned with eating at all. Still, did pretty well all things considered. I seem to be able to handle a dose of carbs quite well, other than bloating I feel pretty fine. I even mistakenly ate gluten - just a little before I realized - and had some blow-out from that but not too bad. Think my body was going easy on me. Overdid the dairy, which I shouldn't do but oh, it's my weakness. Anyway.
Looking forward to getting back on track now. All this talk of abs! Man, I would love to see my abs. My fat gain was predominantly around my middle, partly due to inflammation (wheat belly) but it's still where I hold a big old roll. It's nice to hear that many of you have seen the belly flab melt off via diet. This is really motivating to me, over and above health - oh vanity, my constant companion.

Some questions just for interest. Anyone ever eat some of the more 'interesting' meats? I spent a few days in cottage country with my BIL's parents, and we ate perriwinkles (a type of snail) - this is a great appetizer, just briefly boiled in salt water (in the shell) and then plucked out with a toothpick and dipped in garlic butter. Wow. Also had raw oysters, both on the half-shell with hot sauce and in shooters with vodka, salt and a little seafood sauce. This really inspired me, for variety's sake, to venture out into some seafood, which I don't eat often (I'm a beef and lamb gal, mostly). Anyone here eat much seafood?

What about organ meats? I really want to eat more organs, it's just a matter of finding them. Liver is easy, but I'd love to get into trying sweetbreads and other organs. Anyone ever had brain? Got any good heart recipes? I can get beef hearts at my farmers market and I usually feed half to my cats, and grind the other half into ground beef but I am feeling adventurous lately. Thinking of ordering a quarter beef, and asking for as many organs as I can get, also the tallow/suet and marrow bones. Oooh, beef marrow...so good. Lamb marrow is amazing too. Nice and fatty.

Hi to all the new people since my last post!

Hi Mac.... let's see. Okay, here we go, it's from his blog, one of the comments:
Quote:
Great debunk as usual, but I have a question–when I read the original Protein Power I remember reading about arachnoidonic acid (I hope I’m spelling that right) which is highly concentrated in egg yolks and how a sensitivity to it could heighten blood pressure and slow weight loss. In your later books it doesn’t seem to be mentioned. Should that still be a concern?

Hi Patricia–

It’s arachidonic acid that you’re thinking of, and we did write about it in Protein Power. Unfortunately, I wrote that section just after having fallen under the evil influence of a long conversation with Barry Sears. Subsequently, I realized that it doesn’t really matter all that much, which is why we never wrote about it again.

Cheers–

MRE

I’ve had 3 other people tell me over the weekend that the AA does give them trouble, so I tend to think that it’s a genuine concern, at least for some.

RE: Zero Carb / Meat and Water - ajcav062197 - 07-27-2008 01:45 PM

Hey All.. I have been down w/ a stomach bug the last couple of days. My whole family had it.. no fun.

I did manage to stay on plan. It's been two weeks, tomorrow and I have lost 7.2 lbs. I am happy on this plan I was worried when I got sick. I thought I would have to eat something for my stomach but I didn't. I feel better today and hopeful that I will be up for exercising again soon.

AJ

Hi, Charles!

Thanks for the encouragement. I know I can be hard on myself for one and I was really ticked with myself for falling (almost literally) into the low carb ice cream tub. lol

I think it was triggered when my job scheduled a surprise ben & jerry's ice cream treat for our office and I didn't go for it (of course) but felt I could have MY OWN ice cream.

It just went south from there. lol

I'm glad to know it's just a part of the walk and to not be so hard on myself for it. But I WON'T be touching that lc ice cream for a loooong time. (It left quite a memory for me...)

RE: Zero Carb / Meat and Water - Living_healthy - 07-27-2008 06:03 PM

After eating that lean ham this morning, I had to eat a lot of additional fats today to bring up my daily percentage. I try to not go below 80%. I was able to bring it up to 79% (close enough). Normally, I eat and don't keep records, but I started journaling again at FitDay because I want to make sure that I am consuming enough fats. Ever since I started making sure that my fats are high, I've been steadily losing. 6# this week.

RE: Zero Carb / Meat and Water - Daryl - 07-27-2008 07:07 PM

Charles Wrote:
MAC Wrote:

used extremely lean steaks and whitefish for the measurement. The fish was roughly 90 percent calories protein and 10 percent fat and the meat was 70-30. The more interesting question, and the one more relevant to the arguments in the book, is what happens when the meat and fish are more in the neighborhood of 70 percent or even 80 percent fat by calories. That hasn't been addressed. In short, the assumption that our insulin is primarily regulated by the carbohydrates in the diet is a reasonable one and will tell us most of what we need to know when it comes to fat accumulation and chronic disease."

I'm with Gary Taubes here. The fact that these studies were performed with lean protein doesn't tell us what we're really trying to know. Even if lean protein does raise insulin levels to that degree, one could only consume such a diet for a few days before they would run into trouble so any fat accumulation number would only be speculative because we all know the effects of rabbit starvation.

Saying that consuming excess lean protein raises insulin enough to where it causes fat storage is the equivalent of arguing that a high protein/high fat diet leads to calcium loss and liver damage. The initial numbers are one thing but we know if someone continues on it the studies consistantly show
that the adherents never show any such damage.
I think the same is true here. Someone may note some temporal reading but over the long term I don't think they would hold up. Everyone continues to cite this 150g glucose "need" for the brain. However, we know that if we get the carbohydrates low enough or eliminate them, we don't need even this much -- and of course after 7 days of fasting, we need none at all. There are too many variables and most of them are not static. This is a homeostatic system so we have to expect that any change will affect the entire organism and force a corresponding compensation.

Are you saying that the liver (and other organs/functions) normalize after one begins zero carbing? The body does seem to be an incredibly flexible system.

RE: Zero Carb / Meat and Water - jeepifer - 07-28-2008 05:16 AM

I think given optimal food intake, the body can do wonders to repair itself. Not miracles, but still... just look at the insulin regulation and receptor repair that can take place (eventually) with zero carb. It makes sense that the repair can continue down to the molecular level. Amazing!

RE: Zero Carb / Meat and Water - Daryl - 07-28-2008 06:00 AM

Absolutely, jeepifer. 😊 Severely restricting carbohydrates did wonders for my diabetes, and I hope it will for the rest of my health, also. I tend to think so, anyway.

RE: Zero Carb / Meat and Water - Charles - 07-28-2008 08:09 AM

daveo Wrote:
Question for Charles though anyone else is free to answer.. What are your thoughts about drinking alcohol on a zero carb diet. I'm not talking every day, but I love the occasional dirty martini or glass of red wine.

Hey, Dave.

Alcohol is one of those things. It is metabolised just like carbohydrates in that your body will divert it's whole attention to processing it before it goes back to fatty acids. Many people don't seem to understand that carbs are handled exactly the same way. The liver has to covert it to triglycerides to send it along with fatty acids to the muscles to be burned; (read:. eliminated.)

Many people tout the anti-oxidant potential of red wine but I say, if you don't eat that which oxidizes, then what need have we with the anti-oxidant? So I don't indulge. But perhaps others can share their experiences with it.

I suppose it's a lot like coffee. If you can take it or leave it, it may be harmless. If it is something you have to have, then it's an addiction and has no place in your life.

Regards,
Charles

suzannelyea Wrote:
It was heartbreaking, seeing all these overweight kids eating junk all day.

I was thinking about this a few weeks back as well. These poor kids are eating what they've been told is okay and they don't realize that these foods are making them sick. Fat is only one of many symptoms these children are acquiring and not enough attention is being paid to that. It's heartbreaking to think that they are on their way to everything from obesity to diabetes, hypertension, cancer, Alzheimer's, dementia, and a poor start for their future children, all because of what they are eating. Being at the zoo is a "special" occasion so I'm sure their parents don't see anything wrong with the junkfood because, after all, it's a special occasion.

The very fact that we associate food with "occasions" in general is a problem. Think about it: We go to the movies, we need food. We go to a birth or funeral, there must be food. We go to the amusement park, that's an occasion to eat junk; etc, etc.

They say that zero-carb is boring and I get that. What I don't get is why people can't think of many more things in life that are more exciting than what they are going to eat.

Daryl Wrote:
Are you saying that the liver (and other organs/functions) normalize after one begins zero carbing? The body does seem to be an incredibly flexible system.

Yes, they do. Most of the arguments that people make against zero-carb usually come from an effect of protein or fat during a situation that is not zero-carb. For instance, excess fat consumption can make you fat when you have carbohydrates in your diet. However, if you remove the carbs, your body will process fat exceptionally well. You can find this with regards to calcium, vitamin C. Omega 3s and the whole gamut. These are situational variables and once you remove the carbohydrate, the body tends to normalize all these levels. Studies involving meat-eating cultures never show deficiencies of any type even though they don't eat these so-called valuable phytonutrients.

Another one that we've mentioned from time to time is transient hypercholesterolemia, which is an occasional elevation of cholesterol that will occur with fat loss. We store cholesterol along with fat in our fat cells. When fatty acids are mobilized, the cholesterol is released and thus serum cholesterol
levels (total cholesterol) can spike. This leads people to think that an all-meat diet will drive cholesterol levels through the roof. However, after successful weight loss the levels will be fine.

I hear you on that. I was addicted to coffee, and quit cold turkey 2 weeks ago. Wasn't a problem, and I don't miss it anymore. As far as the alcohol, I only drink occasionally. I was interested more in the effect it has on weight loss than anything else. If I remember correctly, I read at some point that although, like you said, the body metabolizes the alcohol 1st, once it gets through the alcohol it switches right back to fat burning, unlike easting carbohydrates. Do you know if this is true?

I've also heard that we (women) store excess hormones in the fat cells as well. Like those of us that took birth control pills can experience some hormonal weirdness as the fat cells are depleted because of the excess stuff coming out and being burned off. Is that the case as well? What else is stored in there? Yuck!

It's the same as carbohydrates. This is the way our bodies evolved to deal with any foreign molecule. Anything that is not fatty acids are first converted to triglycerides and then sent to the muscles to be burned. While insulin is high, the muscles will burn glucose or any other substance. When insulin is low, the muscles will only burn fatty acids. If the substance doesn't raise insulin, it goes straight to the liver, like fructose and alcohol. From there, it is sent to the muscles and if there are no takers, it gets sent out on lipoproteins which damage LDL cholesterol molecules by shrinking them and making them very low density lipoproteins. These make their way to our arteries and it constricts them.

I haven't heard this one but it's not surprising because there are only so many biological processes that we have. All foreign items are handled like known molecules and that's what causes us problems. Our bodies go about their business as usual and they try to compensate for foreign things. The ways our body's compensate is what causes us the most headache. Our researchers spend too much time trying to counteract the compensation rather than preventing the problem.

I saw in the news today that a Texas billionaire is offering billions of dollars for the person who comes up with the cure for cancer. I'm tempted to place a call...

And people are saying that women can't lose weight on this way of eating? They should ask you ladies! 😊

**RE: Zero Carb / Meat and Water - FormerDonutJunkie - 07-28-2008 12:55 PM**

Wife just picked me up some 75% lean ground beef today at the local Ingles. She's going to make up some patties and fry them for me later. I also went ahead and picked up some Celtic Sea Salt at Earth Fare today.

I'm not 100% M/W yet...but am testing the waters, since veggies have never really appealed to me, even from childhood. However, I do love eggs and still eat 2 to 3 every morning. Matter of fact I've already had four today, 2 for breakfast and 2 for lunch. I may consider backing off the eggs for a few days and trying the ground beef patties to see what negative effect the eggs may have on my weight loss. If their omission speeds it up, then I'd be willing to give them up...for a while at least!

**GROUND BEEF...it's not just for breakfast anymore!**
I should patty the rest of my 73/27 ground beef and have DH cook it on the cast iron pan on the grill when he does the t-bones tonight. I love the taste of charcoal grilled meat!

Any thoughts on having a little coconut oil in warm water? Read something about this elsewhere and it sounded interesting.

Many have inquired about Stefansson's Adventures in the Land. Download it here. Thanks to Daveo, I have Not by Bread Alone which I'm really excited about. It's a huge PDF that's too big but I'm going to use my Adobe Professional to break it down so it's small enough to be posted and everyone can download it for themselves. I may just break it up into several parts and do it that way. We'll see.

I'll work with the moderators to see if we can provide a place to post studies and books so you can read them and have them as part of your low-carb libraries.

I KNOW I'm not eating enough fat.

I always drained the fat from the meat *gasp* before when it was done cooking. I guess it was just habit. Now when I cook it, I try to make sure I'm eating more of the fat. It sounds so gross but it really is good! This afternoon, my hamburger was really lean so I added a little oil. If it works for you the way it did for me, you will really be losing in a couple of days. I got the LOW CARB part before, but I guess it never really clicked with the HIGH FAT part before a few days ago when I was reading some of Charles' old posts on this thread.

And I'm with you on staying away from the lc ice cream... I went really crazy with it once and I decided I wouldn't buy it again. Good luck!!

RE: Zero Carb / Meat and Water - poo123 - 07-28-2008 02:22 PM

Charles, great interview with Jimmy !!!

And Charles, after sticking with the zero carb way of life for almost 5 weeks, I have said before I lost 10 lbs. I was bummed because it was not enough and no fast enough but I stayed the course and didn't cheat or eat anything else. Well I guess my body has finally decided to get with the program and in 3 days I have lost 2 lbs. I hope it keeps dropping off because I am not going to change my way of eating, so the old body better say on board and keep losing. I have believed in your advice from the start, and still have no doubts about it. Thanks Charles...

RE: Zero Carb / Meat and Water - waywardsister - 07-28-2008 02:24 PM

Day 1 and I'm a bloated 118#. Took some pics so I can have a visual record of my progress on this WOE. I've had great luck with it previously, and felt great, so I'm expecting good things!

I'll be eating meat, fat, eggs and condiments like hot sauce, mayo, maybe a little lemon juice etc. Once my coconut milk is gone, I'll take my tea black and keep it to one or two cups in the morning.

Looking forward to listening to the podcast! Something is wonky with my speakers so it'll take some fiddling first.

Charles thanks for the Stefansson stuff. I am a big fan-girl of his 😊I actually have a framed autograph hanging in my kitchen!

**RE: Zero Carb / Meat and Water - Chris - 07-28-2008 03:14 PM**

i just listened to the podcast. I've put this comment on the podcast page:

Charles asks what the mechanism is for getting fat by eating too much fat. It is an enzyme called **ASP**. Insulin is important, but it is not the only thing going on here.....

The standard low carb dogma is that carbs (and to a lesser extent protein) stimulate insulin secretion which activates LPL (lipoprotein lipase) and LPL stores fat. That is true as far as it goes, but there is more to it that this.

LPL is not the only - or the most important - enzyme associated with fat storage. Acylation Stimulating Protein (ASP) appears to be even more critical for fat storage than LPL. It is worth doing a [PubMed search on ASP](https://www.ncbi.nlm.nih.gov/pubmed)

Lyle McDonald's [Stubborn Fat Solution](https://www.stubbornfatsolution.com) has a really good explanation of this.

Thanks Chris, but we've had Lyle McDonald's disciples here already and covered this thoroughly. I eat copious fat as do many here and we lose or maintain our weight just fine. I'm well familiar with M.R.C. Greenwood's work (a student of Jules Hirsch) on LPL and his research has been presented here before.

Insulin is still the primary regulator of LPL activity, although not the only one. In fat tissue, insulin increases LPL activity. In muscle tissue, it decreases activity. As a result, when insulin is secreted, fat is deposited in the fat tissue and the muscles have to burn glucose for energy. When insulin levels drop, the LPL activity on the fat cells decreases and the LPL activity on the muscle cells increase -- the fat cells release fatty acids and the muscle cells take them up and burn them. This is why some some areas of the body will fatten more than others and why the distribution is different between men and women.

Again, lose the carbs and eat fat to your appetite and you will have no problems.
Thanks for the advice.

Regards,

Charles

Thanks, Alison. I've so glad to hear this news. You're doing great and please keep me updated. You're proof that you have to keep working on it and stay consistent. Try not to worry when the scale stalls because that will slow you down. Just stay positive and don't change anything. Keep eating to appetite and your body will regulate your weight just as it's supposed to.

Even when you get to goal, it still fluctuates a few pounds either way, but it works just like your blood pressure and body temperature. Your body knows what it's doing.

**RE: Zero Carb / Meat and Water - aicav062197 - 07-28-2008 06:32 PM**

crud.... i don't know what happend. yesterday, I ate link sausage, and a tiny bit of dressing on a piece of chicken, also a little piece of corn beef and the roast beef, the aujur (sp) the meat juices..and the cheese melted on top ...out of a jason's deli sandwich. TODAY I HAVE CRAVINGS.. Something screwed me up royally because I haven't had cravings or cheated up to yesterday.. I didn't think those things would
make my body react this way.. my weight went up 3 lbs, the cravings sent me off on a binge of 2 hotdogs, a slice of cheese, and a 2 diet drinks w/ heavy cream in it. and then I wanted to quit lowcarb all together. I kept watching my family eating all these high carb foods today and yesterday. Today I through away some cookies that my husband left and it was the first day it was difficult to do it.

I really do not want to regain the same 10 I have lost twice since may. I feel hopeless like this plan is not going to work and the old way I was lowcarbing I was eating to high in carbs.

Up to today it wasn't really about the food.. I was just nutritioning my body and it was working.

UGH!!!!

AJ

I add more fat with butter, coconut oil, or olive oil. I use Fitday to help me see my fat percentage. I plug in what I plan to eat to see what it looks like and what I need to do to increase the fat before I ever start preparing my food. Like I said earlier, I keep my fats no lower than 80%. I eat a lot of ribeyes and 73/27 ground beef.

Great podcast Charles!

AJ

Fast food often has many additives as well as too much sodium so it is hard to tell what screwed you up. I'd advise trying to have home-cooked meals until things settle down. Also you need to get at least 80% of your calories from fat. Meat and water means FATTY meat and water.

Good luck and don't give up; you just need to find the right choices for your body.

---

RE: Zero Carb / Meat and Water - KimPossible - 07-28-2008 10:57 PM

OM goodness...I came to catch up and 3 (maybe more) pages are there from where I was in reading! I just came across this:

Quote:
Many people tout the anti-oxidant potential of red wine but I say, if you don't eat that which oxidizes, then what need have we with the anti-oxidant? So I don't indulge. But perhaps others can share their experiences with it.

I suppose it's a lot like coffee. If you can take it or leave it, it may be harmless. If it is something you have to have, then it's an addiction and has no place in your life.

COMPLETELY agree with the last part--no matter what it is, if we can't live w/o it, it has NO place in our lives...

And I want to share that since really cutting my carbs I have had two instances where I had a glass (or two) of wine (white zin) and have to say that for me, it causes the scale to go up a half pound or a pound. But if I stayed low carb eating-wise, and don't continue day after day to have a glass, it dropped right back off. I have also noticed that it doesn't cause (in ME) the crazy "gotta have everything carby" feeling I get when eating bread or cupcakes or whatever the cheat du jour has been...
Speaking of--I have tried to stick to the lowest carb possible today--day 1 of my vacation and travel day. I had two beef patties this a.m. and nothing the rest of the day (wasn't hungry--had pepperoni in case I got snacky, which I didn't) until dinner, where all of my very low choices were in the $20 range (I wasn't paying) so I opted for the Cobb Salad. Higher carbs than usual, but not a bad choice, I don't think. I DID have a glass of white zin...😊

I checked my weight this a.m. to keep an eye and have an idea of how much I gain, if any--was 162.5--the lowest I've been in about 6 months. My aim is to keep it steady or no higher than 164. Will weigh in again Saturday.

RE: Zero Carb / Meat and Water - KimPossible - 07-28-2008 11:12 PM

Quote:

I wanted to say that sometimes it's crazy where cravings come from. I was hit yesterday by them, and I've been eating nothing but beef for about a week! (I say that, but I do include a bit of mustard, mayo, and lc bbq sauce as well as cheese...but these are not out of the norm things and so far I've handled them well...unless they finally caused a craving...I'm still a girl who loves her condiments!! LOL).

I ended up eating about 3-4 TBS of peanut butter (not the natural b/c it has the same carb content as the other and I'd just rather have the regular if that's the case--it's cheaper) and drinking about 14 oz of Chocolate "milk" from Hood's. It was a good fix and sure, it's higher than zero carb but it was WAY better than regular chocolate milk or worse, a peanut butter cup (or 12) which is the flavor I was going for.

Cheats, or off-plan eating, or carby stuff is going to happen. Hopefully the instances are few and far between, but they are going to occur. We aren't perfect no matter how much we aim for it. I for one think you could've fared a LOT worse. It's time to just evaluate what perhaps might be the trigger (sugars in the deli meat, etc) and avoid that from now on. It was a learning experience! For those, we should all be grateful!!!

just my two cents.... LOL

gonna have to check out the podcast. I'm sittin' on the balcony at the moment listening to the waves...will do the podcast later.😊

RE: Zero Carb / Meat and Water - Chris - 07-28-2008 11:18 PM

hi there

Don't get me wrong ,if what you are doing is working and fine, so be it. I'm no particular disciple of Lyle, I was just sharing my understanding that there is a mechanism for the storage of fat apart from insulin. if you are familiar with that, fine, but that was not the impression I got from your interview.

I also do not follow your statement about fat distribution - it doesn't seem to follow from the mechanism you quote? Maybe I'm just confused.
Cheers

Charles Wrote:

Daryl Wrote:
I'm on page 93 (I think lol) of this thread, so still catching up.... I was pretty pumped about trying an all
meat diet, but am wondering if I'm having problems with arachidonic acid. Dr Eades once wrote that it
can be an issue for some folks, and it's primarily found in red meat and eggs 😞

I'm going to try an elimination diet the next couple of weeks, see if I can confirm if it's a problem for
me.
Well, so far, with no eggs nor red meat, the itching has seemed to lessen quite a bit. It'll take several
days to truly see if the AA is an issue. I hate it, in a way, as my favorite two meals are fatty hamburgers,
and ribeye.

RE: Zero Carb / Meat and Water - Dwayne - 07-29-2008 05:20 AM

I recently found out that the 2 baconators I ate had 4 (I think 5) carbs each and I had two! That was
unexpected. There must be some SERIOUS fillers in that meat. Two of those small patties has 3 carbs,
the cheese has 1. Very shady. They allow you to customize their nutrition info at wendys.com so it was
easy to figure out.

RE: Zero Carb / Meat and Water - LindaSue - 07-29-2008 05:59 AM

suzanneyea Wrote:
I would eat it if starving, but that is about it. Like yesterday, my son had a playdate at Burger King and I
brought both of our lunches in a cooler. Andrew has grown up with me doing this, so he is used to it.
But there is something in that meat that can trigger me too.
The other day someone at LCF posted the ingredients and nutritional info for Burger King burgers and
they do contain sugar and have at least some trace carbs for just the meat. I think the sugar is in the
seasoning that they use on them, or at least that's what it sounded like from the ingredient list.

RE: Zero Carb / Meat and Water - Sambezious - 07-29-2008 06:02 AM

I used to eat the baconators, too, Dewayne. I only had one, but DANG, at 5 carbs - that is way too many
for a burger. I'm glad I found out about the fillers! No more baconators for me!

RE: Zero Carb / Meat and Water - Sambezious - 07-29-2008 06:05 AM
Hi Linda!

Thanks for the info! I've been known to grab a double whopper and remove the buns. I guess we have to give up fast food completely since most fast food places are adding sugar to their foods. That's just crazy!

Sam

**RE: Zero Carb / Meat and Water - montmorency - 07-29-2008 06:10 AM**

Dear Charles,

Your podcast with Jimmy came just at the right time for me, because (possibly inspired by the recent Tour De France) I had begun to think more seriously about whether an athlete could perform at the highest level on a low-carb diet. I hadn't considered a no-carb diet, but (having read (and re-read...) GCBC, when I thought about it, it did make sense.

Inspired by the podcast, I found my way to this forum, and have been working my way through the older posts. Haven't managed to read them all yet, but I noticed that one recurring theme was grass-fed meat versus factory-farmed.

Sorry if this topic has now been done to death, but I'd just like to mention one aspect, which I didn't notice being spelled out: I know that you take the Weston A Price people seriously, and you also mentioned Barry Groves in a positive light in your podcast with Jimmy.

I'm not sure if the point is made explicitly on his site, but in his 2007 book, "Natural Health and Weight Loss", Barry expresses the concern about feeding of farm animals, and said that because of the high grain use now, the actual content of "animal fat" (in typical animals) was changing, and was becoming more unsaturated, i.e. more like a vegetable oil, which, if so, is not really what we want.

Now, the only way you would really know would be if the actual fat on the animal(s) could be analyzed, and I doubt if this is being done anywhere on a regular basis. (I'd like to find out though).

I am not sure if the Weston A Price people share this same concern exactly, but they certainly express a preference for grass-fed meat, as you know.

I know that Barry is concerned about it though, and in a reply to an email, he suggested to me that (here in the UK), the safest meat to eat was lamb, since that is almost always grass-fed anyway. If you happen to know the exact source of your meat (say, from a farmers market) and can find out how it's fed, then you might have other options of course.

BTW, until I had heard of you, I thought I was perhaps the most dedicated fan of Gary Taubes and GCBC (or "The Diet Delusion" as it's known here). I now gladly concede that title to your good self! :-)

Thanks for all the inspirational postings.

Kind regards,
Mike (aka, Montmorency).

p.s. going back to the TdF, it would be really interesting if a current cyclist of the stature of a Greg
Lemond or Lance Armstrong were to publicly declare for "low carb" (or even "no-carb") and demonstrate whether the TdF can be done that way. I suspect that there are too many vested interests involved for it to ever happen though.

RE: Zero Carb / Meat and Water - aim in Fla*working - 07-29-2008 06:24 AM

i have a lot of fish defrosted. How can I add fat to make it more filling?

RE: Zero Carb / Meat and Water - waywardsister - 07-29-2008 06:26 AM

I wonder if the cravings you get from fast food meat, prepared meats etc could be from msg? Do they list 'natural flavour' or similar in the ingredients?

Great podcast Charles and Jimmy!

I am still using mayo. I plan to try and make my own soon. Last time I tried that it didn't taste right, but the way the prices are rising, it will probably be cheaper so I will just have to learn and play with the recipe.

RE: Zero Carb / Meat and Water - travis t - 07-29-2008 07:37 AM

Mike (aka, Montmorency). posted
"p.s. going back to the TdF, it would be really interesting if a current cyclist of the stature of a Greg Lemond or Lance Armstrong were to publicly declare for "low carb" (or even "no-carb") and demonstrate whether the TdF can be done that way."

My answer is that the Tour De france can't be completed with zero carb. There is a thread where this can be discussed if anyone is interested.

travis t

RE: Zero Carb / Meat and Water - Jimmy Moore - 07-29-2008 09:02 AM
Welcome to my forum Mike! I'm glad you made your way over this way. And THANK YOU to everyone who has shared their delight with my interview with Charles. He really is a top-notch guy (but you knew that already!).

Regarding the fast food meats, you're not gonna believe who recommends these for low-carb patients--Dr. Mary C. Vernon from Lawrence, KS, the famous low-carb doctor who I will be interviewing again soon. I'll be sure to ask her why she does that when the quality of those meats seems to be inferior. And Dr. Eric Westman from Durham, NC also regularly eats burgers from a place called CookOut. Granted, the burgers are good, but I found it curious.

By the way, if you have seen my latest menus, then you'll be pleased to learn I'm eating pretty close to zero-carb...Charles said this was virtually a zero-carb diet except for the few veggies and cheese I ate. And I've lost nearly 9 pounds since Saturday, so something's working with it. 😊

RE: Zero Carb / Meat and Water - jeepifer - 07-29-2008 09:19 AM

Congrats on the loss, Jimmy! 😊

I have to find a fast food suspect for lunch today. DH is off work so we're meeting and eating. LOL

Wish they had a Hardees near me. Oh well. Anyone have other suggestions? I'm tired of McD's double cheeseburgers (sans ketchup, pickle, and bun).

RE: Zero Carb / Meat and Water - Charles - 07-29-2008 09:41 AM

ajcav062197 Wrote:
crud.... i don't know what happend. yesterday, I ate link sausage, and a tiny bit of dressing on a piece of chicken, also a little piece of corn beef and the roast beef, the aujur (sp) the meat juices..and the cheese melted on top ...out of a jason's deli sandwhich. TODAY I HAVE CRAVINGS..

When you say dressing, do you mean stuffing? That would make my weight go up. When you do zero-carb, your muscles are not primed to burn glucose at all, they are only primed to burn fatty acids because your insulin is low. Therefore, if you cheat on zero-carb, the reaction will be swift and severe because all of those glucose molecules will be stored and they will stay there since your insulin is so low.

aj Wrote:
my weight went up 3 lbs, the cravings sent me off on a binge of 2 hotdogs, a slice of cheese, and a 2 diet drinks w/ heavy cream in it. and then I wanted to quit lowcarb all together. I kept watching my family eating all these high carb foods today and yesterday. Today I through away some cookies that my husband left and it was the first day it was difficult to do it.

This is a common complaint throughout low-carb dieting. How is it that others can eat high-carb things and not gain weight yet I can only eat a little bit of something and gain weight and have cravings?

This shows us clearly that the metabolic disorder is a slow-moving one and obesity is only one of its symptoms. Only the lucky ones manifest this disorder with excess weight. I say lucky because weight gain, even though it comes slowly, like a couple of pounds a year (long term) is much faster than the other diseases of civilization.
Most of the symptoms of this disorder are associated with aging. So much so that many of believe that it's natural to have arthritis, dimmed eyesight, heart disease, etc, when we're older. We're always shocked to see some 35 year-old having a heart attack. If you understand the seriousness of this metabolic disorder, you would never eat a carbohydrate again!

AJ Wrote:
I really do not want to regain the same 10 I have lost twice since may. I feel hopeless like this plan is not going to work and the old way I was lowcarbing I was eating to high in carbs.

If weight loss is the sole goal, then I have to agree with you.

AJ Wrote:
Up to today it wasn't really about the food.. I was just nutritioning my body and it was working.

As far as you can tell, it was working. The point it, we really can't tell what's going on under the hood. The weight gain you experienced the day after eating questionable food didn't likely come from what you ate that day. It is well-settled that it takes a few days to see the results of the food you ate. It will be another day or so before you see the effects of what you ate that day. There are many reasons for your weight to go up a pound or two even when you didn't do anything differently. Weight is regulated by your body and it will do it quite nicely if you stay out of its way by eating healthy food to appetite.

The bottom line, don't sweat it. Just get back to work and everything will be fine.

Regards,

Charles

I have a question....

Is a Pork Rind considered meat???. ....he asked...crossing fingers....

RE: Zero Carb / Meat and Water - Charles - 07-29-2008 10:08 AM

Chris Wrote:
Don't get me wrong if what you are doing is working and fine, so be it. I'm no particular disciple of Lyle, I was just sharing my understanding that there is a mechanism for the storage of fat apart from insulin. if you are familiar with that, fine, but that was not the impression I got from your interview.

My point is that LPL activity does not work apart from insulin because insulin is the primary regulator of LPL activity. The whole line of thought is called the "gatekeeper hypothesis of obesity" and it is based on the hormonal regulation of LPL.

Dr. Eades contends that overeating on fat will cause weight gain or cause a person to stall in their weight loss. He does not cite fatty foods devoid of carbohydrates. High-fat populations, such as the Masai, among others, do not have a problem with obesity or any of the diseases of civilization so this answer from a leading low-carb expert is disappointing, to say the least.

As Greenwood wrote:

M.R.C. Greenwood Wrote:
"Conditions that favor increases in adipose tissue LPL result in increased fat accumulation and, when food intake is constant, leads to alterations in body composition."

Her studies were based on studies of the Zucker Rat in which LPL activity in the fat tissue is elevated in the womb, apparently the effect of fetal hyperinsulinemia, though it persists well into adulthood. They can still develop obesity in the face of calorie restriction.

Since Greenwood proposed the LPL gatekeeper hypothesis, researchers have reported that obese humans also have increased LPL activity in their fat tissue. They also reported that LPL activity in fat tissue increases with weight loss on a calorie-restricted diet and it decreases in muscle tissue. Both of these serve to maintain fat in the fat tissue regardless of any negative energy balance that may be induced in muscle tissue, enhancing the absorption of fatty acids into the muscles to be burned for fuel. When the workout is over, LPL activity in the fat tissue increases so as to restock the fat tissue with whatever fat it may have surrendered.

The question becomes, does this same hormonal environment that leads us to regain weight once we've lost it cause us to gain weight to begin with. If insulin drives obesity, which it does, this is obvious. There is no evidence to refute it and it must be taken seriously. The weird thing is, none of this is controversial yet obesity researchers don't take anything seriously that suggests that carbohydrates have a unique ability to fatten humans.
Robert Eckel of the American Heart Association said this:

Quote:
Habitual dietary carbohydrate intake may have a stronger effect on subcutaneous fat storage than does dietary fat intake."

The LPL gatekeeper hypothesis does not identify the mechanism wherein humans can gain weight eating excess fat without carbohydrates. Now, if Dr. Eades would have cited a hormonal change or something like that, I would be in agreement with him. Eating the correct diet will result in weight loss and health only to the point where the hormones allow. If there is a defect there, all bets are off. However, weight regulation is only one reason to restrict carbohydrates from the dietary.

Regards,
Charles

Travis and Suzanne, I do eat fast food, but I stick with the burgers.

Travis, I often eat the Monster, but I don't eat the cheese. Cheese gives me cravings every single time so I got rid of it quite a while ago. Try the Monster with just the bacon and I bet you'll be fine!

---

**RE: Zero Carb / Meat and Water - poo123  07-29-2008 10:24 AM**

I consider Pork Rinds a type of meat since it is made from the fat of a pig. Yummy!! I have nibbled them in the past. If you are doing a small amount of carbs you can make a great dip with cream cheese, garlic, s&p and a little heavy cream. Like chips, you can't stop at just one...But for me right now its just meat and water...

---

**RE: Zero Carb / Meat and Water - jeepifer  07-29-2008 10:27 AM**

I eat pork rinds when I'm desperate for a "crunch" to munch. I'm sure that will pass as I get further on ZC, but for now...

Yes, we have seen this one around here too, Mike. Let me say first and foremost, that this is not an attack of you personally. I will feel free to attack the idea, if you don't mind. It's hard to tell people's intent from a post but just know that I am smiling about this even though it may sound like I'm ranting.

The thing is, I do agree that grass-fed beef is more nutritious than grain-fed beef. I have no doubt about it. I saw one study that said that one would have to eat 6 ounces of grain-fed beef to get the nutritional punch they can get from 3 ounces of grass-fed beef.

What these studies do not say is that grain-fed beef is not nutritious. They only argue from a relativity standpoint.

Proponents then argue for the soil and the inhumane treatment of these animals. I don't buy their arguments because first of all, grain-fed beef is less expensive, better tasting and fattier than the grass-fed variety. I think mankind should be commended for coming up with a way to provide us with relatively inexpensive fatty protein which I've used exclusively to attain outstanding health.

There is much talk about the hormones and the injections these animals get but there is no proof that these things pass on to us and survive the cooking process. Animals eat grass and no one argues that this passes on to humans so why should the grain be any different? I know, because cows don't naturally eat grain and to this I agree. Guess what, humans also do not naturally eat grain and when we do, we get fat. I would much rather the animals gain this fat than myself.

I understand the drive for carbohydrates. People believe that if more land is available for growing crops then we can feed more people. Carbohydrates have allowed us to build cities and industrialize, which many argue may be to our detriment. The problem is that these grains and plants are poison for the human body and we are spreading our poison all over the world. Just think, if we could give this grain to animals, we would have more animals and more food for people to eat. Perhaps we could find a way to provide a ribeye for everyone three times a day!

If we didn't have to pay for the research and care of cancer, diabetes and all the other diseases of civilization, we would have plenty of resources to identify how to provide the proper diet for all of us.

That's true, but you know, the more I think about it, all of the things that we humans do are not necessarily the healthiest pursuits. I love the great marathon runners as well but I don't know how healthy it is to continuously run marathons especially for people who do not run with proper technique. It can be quite destructive.

It may be that I have to eat carbohydrates to qualify for Boston, but if that's the case, that's not a sacrifice I'm willing to make. I'll stick with half-marathons. Besides, they are more fun and there are usually more people and they even have rock bands every mile of the way!

Charles, is the couch to 5k a good starting point for those of us looking to get back to running?

There's a 5k in early October I have my eye on.

---

RE: Zero Carb / Meat and Water - montmorency 07-29-2008 10:56 AM

Thanks for the great welcome and reply Charles, and be sure, your smile was coming through loud and clear 😊

My take on pork rinds ... I guess even LCers/NCers need convenience foods from time to time, but it's much more fun (when you have the space and time) to make your own by roasting a nice succulent joint of pork, to make what we call "crackling" (not sure if that term is used in the USA). Mind you, it's quite an art getting the crackling just right, and I fail as often as I succeed (still eat it, of course, it's just a bit chewy!).

Crackling was one of the great gifts that LC-ing gave back to me, after I'd been avoiding it for years on my so-called healthy diet (that made me overweight, like so many of us). I now eat lamb fat, beef fat, and any other sort of fat, right off the joint of meat (and it doesn't make me sick like I thought it might do, at one time), but there is nothing quite like pork crackling.
Is a Pork Rind considered meat???: ....he asked...crossing fingers....

I don't know. I don't eat them because I picked up a bag in the store and there were far too many additives in them, especially things with "ose" on the end of the name, which are sugars. What are the ingredients?

I haven't eaten any lately...not sure of ingredient list. I suppose the plain variety will have the least. one brand I have purchased in the past, but not since zero carbin', does claim to be Zero carb, but does list sugar as an ingredient.....go figure...

Yes, that's a fabulous program!

RE: Zero Carb / Meat and Water - suzanneyea - 07-29-2008 12:41 PM

I just made the Low Carb cream cheese muffins for my son...Oh, the temptation to lick the bowl!!!!!!!!!!
Man, this is the downfall to changing my son's diet to low carb, I have all these tempting lc foods around the house. I can easily resist regular cookies or candy, but the lc versions always tempt me!

RE: Zero Carb / Meat and Water - Charles - 07-29-2008 12:50 PM

abnormalslc Wrote:
Ingredients: Pork Rinds, Whey, NonFat Dry Milk, Cinnamon, Vegetable Oil, Natural and Artificial Butter Flavor, Sucralose.

I would avoid the whey (soy waste product), nonfat dry milk (non-fat, really?, cinnamon, and especially the vegetable oil (raises Omega 6 and lowers Omega 3) and sucralose (reportedly makes holes in rats brains among other things).

The ones that are pork rinds and salt seem to be the best. I guess for me, I rarely am hungry between meals. If you are trying to control insulin (which I hope you are), try to make it 5 hours between meals. Eggs and cheese always shortened this period for me. If I eat bonafide fatty protein at my meals, I just don't need to snack.

So, in short, I'm not so much bothered by the snack (pork rinds) as I am with the need to snack. I imagine the salt in them will make you want to eat quite a few of them. There are always exceptions to everything, of course. If you're out and you're hungry and there is nothing to eat, then by all means, don't go hungry. Although, after doing this for a while, you'll find it's pretty easy to go without eating if you need to or want to.

The homemade cracklin' sounds better than these processed pork rinds to me. My dad used to eat that but I never knew what it was. Thanks for the explanation!

Regards,
Charles

RE: Zero Carb / Meat and Water - jeepifer - 07-29-2008 01:03 PM

I find that I can only eat so many of the pork rinds before I'm decidedly full. I can mindlessly eat a whole bag of potato chips no problem. Wonder if it's the good fats helping control the portions?

I'm giving myself permission to snack for now. My body is still adapting, and I'd rather have something like the PRs than reach for the bad stuff.

I don't think I brought enough food with me today. I thought I did. Just hungrier for some reason. My cravings are more mental than physical at this point.
jeepifer Wrote:
My cravings are more mental than physical at this point.

Hey Jeepifer,
Just wanted to say I've always thought all my cravings were emotionally generated when what to my ASTONISHMENT---I discovered that I NEVER HAVE CRAVINGS when I eat lots of fatty meat on Zero Carb.
So my question (to myself)is am I suddenly addiction free, spiritually healed or emotionally grown-up or has something been balanced in my body that eliminates this gnawing hunger??????
Now I know immediately when I haven't eaten to appetite because I start reading my favorite food blogs and drool.(Think Pavlov)

hmmm...well I eat it rarely and I don't smoke anymore so I guess eating tilapia might be my worst habit~😊
That is a drag it is unhealthy...i had fishy fish.
What about orange roughy?

RE: Zero Carb / Meat and Water - poo123 - 07-30-2008 06:57 AM

Well Charles, I think my body is really on track now. I have lost 4 lbs in 5 days and I am so happy. I do feel the best I have ever felt and once I lose this weight one of my biggest dreams will come true. The dream will be a reality and once that happens I get to have a complete makeover. Hair, makeup and clothes. For me to be a "normal" size woman and be able to shop in lots of different stores rather than just 3 is really great. Well I would like to lose around 100 - 110 lbs to be 130 and feeling this great I will NOT go back to carbs no matter what. 5 weeks in and I am so happy. THANK YOU , alison

Awesome job, Alison! In 5 weeks it will be my birthday and I hope to celebrate at a weight I haven't seen for several years... 😁

RE: Zero Carb / Meat and Water - poo123 - 07-30-2008 07:15 AM

Good luck to you Jeepifer. You have been doing a great job so far by reading all your posts. Keep up the good work. Its easier to play with the little ones as a lighter mom, I know my twins run me ragged at this weight, so its only going to get easier....And more FUN !!

RE: Zero Carb / Meat and Water - jeepifer - 07-30-2008 07:31 AM
Oh, I know, I want to be able to play with them and not sit watching cuz I can't keep up or (even worse) fit in the playground equipment. How old are your twins? My girls are 4-1/2 and almost 3.

As I mentioned in my personal journal, I had a laugh last night at the buffet with a guy that "scolded" me for taking the fatty piece of steak. It was his favorite part, but I got it first. 😁

RE: Zero Carb / Meat and Water - karishma - 07-30-2008 08:36 AM

Omega 6 isn't bad for you. They are an Essential fatty acid, meaning they're something we need to get from diet, and we can't live without them.

The concern with Omega 6 is that it needs to be in balance with Omega 3s, and most of us get too much of the 6 and not enough of the 3.

(But the biggest source of omega 6 is vegetable oils, and most of us on this WOE tend to focus on other fat sources, so we're already better off than most people in this regard.)

It never hurts to try and balance out your consumption of the different EFAs, but there's no reason to go crazy and try and eliminate all food that's heavy on the Omega 6s.

Now I don't eat a lot of fish myself, because of concerns about mercury levels, but that's a whole other story.

Hey, Alison! I am so pleased for you, you really have no idea. If you were in the Raleigh/Durham area, I would treat you to Golden Corral with our low-carb meetup group this Sunday!

This is fabulous news and I hope all continues to go well. Just remember to eat like a "native" and keep those food choices confined and just keep having success. Variety is really all in the mind and it does get easier and easier to resist it as long as you don't wear yourself down too much. When I'm tired and hungry, I'm liable to try anything. Fortunately, I've been working hard at staying refreshed this summer and so far so good.

I hear you on the shopping thing. I have this thing about well-fitting clothes and I can't stand wearing stuff too big or undersized. I hate that I can no longer shop in the bargain stores because 40 year-old men aren't supposed to have 29-inch waists but I'd much rather have this problem.

Once again, Congratulations and Welcome to Life!
Best regards,

Charles

By the way, I noticed your goal weight and I think that's very wise on your part. My goal was also at the
high-end of the BMI. You'll find that you can wear a smaller size at 24.9 than you probably used to
when you weighed the same size. The last time I had a 29-inch waist, I probably weighed 10 pounds less
than I do now.

Charles Wrote:
 [...] 
I hate that I can no longer shop in the bargain stores because 40 year-old men aren't supposed to have
29-inch waists but I'd much rather have this problem.

Ha ha! I love that!

Yes well, I had a 30 inch waist from around the age of 16 to 25 or so.
I can remember an aunt of mine saying: "My Jim used to have a 30 inch waist, but it's about 34 inches
now". At that time, I couldn't imagine ever having a 34 inch waist. Imagine! Ahem, I certainly couldn't
imagine the 40-inch waist I got in middle age! Fortunately, with LC, it is heading back in the right
direction, although it will be some time before it sees 34 inches again, and somewhat longer before it
hits 30!

I am slowly veering in the direction of zero carb, but I think it's better if I do so gradually. First thing to
go has been the cheese (with great regret I must say). I'd already stopped eating nuts ages ago (partly
because for me they were addictive, and partly because of what the Weston A Price people say about
having to soak them ... it all seemed like too much trouble!).
I never did sweeteners in anything; I must say I used to see people on low-carb forums adding sweeteners to all sorts of things, and I just had to bite my tongue, as it were, but it wasn't the way I wanted to go. I felt vindicated by parts of GCBC in this respect, and also some of the things Charles has said.

The biggest problem is, as perhaps many of us find, sharing meals with family and others who do not share our views on diet. My wife thought I was barmy enough going on LC. I think she'd have a fit if I told her about zero carbs, so that's another good reason to introduce the idea gently 😊

I was a little surprised that cheese should be a problem, since the carbs seemed quite low, but I know that people do have problems with it, and Charles has explained why even small amounts of carb can be detrimental. Another factor is that while there is probably a case to me made for our evolutionary ancestors having eaten eggs, at least occasionally, I suspect that cheese is a much more recent part of our food history; essentially a product of agriculture, even if a few thousand years ago.

Eggs will probably be the last to go, partly because of the reason mentioned above, and partly because it seems a shame to lose what seems to be a very nutritional natural food. Since reading about oxycholesterol on Michael Eades' site, I've been less willing to fry them, and now only gently boil them. I eat them soft, and add quite a bit of butter to them - BTW, I am one who can eat butter off the spoon - a little salt helps, although the butter I eat is already slightly salted. On a low-carb diet, I have no worries about salt, especially after reading GCBC.

I lost about a stone and a half (=14+7=21 of your American pounds :-) ) on low-carb, albeit very slowly compared to some low-carbers. I'm not sure if I've stalled ... it was hard to tell at my slow rate of loss ... but in any case, I will see if reducing the carbs still further, helps. I don't totally regret losing slowly; I'm hoping it may help reduce the chance of flabby stretched skin when I get down to my target weight.

I was 10 and a half stone (140+7=147 lbs) in my twenties, and I'm about 5'7". I'm currently just over 13 stone (=140+42=182 lbs), since I think I am more muscular than I was in my twenties, at least in places. That "11" in my mind's eye looks like two thin people standing side by side, which I find a fun target to have!

RE: Zero Carb / Meat and Water - Dwayne - 07-30-2008 11:03 AM

I dream of a 38 inch waist. =) That is what I was when I played football in high school! If I can get back down to that I would be bouncing off the walls.

RE: Zero Carb / Meat and Water - jeepifer - 07-30-2008 11:19 AM

SO, men measure by the waist size, women by the pant size. Too funny! 😁

Honestly, I was sad to lose cheese in my dietary as well. I really loved the Hardees Monster with cheese. I still like it without but it sure was good with it. The funny thing is, I can eat two of them with cheese, but only one of them without. I don't know why that is....

Mike Wrote:

I hear you on this one. I made my wife quite crazy throughout this whole process and she resisted the entire way, but she would play along even if she gave me wierd stares from time to time. Even she is trying a zero-carb experiement with my daughter for the next three weeks. They started on Sunday and she's lost 7 pounds. My daughter has noted huge improvements in her eczema and athsma. I also told her that her teeth would be whiter without the need for Crest White Strips. It's easy to appeal to an 11-year old's vanity! 😊

Mike Wrote:
Another factor is that while there is probably a case to me made for our evolutionary ancestors having eaten eggs, at least occasionally, I suspect that cheese is a much more recent part of our food history; essentially a product of agriculture, even if a few thousand years ago.

I'm currently reading Not by Bread Alone and Stefansson said that the eskimos ate eggs rarely, usually when there was no other food to eat. I personally don't oppose people eating eggs at all. I think they are good for people. My problem with them was that they didn't hold off my hunger long enough like beef did. That's really about the only reason. I did lose 5 pounds quickly after dropping them, but that could have been the cheese as well. I don't think I like eggs without cheese so that was an easy one.

Mike Wrote:
On a low-carb diet, I have no worries about salt, especially after reading GCBC.

I'm just taking this moment to clarify my position on salt. I don't believe salt is bad for anyone. When Taubes writes about salt in GCBC, he's arguing that it does not cause hypertension which is what the "experts" believe. My argument is that salt just doesn't matter. If you grew up eating it, you prefer it. If you did not grow up eating it, you don't miss it or even know from it. That's what Stefansson observed and his archeology background informed him that there are many cultures, such as the Inuit, who actually abhor salt. That was news to me.

He likened it to tobacco and tea. Many believe these to be vital but it appears none of them are. Because I don't need it, I choose not to eat it, not because I believe it's bad for anyone to eat it. I think it may actually exacerbate cramping just like too much water but I haven't proved that to myself. After my August 10th race, I'll tell you if I noticed a difference in competition without salt.
Mike Wrote:
but I'll be happy if my loss stops around 11 stone (154 lbs), since I think I am more muscley than I was in my twenties, at least in places. That "11" in my mind's eye looks like two thin people standing side by side, which I find a fun target to have!

That's my experience as well. The last time I was 154, I didn't have the muscular build so I'm much happier with my body now than I was then.

Great to have you here, Mike and please keep us updated on your progress. I'm thinking the closer you get to zero-carb, the quicker you'll lose.

Regards,

Charles

jeepifer Wrote:
SO, men measure by the waist size, women by the pant size. Too funny! 😄

Honestly, I don't know the difference. I've never measured my waist, I just go by whether the pants fit or not. I used to have the problem that my thighs were too big so I would have to get a bigger waist-size to accommodate them. I now understand I can buy "relaxed fit" which gives room for the thighs but is the correct waist-size. I wasted a lot of money figuring this one out! 😅

Charles Wrote:
My daughter has noted huge improvements in her eczema and asthma.

I used to have asthma as a kid but I outgrew it. I blame it on my dad who smoked. This was in the 50s before the dangers of smoking were publicized in the early 60s so I can't fault him. He picked up the habit in the service when they gave away cigs for free to the service men. I have not noticed any asthma issues being reduced due to low carbing but as an adult I rarely do except for dog and cat hair exposure.

However, I have noticed that some rough, scaly patches of skin around my elbows have completely disappeared in the last year or so. Now totally and completely gone.

MAC Wrote:
I used to have asthma as a kid but I outgrew it. I blame it on my dad who smoked.

We're hoping she outgrows hers. My wife's father was a smoking serviceman as well so she had it growing up. She rarely uses an inhaler nowadays.
However, I have noticed that some rough, scaly patches of skin around my elbows have completely disappeared in the last year or so. Now totally and completely gone.

My daughter marvels how I rarely use lotion and my skin and hair shine.

RE: Zero Carb / Meat and Water - feckless - 07-30-2008 12:19 PM

Charles, do you have journal somewhere that details your original experience with the meat/water diet?

I am wondering what difficulties you went through and what benefits (big and small) you have seen over time. Body composition obviously, but I'm sure there is a whole list of things.

Charles, I thought I remembered reading earlier in this thread that you really loved Celtic Sea Salt. However, I've only caught up to the first fifty pages so far, so there's a lot I may have missed.

I recently bought some of the Celtic Sea Salt and it definitely adds an additional layer of flavor to ground beef patties. I really love it and have always been one to reach for the salt shaker.

Just curious?

EDIT -- I guess I just found the answer on the 'Salt' thread.

Charles Wrote:
Thanks, Caroline. It's probably been about three weeks now. I used to shake Celtic sea salt on everything and then I began to use it less and less. Then, I read Stefansson's book and liked his argument
that it wasn't necessary. In the book I'm reading now, Not by Bread Alone he expands on what he wrote in Adventures in the Land, and adds that the eskimos didn't season their food to taste like something else. They enjoyed each individual food with all its characteristics. Even tougher meats were good and each had their own unique texture and flavor. Part of the reason the tough meats were still good to them was because they had superb teeth even though they didn't brush and floss. He argued that perhaps we would all enjoy more varieties of meat if our teeth were as good.

I found this compelling so I decided to stop using my salt. Since then, I've had no cramping and I even find that I don't eat as much food when it's not seasoned and I'm starting to notice how salty food is without seasoning. I also find that since I've been eating a bit less since the food has no salt, that I tend to stay closer to 156 even though I still eat until I'm full. Go figure!

So basically, I just decided to follow my own advice. If there is something I absolutely need to have, it's an addiction. If I can take or leave it, it stays. I found I couldn't eat hamburger patties unless they were seasoned. That's not good because they have such wonderful fat. I now like them unseasoned.

Regards,

Charles

Charles, I would love to have dinner at the Golden Corral with your group, but driving 2 hours, there and 2 hours back with kids sounds more like a headache dinner instead. I think maybe I will toast you all on Sunday at a quite dinner at home. It sure would be fun and full of info I bet. And all the positive thoughts, info and feedback just puts a smile on this face......

Jeepifer, my twins are 6 I have a boy and a girl and the best day of the year for me is Aug 26th, the first day of school. 1st grade, kindergarten was a blast so 1st grade will be even better...

RE: Zero Carb / Meat and Water - Charles - 07-30-2008 01:30 PM

feckless Wrote:
Charles, do you have journal somewhere that details your original experience with the meat/water diet?

Unfortunately, not. I had a ton of info on the old forum before it was hacked.

feckless Wrote:
I am wondering what difficulties you went through and what benefits (big and small) you have seen over time. Body composition obviously, but I'm sure there is a whole list of things.

Difficulties:

I always kept my carbs at or below 25 since January of 2007 so it all sort of blends together. The only thing that was difficult was getting used to the idea that I was only going to eat meat. I had to do some trial and error to get to that. For instance, I tried eggs, cheese, and even 85% chocolate. These things did not work for me so I had to lose 'em. My body became super-sensitive to carbs all of a sudden so now if
I have ANY, I feel it throughout my whole body. I instantly gain three or four pounds and it takes a week or two to get back to where I was. This has demonstrated for me that it just isn’t worth it. That's why I have such compassion for those who "go off" plan. I think it's all part of the process.

I'm not totally convinced my wife believes this is the way to go, although each conversation we have seems to reassure her a little more. She would probably love for me to go to the doctor and get a whole lipid panel and explain all the numbers for her. I may do that soon just because of that and other curious people.

Even my children think it's a little extreme but they, like everyone else it seems, can't argue with the results.

Advantages:

Besides all the vanity things which can partially be blamed on Planet Fitness and the West Milbrook Middle School track, I have noticed that you can see the results of your exercise much quicker. All of us have a nice set of abs in there but we have to correct our diet in order to get lean enough for them to show.

I noticed that I grow hair much better, particularly in places where it wasn't growing particularly well before. My skin is totally transformed. I used to have some adult acne, especially on my stomach, back, arms, and face, but now, these have all cleared. My skin is not as dry as it used to be. It shines without using lotion.

By the way, my 16-year old doesn't have acne either (I did at 16).

My teeth are white even though I only brush and floss once a day.

I have absolutely zero gas. I mean, zero.

My underarms do not give that horrible B.O. smell like they used to after running. You know what it smells like, I'm sure. I don't get that. Oh, I get sweaty and musty and probably smell like my dog, but it's far different than that strong B.O. smell. I can now use deodorant and don't have to use anti-perspirant with that aluminum stuff in it.

My libido went from 70 to 100. I mean (more than once) if you know what I mean. I am totally convinced that E.D. is a disease of civilization!

My eyesight is better. I got glasses in 2005. In 2006, I got a much lighter prescription because my eyes improved. I now wear contacts but even they are not as strong as my glasses were and I can see very well.

I am much stronger. I can lift heavier weights now than I could at 207. I've never been this strong. I can't run long distance as fast as I could in high school, but I am rapidly approaching my sprinting performance. However, I can run much longer than I used to run in school. That's probably more related to age. It's well-known that distance runners improve with age. The mind is just stronger.

They talk about all-meal diets clogging your arteries, but my bloodflow has improved all over. I don't have to do pushups to look like I've been working out. If I'm outside in the sun, my veins just pop out like I've been lifting. I find that kind of cool. I can't wait to hit the beach next month.

I don't wear sunscreen or take any vitamins or supplements.
I don't chronicle my food in journals because it's usually not very memorable. That may sound bad to you but I think it's critical. Eating is just something I do and once I'm full, it's over. I don't reminisce about how good the food was, unless it's a Brazilian steakhouse! The biggest thing is that I never, ever experience that nagging sensation of hunger that I used to have on my low-fat diet. I'm just either hungry or I'm not. If I'm not, then the thought or smell of food is detestable.

I'm probably forgetting some things, but that's the bulk of it.

Thanks for your question and allowing me to share.

Regards,

Charles

This is the honest truth for myself as well which is documented as you know in my journal. Even though it is water weight, as you say it takes a FULL week to two weeks to lose the water weight. And it doesn't take a whole lot of carbs to push things back up 3-4 pounds in a day or two. For me it also makes it more difficult to keep downward momentum as well.

---

**RE: Zero Carb / Meat and Water**

**suzannevea** - 07-30-2008 02:55 PM

It is interesting you said that about your eye sight. I was on the computer yesterday without my glasses and I didn't even notice. Before, I could not even read the screen without them. I have a couple of other medical problems that have cleared up with zero carb. But, like the rest of us, my spouse is not so sure. Especially at dinner tonight, I was super hungry, so I ate A LOT and he was giving me the eye. And then started talking about how much red meat I eat...you know the drill.

---

**RE: Zero Carb / Meat and Water**

**MAC** - 07-30-2008 03:02 PM

Now you know why propaganda and spin control work so well. We have been fed the big fat lie for so long no one has a clue there is an alternative hypothesis and the science is pure junk.

**RE: Zero Carb / Meat and Water**

**travis t** - 07-30-2008 03:23 PM

Quick weight gain happens to me also. Last Thur, Fri, and Sat night I got on the scales at home and was 166.2-166.3-166.2 before bed. On Sunday after church we went to Walmart and I got a big bag of chips. Ate the entire bag with ketchup while watching TV Sunday afternoon. I couldn't get enough water in me (I drank all day long). Weighed 171.6 Sunday night. 5.4 pounds in about 8 hours. Today when I got home I stepped on the scale and 164.4. Took me three days to lose the water from one
RE: Zero Carb / Meat and Water - MAC - 07-30-2008 03:34 PM

You did say you used hot dogs as a delivery vehicle for ketchup. What happened to the hot dogs? At least you are getting your lycopene. In South America they dip their french fries in mayo instead of ketchup and the French like mustard on their fries. Ketchup is much better than either of those.

I'm curious as to what you mean when you say you feel it throughout your whole body when you eat even a tiny amount of carbs.

I eat about 20gC/day right now, usually in 4 meals. I notice immediately after eating my meals that I feel very jittery and can't concentrate, and feel an overall buzz-like sensation for about 30 minutes. This is replaced by tiredness and a slight headache, and then about an hour after eating I feel progressively and progressively better.

I'm pretty certain this has to do with insulin. What I'm wondering though, is this the way we all used to feel all the time? Or is it more exaggerated now that we are eating VLC and producing less insulin?

RE: Zero Carb / Meat and Water - travis t - 07-30-2008 05:02 PM

Wendyoh
Hey try something tomorrow. Before you eat your four meals spend about five minutes of prayer or even just sitting very quietly just before you eat and then see if your buzz is gone. It just could be you need a little stress reduction to quiet down a cortisol release. This is just a wild guess but maybe worth a shot. Something that I read from Malcolm Kendrick made me think of this.

travis t

I can now use deodorant and don't have to use anti-perspirant with that aluminum stuff in it.

My libido went from 70 to 100. I mean (more than once) if you know what I mean. I am totally convinced that E.D. is a disease of civilization!

My eyesight is better. I got glasses in 2005. In 2006, I got a much lighter prescription because my eyes improved. I now wear contacts but even they are not as strong as my glasses were and I can see very well.

I am much stronger. I can lift heavier weights now than I could at 207. I've never been this strong. I can't run long distance as fast as I could in high school, but I am rapidly approaching my sprinting performance. However, I can run much longer than I used to run in school. That's probably more related to age. It's well-known that distance runners improve with age. The mind is just stronger.

They talk about all-meat diets clogging your arteries, but my bloodflow has improved all over. I don't have to do pushups to look like I've been working out. If I'm outside in the sun, my veins just pop out like I've been lifting. I find that kind of cool. I can't wait to hit the beach next month.

I don't wear sunscreen or take any vitamins or supplements.

I don't chronicle my food in journals because it's usually not very memorable. That may sound bad to you but I think it's critical. Eating is just something I do and once I'm full, it's over. I don't reminisce about how good the food was, unless it's a Brazilian steakhouse! The biggest thing is that I never, ever experience that nagging sensation of hunger that I used to have on my low-fat diet. I'm just either hungry or I'm not. If I'm not, then the thought or smell of food is detestable.

I'm probably forgetting some things, but that's the bulk of it.

Thanks for your question and allowing me to share.

Regards,

Charles

good grief, Charles...

These results are incredible!!!! And way encouraging to keep at this way of life! Thanks for sharing this! (ohmigod!) my mouth is literally hanging open in shock at all of these advantages.
Charles Wrote:
Honestly, I was sad to lose cheese in my dietary as well. I really loved the Hardees Monster with cheese. I still like it without but it sure was good with it. The funny thing is, I can eat two of them with cheese, but only one of them without. I don't know why that is....

I've come up with a theory about cheese...see below.

Charles Wrote:
Mike Wrote:
I never did sweeteners in anything;

I can't begin to tell you how much further ahead of the game you are!

😄Thanks, but I still have my vices, e.g. (hot)tea(unsweetened) with a little full-cream milk. I'm slowly cutting this down, but it's not my first priority. Having said unsweetened, after I began to lose my sweet tooth on LC, I could begin to taste the natural sweetness of the lactose in the milk, even the small amount I use. I think that's why I prefer milk to cream in tea.

Charles Wrote:
They started on Sunday and she's lost 7 pounds. My daughter has noted huge improvements in her eczema and asthma. I also told her that her teeth would be whiter without the need for Crest White Strips. It's easy to appeal to an 11-year old's vanity! 😏

*chuckle* - That's great!

Charles Wrote:
I'm currently reading Not by Bread Alone and Stefansson said that the eskimos ate eggs rarely, usually when there was no other food to eat. I personally don't oppose people eating eggs at all. I think they are good for people. My problem with them was that they didn't hold off my hunger long enough like beef did. That's really about the only reason. I did lose 5 pounds quickly after dropping them, but that could have been the cheese as well. I don't think I like eggs without cheese so that was an easy one.

I understand; cheese and eggs is a great taste combination, and I always used to combine them. I agree they are not as good at holding off hunger as fatty meat though. I'm cutting back on them anyway, because I'm increasing my meat, but won't eliminate them for a while. I'll let the "more meat" diet stabilise for a while. I had ground (minced) beef yesterday for breakfast, with some bacon, but probably not enough, as it "only" kept me going for 4-5 hours. I had a bit more this morning, and I can feel the difference; still have no interest in food, from an eating point of view, after nearly 4 hours.

Interestingly, the highest fat ground beef I can find here is 20% fat, presumably what you would call 80/20. The low fat message really took hold here, and the less fat the "mince" has, the more expensive it is. Good isn't it; the less healthy it is, the more you pay, and they kid you it's more healthy! 😔

(Of course, reducing fat made food taste bland, so the processed food makers started increasing salt. Now salt is a "demon food", so they've had to decrease that again (patting themselves on the back for
making it "healthy"). I believe the latest trick is to sneak in sugar or sugar substitutes.

Charles Wrote:
My argument is that salt just doesn't matter. If you grew up eating it, you prefer it. If you did not grow up eating it, you don't miss it or even know from it. That's what Stefansson observed and his archeology background informed him that there are many cultures, such as the Inuit, who actually abhor salt. That was news to me.

My Dad was put on a low-salt diet in his 50s because of his high BP (he lived to 84 BTW). We therefore got used to not adding much salt to our food, and I could take it or leave it - still can. However, I have noticed sometimes that if I drink a lot of water in hot weather, it's a bit more satisfying if I occasionally add a few grains of salt. I got this idea from Thor Heyerdahl's "Kon Tiki" account, where they found that adding a small amount of sea water to their fresh water made it more quenching. Those Scandinavian guys are pretty smart, don't you think?

Charles Wrote:
Great to have you here, Mike and please keep us updated on your progress. I'm thinking the closer you get to zero-carb, the quicker you'll lose.

Thanks again Charles, and I believe you are right. It's really great to find a place where these things are debated in such detail (subjects which fascinate me, though I am a complete layman), and names like Pennington, Cleave, Krebs and Randle come up routinely, as well as the more expected Taubes, Banting and of course, Atkins, and concepts like esterification, mobilization of free fatty acids, and gluconeogenesis are batted to and fro with ease. I feel quite at home!

(BTW, talking of names, if people here have not heard of Malcolm Kendrick, I'd really recommend his book "The Great Cholesterol Con" (confusingly the same title as Anthony Colpo's book, which I've not had chance to read). People here may not agree with his verdict on diet, but I think you'd be happy with his ideas on cholesterol. His style of writing is also very appealing - if you don't laugh out loud at some points, you aren't eating enough fat! 😄. He's also a fan of Gary, and plugs his book at the end of a lecture you can find on UTUBE. You can also find some great articles by him at: http://www.thincs.org).

I've been working through the "Dr Eades" thread on this site; as it seems to have been put to bed, I won't post there, but one comment here, if I may, about those eggs, nuts and cheese which seem to cause problems for many.

A point occurred to me - it was like a light going on actually, but maybe that's overstating it: It's true that, say, cheese may have some carbs, and that is no doubt a factor, but the other interesting thing about cheese is that it has less protein than beef, for example, even though it has a lot of fat.

I remembered something that Barry Groves says in Natural Health and Weight Loss, that unless you have enough protein in your meals, they aren't going to be as satisfying, and this is because, basically, having enough protein helps to keep the blood sugar more stable for longer.

Cheese, although it comes from "natural" sources, is not exactly a natural food - it's a processed food, even if the process has been around a long time. Nuts may be natural, but perhaps not for man; possibly the same is true of eggs.

What I am getting at here is that, as well as low (or even no) carb being important, could it be the ratio
of protein to fat that is important here? Meat (and arguably fish) have these in a natural proportion which man evolved to eat, so we do well with them.

That's one point. Next main point, really a question which has been bugging me since I read (and re-read and re-read ...) Taubes on hunger, and the dynamic balance of free fatty acids going in and out of the adipose cells:

Just say an overweight/obese person has been established on a low-carb diet (say <20gm) for sufficient time to be well adapted to fat-burning. His insulin and trigs should have come down, and there should be nothing to inhibit the free flow of fatty acids into the fuel stream.

Since he is still overweight or even obese, by definition, he still has plenty of potential fuel packed away in his adipose tissue, and if the insulin and trigs are low enough, nothing to stop it being burned for fuel.

OK, so if hunger (as defined in GCBC) is basically a perceived unavailability of usable fuel in the fuel stream, why on earth does this guy ever even get hungry? Why doesn't he just burn his spare fat until it's all gone, or almost all gone, and _then_ get hungry?

Sorry if that's a naive question, but sometimes one needs to ask the dumb question!

Clearly there are other factors present here: blood glucose levels; other hormones coming into the equation. But if the fundamental cause of hunger in an obese person is that he can't get to his stored fatty acids because they are "locked away", why does he still get hungry when they are "unlocked".

The only answer that I have been able to come up with for myself is that, as Taubes says, insulin levels (other things being equal) are in proportion to body fat, so if you still have excess body fat, you still have higher than ideal insulin, and so you _still_ aren't getting proper access to your fatty acids as fuel.

I asked a similar question on Dr Eades site a few days ago, in the "Taubes - Bray" thread. It has now made it out of moderation, and Dr Eades has kindly replied, but I have to say, I am not much more the wiser. Maybe someone here can explain it to me in terms I can understand. Maybe the answer is already in GCBC, but I didn't understand it. One point that MRE does say in his reply was that GT was probably talking about long-term-hunger. Well, maybe, but I don't really remember Gary differentiating between long-term and short-term hunger very much; maybe that is something I have missed and need to go back to. MRE also mentions leptin, which I know is important, but could not find in the index to GCBC. When I googled for leptin, I must admit, I only got confused by the articles that I found, and it didn't really answer my basic question.

With kind regards and much thanks,
Mike

The first thing that comes to my mind is that we don't only live on fatty acids. What about protein and other nutrients that we get daily from eating? Sure, we may have enough fat on us to live off of for a long time but we don't want to "eat" our muscles to get the protein that we need every day.

RE: Zero Carb / Meat and Water - jeepifer - 07-31-2008 07:18 AM

I think I agree with LindaSue -- without intake of dietary protein and fat, you would lose both fat and lean muscle.

You hit the nail on the head. Hyperinsulinemia is going to keep your body from getting at stored fat. Insulin is the gate keeper of fat storage.

I never get hunger pangs on zero carb. I can go a long time between meals. 5-6 hours or more. Taubes has written about the lack of hunger on a low carb diet as well not just that it disappears during starvation. That is why low carb works so well.

RE: Zero Carb / Meat and Water - waywardsister - 07-31-2008 07:52 AM

First of all, congrats to Jimmy and to Alison! And hi to Montmorency *waves*

I'm 4 days in, and have shed the 2lbs water weight I gained the week prior so back to 116#. That always feels good 😊 I am opting not to use Fitday or anything, but I am tracking my progress (body-composition wise) with weekly pics. For my eyes only, for now! But I do feel clear-headed and have more energy, and am sleeping well again. Skin is clearing up as well.

Charles, I have Stefansson's "Life With The Eskimo", which I haven't tackled yet (it's huge) - since you're a fanboy, I'll tell you that it's an old hardcover ordered from an online used bookseller, and when I opened it I was thrilled to see that Stef. had actually signed it in 1948 - inscribed it to a friend, Shelley (don't know who that is) And I paid next to nothing for it. Okay, okay, enough Stef gushing. I would like to read his other works, you mentioned they were online somewhere? Fat Of The Land is one I am dying to read.

With regards to cheese, I have a theory as well (don't we all). Cheese has a very high concentration of casein (one of the dairy proteins), I believe it's highest in hard cheeses like cheddar. Casein, like gluten, can act as an opiate in the body, meaning you start to want more and more of it. Butter and cream, on the other hand, have far less casein, though it's still present and can cause issues for some. I think for some of us, we're sensitive to the casein and as such have a hard time regulating our cheese intake, or experience bloating and other inflammatory responses to it - it is a foreign protein, from a paleo/evolutionary standpoint anyway, and some people like myself have an autoimmune response to it, esp. if we have a 'leaky gut'. I suspect that the industrialization of dairy (pasteurization, etc) has had an effect as well, as many people who have trouble with 'modern' dairy are perfectly fine with raw versions. I'd love to self-experiment with this, but raw milk is illegal in my province, and raw cheeses are tres
spendy! I may try, one day, a goat/sheep dairy experiment, bc I don't find goat or sheep cheeses have that 'keep coming back' effect - I can take them or leave them. Plop an aged, hard cow cheddar in front of me though, and I'll down the whole block!

**RE: Zero Carb / Meat and Water - LindaSue - 07-31-2008 08:14 AM**

I hope that your theory is right about cheese, waywardsister. If there is something that's in cheese that causes people to eat too much of it then that's not a problem for me. I can take or leave cheese and it's a struggle to get down as little as an ounce at a time by taking very tiny nibbles. I do like cheese but I never crave it. It's just a convenient food to have on hand when I need to eat something and don't feel like eating a full-size meal. I quite often have an ounce of cheddar right before bed so that I don't have to go to sleep hungry.

**RE: Zero Carb / Meat and Water - montmorency - 07-31-2008 08:24 AM**

Good points both. I agree; we get our energy from free fatty acids and/or glucose (which can either come from carbs or protein via gluconeogenesis). But we need protein in addition for bodily cell/tissue repair and maintaining muscle mass; no question.

But what is the hunger-signalling mechanism that tells us to eat protein? It must be something other than that unavailability of free-fatty-acids that GCBC talks about, because in the scenario I have posited, there should not be an unavailability.

I never get hunger pangs on zero carb. I can go a long time between meals. 5-6 hours or more. Taubes has written about the lack of hunger on a low carb diet as well not just that it disappears during starvation. That is why low carb works so well.

So, during those 5-6 hours, presumably your insulin levels are sufficiently low to mean that FFA mobilization is taking place, but what is it that eventually gets you hungry? (BTW, I don't know if you are currently above your ideal weight or not, but lets talk about someone (like myself) who is still carrying more than enough spare fat. I too don't get pangs between my normal meal times now (on LC),
but I do definitely get hungry before the actual meal, and it doesn't have to be immediately before the meal.

The thing about whether we all get an insulin raise just prior to a meal which clears out all fuel (FFA or glucose) from the bloodstream and induces hunger: I believe Charles has said here (sorry if I misrepresent him) that this *always* happens. I'm not sure if I understood from GCBC that it always happened; I'd got the impression that either this was more of a feature of anticipation of carb-rich meals, or only happened in certain circumstances.

So would it be the case that if we have been only on a low-carb diet, and we have spare fat that we could potentially burn, we only get hungry because we are anticipating a meal?

If that's not the case, then what is the mechanism for making us hungry?

We are not hungry all the time (on a LC diet), so at least at some times, our insulin levels must be sufficiently low. What will it be that's making them go up, if that's what it is?

Or if not that, what other mechanism?

Regards,
Mike

Yes. I am above my ideal weight. I was distinguishing between hunger pangs and hunger or at least the type of hunger/hunger pangs one gets on a diet that is caused by high carb intake. I pretty much eat by the clock more or less. It just works better for me but it is usually 5-6 hours between meals. More like 5. I get a sensation of my stomach not being full. But these are not the I have to eat hunger pangs. Just more of a general sense of hmmm I feel like eating. Whether or not FFAs are being released is a question I cannot answer. One would assume so at some point during those 5-6 hours as like I said I feel the need to eat and otherwise I don't. Whether these FFAs are from the blood stream or the adipose tissue or both I don't know. Whether this is a conditioned response or not is open to question as I generally eat by the clock.

Insulin is released by the body in 2 phases. Phase I is the initial response to food or the anticipation of food. Protein intake will raise insulin levels. However, it generally does not cause that much of a rise in blood glucose as it is counter balanced by a release of glucagon from the pancreas as well. Phase II insulin will continue to be secreted until blood levels return to normal. Fat does not raise insulin levels. Carbs raise insulin levels and there is NO glucagon released in response to carbs.

There are many hormones that regulate hunger. Some 14 in all according to Dr. Oz in YOU ON A DIET. Insulin is the master hormone. Other counter regulatory hormones increase/decrease according to the level of insulin. All these hormone levels are sensed by the hypothalamus based on output of hormones at the cellular level. There is leptin and ghrelin and many other appetite hormones that come
into play but insulin is still the master hormone. The hypothalamus, based on what level of appetite hormones are in play, is what controls your actions depending on if you are full or hungry. It forces the behavior to make you eat or stop eating. It is the control center but not what really makes you hungry or satiated. That is all due to hormone levels at the cellular level. The hypothalamus just senses the levels of hormones in your body and then causes you to take action one way or the other.

RE: Zero Carb / Meat and Water - montmorency - 07-31-2008 08:40 AM

Thanks for the wave, waywardsister *waves back* :-)  

V. interesting about cheese/casein/opiate. 

I could practically "mainline" cheese if I let myself, so I think there is something in this. 

Unpasteurised cheese is trés chere here too, but when I do buy it, it is somehow more satisfying than bland mass-market cheddar; much sharper taste for one thing, so maybe that would be less addicting.

But hey, if we are saying that the problem with cheese is that it is addictive and we eat loads of it, isn't that another way of saying that the problem is all the additional calories that this would entail....? 

Slippery slope here! 

But addictive substances are not good news, as Charles has warned us many times, so if they really are addictive to an individual, then that individual at least, should probably avoid them. 

Regards,  
Mike

RE: Zero Carb / Meat and Water - deedum - 07-31-2008 08:56 AM

Update on my zero carb experience. I'm at 4 weeks zero carb today and have lost zero pounds! However, I've noticed slimming in my upper body but no change in the globule of fat that I gained in my lower abdomen last year. This tells me a couple of things: I may still be insulin resistant and those wacky, out-of-balance, perimenopausal hormones are making me hold on to that fat.

I do feel like I am more fat adapted. My energy levels are much better. I don't experience fatigue like before but no energy bursts either. Like what Charles said, I don't feel like I have the energy to work out but when I do work out I have plenty of energy to actually do it. More like a steady, low to mid, energy level all day long.

One bad thing though, I can't bear to eat the cheaper chuck steaks anymore, have to have the ribeye which rarely goes below $6/lb here!  
So, I'm livin' on ribeye and ground beef.

I'm going away to a Turbo Kick convention today through Sunday. I cooked up a bunch of steaks and ground beef to take with me so I requested a refrigerator in my room. This will be a real test of my fat adaption because I will be working out more than I ever have in my life the next four days! I'll be trying out all the other workouts the Turbo Kick organization certifies in. They have names like, "Hip Hop Hustle", "Turbo Kick Strength", and "PiYo" (pilates/yoga). They also split us up into teams and we compete against each other to see who's the most spirited. Sounds like junior high drill team camp to
me, been there, done that, don't really want to do it again so let's hope I catch the spirit while I'm there.

Deanna

I find I can eat goat cheese without any consequence - and it's still pasteurized. I also find that any cheese actually seems to keep me full for quite a long time funnily enough - even compared to meat. It is if I eat too much cream that I start to get bizarre hunger (probably the lactose). I'm cutting down on cheese intake too (and for the time being all cream). I'm all for doing things gradually. Right now I'm struggling with overeating ground beef - when I say that, I'm not worried about how much I'm eating - but I felt AWFUL the other night from eating way too much. I was so bloated and full and it just wouldn't go down! I don't know why I ate so much. I was reduced to lazing around on the couch for several hours afterwards.

I'm going to try to stop eating after a bit to avoid that kind of scenario again. I really thought I was going to explode!

Deanna

Deanna,

I know there are all kind of 'cheap' chuck steaks out there that are tough and no good, but I've found one called the 'Chuck Eye' that will nearly pass as a rib eye, at least in my book. It is a somewhat smaller steak but at $3.49 to $3.98 per pound, it's a real bargain. You don't often see them displayed in the meat counter so sometimes you have to ask for them. I've seen them at Wally World only a few times. My wife, who shops at Ingles quite often, buys them for me there on a pretty regular basis. They are tender and have good fat marbling just like a rib eye. My 2CW, FWIW, YMMV, etc!

**RE: Zero Carb / Meat and Water - con - 07-31-2008 09:40 AM**

CHARLES did you see this comment answer by Dr. Eades on his blog yesterday?
"Calories do count. And Gary (Taubes) agrees that they do. You’ve got to have a caloric deficit to lose weight. The confusion arises because it’s difficult to lose weight by counting calories even though a caloric deficit brings about the weight loss. Problem is there is the whole calories-out side of the equation that isn’t independent of the calories-in side. When people volitionally reduce calories coming in (by dieting) they also decrease calories going out involuntarily. If they try to increase calories going out voluntarily, they end up increasing the calories coming in by eating just a little more (it doesn’t take much to compensate for the amount lost due to exercise). On low-carb diets people spontaneously consume less because they lower their insulin levels allowing fat to escape from the fat cells to meet the body’s needs. But they do create a caloric deficit by eating less, but at the same time don’t decrease their energy expenditure because the body doesn’t view the caloric deficit of a low-carb diet as starvation. I can see how this could be confusing. I should do a regular post on it because I’m sure others wonder as well."

I'd love to get your rebuttal. I don't think Taubes does agree with this.

RE: Zero Carb / Meat and Water - suzanneyea - 07-31-2008 09:48 AM

But, I have tracked my calories before and when I was on low fat I never went over 1200 and my weight was never lower than 130, now I never eat under 2000 calories and I can barely stay at 110...

---

RE: Zero Carb / Meat and Water - MAC - 07-31-2008 10:16 AM

I have copied Con's and Suzanneyea's comments over to the new thread I started. See above. This is about more than zero carb and water and thus would be visible to a larger audience in another thread IMHO.

---

suzanneyea Wrote:
It is intersting you said that about your eye sight. I was on the computer yesterday without my glasses and I didn't evennotice. Before, I could not even read the screen without them. I have a couple of other medical problems that have cleared up with zero carb.
But, like the rest of us, my spouse is not so sure. Especially at dinner tonight, I was super hungry, so I ate A LOT and he was giving me the eye. And then started talking about how much red meat I eat...you know the drill.

I noticed that I am seeing better too, and my constant allergies don't even bother me anymore-not at all! I'm surprised by this... I wonder if they will get worse again in the fall.
LOL@ your husband giving you the eye. Mine said the other night, "You should be careful not to eat too much fat!" I think he's afraid I'll gain weight. Ha ha!

Wendyoh Wrote:
I'm curious as to what you mean when you say you feel it throughout your whole body when you eat even a tiny amount of carbs.

That's a great question, Wendy. Well, for one, I have gas which I never have. I get "regular" again after being quite irregular on zero-carb. It could be every other day and somehow that seems fine. I feel bloated in my stomach and I have the feeling that someone just pumped water throughout my body. I guess I'm just generally uncomfortable. I don't shake or get dizzy or anything but it's just so different than how I usually feel.

I hope that helps. I was surprised by all of this. I figured that since I didn't eat them, perhaps if I did have a few, my body would just eliminate them and go back to business as usual. I couldn't have been more wrong. I came to grips with this even better when I read in Stefansson where he says that:

**Quote:**
I have suggested that there must have been a cycle of malnutrition, discomfort and early deaths that lasted many tens of thousands of years, while the mechanism of the body for handling monkey food was being adapted to handling considerable and at length very high percentages of flesh foods. It is doubtful that mankind is as yet through biologically with the worst of the corresponding period of change from the hunting and pastoral to the agricultural way of life

That means when you go zero-carb for a while and switch back, you shouldn't expect it to be easy.

Wendy Wrote:
I'm pretty certain this has to do with insulin. What I'm wondering though, is this the way we all used to feel all the time? Or is it more exaggerated now that we are eating VLC and producing less insulin?

Another excellent question. I'd like to say it's different now, but I can't really say. When insulin was high, I suppose we got used to it. Now that we've come to understand a little of what it's like to have low insulin, there are so many possibilities now.

**RE: Zero Carb / Meat and Water - Charles - 07-31-2008 11:28 AM**

Mike Wrote:
OK, so if hunger (as defined in GCBC) is basically a perceived unavailability of usable fuel in the fuel stream, why on earth does this guy ever even get hungry? Why doesn't he just burn his spare fat until it's all gone, or almost all gone, and _then_ get hungry?

I think that one part that gets lost in the mix is the notion of cellular equilibrium. Keep in mind that obesity is a compensatory reaction to internal starvation caused by a metabolic disorder of fat accumulation. This comes courtesy of Dr. Stephen Ranson. This guy died far too soon.

This is tough for the calorie-counters like Eades because they can't assimilate this into their understanding of the law of conservation of energy. When Taubes talks about hunger, he does so from the cellular perspective and you're right, it's not long or short term -- it just is what it is.

This obese fellow is at equilibrium. This means that at his present weight, his cells are getting their nutrients at the correct rate which will keep him within his body's regulated parameters. He gets hungry
at a rate to keep that rate constant, just like a thin person does. In order for him to become leaner, he has to increase the rate of flow of those nutrients into the cells. When he does this, the body will compensate by shrinking the fat tissue so the rate stays constant. This was Pennington's understanding.

When a lean person, such as myself, eats carbohydrates, I cause a slow-down to the rate of flow for my cells. My body compensates by increasing the size of my fat tissue to keep the rate constant. This probably explains why it takes several days or weeks to re-adjust that flow. We have to understand that even a little carbohydrate can do this. People always say, "oh, this little bit won't hurt..." The amount is irrelevant. It's the effect.

Some people call this a "set point" but that doesn't quite fit the alternative hypothesis. That's like looking at a lake and naively declaring it to have a set point without realizing that the level is just the average between the flow of water into and out of the lake.

The problem is that since the person is so obese, they mistakenly believe that by eating less, they will lose weight. When they do that, they slow down the flow of nutrients into the already starving cells so the body has no choice but to compensate by enlarging the fat tissue even further to keep the flow rate constant. It's like constricting a garden hose. He has to eat more fat and protein to appetite to ensure those cells get the nutrition they request at the proper rate.

As MAC said, Yalow, Berson and Le Magnen came along and taught us that when insulin truly gets under control and the pancreas slows hypersecretion (I don't think it ever gets fixed), then there is more time that fatty acids can circulate which will shrink the fat tissue. If the person is obese and their insulin levels are high, then your scenario can't be true. It's impossible that he is still obese and his insulin levels are normal. Just because one is on a low-carb diet and even losing weight, does not mean that their insulin is normal. Some of those cells remain insulin resistant. I hope I'm wrong on this last point but I don't think I am, unfortunately.

This is the mechanism that seems to elude Dr. Eades. He apparently hasn't studied the research on hyperinsulinemia closely enough. His observations on his patients are obviously correct but he doesn't identify the mechanism. Some people are not going to tame their insulin enough to get the flow they need to become thin due to hormones and also their inability to beat their addiction to carbohydrates. Cheese and nuts don't have many carbs, but as Pennington observed, one guy at DuPont couldn't eat as much as an apple or he would gain considerable weight. Me and this guy are probably related!

What about zero-carb? Perhaps but it's going to take a while which is probably proportionate to how long they have been obese. Someone who has been obese their entire life will probably need to go zero-carb and remain there for years in order to achieve the weight loss they want. Others will respond quickly.

Basically the calories-in/calories-out thing happens at the cellular level, not in your brain or in your stomach. When you understand it this way, then you can reconcile all the observations.

Regards,

Charles

RE: Zero Carb / Meat and Water - jeepifer - 07-31-2008 11:30 AM

Someday I'm going to come visit your area and make a pilgrimage to the Golden Corral. 😊 I can't tell you how envious of your regular LC meetups I am. We've tried a gathering here once or twice but
pzzzzzzzzzzzpt. I think I'm the only low-carber in Minnesota!

We used to have a place that offered all you could eat prime rib on Fri or Sat nights for about $20. Dan (hubby) and I went there the night we were engaged. Unfortunately, they closed and we haven't found such a good deal since.

I can eat the ribeye at Outback and be pretty full, though. Of course, I have much more body fat to burn than Suzanneyea (for now 😊) so I'm finding when I am fully on plan my appetite is satisfied more easily.

**RE: Zero Carb / Meat and Water - Charles - 07-31-2008 11:45 AM**

montmorency Wrote:
But what is the hunger-signalling mechanism that tells us to eat protein?
It must be something other than that unavailability of free-fatty-acids that GCBC talks about, because in the scenario I have posited, there should not be an unavailability.

In nature, it's quite difficult to get good fat without some protein there. When Stefansson talks about 80% fat, he's mainly talking about fatty protein. He's not talking about eating lean by itself because that makes him sick. By the way our bodies have been shown to work, it's clear that it was set up to most efficiently deal with fat and protein from animals. We absorb the nutrients most readily, our mitochondria handle fatty acids naturally and even glucose is converted to fat via triglycerides and handled exactly the same way as fatty acids. If triglycerides weren't so big, we would function normally with them. Because of their size, they undergo esterification which slows down the stream of nutrients.

Mike Wrote:
So, during those 5-6 hours, presumably your insulin levels are sufficiently low to mean that FFA mobilization is taking place, but what is it that eventually gets you hungry? (BTW, I don't know if you are currently above your ideal weight or not, but let's talk about someone (like myself) who is still carrying more than enough spare fat. I too don't get pangs between my normal meal times now (on LC), but I do definitely get hungry before the actual meal, and it doesn't have to be immediately before the meal.

The mechanism is the availability of the long-term fuel supply. You have to understand that all the
nutrients go throughout your body in the stream of nutrients which is basically your blood circulation. When you need energy, the stream changes directions instantly and directs the flow of free fatty acids towards your limb or organ that requests energy in the blink of an eye. When this long term fuel supply begins to falter, your cells signal your brain, via your central nervous system, to eat. Your hypothalamus coordinates your five senses via the nervous system, insulin is secreted and then you begin the Krebs cycle.

The food that goes into the gut gets broken down and the majority of it goes to your fat tissue. It stays there until it is slowly absorbed into the stream of nutrients. Hunger doesn't mean you're out of fuel, it just means that the body wants to replenish the long term fuel supply. It can go much longer if it has so, but you can condition it to get topped off more often than it absolutely needs to. I've read that every system in our body actually overcompensates.

This cycle happens every meal regardless of your low-carb status. Insulin doesn't sit dormant just because we don't eat carbohydrates. It always performs in the way described, it just doesn't stay in circulation in thin people as long as it does in obese people.

The problem in hyperinsulinemics is that their pancreas secretes insulin even between meals so they don't get the opportunity to live off the stream of nutrient (the long term fuel supply) as long as thin people do.

Hope this helps,

Charles

This is me for sure. And it's something I just cannot explain to those around me (who don't agree with low-carb to begin with, let alone zero-carb).

When I was pregnant with my son, I upped my carbs to Atkins maintenance levels - so I was eating things like whole wheat tortillas, beans, etc. And I didn't gain weight (beyond the growing baby), or really suffer any of the other symptoms of eating too many carbs.

(I'm finding the same effect this time around too, although I'm trying to keep my carbs lower than I did last time. I'm sure I could build a healthy baby on zero-carb, but I get so much flak just for eliminating sugar and bread that it's not worth dealing with it. Maybe baby #3 will be a zero-carb baby...)

Anyway, after my son was born, I dropped my carbs back some but not all the way. and even though I was eating fewer carbs than when I was pregnant, I started gaining weight. One time I literally only ate a 2" cube piece of pineapple, and I gained about 3lbs, and it took me at least a week to lose it again.

I do believe I need to get down to zero-carb to lose weight, and hopefully, once this baby gets here, I'll be able to do that.

I don't mean to overstep my bounds but...

The sad part here is that it's about so much more than weight. I would be concerned about my child's teeth and their insulin levels when they are born. It may not do much to you but it's impossible to know the effect on the cells and what gets passed on to the child. That's far more important than the scale. You have hormones working for you that will make you nice and fat regardless of what you eat.

Just because you eat zero-carb while pregnant, do you think that you will not get fat? You most certainly will! Those sex-hormones will work to store fatty acids regardless of what you eat. The most important thing is what happens at the cellular level and that's what would worry me.

Charles, I am confused by your response. Did you mean to say you are worried because you think I should be eating zero-carb while pregnant or because you think I should eat more carbs? (Your first paragraph suggests the former, and your second the latter)

I was just pointing out that (when my metabolism isn't in overdrive due to pregnancy), I'm one of the people who needs to eat practically zero-carb to avoid the hyperinsulinemic response.

When I'm pregnant I can tolerate more carbs, but it's because my body needs so many more nutrients at this time that it can handle whatever I throw at it. I didn't mean that I'm stuffing my face with pizza or other junk, just that if I eat some fruit (for example) I can tolerate it without the negative effects I would immediately see if I were not pregnant.

As for how I'm eating while I'm pregnant, I'm not concerned about gaining weight. I just want to eat the healthiest diet I can to grow a healthy baby.

I've told this story on some other thread before, but i'll repeat it in case you've missed it.

In my first pregnancy I successfully ate a healthy lowcarb diet (at Atkins maintenance levels) for the first two trimesters, but got off track in my third trimester because I simply couldn't carry around enough quantity of lowcarb food to satisfy my hunger - so I'd eat whatever was available. Towards the end of that pregnancy I started developing signs of pre-eclampsia, and my son was eventually born 6 weeks early.

I am completely convinced that the problems I experienced were the result of not being able to stick to lowcarb the whole way through, and I am determined to not let the same thing happen this time around.

Hence I'm trying to be fairly strict in my lowcarbing - I'm just not going down to zero-carb because "don't you know your baby needs carbs?" is a lot easier to deal with than "don't you know your baby needs the nutrients from fruits and vegetables?"

(Even on this forum, you get people arguing with you about how healthy zero-carb really is; imagine
trying to argue with someone (say a mom or MIL) who is already convinced that you are doing irreparable harm to their grandchild by staying away from milk, bread, bananas, etc.) Even my husband, who is completely supportive of my eating lowcarb, was only reluctantly supportive when I tried zero-carb before I got pregnant, and would be absolutely opposed if I tried it now.

RE: Zero Carb / Meat and Water - Ell.eee - 07-31-2008 01:57 PM

Yesterday morning I changed my usual breakfast because I was in a hurry and had just 2 eggs and 1T of butter with my coffee. I headed off to work with my bottle of water (I haven't had lunch on work days in over a month and am never hungry). Well by 3pm I was starving! When I got home at 5:30 I cooked about 1.25 pounds of 73/27 ground meat and then put 4 eggs in with it to soak up the fat. I planned to eat 1/2 for supper and the rest for breakfast today but I ate the whole pan and still felt hungry for about an hour as I always do even though my stomach was uncomfortably full. Loops I know just how you felt!

Now today it is almost 5pm and I haven't gotten hungry yet. I made myself eat about 1/2 pound of fatty beef rib meat at 3pm because I was worried that I hadn't eaten yet and I don't feel hungry at all for dinner. I guess I'll make sure to include some meat and the 2T of coconut oil I usually have with breakfast on work days from now on. Feel like I really messed up my system getting too hungry and then overeating. Plus the thought of ground beef is repulsive to me right now - hope I haven't lost my taste for it cause I can't afford rib eye! I'm thoroughly disgusted with myself. Can't believe it was even possible for a woman my size, 106 pounds, to eat 1.25 pounds of meat and 4 eggs in one sitting - never again.

RE: Zero Carb / Meat and Water - jeepifer - 07-31-2008 02:04 PM

karishma Wrote:

On one hand, you are correct in saying that your diet can help influence and perhaps delay the pre-eclampsia. But having had it once, you are more likely to develop it again. Also, not all factors have do to strictly with diet. What I'm trying to say is don't beat yourself up if it occurs again.

Don't get me wrong -- I think you are doing an awesome job keeping the carbs to a minimum. I only gained baby weight both my pregnancies, and had two beautiful, healthy girls. 😍

And congratulations! Babies are beautiful!

RE: Zero Carb / Meat and Water - Charles - 07-31-2008 02:11 PM

Ell.eee Wrote:

Please, please, don't think like that. You were hungry and therefore you ate! Never apologize for hunger. Also, don't eat when you're not hungry. If you eat a lot, that just means it will take that much longer for you to be hungry again. There's no shame in that, really!

Don't feel like you have to eat according to some convention, such as eat once a day or whatever. Let
your hunger control when you eat and when you don't. You're doing fine, don't worry about this.

I know it's strange to sometimes feel like gorging and other times you eat just a little. That's more natural and that's how it's supposed to be. You don't control hunger. Your body does. All you can do is respond to it and let your body lead the way.

Keep your head up, you're doing great!

Regards,

Charles

Amy

Hi Amy!
It's possible because zero-carb doesn't aim to reduce your weight. It aims to repair a hormonal condition in your metabolism. Deana has hyperinsulinemia which means that she likely secretes insulin for much of the day. That leaves little time for her fatty acids to circulate. By going zero-carb, she is trying to condition her pancreas not to secrete so much insulin which will allow fatty acids to flow for longer periods of time. This takes time. It's not just about how many carbs you eat, it's about how much insulin you secrete. The carbs are truly secondary, although not eating them is the best way to improve the condition.

This level of hyperinsulinemia varies wildly between people. Not only that, but if there are any other issues that she has, these can also exacerbate the condition. I don't know what, if any, supplements she may be taking, whether she has trouble with her menses, whether she has any sort of chronic pain anywhere in her body, etc.

Our bodies are a homeostatic system and it's impossible to separate weight from the other regulatory processes in the body. They are all driven by hormones with insulin being the chief hormone. If one of these is acting up, it will affect all the others. I would have to get a lot more information to know why she isn't losing weight, but she said that she had other markers like sleeping better and higher energy levels. These are signs that her insulin levels are improving and as long as this continues, it's a great sign that she'll begin losing weight soon.

Alison didn't lose weight for a while and then began to lose one day. That's how it works sometimes.

For some people, it takes a while to jumpstart the system and then once it gets going, it can take a long time to regulate itself properly. One has to be in it for the long haul because for some people, it will take that long to get where they are trying to go. I hate it that it's like this, but that's really how it is.

Regards,
Charles

I hope I'm wrong on this last point but I don't think I am, unfortunately.

OK, many thanks Charles. I think these paragraphs help a lot with the things I wasn't quite understanding; partly I've never totally "got" insulin resistance, but I was forgetting insulin's role (I know it has many) in causing glucose to be stored within the cells (and that this may not happen if the cell is insulin resistant).

From what you say, if we are stalled, then probably eating fewer calories is about the last thing we should do, provided they aren't carb calories of course.

Charles Wrote:

I didn't buy his calorie argument; I might have at one time, but certainly not after reading GCBC, and my eyebrows raised at his suggestion that GT would agree with this argument. I don't personally count calories; never have; never will.

Charles Wrote:
What about zero-carb? Perhaps but it's going to take a while which is probably proportionate to how long they have been obese. Someone who has been obese their entire life will probably need to go zero-carb and remain there for years in order to achieve the weight loss they want. Others will respond quickly.

This rings true to me. I could tell in the last couple of years or so that something had really "broken" in my fat mechanism. I'd gained weight and lost weight over the years but this was something else. I'm glad I decided to go myself down the LC route, before some doctor got hold of me and (probably) put me on statins and the rest of the paraphernalia. Now that I know a little more about how it all works, I know that I made the right decision.

Charles Wrote:
Basically the calories-in/calories-out thing happens at the cellular level, not in your brain or in your stomach. When you understand it this way, then you can reconcile all the observations.

Thank you once again Charles for some wonderfully thoughtful, considered and insightful commentary.
Yes, as I think someone suggested (or it may have been you!) an interview between you and Gary would be superb!

With kind regards,
Mike

**RE: Zero Carb / Meat and Water - Glenice - 07-31-2008 04:15 PM**

Charles, I am slowly reading through this thread and find it fascinating and am learning a lot. I am particularly interested in your statement about zero carbs repairing hormonal conditions in the pancreas. Is it possible to do this even despite Type 2 diabetes? My feeling is that one would have to drop injecting insulin altogether for it to happen. I would think that exogenous insulin would block all efforts to lose weight, as has been my experience. On Dr Bernstein's diet of 30 or less carbs I have been able to wind back the insulin doses to around 30 to 40 units per day, though I have mostly consumed only around 10g per day to do this. I am going to try going completely zero, but I am wondering if it is even possible for any repairing to be done if you are injecting insulin. Your thoughts would be most appreciated.

Regards,
Glenice

Ketones are bad for babies. My wife would not go into detail, but she is an ER Doctor and is pregnant. Low carb, but not so low you become ketotic

This is ridiculous. Tell her to come on and provide some science. We're not talking about ketoacidosis, we're talking about ketosis. None of us here on zero-carb should really be in ketosis unless we're eating lean meat or just starting out. Either way, ketones are safe for any state our bodies are in.

We need the science.

There were some posts on Dr. Eades site about ketones and pregnancy under I believe the comments for the Ketosis and Metabolism thread. Most of 'the facts' by one poster were related to levels of low
carbing depending on trimester. But even Dr. Eades said he knew very little about pregnancy and ketones so he offered no advice.

There have been some studies recently about gestationally diabetic mothers getting pancreatic cancer later in life because of the gestational diabetes.

And this link about high sugar levels in pregnant women and childhood obesity in their offspring: [http://www.sciencedaily.com/releases/2007/08/070828084428.htm](http://www.sciencedaily.com/releases/2007/08/070828084428.htm)

Hi Glenice, welcome to our thread! I believe that Type 2 is reversible because if you don't supply any glucose phosphate, then over time your pancreas should secrete less insulin. Dr. Mary Vernon deals with this often and she reports that most of her patients no longer need insulin very quickly after changing their diet. You would want to work with a doctor because as you go to zero-carbs you would need to adjust your dosage of insulin down to keep from getting too much. I would expect on zero-carb that your need for insulin would plummet very rapidly.

Insulin injections would certainly cause fattening and in the 20s, Taubes' research tells us that this is how they used to treat anorexics. Dr. Blake Donaldson regularly chastised his patients for "wanting an insulin shot to cover their Danish."

Again, if you remove the carbohydrates, then your need for insulin will disappear pretty quickly afterwards but work with a doctor to keep from overdosing on insulin. I'm sure Jimmy can hook you up with a low-carb doctor in your area or if you feel like taking a trip, it would be worth it to visit Dr. Vernon in Kansas!

Regards,

Charles

Well, that makes sense if you're talking about diabetics. However, just a blanket statement that very low-carb eating is not good for pregnancy is quite a stretch. The Masai have babies every day and I don't
think they have any trouble.

Any diabetic would want to work with an experienced low-carb doctor in anything they do in order to get their medicines adjusted accordingly. However, for the general non-diabetic pregnant woman, I don't see how a zero-carb diet would harm them any more than it does any other meat-eating woman in the world.

RE: Zero Carb / Meat and Water - montmorency - 07-31-2008 04:47 PM

Charles Wrote:
In nature, it's quite difficult to get good fat without some protein there. When Stefansson talks about 80% fat, he's mainly talking about fatty protein. He's not talking about eating lean by itself because that makes him sick. By the way our bodies have been shown to work, it's clear that it was set up to most efficiently deal with fat and protein from animals.

Which reminds me of the cheese thing again; it has fat, and yes, it has protein, but not exactly protein as we know it Jim, I mean it's not a natural combination like the combination of the protein and the fat from the flesh of the cow that produced the milk for the cheese would have been.

Charles Wrote:
The mechanism is the availability of the long-term fuel supply. You have to understand that all the nutrients go throughout your body in the stream of nutrients which is basically your blood circulation. When you need energy, the stream changes directions instantly and directs the flow of free fatty acids towards your limb or organ that requests energy in the blink of an eye. When this long term fuel supply begins to falter, your cells signal your brain, via your central nervous system, to eat. Your hypothalamus coordinates your five senses via the nervous system, insulin is secreted and then you begin the Krebs cycle.

The food that goes into the gut gets broken down and the majority of it goes to your fat tissue. It stays there until it is slowly absorbed into the stream of nutrients. Hunger doesn't mean you're out of fuel, it just means that the body wants to replenish the long term fuel supply. It can go much longer if it has so, but you can condition it to get topped off more often than it absolutely needs to. I've read that every system in our body actually overcompensates.

This cycle happens every meal regardless of your low-carb status. Insulin doesn't sit dormant just because we don't eat carbohydrates. It always performs in the way described, it just doesn't stay in circulation in thin people as long as it does in obese people.

The problem in hyperinsulinemias is that their pancreas secretes insulin even between meals so they don't get the opportunity to live off the stream of nutrient (the long term fuel supply) as long as thin people do.

Hope this helps,

Yes, enormously, and thank you very much once again.

Just a quick personal update: I increased the quantity of minced beef this morning (packet of 500 gms); cooked in its own fat with a couple of slices of bacon, topped off with some butter for added flavour and vitamin A, etc. Possibly ate slightly more than originally intended, but boy, was this powerful. This kept me going comfortably for at least 10 hours; I couldn't quite believe it. When I did eat again, I wasn't
ravenous, just comfortably hungry and didn't overeat; just some more minced beef and a few slices of fatty topside; v. small amount of non-starch veg mixed in as it was shared with my wife.

With kind regards,
Mike

I figured you would say that so she will provide it shortly. Her last pregnancy she became gestationally diabetic and had to go low carb. Her OB warned her about ketones and fetal brain development (she will look up the specifics at work since she is concerned,) not to mention gestational diabetics have low birth weights (Jack was 6 pounds at 39 weeks.)

I think perhaps someone who is Keto-adapted fully may not run these risks, but advising someone who is not running off their ketones may be unwise. Causing your body to change fuel sources during a pregnancy sounds like a bad idea. She wanted to do atkins since her dad has been on it for 5 years, but her OB and others told her it would be dangerous.

I will get you more information, but I would err on the side of existing procedures for pregnancies that are established. I mean what were infant mortality rates of paleo cultures? If someone is going to go low carb while pregnant at least look into a gestational diabetic diet.

It is one thing to say that doctors know little about nutrition and have a bias towards low fat, carby diets. It is another to say they don't know about keeping babies healthy.

At the end of the day I would tell our pregnant friend to talk to her doctor. None of us, that I know of here, have the authority to give advice sans malpractice on what a pregnant woman should or should not eat. It is an interesting topic though.

RE: Zero Carb / Meat and Water - Kristi31 - 07-31-2008 05:14 PM

So maybe, just maybe some of the problems I encountered when eating all-meat (raw) were due to inadequate fat in my diet. Tonight, I bought some very fatty (regular) ground beef. 100 grams of it contains 25g fat, 17g protein. About 77% of calories come from fat, close to the 80:20 ratio Stefansson and others recommend.

I suspect women may perhaps do better on higher fat as opposed to men who do well on more protein due to sex hormones (androgen vs estrogen).
I only ate about 100-150 grams of ground beef and I was full! Whereas I can easily eat much more, about 400-600 grams, in one sitting, with other meats such as chuck or rib steak.

Maybe that's why I was constipated and tired after (or during) meals. Maybe that explains why my skin is dry, hair is brittle and I have a hard time shedding those last few pounds. And maybe, just maybe, that's why I feel sometimes bloated but crave carbs AND do better when adding them back in. More fat!!!

Let's see what happens in the next few days...

However, for the general non-diabetic pregnant woman, I don't see how a zero-carb diet would harm them any more than it does any other meat-eating woman in the world.

Look, I made that statement quickly so that a pregnant mother wouldn't start a potentially harmful course of action. How many studies have been done on people that suddenly transition from carbs to all meat while pregnant? What kind of development issues would that cause? I am not advocating going out and eating sugar to save a baby, but I think non-zero carb people should be careful while pregnant. Our bodies are in states of equilibrium either way, change it at your risk is fine, but at the risk of two seems irresponsible. Again all the internet studies in the world and all the reading do not make anyone here a medical authority. Nor does being a medical authority make anyone always correct. At the end of the day I think someone consulting an OB/doctor that is specialized in pregnancies would be the course to go before changing to ANY diet.

I buy what you are selling about 0 carbs, but unless anyone here is willing to be responsible for problems during pregnancies maybe some information from some other sources are needed.

Maybe it would be a good idea to see what Eskimos/Masai and others do for pregnancies? Do they eat more root vegetables? Do any of these books talk about diets of women that are pregnant? What about all the rainforest cultures that have bananas and yams/obscure root vegetables in their diets? Are those for special events or for pregnancies? What would a shaman/witch doctor tell a woman to do in those cultures to produce a healthy baby?

Sorry if any of this seems harsh, but I feel slightly attacked myself.
How many low carb doctors deliver babies? Maybe this is something you should email to the doc Charles?

RE: Zero Carb / Meat and Water - nyteez - 07-31-2008 05:27 PM

Wow! I am finally caught up in this post. I spent a month reading The Bears post from 2 years ago and have spent the last 4 days catching up on this post (I have had no life LOL!)

It is interesting that I see a few people over here from The Bears post, with the same arguments and asking the same questions and essentially getting the same answers.

This quote from Charles really sums up this WOE.
Quote:
What about zero-carb? Perhaps but it's going to take a while which is probably proportionate to how long they have been obese. Someone who has been obese their entire life will probably need to go zero-carb and remain there for years in order to achieve the weight loss they want. Others will respond quickly.

It took me, my whole life, 41 years to wreak my metabolism with a high carb diet. I can't expect my body to respond to ZC in just a few weeks or even months. It does with some people, but not me. I started Atkins in Feb 08. I stayed around 10 carbs and lost 10 lbs in 2 weeks, then stopped losing for about a month. I was getting discouraged until I found Jimmy's Forum. I eventually started eliminating more foods from my diet and lost more weight. I am not losing as fast as I would like, but what is my alternative? For the past 10 years I have tried every diet in existence and managed to put on 60 lbs! Obviously going back to eating carbs is not going to do me any good, I have no choice but to press on with zero carb.

ZC is not exactly simple either, some people can eat eggs & cheese. Getting the fat ratio right took me a while too. I have been basically ZC since April, but have not seen a dramatic weight loss. I believe this is because of cheese and eggs. I eliminated cheese, lost 5 lbs then added cheese back in, gained 5 lbs. OK, no more cheese for me. I thought I could eat salads..... felt horrible!, took me a week to recover from that. Thought I should maybe add a potato to speed up my metabolism. (I read this in some study about pyruvic acid), I am currently recovering from that 5 lb gain LOL! So as you can see this WOE is a learning experience that is going to take time to figure out what works for each person.

As Charles has said over & over, your reason for wanting to eat this way should not be to lose weight, it should be to get healthy. Although I am not losing as fast as I would like, I feel awesome! Better than I have in years! My skin looks better, I am not puffy, no digestive problems, I don't think about food 24/7 and I have more energy.

This week I have eliminated eggs and have lost 4 of the 5 lbs gained from the potato experiment. So, now I am down to meat, water and sometimes a cupa coffee w/ heavy cream and a glass of wine. I Love eating just meat & fat, I am not bored at all and I used to be a gourmet cook! I am saving so much time and money by not having to plan/prepare meals and by not having to buy a million ingredients. I just buy meat, I don't need a 2 page shopping list anymore! LOL

So, for those of you getting discouraged, just stick with it! You will see results eventually. Besides....there is no other alternative unless you want to starve yourself and work out 4 hours a day.

Thanks Charles and everybody else for your support and information!
I personally do not trust doctors. They have tried to put me on so many medications for all sorts of things and all these things have cleared up on low carb. So, if I got pregnant again I believe I have more knowledge of my body and what it and my baby needs than the majority of doctors. I would stay low carb during my pregnancy.

Also found something interesting on this very blog. =)

Talk about how to low carb safely while pregnant. Healthy carbs, no white carbs. Atkins maintenance levels.

I will look for the problems for the babies specifically when my wife gets back to me. She is working till 11 tonight.

Would you stay 0 carb? Do you trust doctors for things besides diet? My wife gets to see people that ignore their doctor's advice daily in the ER. Doctors I would not trust would be ones that wouldn't listen to reason or new research. I know my wife is going on South Beach after her pregnancy. She recommended her father go on Atkins while she was in medical school after talking to her biochem professor on what it really does to the body. I think too often we don't challenge doctors, but do research behind their backs. I confronted my doctor when she prescribed BP meds for me. She asked why I wouldn't take them. I told her that I had switched diets and had lost 70 pounds since she last saw me... She looked at the chart and said, Oh... Then we had a nice long talk about why I wouldn't and how long I would wait and what my plans were. If your doctor won't have an opened informed dialogue with them don't trust them. But don't forget communication is a 2 way street. Just like mechanics and PC repair people that "won't get into it with you." Move on to someone else. I think throwing out what medicine has done for us completely is throwing out the baby with the bath water. I know I am comforted knowing that if anything happens to me people like my wife will be there. Her partners on the other hand... (I kid!)

Bacon wrapped chicken thighs swimming in butter! I'm gonna try that!

RE: Zero Carb / Meat and Water - Tana - 07-31-2008 06:14 PM

nyteez

I also started using Fitday again, and am finding that my fat percent is not high enough. It does make a difference, I have no problem eating twice a day and do not feel hungry or snack in between.

RE: Zero Carb / Meat and Water - nyteez - 07-31-2008 07:18 PM

We have an old fashioned butcher shop in town. He gives me beef fat & pork fat for free! (nobody else wants it) I just cut it up and throw it in the crock pot for about 2 days. Then store it in mason jars. About 2 lbs gives me 2.5 mason jars full and that lasts a long time. The beef and the pork have different flavors. Adds great flavor to foods cooked in it.

Sounds great, but I picked up some Tyson chicken thighs today and grilled them but I'd never get bacon wrapped around these monsters. These are absolutely 8 of the hugest chicken thighs I've ever seen. Two of’em are a meal for me. But I'll definitely remember that bacon wrapping trick! Pork Fat Rules!!!

a little toothpick poked here and there keeps the bacon in place!

Charles Wrote:
aim in Fla*working Wrote:
Charles, a poster earlier posted that she had been on zero carb for 4 weeks and had not lost weight...could you explain how that is possible?
Thank you😊
Amy

Hi Amy!

It's possible because zero-carb doesn't aim to reduce your weight. It aims to repair a hormonal condition in your metabolism. Deana has hyperinsulinemia which means that she likely secretes insulin for much of the day. That leaves little time for her fatty acids to circulate. By going zero-carb, she is trying to condition her pancreas not to secrete so much insulin which will allow fatty acids to flow for longer periods of time. This takes time. It's not just about how many carbs you eat, it's about how much insulin you secrete. The carbs are truly secondary, although not eating them is the best way to improve the condition.

This level of hyperinsulinemia varies wildly between people. Not only that, but if there are any other issues that she has, these can also exacerbate the condition. I don't know what, if any, supplements she may be taking, whether she has trouble with her menses, whether she has any sort of chronic pain anywhere in her body, etc.

Our bodies are a homeostatic system and it's impossible to separate weight from the other regulatory processes in the body. They are all driven by hormones with insulin being the chief hormone. If one of these is acting up, it will affect all the others. I would have to get a lot more information to know why she isn't losing weight, but she said that she had other markers like sleeping better and higher energy levels. These are signs that her insulin levels are improving and as long as this continues, it's a great sign that she'll begin losing weight soon.

Alison didn't lose weight for a while and then began to lose one day. That's how it works sometimes.
For some people, it takes a while to jumpstart the system and then once it gets going, it can take a long time to regulate itself properly. One has to be in it for the long haul because for some people, it will take that long to get where they are trying to go. I hate it that it's like this, but that's really how it is.

Regards,

Charles

thank you!! I appreciate the info....are you familiar with any studies on the benefits of zero carb on adrenals?

---

RE: Zero Carb / Meat and Water - karishma - 07-31-2008 09:50 PM

It seems like I highjacked this thread into a discussion of LCing during pregnancy, but in my defense, I have to point out that I did not ask advice on what my diet should be, nor suggest that I would change how I was eating depending on suggestions made in this thread.

My original point was that my tolerance for carbs varies wildly depending on what else is going on with my body, eg. pregnancy. When I'm not pregnant, I need to stay practically zero carb to avoid weight gain, but when I'm pregnant, I can eat much higher levels of carbs and maintain a reasonable weight.

Dwayne, the concern with gestational diabetes usually is high birth weights (10, 11lb babies). If your son had a low birth weight at term, my guess is you guys had other issues besides the gestational diabetes going on.

I've read everything I can find about lowcarbing during pregnancy, including the standard medical advice (eat according to the food pyramid). Practically all the studies that found negative effects of ketosis were done either in diabetics (in ketoacidosis), or women who were burning ketones due to starvation. Obviously, neither of those is equivalent to a woman on a LC diet.

The general opinion is there isn't enough research done to know if ketones are safe for the baby so it's best to avoid them. Which is all well and good unless you are one of the many women who needs to stay at a very low carb level to avoid gestational diabetes and the sugar high/crash rollercoaster. Given a choice between the known negative consequences of gestational diabetes (on mother and baby), and the theoretical consequences of ketones on the baby (since ketones obviously don't harm the mom), I would take my chances with the latter.

As far as discussing my dietary choices with my midwife, that will depend on my overall impression of her when I meet her for the first time in a couple of weeks. All I really need her to do is catch the baby; everything else is nonessential.

---

Macrosomia occurs if you do not adjust your diet and have too much glucose. When my wife followed
the low carb diet the opposite occurred and the baby was smaller. I would imagine if you eat enough fatty meat with the prescribed gestational diabetes diet you would be fine.

karishma Wrote:

Obviously, neither of those is equivalent to a woman on a LC diet.

This is true, ketones being dangerous is from flawed studies in the past. Something that my wife and a few other doctors at work had a nice discussion about. They found some similar studies done to isolate ketones in rats that caused issues, but that is just for rats and who worries about studies in rats. =)

karishma Wrote:

Look I was not advocating a sugary diet. I was warning against 0 carbs during pregnancy since the reason research isn't done is because it is not worth risking an infants health to prove a point. I think Low carb is the way to go during pregnancy, if by low carb you mean no refined sugar, lower glycemic index fruits and veggies, and nice fatty meats.

I am sorry if I derailed the discussions here a little, but I was concerned. I can see that no one really likes dissenting opinions here, and I am not a big fan of back and forth comments on message boards. I just felt it was my duty to say something. At the end of the day you can find whatever slant of information you want on the internet and you have to make an informed decision with little hard proven facts.

For example when I started my search on Masai infant mortalities I found this interesting note:

From this article
From Article Wrote:
A reader commented that life expectancy does not say much, and he is right. In poor countries, life expectancy numbers are skewed, because so many children die at birth. If you have ten people die at birth and ten die at age 90, the average life expectancy is still only 45 years. However, in this particular case I do not think it is very relevant, because life expectancy at age 15 in Kenya is still only 60 years. It is also interesting to note that one of the reasons that the Masai have such a high neonatal mortality rate is exactly because of their beliefs about a healthy diet: Masai women eat less food during pregnancy because they want smaller babies.

I am sure some way to rebut that is possible, but I am just trying to make the point that none of us is doing real research on these subjects. The information is incomplete.

karishma Wrote:

Well I am sure she is experience in baby deliveries. Not sure how much organic chemistry as it relates to the body she would know.

Anyway, I have said my piece. Since my wife is pregnant herself I am rather touchy about the subject and worried about healthy babies. There are 1000 things that can go wrong outside of diet with pregnancies. Diet is one of the few we can control. If doctors didn't think it was important they would not do a glucose test at 28 weeks and change your diet to low carbs.

I am not going to keep going with this, but thanks for keeping the tone civil. I wish you and your child good health, and I hope everyone understands that my comments came from a good place.

RE: Zero Carb / Meat and Water - Wendyoh - 08-01-2008 06:47 AM

Dr. James Carlson's Book "Genocide" has its longest chapter about the importance and safety of VLC during pregnancy. He advocates 30gC/day to all of his pregnant and breastfeeding patients.

I think most who say you must eat more carbs are just responding with a scared, knee-jerk reaction, not based on any kind of science.

When/if I become pregnant, I have no doubt in my mind that I will do it on less than 50gC/day.

I also am highly skeptical of doctor's knowledge. Most of them say you should eat a lowfat, highcarb diet! And they are quick to prescribe meds, anti-depressants, statins, anti-anxiety meds, when proper diet will take care of most things. If, in an emergency situation, I highly respect what western medicine has to offer, but beyond that, I'm not impressed.

RE: Zero Carb / Meat and Water - karishma - 08-01-2008 07:13 AM

Dwayne, thank you for your concern. I'm sorry our discussion touched such a sore spot for you (it's a sensitive subject for me too, obviously).

I do believe you and I agree more than we disagree, but for some reason that did not come through in this discussion.

I wish you and your wife all the best with your pregnancy and hope and pray that you have another healthy baby.

RE: Zero Carb / Meat and Water - jeepifer - 08-01-2008 07:15 AM

Feeling pretty good today. Skipped dinner completely last night. My boss (such a sweetie) had picked up treats to celebrate a coworker's birthday. Know what? She bought a meat/cheese tray too, and told me it's cuz she knows I'm watching carbs. I was so very touched!

So after some salami, pepperoni, and 4 little cheese slices, I didn't need to eat the rest of the day. Yay! And, had a diet root beer over at the in-laws. They were having chicken noodle soup rice, and baked beans. I was fine sipping the root beer, and even gave it to DH to finish.

I guess what I'm trying to say is that my appetite is good but not out of control, and I was able to have
something "sweet" but it didn't set off *any* cravings, nor did it make me want to eat. ::::happy dance:::

I've been avoiding the scale, since I know I gained during my carb fest last week. I'll probably weigh on Monday (1 week at ZC) to check in. My clothes are looser, even pants that were ok fitting a few weeks ago were loose yesterday. I feel good. Not bubbling with energy, but not tired. I'm sure it will take a few more weeks to get fully fat-burning adapted.

---

RE: Zero Carb / Meat and Water - nyteez - 08-01-2008 07:51 AM

Yesterday was my first day of true meat & water, no eggs, no cheese, just beef & fat. I am 2lbs lighter today and feel great, lots of energy. I know 1 day isn't enough time to really know if cutting out eggs is going to help break my stall, but I'll know by next friday for sure. I raise chickens, so I have lots of eggs and used to eat about 6 eggs a day, 3 for breakfast, and 3 for lunch. Over the past month I have cut back on the eggs more and more, until I was just having 1 egg w/ my beef in the morning. It is hard to beleive 1 egg a day was preventing weightloss and making me tired. I guess I'll find out soon enough!

---

RE: Zero Carb / Meat and Water - Charles - 08-01-2008 07:53 AM

Dwayne Wrote:
I figured you would say that so she will provide it shortly. Her last pregnancy she became gestationally diabetic and had to go low carb. Her OB warned her about ketones and fetal brain development (she will look up the specifics at work since she is concerned,) not to mention gestational diabetics have low birth weights (Jack was 6 pounds at 39 weeks.)

We would need to see that. The more carbohydrates she ate, the more supplementation she needed. As she lowered the carbohydrates she would have improved her health as well as the health of her baby.

Many doctors are deathly afraid of ketones but as we've noted around here many, many times, there is nothing unhealthy about ketones. In fact, our bodies run much better on them than they do glucose. The higher insulin levels will certainly affect a fetus far more than harmless ketones.

Dwayne Wrote:
I think perhaps someone who is Keto-adapted fully may not run these risks, but advising someone who is not running off their ketones may be unwise. Causing your body to change fuel sources during a pregnancy sounds like a bad idea. She wanted to do atkins since her dad has been on it for 5 years, but her OB and others told her it would be dangerous.

Fortunately, science does not depend on sound and possibilities to determine what is healthy or not. Anything that is unhealthy for the mother is bound to be unhealthy for the infant. The infant will get its needs from the mother regardless of how healthy or unhealthy she is. In my line of work we observe crack mothers delivering healthy babies all the time. Unfortunately, they deliver crack babies as well which underlines my point. What is unhealthy for the mother is unhealthy for the baby.

As we've discussed, reproductive biologists have long considered the availability of food is the most important environmental factor in fertility and reproduction. The critical variable is the immediate availability of metabolic fuels as George Wade and Jill Schneider described their 1980's research. If this is so critical during fertility, how much more so should it be considered during pregnancy?

As Dr. Price wrote:
Quote:
It is significant that the vegetarian groups practiced the feeding of special foods during gestation and lactation. Apparently carnivorous groups found no need to supplement the diet, as it was already rich in the factors needed for reproduction and optimum growth.

We hold on to these erroneous beliefs that vegetables, fruits and whole grains are healthy because they come from the earth. In reality, these foods cause us to lose nutrients and in pregnancy where nutrients are precious, we should do all we can to be as healthy as possible. Eating a high-carb diet is not healthy for any purpose.

Looking forward to her "proof",

Charles

RE: Zero Carb / Meat and Water - Dwayne - 08-01-2008 08:09 AM

Ok I guess I need one more post to get my point across.

1. 0 Carbs is not recommended for pregnancies
2. Low Carbs are

I still don't understand how this got turned around to me saying that pregnant mother should drink apple juice and suck down french fries.

Also as far as proof goes I think singling out carnivorous isolated cultures that have genetic differences from many of us and calling that proof only begs for more research with different groups. It is the scientific equivalent of picking what best fits your hypothesis. It is a testament to the human body that we can develop and change to suit our environments. This has sparked some interesting talks last night after work. My wife talking about how groups of people with similiar genetic markers are more prone to certain diseases, both metabolic and cellular. The one diet fits all, panacea as you will, seems to be a myth.

--disclaimer: I still never implied refined carbs were the way to go, and have eliminated cheese from my diet as of today =)

RE: Zero Carb / Meat and Water - lowcarbhealth - 08-01-2008 08:13 AM

Props to yall, I don't think I could ever do JUST meat and water!!! I am impressed.

RE: Zero Carb / Meat and Water - nyteez - 08-01-2008 08:15 AM

I have never had children, but of course most of my friends have. I will never forget when I saw my friends 4yr old son with black rotted out teeth! All of his teeth! I was shocked! He didn't have those teeth long enough to rot them out on his own. It had to be his mothers bad eating habits while she was preganate to cause his teeth to be so bad. That was the first time that I really thought about how what the mother eats affects the baby.
I just thought I would share this because it is such an extreme case of how the mothers food choices affected her baby.

It could be the mother's bad eating habits while pregnant or it could have been she let her son suck on fruit juice bottles all day when younger.

Kristi31 Wrote:
I suspect women may perhaps do better on higher fat as opposed to men who do well on more protein due to sex hormones (androgen vs estrogen).

I wouldn't say this. I do well on more fat as well. Men need fat just as much. The Inuit women ate no differently than the men.

The real problem is we don't correctly identify how much fat is in meat. For instance, Stefansson describes it this way:

Quote:
A conclusion of our experiment which the medical profession seemingly finds difficult to assimilate, but which at the same time is one of our clearest results, is that a normal meat diet, where one eats at each meal as much lean and fat as he likes, is not a high protein diet.
A casual look at the meals we ate in Bellevue might lead to the conclusion that we were living chiefly on lean; but then you would be forgetting that in a medium or rare sirloin steak the red meat on your plate is mostly water, while the white suet has very little water in it. Speaking in terms of calories Dr. Lieb, the clinician of the Russell Sage tests, put it this way:
"Stefansson averaged about 2,650 calories a day, 2,100 calories consisting of fat and 550 of protein. Andersen aver, aged about 2,620 calories a day, 2,110 calories consisting of fat and 510 of protein."

Not By Bread Alone 83

In another part of the same paper Dr. Lieb says that the ratio of protein to fat in Andersen's food and mine does not make this a high protein diet. He said elsewhere that while the protein percentage of our diet was perhaps a little
above average, it was not as high as the protein ratio of a
great many New York businessmen who are fond of meat
and who can afford to eat as much of it as they like at their
various meals. This is remembering, of course, that the said
businessmen would be getting protein from a number of
sources other than meat; as, for instance, from oatmeal,
chocolate, baked beans, milk and eggs.

That meat, as some have contended, is a particularly
stimulating food I verified subjectively during our New
York experiment—**it seemed to me that I was more optimistic**
and energetic than ordinarily. To the best of my
memory and judgment, I looked forward with more anticipation
to the next day or the next job, and was more likely to
expect pleasure or success. This may have a bearing on the
common report that the uncivilized Eskimos are the happiest
people in the world

From *Adventures in the Land* we know that he ate 2 and 1/2 pounds of sirloin steak a day. That doesn't
seem too fatty to me and indeed, the nutrition label would not identify it as particularly fatty. They
clearly had a different way of looking at this.

The neat part about this quote is that Stefansson seemed to find more pleasure in the New York sirloin
beefsteaks than he did on caribous and seal in the Arctic. That's what excites me so much about our way
of eating. People always say, "you can't live like an Inuit today." There's no need to. It was better in New
York at Bellevue eating the kinds of meat we eat. You may argue that Stefansson's was grass-fed if you
want to, but we all know that grain-fed beef tastes better so he would have really been happy today!

Not only that but people seem to have this notion that high fat without protein is somehow beneficial. In
*Not by Bread Alone*, we find this:

**Quote:**
My trouble, it will be remembered, had been that at the
outset they stuffed me with lean. Andersen's difficulty, or at
least annoyance, began on the second day after he completed
a year on meat (January 25, 1929), when they asked him to
eat all the fat he could, permitting along with it only a tiny
bit of lean, about 45 grams per day. There they kept him, on
the verge of nausea, for a week

Too much fat without protein is nauseating.

While I'm quoting Stefansson, I should add this also:

**Quote:**
The first glucose "meal,"
when we were immediately off the meat, showed a poor sugar
tolerance; but in a week or so we were back to where we
had been before the meat year began.

This mirrors my experience. I show a poor sugar tolerance if I eat a little bit of carbs. However, if I kept
it up, I suppose it would improve. Rue the day that would happen!

Regards,

Charles

Not so sure that grain fed tastes better than grass fed. In the 80s I lived in the home of the gaucho-Argentina for 3 consecutive months at one stretch. If I remember right, their beef is/was grass fed. Since I was on expense account I ate a LOT of steaks. They tasted pretty darn good. So good that when I came back to the states I told my uncle how good they were. Since he had also been on business in Argentina in the past he said he preferred grain fed beef as it tasted better. Maybe it is what you get accustomed to eating. I sure know that I would like to go back again some time and find out. Plus they had great blood sausage and Chicken Maryland with the fried bananas.

RE: Zero Carb / Meat and Water - Charles - 08-01-2008 08:43 AM

Dwayne Wrote:
Ok I guess I need one more post to get my point across.

1. 0 Carbs is not recommended for pregnancies
2. Low Carbs are

I believe you. Zero-carb isn't recommended by hardly anyone. It seems people totally forgot about Stefansson and the classic Bellevue study of the 1920s. It still exists in the medical journals but surely you don't think these board-certified doctors have time to read these things, do you? They are enormous and the same studies get repeated every 20 years with the same proviso that "more research is required." In fact, I would be surprised to find too many obstetricians who recommend low-carb for pregnancy.

Dana (I hate those screen names) makes a great point. Dental problems are the first sign that the diet is a problem. As I mentioned elsewhere, Stefansson provided 800 skeletal remains of various Inuit and not ONE of them had a single cavity. They did not eat fruit, whole grains, or vegetables. Ancient Egypt ate a good-carb diet with no refined carbohydrates and no meat.

Dwayne Wrote:
I still don't understand how this got turned around to me saying that pregnant mother should drink apple juice and suck down french fries.

Who said you are talking about apple juice and french fries? I'm talking about wholesome fruits and vegetables like the Egyptians ate. They didn't eat "bad" carbs!

Dwayne Wrote:
Also as far as proof goes I think singling out carnivorous isolated cultures that have genetic differences from many of us and calling that proof only begs for more research with different groups.

Okay, see, there you go again. Genetic difference? Scientists say the exact opposite.

Quote:
The scientists believe that the Masai are protected by their high physical activity (walking) rather than by some unknown genetic factor.

This is preposterous as well, but at least they know it's not genetic. Stefansson made the same argument about the Inuit:

Quote:
There is, however, among Eskimos no racial immunity to corpulence. That is proved by the rapidity with which and the extent to which they fatten on European diets

Dwayne Wrote:
It is the scientific equivalent of picking what best fits your hypothesis. It is a testament to the human body that we can develop and change to suit our environments. This has sparked some interesting talks last night after work. My wife talking about how groups of people with similiar genetic markers are more prone to certain diseases, both metabolic and cellular. The one diet fits all, panacea as you will, seems to be a myth.

That sounds good but Stefansson was not an eskimo nor were the traders and explorers who were with him. In fact:

Quote:
Moreover, he knew from experience of a dozen members of the expedition that his healthful enjoyment of the diet was not peculiar to himself but common to all those who had tried it, including members of three races—ordinary whites, Cape Verde Islanders with a strain of Negro blood, and South Sea Islanders.

Are 1 in 5 Americans all genetically predisposed to be fat?

Dwayne Wrote:
--disclaimer: I still never implied refined carbs were the way to go, and have eliminated cheese from my diet as of today =)

That's a very good thing!

Regards,

Charles

RE: Zero Carb / Meat and Water - suzanneyea - 08-01-2008 08:43 AM

Speaking of children, how are you guys feeding yours? I have got Andrew pretty low carb now. I do
have cheese and milk for him. He eats a lot of cheese and I still do the Dreamfield's pasta, but I am reducing the portion sizes, lol. I still do fruit, but only at daycamp cause he needs a snack that travels easily and he will not touch cheese if it is not right out of the fridge. He comes home for lunch during the school year, so that is easy enough. We never have veggies in my house and no one ever complains about that.

RE: Zero Carb / Meat and Water - Charles - 08-01-2008 08:48 AM

Mine eat low-carb/zero-carb. My wife makes vegetables but no one eats them. They might eat a little but not very much. We're going grocery shopping today and she announced that she wasn't buying anymore because she was sick of watching them go to waste!

They will have fruit on occasion as a treat.

I'm pretty sure my 16-year old will eat carbs when he's out with his friends sometimes, but he doesn't get them at home and he's fine with that.

During the school year, they get deli meats and cheeses for lunch along with the occasional nuts (for one kid).

RE: Zero Carb / Meat and Water - jeepifer - 08-01-2008 08:50 AM

My kids and Dh eat what I do, for the most part, since I cook. We'll have meat and an lc veggie most nights. Sometimes I make "shells and cheese" for them, maybe every 2 weeks or so. Since I've been on ZC, I just skip the veg for myself. No biggie.

For beverages, I do 1 cup lemon juice to 8 cups water, with 1 tbsp stevia. That's our "juice". Very rarely do we drink milk. DH does on occasion, but he's a big (as in grown, not in size) boy. LOL

Both my girls are very normal, healthy kids. They get their share of sandwiches, grilled cheese, and too much starch at daycare, but I only have so much control over that. I know they're eating healthfully at our house, and hopefully as they get older they can make more educated choices on their foods.

aim in Fla*working Wrote:
thank you!! I appreciate the info....are you familiar with any studies on the benefits of zero carb on adrenals?

You're welcome, Amy. No, but I know that this one of the things that Stefansson confronted in the 1920s prior to the Bellevue experiment. They all said that his and Anderson's kidneys would be overworked by all the meat, etc, etc. Schwarzbein (however you spell it) holds this view too, I think. I stick with my hero:

Stefansson Wrote:
but special attention would be paid to certain common views, such as that scurvy will result from the absence of vegetable elements, that other deficiency diseases may be produced, that the effect will be bad on the circulatory system and on the kidneys, that certain harmful micro-organisms will flourish in the intestinal tract, and that there will be insufficient calcium. The broad question was, of the supervising doctors and by the testimony of the subjects themselves.

RE: Zero Carb / Meat and Water - Charles - 08-01-2008 09:10 AM

karishma Wrote:
It seems like I highjacked this thread into a discussion of LCing during pregnancy, but in my defense, I have to point out that I did not ask advice on what my diet should be, nor suggest that I would change how I was eating depending on suggestions made in this thread.

My original point was that my tolerance for carbs varies wildly depending on what else is going on with my body, eg. pregnancy. When I'm not pregnant, I need to stay practically zero carb to avoid weight
gain, but when I'm pregnant, I can eat much higher levels of carbs and maintain a reasonable weight.

Dwayne, the concern with gestational diabetes usually is high birth weights (10, 11lb babies). If your son had a low birth weight at term, my guess is you guys had other issues besides the gestational diabetes going on.

I've read everything I can find about lowcarbing during pregnancy, including the standard medical advice (eat according to the food pyramid). Practically all the studies that found negative effects of ketosis were done either in diabetics (in ketoacidosis), or women who were burning ketones due to starvation. Obviously, neither of those is equivalent to a woman on a LC diet. (Emphasis mine)

The general opinion is there isn't enough research done to know if ketones are safe for the baby so it's best to avoid them. Which is all well and good unless you are one of the many women who needs to stay at a very low carb level to avoid gestational diabetes and the sugar high/crash rollercoaster. Given a choice between the known negative consequences of gestational diabetes (on mother and baby), and the theoretical consequences of ketones on the baby (since ketones obviously don't harm the mom), I would take my chances with the latter. (Emphasis mine.)

As far as discussing my dietary choices with my midwife, that will depend on my overall impression of her when I meet her for the first time in a couple of weeks. All I really need her to do is catch the baby; everything else is nonessential.

I'm reprinting this because I like what you wrote.

I wasn't trying to give you advice, I was just challenging this small part:

Quote:
My original point was that my tolerance for carbs varies wildly depending on what else is going on with my body, eg. pregnancy. When I'm not pregnant, I need to stay practically zero carb to avoid weight gain, but when I'm pregnant, I can eat much higher levels of carbs and maintain a reasonable weight.

My point was just because you will not gain weight during pregnancy (although it's hard to judge the source of weight gain during this phase) eating higher carbs, doesn't mean it's good for you or your baby because carbs work their magic on your hormones and hormones work their magic at the cellular level. That's all I was saying. It appeared you were basing this on whether or not you gained weight and my counter was that weight shoudn't be the marker you use when deciding whether to increase carbs during pregnancy. Schroeder and Wade showed us that the metabolic fuel was the best thing you could provide, not weight.

However, I do understand the pressure you're getting from your husband and family. I respect that!

This hits home for me because my father is suffering from esophageal cancer and he had chemo and radiation before which didn't remove all the cancer. He can't have surgery because they don't think he'll survive it. He has trouble eating because when he does, it comes back up. So what does the doctor encourage him to do? Drink Boost or other energy drinks AKA Sugar water. Unbelievable! That's good, just give the cancer something to feed off and spread faster. Just a brilliant board-certified doctor.

There was someone else recently who spoke of getting pregnant and eating higher carbohydrates and just like then, I don't think it's a good idea. If it's not healthy when you're not pregnant, I have trouble seeing how it's healthy when you are.
Charles Wrote:
I would be surprised to find too many obstetricians who recommend low-carb for pregnancy.

True but I have yet to see any that would recommend 0 carbs for pregnancy.

I doubt even a low carb doctor would.

Charles Wrote:
Nyteez makes a great point. Dental problems are the first sign that the diet is a problem. As I mentioned elsewhere, Stefansson provided 800 skeletal remains of various Inuit and not ONE of them had a single cavity. They did not eat fruit, whole grains, or vegetables. Ancient Egypt ate a good-carb diet with no refined carbohydrates and no meat. Their teeth looked like this:

Actually I found this out about the Egyptian diet:

Quote:
All modern humans evolved from the same ancestors, whether out of Africa or returned to Africa, but over the years there has arisen some racial differences. Tooth decay is a 'disease of civilisation' - the more refined a diet, the more potential decay. The upper classes in Ancient Egypt certainly showed dental caries and abscesses as a result of their high sugar intake, especially honey.

From the comments by a doctor (eep!) in this article.

To be fair the comment under that one talks about carbs and tooth decay and how well the inuits did. Also there is a mention of stone ground bread in their (Egyptian) diet corroding the teeth.

Charles Wrote:
Who said you are talking about apple juice and french fries? I'm talking about wholesome fruits and vegetables like the Egyptians ate. They didn't eat "bad" carbs!

They did eat honey, at least the wealthy did. As well as stone ground bread (with stones in it! Eww!)

Charles Wrote:
Okay, see, there you go again. Genetic difference? Scientists say the exact opposite.

All scientists? So people genes are mostly similar and there are not gene markers that imply a susceptibility to certain problems? The system is too complex again for a one diet/one drug fits all. We are too diverse genetically.

Quote:
The scientists believe that the Masai are protected by their high physical activity (walking) rather than by some unknown genetic factor.

Charles Wrote:
Are 1 in 5 Americans all genetically predisposed to be fat?

How many women were on the expedition? How much time did they spend studying women? Of course men would be concerned with male health.

Dwayne Wrote:
--disclaimer: I still never implied refined carbs were the way to go, and have eliminated cheese from my diet as of today =)

Charles Wrote:
That's a very good thing!

On that we are agreed. =) I think we agree more than we don't, but I just want to make sure that we can keep open minds. You have me with VLC, the arguments are strong, but I think agreeing to disagree about women's health is going to have to be where we leave it.

RE: Zero Carb / Meat and Water - waywardsister - 08-01-2008 09:26 AM

Dairy thoughts 😊

LindaSue Wrote:
I can take or leave cheese and it's a struggle to get down as little as an ounce at a time by taking very tiny nibbles.

Wow. I am so the opposite! I'll slice off a chunk, eat it, go slice another chunk, eat it...though as I said, this doesn't seem to happen with goat/sheep cheese. Same with heavy cream, once I start on it I want to put it in everything, all day. I would love to be able to take/leave it. I used to say that if I could easily live on crusty bread and old cheddar - and I practically did.

montmorency Wrote:
Unpasteurised cheese is trés chere here too, but when I do buy it, it is somehow more satisfying than bland mass-market cheddar; much sharper taste for one thing, so maybe that would be less addicting.

This is something I want to try when I'm at my goal weight - raw cheese only. I'm curious to see how my body responds. Wish I could find raw milk/cream here. I remember visiting my nana in England when I was younger, and she had milk delivered in glass bottles...it had the most wonderful layer of cream on top. Very weird for a Canadian kid raised on 2% in plastic bags, but I took to it! Never went for the orange chocolate though 😊

Loops Wrote:
It is if I eat too much cream that I start to get bizarre hunger (probably the lactose).

Interesting. I find the opposite, that cream keeps me full for ages. IIRC from other forums, you're quite sensitive to carbs, so it could be the lactose in your case? Augh, why does dairy have to be such a finicky thing, at least for some of us? It's so tasty and fatty and goooooooood...
This thread moves so fast, it's hard to reply to everything! Love it.

RE: Zero Carb / Meat and Water - Charles - 08-01-2008 09:31 AM

Dwayne Wrote:

Tooth decay is a 'disease of civilisation' - the more refined a diet, the more potential decay. The upper classes in Ancient Egypt certainly showed dental caries and abscesses as a result of their high sugar intake, especially honey.

If you're going to quote this, you should first take a look at all the comments underneath the article. None of them bought this guy's theory just as I don't. Ancient Egypt did eat some honey, but do you really think their consumption of honey alone did all this? Honey would have been seasonal and everyone wouldn't have eaten it. Their poor dental health went across the board.

This business about teeth and chewing is also false. As Stefansson noted, there were Inuit who only ate soft foods and they had strong teeth just as there were Inuit who ate caribou and the bones and also had strong teeth. He was an anthropologist and he devotes an entire chapter to this subject because it runs counter to the dental advice given in New York in the 1920s. Again, he provided some 800 skeletons to prove his point and the meat industry gave a lot of money to Dr. Hooten to provide the funding to prove this point. It wasn't at all controversial.

Quote:
Teeth superior on the average to those of the presidents of our largest tooth paste companies are found in the world today, and have existed during past ages, among people who violate every precept of current dentifrice advertising. Not all of them have lived exclusively on meat; but, so far as an extensive correspondence with authorities has yet been able to show, a complete absence of tooth decay from entire populations has never existed in the past, and does not exist now, except where meat is either exclusive or heavily predominant in the diet.

We can't use genetics to explain everything we don't understand. I just don't believe people are that different, especially when there is ample evidence that there are entire populations that did not or do not suffer from the diseases of civilization.

Regards,
Charles

I noticed that I am seeing better too, and my constant allergies don't even bother me anymore-not at all! I'm surprised by this... I wonder if they will get worse again in the fall.
I used to have debilitating hayfever from late summer through the Fall - I mean bad enough that no medication worked, and I would actually miss work. I was constantly exhausted from my body being in fight mode. Haven't had even a hint of it since going LC/gluten-free. From what I understand of what I've read on the subject, your body has an allergy threshold. It can take so much, but there's an end-point. Cross that end-point, and boom, you're in allergy symptom territory. So if you're eating foods that your body doesn't like, and it's constantly having to defend against them and flush them out, something like pollen or cat hair can push you over the edge and you're a swollen, teary, red-eyed, sniffling mess! Your cup runneth over, so to speak, and pours right out your mucous membranes.

**RE: Zero Carb / Meat and Water - Dwayne - 08-01-2008 09:41 AM**

I guess at the end of the day I would want to see tropical cultures that ate carbs compared. As well as the cultures that tend to have a long life span. I don't think asking for more research in this limited amount of data is silly. These stories and studies came from the same time when those bad ketones in pregnancy studies came from. Obviously I see merit to them or I wouldn't be eating so close to 0 (probably going there after gaining 3 pounds this week.)

Charles Wrote:
My point was just because you will not gain weight during pregnancy (although it's hard to judge the source of weight gain during this phase) eating higher carbs, doesn't mean it's good for you or your baby because carbs work their magic on your hormones and hormones work their magic at the cellular level. That's all I was saying. It appeared you were basing this on whether or not you gained weight and my counter was that weight shouldn't be the marker you use when deciding whether to increase carbs during pregnancy. Schroeder and Wade showed us that the metabolic fuel was the best thing you could provide, not weight.

However, I do understand the pressure you're getting from your husband and family. I respect that!

In general I agree with you here, and if I'd been eating zero-carb for a longer period of time like you had and was well-adjusted to it, I would probably have continued eating that way.

The way I'm eating now is still VLC; it's still very much based on fatty meat. I just let myself have some veggies, cheese, cream and the occasional berry or small piece of fruit on the side.

It's not because I think zero-carb is unhealthy; it's because I think this is a carb level I can sustain throughout the pregnancy. I think if I ate zero-carb for a few months during my pregnancy but was unable to stick with it (because I couldn't tolerate red meat, say, which happened for a while during my last pregnancy), the consequences would be worse than just starting off at a slightly higher carb level to begin with.

I do hope to go back to zero-carb after this baby is born and hopefully get adjusted enough to it that my next one can be a zero-carb baby, but I just think it's too drastic a change to implement in the middle of a pregnancy.

And I respect your decision greatly. Please don't ever think for a second that I don't.

I honestly don't have a problem with a low-carb diet except for those people who can't tolerate even that many carbohydrates due to their hyperinsulinemia.

All the best,

Charles

RE: Zero Carb / Meat and Water - aim in Fla*working - 08-01-2008 10:09 AM

This is something I want to try when I'm at my goal weight - raw cheese only. I'm curious to see how my body responds. Wish I could find raw milk/cream here. I remember visiting my nana in England when I was younger, and she had milk delivered in glass bottles...it had the most wonderful layer of cream on top. Very weird for a Canadian kid raised on 2% in plastic bags, but I took to it! Never went for the orange chocolate though that is such a lovely memory of mine...getting up and drinking all the cream off all 6 bottles....and I was a skinny kid! The closest I have come to it it at Target actually....their heavy cream...and I am addicted to it..

RE: Zero Carb / Meat and Water - abnormalslc - 08-01-2008 10:29 AM

This is my 12th day of ZC livin'. I have lost 7 of 10 pounds that would fluctuate up and down when simply doing LC.

And remember...Charles is not pounding the pulpit that "Ye must eat meat/water only!"

Eating this way works wonders for Charles and he is sharing his experience with us. I am hoping to experience the same wonders!

I think Charles agrees with Jimmy, when Jimmy says..."Find what way of eating works best for you, and do that."

---

You got it! I certainly don't get any brownie points for how many people do zero-carb. Heck, I don't get anything...I've been meaning to talk to Jimmy about that! LOL 😄

RE: Zero Carb / Meat and Water - poo123 - 08-01-2008 11:44 AM

Hi guys, I was catching up on the posts. With the subject of feeding the kids. My 6 year old twins are a pain in the butt. My daughter only wants tuna with mayo in a pita (I give her low carb pita) and milk or juice. My son only wants chicken sandwich with mayo I give him very thin, high fiber bread, and milk or juice. They hate veggies and fruit so I just have to keep working on them eating a few more things. But all in all they really don't eat very much and are a perfect weight and height right now. When I was 6 I was already fat. So maybe we can avoid this in them. Now about me. I am really doing GREAT!!! I am down from 244.0 to 229.6 since June 28th. 14.4 lbs of all fat is so cool. I can't wait for the 1st day of school to start on Aug 26th so I can dazzle some of the mom's. My husband is doing low carb and doing great too. He has lost 15 lbs in about 6 weeks and is still going strong. We are going to be such a cute family when the Christmas pictures are done. I am so excited.... alison

RE: Zero Carb / Meat and Water - jeepifer - 08-01-2008 11:54 AM

Congrats on the losses, Alison! We wanna see those cute pics when you get them taken! LOL

RE: Zero Carb / Meat and Water - Charles - 08-01-2008 12:11 PM

Congratulations, Alison!

Can this be the same lady who wrote:

Alison Wrote:
I know it took me some time to put it on so it will take some time to take it off but I am getting annoyed. I am really glad this way of life has helped with my sleeping, eating and mood patterns and my hair has stopped falling out. So I guess the weight loss is going to be the last thing to kick in since everything else is falling into place, it will finally come but like my kids say I WANT IT NOW!!!

Yes it is and I am so elated! See, women can lose weight on zero-carb too!

RE: Zero Carb / Meat and Water - DEEDLYNN - 08-01-2008 12:21 PM

I need someone to give me a snapshot of the zero carb thing. I am going to check out some books, but this came up on another thread. Someone inquired as to whether or not some of the rest of us wanted to try.

I'm intrigued, but very gun shy about it. I think I am one of those folks who are hyper sensitive to carbs. Not sure, but would like to think about this a little more.

I am accustomed to flaxmeal cereal every morning. After the fiber deduction it would be zero carb. Would I still be able to enjoy it?

Someone please help me with some basic understanding of zero carb.
Thanks,
Dee

In its PUREST form, fatty protein and water. Meaning steak, hamburger, chicken thighs, pork chops, pork loin, etc. Meat. No veggies. No fiber. No coffee, no diet drinks, no cream, no salads. Fatty protein and water. You can have salt and/or pepper on your meat at your option. In short, NOTHING with carbs in them. Oh maybe eggs are ok and butter. No cheese. Just you and what you could slice from from a pig, a cow, a lamb, a duck, a chicken if you had a big knife and what you could drink from an unpolluted river would be even purer and of course an oven or grill to cook the meat.

For me, zero carbs and water gives your body no excuse to lose weight as there are zero carbs to influence insulin and thus fat storage.

---

**RE: Zero Carb / Meat and Water** - [DEEDLYNN](mailto:DEEDLYNN) - 08-01-2008 12:34 PM

Thanks MAC,

Now is this a long-term way of eating. Is it done in intervals? I'm intimidated to take the plunge on this one. Is there a book that people generally follow with regards to low carb.

In one aspect, it seems like it may be very beneficial to me right now with some of the foods issues I'm having.

On the other hand, even prior to low carb, I a more of a seafood, turkey, chicken eater. Very rarely eat beef, so....yikes.

Enquiring minds want to know.

Thanks!
Dee

Hey, Dee:

We basically just eat fatty protein and drink water. There are people who are gradually working down to that which is also fine, but basically, it is what it is. There is no concept of NET CARBS over here so flax and things like that are grains and therefore are avoided. I do not take vitamins or supplements of any kind but I'm sure others do.

You don't have to do zero-carb, of course. It's pretty extreme, I guess, so not something to take on lightly. If you try it for a while and are unable to continue, you may find that when you return to carbs you'll gain much more than you were before you started and it may take some time to lose what you put on.

If you want to try it, I would say give yourself at least three or four weeks to see if it's something you'll be able to continue. I wouldn't expect too many results on anything shorter than that.

On the other hand, I think it's better to approach zero-carb from the purely intellectual position. What do I mean by that? I mean that you should read either the Bear or Stefansson and decide whether you buy the argument for zero-carb. If you do, then it's much easier to endure the first six months because you have a broader purpose than just losing some weight. Stefansson says that it takes at least 6 months to see whether a person will take to meat only or not. If they are able to endure 6 months, then it's highly probable that even if the person gives it up later, they will voluntarily return to meat later on.

I wouldn't advise zero-carb for just weight loss because I think it's an awful lot to go through especially when no one else but me seems to recommend such a thing.

With that proviso, I would say come on in, the water is warm.

Regards,

Charles

Yes you are right. Seafood is fine. Turkey is fine but you want the fatty parts of it. The dark meat. No.
No intervals this isn't intermittent fasting. No books except for the ones Charles mentions.

**RE: Zero Carb / Meat and Water - travis t - 08-01-2008 12:54 PM**

Dee
You listed chicken, turkey, and fish. I don't know about anybody else but i need a lot more fat than those could provide. I even add extra butter to 80/20 beef patties because i find them to dry. This is such a great ride, these last two months of beef, butter, and coffee have been awesome (even with my splurges).

happy friday

travis t

p.s. did i mention how awesome i feel !!!

Chicken thighs with the skin left on and eaten are fatty. Turkey legs should be fairly fatty. Salmon is a relatively fatty fish. One can always wrap chicken and turkey legs with bacon to up the fat.
Travis t,
Have you upped your fat along the way and found greater weight loss?

Dee, there aren't really any set rules for this way of eating and not all of us are as strict as MAC is. Some of us do eat some cheese and eggs and others don't. Some drink coffee and cream and some don't. However, to be truly ZERO carb you would have to eat like MAC said. Most or at least many of us don't always go quite that low. Anything less than 10 carbs per day is still basically zero and allows for the little bit of carb in eggs, cheese, cream, seasonings and things like that. Charles will even tell you that anything under 20 carbs is metabolically zero. You don't have to be concerned with counting net carbs since there won't be any fiber to deduct other than trace amounts from spices perhaps.

I am not that strict as you can tell by my journal. I was just setting a baseline. But it is possible that if you can't lose with < 10 carbs you may need to go to zero to lose weight. Now I wouldn't go there necessarily unless you had too. Dr. Eades looks at zero carb as a two week thing to break a stall. If I REALLY wanted to be strict, then I would say fatty protein and water and the meat has to be eaten RAW:-) I am not a follower of a raw paleo diet but some are.

RE: Zero Carb / Meat and Water - feckless - 08-01-2008 02:14 PM

I am having the nausea problem Charles mentioned, I guess from too much fat. Well, it's not that much fat, but maybe too much for my body too soon. I eat 5 ounces of beef short rib and it seems like the right
amount hunger-wise. Then shortly after I want to throw up and I stay nauseated for many hours. Even typing 'short rib' made me sick and it's been 6 hours! Do I need to eat tiny amounts, until my body gets used to this? How long is it okay to fast if you are feeling this way? I don't want to eat anymore today and yet 4 oz of short rib, even it is was mostly fat is not a lot of calories. This has been going on for a week now.

Interestingly, sometimes when I am feeling sick, if I think of fatty meat, the nausea surges....but if I think of something like scrambled eggs, or a slice of turkey deli meat, the nausea does not surge. My gut really knows what I am thinking.

---

RE: Zero Carb / Meat and Water - Kristi31 - 08-01-2008 04:37 PM

I am feeling pretty damn good tonight. Had some regular ground beef with a couple of slices of pork belly. Yum!

Charles, I have Stefansson's "Life With The Eskimo", which I haven't tackled yet (it's huge) - since you're a fanboy, I'll tell you that it's an old hardcover ordered from an online used bookseller, and when I opened it I was thrilled to see that Stef. had actually signed it in 1948 - inscribed it to a friend, Shelley (don't know who that is) And I paid next to nothing for it. Okay, okay, enough Stef gushing. I would like to read his other works, you mentioned they were online somewhere? Fat Of The Land is one I am dying to read.

Just a few pages back, you can download Adventures in the Land. Not By Bread Alone has the Adventures information in it, but it expands a great deal on what was said there. Bellevue is covered in excruciating detail. I tell you, he must have countered every argument that could possibly be made against an all-meat diet. It's incredible so far. The copy I have was scanned and it's huge.

I've seen Not By Bread Alone also called Fat of the Land, it's supposedly an expanded version; the cheapest one I've seen online? $325 😢I hope to read it someday, what he and Anderson did at Bellevue endlessly fascinates me.

---

RE: Zero Carb / Meat and Water - montmorency - 08-02-2008 03:57 AM

Some points at random:

On fat without sufficient protein: I speculate that this may be one reason why cheese may not be so good for us - lots of fat, but not as much protein as meat, and possibly the wrong sort of protein. Just a thought.

On grain-versus-grass-fed: I guess it's possible we're not always comparing like with like here (I will refrain from using the "apples and oranges" metaphore!). Traditional grains for animals were not the same as what tends to be used now, in a factory-farming environment. I'm not certain, but I think cattle in the UK get a mixture of grass and grains, typically. We get a lot of lamb from New Zealand (because
of our historic ties with that nation), frozen of course, and I think almost by definition, it's grass fed, and it's pretty good. Their butter is pretty good also (and cheap), and I notice they are now calling it "free range", although I think it's the same as it's always been. Just that no one thought about "free range" before.

A pedant writes:
I notice that Stefansson uses the spelling "Andersen" for the Danish colleague, which is the spelling I'd expect for a Dane. Gary Taubes spells it "Anderson" consistently, but I found it as "Andersen" on various google hits.

Small personal update: I seem to have settled down to two meat and fat meals per day; this wasn't intentional, but it satisfies me. No snacks; no hunger pangs. I seem to have cut out the eggs sooner than intended; we'll see how that goes. The cheese had already gone. Still not meat and water though, because I haven't kicked the tea with (very little) full-cream milk yet. No dramatic weight loss yet, but I feel fine.

Regards,
Mike

Very weird for a Canadian kid raised on 2% in plastic bags, but I took to it! Never went for the orange chocolate though Wink

We still get milk delivered in glass bottles, although this is a dying tradition. You are no longer allowed in England to buy raw unpasteurised milk from retail outlets (it used to come in bottles with green tops). Apparently it's still legal to buy it direct from a farmer, if you can find a source.

Most milk these days, even in bottles, is homogenised, so you don't get the cream at the top. I asked our milkman if he could supply unhomogenised, but I don't think the stuff that came is, although it is full-cream. Fortunately, you can buy unhomogenised full-cream milk in the supermarket. I believe there have been suspicions of health problems with homogenised milk, although these are contested. Even if not, it's unnecessary processing, and I'd prefer to avoid it. Similarly, the "full-cream" milk has apparently been skimmed, and then had the cream added back in some official proportion or other. This is to allow for the fact that the cows' production of cream varies through the year. Again, it's processing I'd prefer to avoid. An example of the mechanisation of our food supply that may not be harmful, but is it really necessary?

Needless to say, the majority of people buy lower-fat milk, what we call semi-skimmed. I think it's about 2.5%. Barry Groves says you need the fat in order to absorb the calcium. When I read that, I changed our order to full-cream! (This was when I was LC-ing and before I'd come across zero-carbing).

Regards,
Mike
it is my one true love...cream.

Sorry, more randomness from me:

I think I detect a preference away from frying here, in favour of oven-cooking or grilling, and I am not sure why this is.

Obviously large joints of meat need to go into an oven, but grilling, in my perception, is associated with low-fat eating. It certainly became the preferred option in England after the low-fat orthodoxy took hold.

I am not sure why (for smaller items that don't need the oven) a person on a high-fat diet would shun frying. Clearly frying in vegetable oil would be an issue; (Barry Groves says that even the monounsaturated olive oil is not stable at high temperatures.)

I fry in beef dripping/tallow, or butter, or I might use coconut oil if I had it in stock, or lard if I could get it additive-free. Fatty ground/minced beef will fry quite happily in its own fat, so that's ok 😊

Stefansson: I haven't read his own work (except that which has been quoted here), but in the various accounts I have read, it was suggested that after the Bellevue eating year, they reverted to a "normal" i.e. "balanced" diet. Is that actually the case? Did they not believe that meat-only was healthier, only that it wasn't less healthy than a "normal" diet?

I was intrigued by the apparent fact that they had apparently bad results on the glucose tolerance test, although after a week (on a "normal" diet I think), it had normalised. I believe the explanation was that their pancreases needed time to adapt to the glucose in order to generate enough insulin.

This all makes perfect sense to my mind ... it was not that their glucose tolerance had become faulty or unhealthy in some way, but that they had perfectly adapted to an all meat diet, and were perfectly healthy in fact.

The only unhealthy thing going on here was in fact the glucose tolerance test! It seems a very crude "weapon". The thought of drinking or being infused with glucose is repulsive to me! I don't know if a more sophisticated version of this would be done nowadays. (I doubt it somehow, although the measurements are presumably more sophisticated).

Regards,
Mike

Thanks for all the information and responses.
After reading through them, I'm not sure that true zero carb is the way for me right now.

I have a lot of pounds to lose. I just really need to learn and accept that I may be hypersensitive to carbs and act accordingly. I am going to continue reading the thread because there is a WEALTH of knowledge out here....Actually a lot of it is over my head. LOL.

Again, thanks for all the help....Congratulations to all of you on your successes and commitment to a healthier lifestyle.

Dr. Eades explains the high glucose for a fat adapted individual as that they don't have enough of the enzymes to digest carbs. After 3-4 days of >150 carbs they had normal results as the enzymes are then produced in sufficient quantities to fully digest the carbs. This is also why it is necessary for any one low carbing to do the same so their GTT results are not skewed.

**RE: Zero Carb / Meat and Water** - travis t - 08-02-2008 10:21 AM

MAC
I am thinking that glucose tolerance testing is not worth much. Why would we change the way we eat just so we can pass a lab test that doesn't even correlate with the way we eat 99% of the time.
I think that the real lesson to be learned is consistency with what ever level of macro nutrients we choose to consume. This goes for carbs, fats, and proteins as they all need different enzymes to be used
effectively. Enzymes are very complex protein structures and can't be just whipped out in an instant. (by using eades 3-4 days).

Those are the instructions for an OGTT. It is not just Eades but Vernon and every other doctor that gives GTT tests. So I assume somewhere a long time ago someone figured out how many days and how many carbs it takes to be readapted. I agree about the correlation or why you would want to change what you eat for these tests but if you don't carb adapt before an OGTT you are most likely going to be labeled diabetic when you may in fact not be. If you have any papers that show it takes more than 3-4 days for proteins to be created I'd like to know about them as I did a home GTT and my blood glucose spiked in spite of having done 3 days of carb adaptation of > 150 carbs/day.

In Dr. Atkins Diabetes Revolution book, Dr. Atkins after a OGTT test, then used to give his newly diagnosed patients another GTT but this time by eating a high carb meal. The reason was to find out the amount of insulin they would need. Same kind of test Jimmy did but it was not a high carb meal and Jimmy is not diabetic. Dr. Atkins also used to take insulin levels along the way. Fasting insulin <10 is normal. Five times your fasting insulin 1 hr into a GTT and you have insulin resistance.

suzanneeyea Wrote:
I personally do not trust doctors. They have tried to put me on so many medications for all sorts of things and all these things have cleared up on low carb. So, if I got pregnant again I believe I have more knowledge of my body and what it and my baby needs than the majority of doctors. I would stay low carb during my pregnancy.

I don't trust their advice, either. I've had 4 babies, and the healthier ones are the ones that I was careful what I ate while I was pregnant. I had gallbladder problems with my 2nd, and they put me on a low-fat diet. I got fat, the baby was HUGE and has had issues ever since. I didn't have any problems, with gestational diabetes or otherwise, when I was low-carbing while I was pregnant. I feel like what these doctors are taught is so out-of-date and they really just do't know any better. Even when they put you on a "low-carb" diet for gestational diabetes, it's 150 grams of carbs a day. That's lower than 300 most people eat, but not low. I wish doctors would do research on their own more often.

RE: Zero Carb / Meat and Water - rozi - 08-02-2008 11:21 AM

No one has mentioned a problem I have had long ago in the past. After I had been low carbing for
several months I went into the hospital for surgery and I didn't even think to mention to either the Dr. or
the anesthesiologist about the diet. During surgery they started a glucose drip and my blood pressure
started dropping, they ended the surgery without quite finishing, and after I got back to my room my
blood pressure kept going down until I remember the nurse saying 40 over zero as I passed out. It felt
like I was dying and the nurse who was a personal friend told me later that she thought she had lost me,
but I did come out of it. The moral of my story is "If you go into the hospital be sure to tell the Dr that if
he gives glucose to expect a reaction".

Don't have anything to add, just checking in. Pork steak for breakfast, double hackamer sans everything at McDogfoods. Kids were super-good at swimming lessons today. I know food shouldn't be a reward, but my oldest, Nuttles, had a potty-training issue (No TV if she has an accident) so I couldn't let her come home and watch a favorite movie, which is her usual treat. 😅 We're one of those wacko families that doesn't have broadcast/cable/satellite tv, so they only watch movies or previously recorded stuff, or shows we get off of iTunes.

Had to laugh -- fixed DH and the kids an egg/cheese omlette for breakfast. My little one, Squeaks, took one look at *my* food and asked for a bite. She ate a couple of ounces of my pork steak instead of her eggs!

Saline alone works fine, if the Dr is warned to use it. And if he believes you about a problem.

RE: Zero Carb / Meat and Water - suzanneyea - 08-02-2008 01:07 PM

I was at an indoor playground place today and there was this child, totally out of control. He obviously had "behavior issues." The first thing the mother gave him was an ice cream at 11:00am. Then she ordered him a burger and fries and I had to listen to her talking him into eating more of this crap. It was driving me nuts! "Come on, come on if you don't come and eat your fries mommy is going to eat it,...yummy." It is bad enough to feed your children this crap, but then to encourage them to eat instead of play? What are these parents thinking? Maybe if this child had a healthy diet I would not have had to listen to him scream all day long.

I'm going to try to find that post talking about his post-Bellevue diet, but that thread is huge, and may take a while.

What I've been able to find:

Quote:
For example, Stefansson thought that nutritionists were in error in promoting balanced diet. His experience and research had convinced him of the benefits of a fat meat diet. In 1927-28, under medical supervision, he and a companion from one of his Arctic trips lived for a year on nothing but meat and water. In 1955 he adopted a "stone-age" diet—high-fat, low-carbohydrate, mostly meat—which he credited with helping him maintain fitness and health. He wrote two books on his nutritional theories: Not By Bread Alone, 1946, and Cancer: Disease of Civilization?, 1960.

http://www25.uua.org/uuhs/duub/articles/vilhjalmurstefansson.html

And Bear followed that with:

Quote:
Stef only lived on an all-meat diet intermittently for a total of about 8 years out of 83 (that leaves 75 years on a normal diet)- I have been on it continuously for 47 years out of 71. The damage my high carb dietary intake, incurred while I ate a 'normal' diet, was a single, simple blockage in one of my coronary arteries, which began causing me mild angina from age 20. I began all meat at 23, so the heart problem predated, and was reduced in growth and severity- by my present diet. Strokes are due to weak blood vessels and Stef's intermittent meat diet excursions were not long enough in duration to have reduced the insulin damage leading to his blood pressure or anything else. Admit it, you have absolutely nothing of value to offer us here, and you cannot even find a valid reason to attack what I say- you are in denial about your own state of health, but cannot accept this dietary path and are projecting you disability outwards. I enjoy excellent health- Give it up.

RE: Zero Carb / Meat and Water - montmorency - 08-02-2008 03:21 PM

Thanks Daryl; very interesting. I will try to read some of Stefansson's writing in full. Whatever he lived on, 83 isn't a bad score, especially as he must have suffered some hardships in his exploring days.

Regards,
Mike

**RE: Zero Carb / Meat and Water - Kristi31 - 08-02-2008 03:48 PM**

I actually read his book "Not by Bread alone" borrowed from the library. Also, another book, "The Stone Age Diet" by Walter L. Voegtlin, also found at the library. Amazing stuff! I think I might just borrow the books next time and photocopy them OR not ever return them...hehe!

Here is the scientific article on the Bellevue experiment...

[http://www.jbc.org/cgi/reprint/87/3/651](http://www.jbc.org/cgi/reprint/87/3/651)

---

**RE: Zero Carb / Meat and Water - rozi - 08-02-2008 03:54 PM**

As I recall what I read some time ago, at some point not too long after the Bellevue stay, after going back to the basic diet of the day, he got so fat and grumpy his wife put him back on the all meat diet. I remember that much because I loved the story. According to what I read he soon lost the weight and felt much better and his disposition improved according to his wife.

I have no idea how accurate that is, I read it on line several years ago.

I've seen Not By Bread Alone also called Fat of the Land, it's supposedly an expanded version; the cheapest one I've seen online? $325 😕 I hope to read it someday, what he and Anderson did at Bellevue endlessly fascinates me.
I'll get it up here free for everyone as soon as the Admin here tells us how I can do it. It's really huge so I may have to do it in segments. A lot of it has been told in the other books so once I finish reading it, I may end up telling you that all this information is available in such and such a book. The book on page 45 of this thread gives a nice account of Bellevue and it's very similar to what is in Not by Bread Alone which by the way was called Fat of the Land because the publisher had the same concern as they do today when you add "low-carb" to any title.

RE: Zero Carb / Meat and Water - Charles - 08-02-2008 05:02 PM

As far as Stefansson, he didn't necessarily recommend an all-meat diet for everyone. In fact, at the end of Adventures in the Land, he questioned why anyone would want to and said that eskimos don't live longer than other groups of people which may be due to many factors. None of this deterred me because I would rather have 70 years of looking like Jack LaLanne than 90 years of looking like Ancel Keys!

The same is true of Gary Taubes' work and that of many of the researchers he presented. The sum total of their work indicated very strongly that an all-meat diet was the best thing; however, they all stopped short of making that recommendation for some reason or another. This makes the argument that much more powerful to me they they weren't looking for it. If you step back and consider all the research and all the facts, the conclusion is crystal clear.

I desperately need someone to explain in concise detail what just happened to me. Let me preface this by saying I had a good dinner last night and was getting ready to fix my breakfast at the regular time of 9am-ish.

I was in the kitchen having just given my little ones their breakfast. I was starting a bottle for the baby and I started getting the feeling like I was going to throw up and felt light headed. I put the bottle down and hung on to the counter, thinking it would go away. Well it didn't. I walked into the living room and sat down to put my head between my knees because I was sure passing out was coming up. I thought to take a bite of something, so I went back in the kitchen, snatched a banana off the counter, and took a bite. I was feeling so bad at that point I literally couldn't see straight, my ears were buzzing, and I just broke the banana up and gave it to the kids. I went to walk back into the living room thinking I'd lie down a few seconds and literally collapsed to the floor. I couldn't get up so I just watched my house spin around my head for about five minutes. When I finally dragged myself off the floor I went and got another banana. Sorry if this is TMI but all of a sudden I had the immense need to poo, so I hobbled to the bathroom. Not to be gross, but I tended to that business and ate my banana, and things started easing off. I am STILL shaking I feel like from the inside out. WHAT IS WRONG WITH ME???

I'm not trying to sound like a jerk or anything, but this is how I felt on Kimkins last year only I never collapsed. I am horrified at this because I FEEL SO DARN GOOD EATING THIS WAY!!!! I don't want to stop! So please, someone, tell me what just happened here and tell me how to avoid it. To have lived a week with no cravings and feeling satisfied is so insanely awesome to me and I don't want to give it up. But I can't be worried of having episodes like this. It sounds like a textbook rapid sugar drop
to me, but with all the science on these thread pages saying that won't happen.......what am I to think????
Someone help!!

I have an inner ear disorder called Meniere's disease and this is exactly how I get when I have an attack.
For your sake I hope it is nothing like that but just wanted you to know of the possibility. Take care.

To me, it sounds like "dumping syndrome" related to excessive levels of insulin in the bloodstream. "Symptoms of early dumping include nausea, vomiting, bloating, cramping, diarrhea, dizziness and fatigue. "Late" dumping happens 1 to 3 hours after eating. Symptoms of late dumping include weakness, sweating, and dizziness. Many people have both types.

It is speculated that "early" dumping is associated with difficulty digesting fats while "late" dumping is associated with carbohydrates.[citation needed]

In addition, people with this syndrome often suffer from low blood sugar, or hypoglycemia, because the
rapid "dumping" of food triggers the pancreas to release excessive amounts of insulin into the bloodstream. This type of hypoglycemia is referred to as "alimentary hypoglycemia."

i only eat about 1/3 of a short rib, but i did, in fact, make a small beef patty and had less short rib with it twice today and the nausea is much less, so i will continue that. after two weeks, i'm still VERY lethargic, and having some inflammation in my knees. is this common? it seems transient, sometimes it is there...then it's not. so i'm thinking the body is just making some adjustments. i've never had any problem with my joints hurting ever, and have been doing only the lightest exercise the last two weeks, so i am sure it is the change in diet.

It's hard to say "common" but certainly, I can imagine what you're feeling. I often feel a bit "lethargic" but I find that I always have energy. There is some degree of this that you get used to. When you're used to sugar highs, this is quite a different feeling. However, you should begin to have energy soon, I would think.

Ketoadaptation takes anywhere from 2 weeks to 2 months and it varies for everyone and there is no getting around it. Try not to expect too much too soon from exercise. In fact, I wouldn't even do it until I truly felt like it. Don't drag yourself to work out when you don't feel like it. One of these days you'll feel as if you have energy to burn and there will be no stopping you.

You'll always have some days that are more energetic than others, and then again there will be days where you sit around the majority of the day. If I'm "normal" then I would say so is this.

I used to have joint pain when I ate carbs, but that was one of the first things that went away for me. For now, I would say eat more ground beef or whatever makes you feel better and just hang in there. Things are bound to improve!
Regards,
Charles

Would assume it has to be the antibiotics as a low carb or zero carb diet is VERY diuretic. Don't have
any advice or observations other than that. Are you on any other medications?

RE: Zero Carb / Meat and Water - montmorency - 08-03-2008 12:41 AM

Although I couldn't find the PDFs, I did read the "Harpers" article. Fascinating stuff about scurvy, for
example. However, there is a sting in the tail:

"The danger is that you may reason from this good health to a great longevity. But meat eaters do not
appear to live long. So far as we can tell, the Eskimos, before the white men upset their physiological as
well as their economic balance, lived on the average at least ten years less than we. Now their lives
average still shorter; but that is partly from communicated diseases.

It has been said in a previous article that I found the exclusive meat diet in New York to be stimulating -
I felt energetic and optimistic both winter and summer. Perhaps it may be considered that meat is,
overall, a stimulating diet, in the sense that metabolic processes are speeded up. You are then living at a
faster rate, which means you would grow up rapidly and get old soon. This is perhaps confirmed by that
eyarly maturing of Eskimo women which I have heretofore supposed to be mainly due to their almost
complete protection from chill - they live in warm dwellings and dress warmly so that the body is
seldom under stress to maintain by physiological processes a temperature balance. It may be that meat as
a speeder-up of metabolism explains in part both that Eskimo women are sometimes grandmothers
before the age of twenty-three, and that they usually seem as old at sixty as our women do at eighty."
hm...so, live a short live but a happy one...?

[UPDATE: oops, sorry, I meant to post this in the "book review" thread! - had 2 windows open and confused them - have re-posted it there now]

[Update2: double-oops: now I see what happened - both threads were covering some of the same ground. I now see that Charles has covered the point about length of Eskimos lives in this thread, and the fact of Stefansson and also Gary Taubes, stopping short of recommending all-meat to everyone.

I'd think a useful research project, could it ever be done, would be to establish the baseline health level engendered by an all-meat & water diet, and then selectively add "healthy" low-starch veg and conventional (not synthetic) sources of Vitamin C to it, and see if it makes it better, worse, or has no effect.

I'm slightly intrigued by Stefansson's comments about lime juice at one point: after pretty well showing that conventional anti-scurvy regimens didn't stand up to extreme load, he then says that since lime juice is convenient and can be packaged to retain its goodness, you might as well use it (or something like that).

Regards,
Mike

RE: Zero Carb / Meat and Water - Daryl - 08-03-2008 02:49 AM

All valid points to bring up, Mike. Is the meat diet "stimulating", speeding up our metabolisms, leading to a bit shorter lives on average, while something like calorie restriction, slowing down the metabolism, extends it? That leads to the question, is the extra time worth it?

RE: Zero Carb / Meat and Water - suzanneyea - 08-03-2008 03:18 AM

Quote:

4 days is a very short period of time, you cannot judge things yet. I cannot imagine what my body was going through the first weeks or even months of low carb and zero carb. I was a mess when I started low carb. I felt sick most of the day, like I was going to puke, I was so tired other days I could not move off the couch, my BM were all over the place. It was a rough go and this lasted well over a month for me. The only solution is to stay on plan. Everytime you take a bite of a carb, you have to begin the process all over. It takes weeks and months for your body to adjust, not days.

RE: Zero Carb / Meat and Water - Loops - 08-03-2008 05:47 AM

Charles Wrote:
MAC Wrote:
There have been some studies recently about diabetic mothers passing on traits to their newborns because they are diabetic. We are not talking about gestational diabetes here but diabetics before pregnancy.

Well, that makes sense if you're talking about diabetics. However, just a blanket statement that very low-
carb eating is not good for pregnancy is quite a stretch. The Masai have babies every day and I don't think they have any trouble.

Any diabetic would want to work with an experienced low-carb doctor in anything they do in order to get their medicines adjusted accordingly. However, for the general non-diabetic pregnant woman, I don't see how a zero-carb diet would harm them any more than it does any other meat-eating woman in the world.

hi -

I'm still catching up on the rest of this thread, but...um...well, the Masai used to drink milk - quite a lot of it, which isn't zero carb. Still, I'm sure there must be other examples.

Loops

RE: Zero Carb / Meat and Water - LindaSue - 08-03-2008 06:43 AM

Welcome to the forum, momandray. I also suffer from bouts of vertigo that can go on for weeks or even months. It's no fun at all. It comes and goes for no apparent reason. The last one lasted several months and then went away overnight a few weeks ago. Now that it's gone again, I've been able to get back into my exercise routine.

RE: Zero Carb / Meat and Water - **Loops** - 08-03-2008 08:34 AM

hi everyone -

ok so I am still struggling with the no cream and no cheese thing, and also I am up 3 pounds which came on before my TOM (straight after my meat binge not that that bears any relation), and HAVEN'T LEFT SINCE! Arg.

I really need some support. I had previously been doing a high fat, controlled protein low carb WOE (Banta diet) and was down to 64 kilos (63 at one point). It seems since I have relinquished my control over protein and instead opted to go for close to zero carbs (this time without dairy as much as I can stand it) I'm gaining again. Pants.

Is it possible that too much protein really CAN make me gain weight? I want to believe it's not so, but crap, I am getting fed up with the scale going up and not down, especially when <5g of carb is involved. I lost a small amount of weight eating nuts, cream, cheese and less protein overall, but can't ever seem to get back down to the 60 kilos I reached before (general low carb, lots of fat, cheese, salads - then one day without changing anything I started to gain weight again - so went zero carb with cheese and gained even more).

What is going on with me? Please excuse my negativity today - I am writing this here because I really really want zero carb to work for me so I need somewhere to vent and also get some support. This morning I had pork ribs for breakfast which was nice, and also some black coffee, but I was kind of down after jumping on the scales and it still has me at 65.5 kilos.

I don't ever do carb-ups or anything like that - never cheat etc. I was at one point eating nuts and actually was at a lower weight, but that was before I decided to give zero carb another shot WITHOUT dairy.

It really isn't muscle because my test jeans are once more feeling tighter. I wonder if I really do react to too much protein. After all, if it wasn't partly true, why do some low-carb authors recommend controlling protein intake (Kwasniewski and Barry Groves for instance)?

Please don't take this post as attacking zero carb - I'm just feeling a bit frustrated.

Thanks for listening
Loops

Why hyper symptoms do you have?

Did you say that you are taking antibiotics? Did your hyper symptoms show up or worsen when you started the antibiotics?

hyper is the agitation and lack of sleep and the high blood pressure I have had recently. I have never had high blood pressure in my life...i started ZC and antibiotics at about the same time...which was Monday.

**RE: Zero Carb / Meat and Water** - *aim in Fla*working - 08-03-2008 09:53 AM

my bloodwork has me at tsh which I do not even really use...at .03. Everything else is high end normal.

TSH is not very meaningful when you are on Armour.

But if your FT3 and FT4 are on the high end, that could explain your symptoms. How much Armour had you been taking?

**RE: Zero Carb / Meat and Water** - *poo123* - 08-03-2008 10:28 AM

Loops, Don't give up on the zero carb. I have been doing it since June 28th and for the first 2 weeks I lost 10lbs, then put 3 back on lost it again and then thats it for 4 weeks. Now the weight is coming off 3/4 - 1 lb a day. I really took a while for my body to get used to eating this way and Charles said the insulin had the "clear" my system. Sometimes it takes a while just hang in there. Once it happens you will be so happy. But if you are doing zero carb that really means ZERO. I have not had one cheat and my weight did go up and down like I said. So I am glad you are here, just give it a few weeks... alison

Keep in mind that we're only speculating lol.... along with zero carb, they also had to endure living in the Artic, in rough conditions.

**RE: Zero Carb / Meat and Water - Loops - 08-03-2008 01:55 PM**

yeah well I guess you can't really blame me for being a bit disillusioned - I've been in this place before-gaining on <10g of carb a day - I just really want to believe it will be the answer for me. Anyway - onwards. The thing is, I'm not hyperinsulinemic - I've never been obese in my life either, just had a tendency to put on weight if I ate too much (which is easy to do high carb). I do intense tennis training and am only 32 so I'm in good shape - but still have rolls round my middle (have had them since childhood). I never let myself go above 65 kilos on a 'normal' diet - which meant lots of calorie restriction. However, for the 3 years doing low-very low carb with high fat my calories are about 2000 a day - so I'm used to lots of calories now.

I've read most of the low-carb books out there, and am at present reading Barry Groves' book. It's kind of frustrating to read that his wife who is my height lost down to 122 pounds on 60g of carb a day and high fat. I've been high fatting all along, and it hasn't gotten me anywhere - not a single damned pound in 3 years. I think my body is happy at 24% body fat (well actually doing it by measurements tells me I'm 26%). Just feel like crying because I'M not happy at 26% body fat - and I don't think I should have to stay here at only age 32 - no kids either yet! What the hell am I going to look like at 50 if zero carbs makes me gain now?!!

Anyway, nuff said, enough wingeing - guess I've just got to suck it up and hope that cutting out the dairy does something.

I'm still confused about protein as well. I've just seen too many people say how they cut protein to minimal amounts (well, still plenty but not huge quantities) and started to lose fat. I think I will be very miserable on zero carb if I can only have a couple of pork chops and a stick of butter every day. Just doesn't sound very appetizing. Still, anything to shift 5% body fat eh?

**RE: Zero Carb / Meat and Water - aim in Fla*working - 08-03-2008 02:48 PM**

Loops, I hope you get the answers you deserve. It is one thing to screw up and blow it some and wonder why you are not losing...it is another to do the 'right thing' and endlessly never lose...hugs, and I hope you find out why.

**RE: Zero Carb / Meat and Water - deedum - 08-03-2008 03:35 PM**

Charles Wrote:
aim in Fla*working Wrote:
Charles, a poster earlier posted that she had been on zero carb for 4 weeks and had not lost weight...could you explain how that is possible?
Thank you😊
Amy

Hi Amy!

It's possible because zero-carb doesn't aim to reduce your weight. It aims to repair a hormonal condition
in your metabolism. Deana has hyperinsulinemia which means that she likely secretes insulin for much of the day. That leaves little time for her fatty acids to circulate. By going zero-carb, she is trying to condition her pancreas not to secrete so much insulin which will allow fatty acids to flow for longer periods of time. This takes time. It's not just about how many carbs you eat, it's about how much insulin you secrete. The carbs are truly secondary, although not eating them is the best way to improve the condition.

This level of hyperinsulinemia varies wildly between people. Not only that, but if there are any other issues that she has, these can also exacerbate the condition. I don't know what, if any, supplements she may be taking, whether she has trouble with her menses, whether she has any sort of chronic pain anywhere in her body, etc.

Our bodies are a homeostatic system and it's impossible to separate weight from the other regulatory processes in the body. They are all driven by hormones with insulin being the chief hormone. If one of these is acting up, it will affect all the others. I would have to get a lot more information to know why she isn't losing weight, but she said that she had other markers like sleeping better and higher energy levels. These are signs that her insulin levels are improving and as long as this continues, it's a great sign that she'll begin losing weight soon.

Alison didn't lose weight for a while and then began to lose one day. That's how it works sometimes.

For some people, it takes a while to jump start the system and then once it gets going, it can take a long time to regulate itself properly. One has to be in it for the long haul because for some people, it will take that long to get where they are trying to go. I hate it that it's like this, but that's really how it is.

Regards,

Charles

Hey, you guys are talking about me!

Yes, hyperinsulimia is very insidious indeed. If you could look at me, you wouldn't guess that I was hyperinsulimic. I only have 10 lbs to lose and have never been obese. I am a professional fitness instructor. I am doing everything right. However, even though I was on The Zone diet for 11 years I am still hyperinsulimic. I suspect I was born with some kind of insulin issue because I can remember having crazy blood sugar swings my whole life. Going from "about to faint" before eating to "ecstatic euphoria" after eating. Heck, hyperinsulemia probably started in my early 20's even though it didn't show up as obesity. I am also going to get my thyroid and sex hormones tested in a couple of weeks (considering my age, 43).

Quote:
I'm going away to a Turbo Kick convention today through Sunday. I cooked up a bunch of steaks and ground beef to take with me so I requested a refrigerator in my room. This will be a real test of my fat adaption because I will be working out more than I ever have in my life the next four days! I'll be trying out all the other workouts the Turbo Kick organization certifies in. They have names like, "Hip Hop Hustle", "Turbo Kick Strength", and "PiYo" (pilates/yoga). They also split us up into teams and we compete against each other to see who's the most spirited. Sounds like junior high drill team camp to me, been there, done that, don't really want to do it again so let's hope I catch the spirit while I'm there. I am in pain, head to toe. I noticed that during the workouts that I didn't like (the ones that had no dancing) I had a hard time keeping up and I couldn't do even 80%.
However, yesterday I danced for 2 1/2 hours straight, learning a stomp routine from a professional stomp company (hurt my body and my brain), then learning and dancing a hip hop routine right after. Because I love, love, love dance I had more than enough energy to keep going. But when I got back to my room, I laid down and couldn't get back up. Even the Aleve I took didn't help with the muscle pain. I even missed the big party that evening.

My muscles are still sore from the strength workout we did Friday morning.

How does this compare to how I would have done before zero carb?

I noticed a substantial difference in endurance. Less endurance when it comes to weight resistance. However, cardio-wise, my endurance was good if not better. **I am still not fully adapted to zero carb but I am confident that I will be very soon** I also think I am adapted enough to resume regular weight resistance by the fact that I am still alive after Camp Turbo!

Deanna

**RE: Zero Carb / Meat and Water** - **caroline** - 08-03-2008 03:45 PM

I was just talking about this on another thread--someone asked Jimmy about working out--I am highly athletic--one of those people who could never sit still--since I do very low carb, my whole approach has changed--I've stopped trying to keep everything the same--after all, I was fueled by sugar and carbs before--Now I work with what my body feels comfortable with--and I feel much better doing less--maybe this is not the answer you want to hear, but this is my experience. I am still very energetic, but it is a slow constant burn kind of energy. When I do more high intensity, it is no longer for hours but a shorter time.

---

**RE: Zero Carb / Meat and Water** - **twilight** - 08-03-2008 04:11 PM

That's very interesting Caroline. I'm looking forward to see how zero-carbing will affect my running/fitness/strength-training. Only on my 6th day so far.

---

**RE: Zero Carb / Meat and Water** - **suzanneeya** - 08-03-2008 04:22 PM

All my life I did huge workouts, I was usually in the gym for over two hours. When I switched to atkins, EVERYTHING changed. I went to the gym during my long induction/adjustment period, but it was hard going cause I was dead tired. Now, I workout so much less. I do 30 minutes medium cardio and 30 minutes weights and stretching, but I am more cut and buff than I ever was on those two hours workouts.

---

**RE: Zero Carb / Meat and Water** - **aim in Fla*working** - 08-03-2008 05:09 PM

suzanneeya, I was wondering when I am going to feel really good? Also, I am losing .5 every day or every other day...which is good..but, I am retaining so much water~

---

**RE: Zero Carb / Meat and Water** - **suzanneeya** - 08-03-2008 06:07 PM
You have to stick with it for a significant amount of time, no cheating. No bites of cookies. It still took me a few months to feel "good." And that was months of pure low carb (under 10). It takes time for the body to adjust.

---

**RE: Zero Carb / Meat and Water - montmorency - 08-03-2008 06:14 PM**

I had to get the calculator out ... 65 X 2.24 = 145.6 lbs or 10 stone 5 lbs in English money.

I don't know your height or build, but that doesn't sound heavy to me.

What had your target weight been?
Maybe you and your body don't agree about your goal weight?

Could you have less fat and more muscle than you think you have?

Regards,
Mike

**RE: Zero Carb / Meat and Water - Loops - 08-03-2008 06:22 PM**

Hi -
thanks for the thoughtful replies and the hug! I felt like I needed it today that's for sure (2nd day of no dairy!).

Yeah at 5'6, even with a bit of muscle from tennis and swimming 65 kilos is quite high for me, and I really do have quite a bit round my middle to lose - I wouldn't say I'm fat or even really overweight - but I don't feel like I'm at my ideal weight. I was hoping that zero carb might push me in the right direction.

I also felt like I had a bit of a hopeless dairy addiction - which is why I'm trying day by day to try to go without to see how it makes me feel. I had an awful time on a normal diet - rashes round my eyes, terrible eczema which covered my whole body (after being vegan for a year or so), not to mention several eating disorders.

Anyway, happily those cleared up - but I would love to be at 60 kilos again. Maybe that is just wishful thinking.

Anyway thanks! I'll keep on anyway

---

**RE: Zero Carb / Meat and Water - Daryl - 08-03-2008 06:35 PM**

Loops, are you certain that you aren't insulin resistant? Concentration of weight in the midsection is a sign of it, I think.

---

**RE: Zero Carb / Meat and Water - caroline - 08-03-2008 08:36 PM**

Hey Loops, I am not denying that men have equal challenges in weight loss--just wanted to get that out of the way. But as women, we are more padded in general (even if we have a lean body type) We have all those hormones. The point being, it takes time.

That's why I like to think I am a good reminder for people that it takes time. I am slim, high metabolism. all meat and also--I do eat cheese, nuts, cream (no fruit or vegs)--But it has and is taking me a while. I feel like my body had to get back in order--It takes time Can't recommend coconut oil enough.

Suzanne, you and I have had the same experience in regards to fitness. Tons of time spent pre low-carb. Now, it's no longer appropr. or necessary OR desirable for greater fitness.

We just need to remind ourselves that patience is a key factor. Also, there is something to be said for the complimentary effects of gratitude. Being positive WILL help progress.

---

**RE: Zero Carb / Meat and Water - suzanneyea - 08-04-2008 01:54 AM**

I think a lot of people forget that I have been doing Atkins for 5 years. I did just switch to zero carb, but my carb level was never over 10 before that. I also never go off plan. For those who are just starting out, do not get discouraged. I did not just wake up with a flat stomach after a week, lol. I went through a lot to get to this point. I am not even sure exactly how long it took my body to adjust to this way of life, but I know I hung in there through some hard times. My best advice is to keep going, eat on plan and give it time.
hiya -

yeah - Daryl, maybe I am insulin resistant. I have noticed a few positive changes in my body - and also a few undesirable ones though! I lost a bit of fat around my upper middle (but not my lower) - that went in a couple of months about 3 years ago. However, get this - I gained cellulite/fat on my thighs and put on fat around my hips! Maybe that is something to do with coming into my early thirties though.

Caroline I was eating much like you do. I just can't figure out though what happened - it was really weird. I kept on plan (I adore eating low carb and never get cravings for carbs), and during the first year I bounced up and down the scale - down to 60 kilos, back up to 65, down to 60 etc. At one point it seemed I would stay at 60 kilos (and I was eating nuts, cheese, cream and salad at this point still). However in the third year my weight rose to 66 and pretty much stayed there. This coincided with my first attempt at going close to zero carbs. Since then I have tried all sorts of things - playing around with fat/protein ratios, eating more veg etc.

Most days I don't stress out about it. I decided that going pretty low carb is what matters in the long run so messing with ratios - or whether or not to eat veggies doesn't matter as long as I'm not giving up on the whole thing overall.

What I'm saying is, I haven't lost body fat in 3 years, and that is a long time to be patient, but I appreciate the encouragement. It's just hard to know what to 'tweak' next.

Anyway yesterday I was very good and just ate pork ribs all day. I know I didn't eat enough because I didn't eat any dairy which usually bumps up my calories - and I find it hard to eat enough when it is just meat (even fatty meat). Maybe that will change.

Ok -

well this morning finally I'm back down to 64.5 kilos since TOM. Breakfast was pork ribs instead of eggs. My muscles feel quite tired, which is unusual for me. Hopefully today I can eat more to get my calories up higher without dairy!

Other than the leg fatigue I feel pretty normal, although I also woke up with a headache. This is the first time since I started low-carbing 3 years ago that I dropped all dairy. Is a headache normal? What would it mean? I know I'm pretty fat-adapted as I've been <10g carb for long periods of time, but with the inclusion of cream and cheese.

Thanks

Loops
Hi Loops,

I know I sound like a broken record, but I notice some difference in my body shape (more contour) since I have been upping the fat with coconut oil. For ex., this morning when I got up, I put a few big hunks of coconut oil in some hot water and drank it. I just don't think the fatty meat is enough. (and I have the butcher grind us extra fatty meat) Then I put a pad or two of butter on my meat. I know Charles doesn't put butter on his stuff, but I find I need more. It seems the more fat I add, the better it works. You can try it and see...I appreciate your frustration. You have been really focused on this diet. I hope that the extra fat helps. Also, I think Jimmy and others (me included) are on the mark when they say that some resistance training also helps. If you have any questions about my workout, you can e-mail me and I'll tell you...Keep up the good work and the faith!

---

RE: Zero Carb / Meat and Water - Loops - 08-04-2008 07:51 AM

Hi caroline -

yes, I do and will continue to add extra fat to my food. I find this is natural for me. I'm going to make some ghee today. Unfortunately, I can't get coconut oil here, so that is a no-go for me unless I order it (pricey). Pork fat seems to give me the most energy, but also I can't buy unmodified lard here. Everything is modified. I tried asking the butcher for spare pork fat but they never have any - the meat always arrives already cut. So pork ribs are the closest thing I can get to fatty meat. The butter is good here though thankfully. When I was eating cheese the goat cheese is very good - but I won't talk about that now!

The ground beef here is per 100g - 20g protein and 10g fat - that is the fattiest they have - everyone is into low-fat eating here now apart from the very poor who eat lots of organ meats. I also buy salmon and cook it with a few spices and lots of butter. I used to cook it in sesame oil which was yummy but stopped that when I read up on how veggie oils are bad for you.

For me I really really want to make sure I eat a lot of calories - otherwise I won't be convinced that if I DO have success it wasn't to do with lower calories. I need to see a clear result from dropping cream/cheese. If it doesn't make any difference I will have peace of mind and go back to it - if it does, then great!

The first time round years ago I tried Atkins I didn't realize that when you cut the carbs you have to add a lot of fat. I think that's why I eventually went off plan - I was always tired and not eating enough fat.

Anyway, I am really really determined to complete my no cheese/cream experiment. If it is simply a craving for fat, then eating my pork ribs with butter should ensure no dairy cravings. If not, then I might just have a problem with the cheese/cream.

I would think a month would be enough to see. So that is where I'm at anyway. Just going to start cooking up a storm to get prepared!

---

RE: Zero Carb / Meat and Water - abnormalslc - 08-04-2008 08:57 AM

well....I did not quite last a full 2-weeks on ZC...I had a very frustrating weekend...and...horror of horrors....I ate some strawberries and cantaloupe yesterday at a BBQ we hosted....the meat skewers were delicious....but I just HAD to have something else...I felt like such a failure.
but...on the bright side...I still remained low carb...just not zero carb....
I weighed in today at 216...4 pounds up from my lowest....6 pounds down since starting ZC...
I also gave in and had Diet Pepsi....sorry Charles....I tried to stick to water only, but I was not "on my
game" this weekend and could not maintain that.
I have also added eggs back into my routine now that it has been 2 weeks....

so for me...I will remain actively living "very-low-carb" and see what happens.
I am back to water only as of this morning....so we shall see.

---

**RE: Zero Carb / Meat and Water** - jeepifer - 08-04-2008 09:04 AM

We all do the best we can, and we're only human. Keep on keepin' on... :hugs:

---

**RE: Zero Carb / Meat and Water** - LindaSue - 08-04-2008 09:04 AM

Don't beat yourself up, abnormalslc. That's pretty much how I eat lately. I mostly eat meat but I don't get stressed out if I have a small serving of veggies once in a while or a diet drink or whatever. I also eat cheese most days and eggs a couple times a week. I'm sure I'm still under 10 carbs per day so I just don't too worry about what I eat as long as it's low or no carb.

**RE: Zero Carb / Meat and Water** - Kristi31 - 08-04-2008 12:04 PM

Since upping my fat a few days ago, I feel incredible! I don't EVER feel tired now, sleep very well, probably about 6-7 hours, don't get all screwed up and drowsy after my meals, feel full on a smaller amount and can easily go 12 hours without eating. I also feel more relaxed and positive about life. Skin is great too...no hives to speak about. Bloating and stomach cramps are gone. Weight is stable for now. And I met a guy yesterday...who knows? He's pretty cute and offered to buy me a drink so I told him I only drink water...and what a cutie! he bought me a bottle of water.

Life is gooood. 😊

**RE: Zero Carb / Meat and Water** - nyteez - 08-04-2008 12:06 PM

Today is my 5th day of just meat, water & wine. I am down 4 lbs! I am surprised, because we went
camping/fishing this weekend and I always gain 3 lbs when we go fishing for the weekend. I blamed it on the beer/wine we drink all weekend but, I guess it was the eggs.

I feel great, have lots of energy and went for a nice run then lifted weights. I wasn't even hungry for breakfast, but I know if I eat then I won't have to worry about food until 7pm. I had ground beef, with some homemade pork sausage, butter & tallow(beef fat) w/ a splash green hot sauce, Yummy!

Caroline is right, the FAT is so important! I wonder if women need more fat than the men and maybe this is why we have a harder time with zero carb. It was so hard for me mentally to eat fat. And eating all the melted fat from the bottom of the bowl with a spoon is something I would NEVER do before.

I have been doing VLC since February and cut way back on cheese a few weeks ago. I haven't noticed anything bad (tired, headaches) from switching to just meat.

How funny Kristi! I feel the same exact way! Fat is the key!😊

---

**RE: Zero Carb / Meat and Water - Charles - 08-04-2008 12:28 PM**

Congrats Kristi and Dana on your weight loss and yes, fat is definitely the key for both men and women.

Mike, I hear you on Stefansson's quote and that gave me pause the first time I read it as well. I'm just resigned to the fact that I will have good, lean years, regardless of how long it happens to be. What good is it to live 20 years with medicine, tubes, and hospitals?

I've seen Not By Bread Alone also called Fat of the Land, it's supposedly an expanded version; the cheapest one I've seen online? $325 😢I hope to read it someday, what he and Anderson did at Bellevue endlessly fascinates me.

Good grief--I'm still trying to catch up. My local library has Not By Bread Alone but it's not reservable. I'd have to make time and go read it in the library... 😞

But it is there. See if your local library's have this available... you might be wonderfully surprised.

---

**RE: Zero Carb / Meat and Water - Charles - 08-04-2008 01:19 PM**

If anyone wants the big PDF version of Not by Bread Alone e-mail me and I will return the e-mail with the PDF. That's probably the simplest way to go about it. It is huge though. I printed it out and put it in a
big binder that I keep by my bed. The other book, *My Life with the Eskimo* is also a gigantic book. It was larger than *Bread*.

The file is 5.24 megabytes. It's too big to post on the forum but it doesn't seem too terribly bad over e-mail.

---

**RE: Zero Carb / Meat and Water** - [waywardsister](#) - 08-04-2008 01:50 PM

Quick update - it's been a week, and I am down 4lbs of what I assume was water weight. Been eating meat/fat, a little bit of veg now and then, and drinking tea w/coconut milk, water and...wine. Not copious amounts, but more than usual be everyone's birthday is in July/August and there's a lot of celebrating going on! I faltered in my dairy-free efforts and had some blue cheese dip with chicken wings, and paid for it with bloating and a rash on my arms. Why does blue cheese have to be soooooo good?

I just wanted to say that you look awesome and you really give the rest of us hope that someday we can look as good as you.

Thank you, I also feel great. I was someone who really battled a lot with stuff in life and this diet plan has basically eliminated all this emotional baggage I had been carrying around, just amazing. But, we all have good and bad days, even on zero carbs. I still have days when I do not move off the couch or get cross for no good reason, but they are much much less frequent than before.

**RE: Zero Carb / Meat and Water** - [FormerDonutJunkie](#) - 08-04-2008 05:07 PM

I'd already lost forty pounds on LC in the past year, but after stalling out for a while I started VLC a couple of weeks ago [still eating some eggs and coffee]. Wow, what a difference a couple of weeks can make! Ten more pounds gone on VLC.

What amazes me is the satiety factor eating 73/27 ground beef. First of all I find that most times I can only eat one patty of about 1/3 pound size. I ate two patties this afternoon and I'm still not even close to being hungry. I thought I was that hungry but soon afterward felt stuffed. I'm going to slow down eating, which I'm sure will solve that problem.

I've always been a meat lover, especially beef and pork. Steak has always been a staple with me but I just never realized the power of 73/27! Quite possibly the best value of low-carb.

Loops Wrote:
Yeah at 5'6, even with a bit of muscle from tennis and swimming 65 kilos is quite high for me, and I really do have quite a bit round my middle to lose - I wouldn't say I'm fat or even really overweight - but I don't feel like I'm at my ideal weight. I was hoping that zero carb might push me in the right direction.

Anyway thanks! I'll keep on anyway
Ha ha! I'm about 5'7" and my goal weight is more than you are now (~154 lbs) and I'd settle for 160 or so :-) On the other hand, I've been pretty overweight to a varying degree for quite a few years, so we are coming from a different place.

BTW, I could be kidding myself, but in the brief few days I have been all but zero-carbing, while my midriff hasn't shrunk exactly, it does seem to have firmed up a bit, and in the mirror, it even seems to have the glimmerings of some definition. I don't work out, but I do cycle and swim a bit.

Regards,
Mike

I'm finding that half pound cheeseburgers (6 ounces cooked weight) are the only food that keeps me full for more than a couple of hours. I've been having one of these just about every morning around 8:00 and I can usually make it until almost 2:00 before I need to eat again. I have no trouble eating a whole one but I'm very full afterward.

RE: Zero Carb / Meat and Water - Charles - 08-04-2008 06:23 PM

Well, I have to apologize for anyone I might have thrown off with my "Thanksgiving-Full" rantings. Don't get me wrong, I still believe that you have to eat to appetite -- that's for sure, and if you're over 40 pounds from 24.9 BMI, that means a good bit of food is necessary. However, if you get to where you're within 20 pounds of your goal, I think you have to listen a little closer to hear your appetite so you don't engage in an overfeeding experiment ala Ethan Sims.

When you do that, you pretty much find that you only need to eat two times (maybe three, although the third is not much) per day. Since I've dropped the salt, my appetite has severely decreased (and the occasional cramping after a stretch in the bed has stopped). I can eat a single quarter-pound (pre-cooked) 73/27 patty and four strips of bacon for breakfast and I can easily go 6 and 1/2 hours before feeling the need to eat again. It's incredible. Even at lunch, I can get the thin ribeye steak from Wal-Mart and that satisfies me for lunch. Today, it was 7 hours because I went to the gym this evening. I ate just a few spoonfuls of 73/27 ground beef and carne asada (chopped up skirt steak Mexican-style) and I'm full 'til mornin'.

I wrote all that to say, just eat fatty meat, drink water and stop when you're full. Don't eat when you're not hungry and things should be just grand! When I do this, I have no trouble staying at 156 or below. If I eat more than I need, I can go to 158 or 159, but as soon as back off, I go right back to 156.

Regards,
Charles
Things are going quite well. I did try and add some coconut oil in some water, well I got it down, it didn't come back up so yeah for me. 1 tablespoon on the 1st day. I am still losing and I even tried on my 1 set of "thin" clothes. I do have many sizes to keep on trying. I think this time once they are too big to the goodwill they go. Why keep them anyways. And this is probably too much info but my undies are too big!!!!!Yeah (Sorry for that last bit, but I am sure the girls know how cool that is!!)

Loops Wrote:
Unfortunately, I can't get coconut oil here, so that is a no-go for me unless I order it (pricey).

Loops, can you buy whole coconuts where you are? Maybe you could make your own, or eat fresh coconut meat with the oil in it.

Charles Wrote:

Wow, Charles. I can't believe that I'm eating more for breakfast than you are. I've tried eating just half of one of my half pounders (3 ounces cooked weight/4 ounces raw weight)) for breakfast and I end up right back to being hungry again in 2-3 hours. It seems that I must have that half pound of meat to keep me full long enough. I do eat much smaller meals later for lunch and dinner but I need to be careful not to fill my stomach up too much late in the day. I'm fine in regard to reflux if I eat that big meal first thing in the morning but not later.

poo123 Wrote:
I bought the Nutiva coconut oil and tried it. blech!! What was I thinking!? lol

I just thought for some insane reason there'd be this flavorful coconut taste and it'd be more creamy than... well, oily! Of course oil is still oil.

I still need to up my fat intake but I'm hesitant to try and just sop up a spoonful of the stuff. I'm kinda glad to hear you struggled with it too. It makes me feel better. It means I wasn't doing something wrong. lool
But I've got to find some way to up my fat... I'm eating a lot more red meat now, fat included. I'm even going to a meat market instead of a local supermarket, cooking my meat and bringing it to work. But I'm not losing more than maybe .5 pound a week... if that. Honestly I don't check the scale much so I really don't know how much I'm losing. My clothes are my indicator.

But I'm falling off-track here. lol

Are you forcing yourself to take that spoonful of coco-oil? What brand are you using? Maybe Nutiva's just not the one for me... (she says hopefully)

RE: Zero Carb / Meat and Water - Loops - 08-05-2008 06:22 AM

Hi Vesna -

no - no coconuts - it's not tropical where I am. I can only buy dessicated coconut, but then that has carbs right?

Charles - 1/4 pound of meat, even if fatty, is so little calories. I know you don't count calories, but it would be interesting to see how much you eat? The reason I bring this up, is because yesterday after eating a lot of pork ribs (which was great and made me feel very good) - I got to the evening and was acutely aware that even though I didn't have a big appetite (well, for more meat anyway) I hadn't eaten anywhere close to the normal amount of calories I would ingest - or that I need. But I couldn't bring myself to eat more fat meat, so I did falter and had some cream and a few nuts.

This is what worries me - I would of course like to get ripped like Suzanne or yourself, but I am wondering if doing the all meat thing simply reduces one's appetite and thus ingestion of calories continually and that this could be really bad for me in the long run. It is true for me, that if I have no option but to eat meat and non-dairy fat (with inclusion of butter) I naturally drastically reduce my calories - but I feel kind of a bit hungry or like something is missing (calories)- but then I really can't eat anything because the only thing allowed is meat and the idea of that makes me feel really like not eating.

Does that make any sense? How does one get past this? I know people might not be in agreement here, but I really do think that eating LESS than a certain amount of calories is very bad for the metabolism in the long run, so I want to avoid doing this. Unfortunately that means eating dairy, which I'm trying to phase out. I find it quite easy to get my calories up to say 2000 eating cream and cheese, but near impossible to do eating meat/butter/other fats.

Opinions/ideas?

Loops

caroline Wrote:

Hi Loops,

I know I sound like a broken record, but I notice some difference in my body shape (more contour) since I have been upping the fat with coconut oil. For ex., this morning when I got up, I put a few big hunks of coconut oil in some hot water and drank it. I just don't think the fatty meat is enough. (and I have the butcher grind us extra fatty meat) Then I put a pad or two of butter on my meat. I know Charles doesn't
put butter on his stuff, but I find I need more. It seems the more fat I add, the better it works. You can try it and see... I appreciate your frustration. You have been really focused on this diet. I hope that the extra fat helps. Also, I think Jimmy and others (me included) are on the mark when they say that some resistance training also helps. If you have any questions about my workout, you can e-mail me and I'll tell you... Keep up the good work and the faith!

Caroline,

Did you have fatigue when you started low carbing? Did you push through it to start working out? My fatigue comes and goes but I really want to start working out. In fact, I'm starting today with just some cardio... just walking to begin with... then the couch to 5k (with jeepifer) but my heart is truly in to weight lifting. That was always fun to me. But I've not been back in the gym since... oh wow... maybe 2003ish? I know that weight training will help reshape my body (translation: cut this gut back) while I lose. I don't mind being big if I can be the hourglass big. lool

And did the coco-oil mix well with the hot water? I'd not thought of trying that myself... someone else wrote they drank their oil with their coffee or something and I couldn't imagine how or if it would even mix well.

Questions... questions... questions... lol

Well to add to that -

yesterday was mostly a success for me. I ate the ribs for breakfast, lunch and dinner. They were pretty fatty.

The positive:

I felt extremely relaxed in the evening after eating. I didn't have the usual dairy bloat either. I felt pretty good. The night before I slept pretty well as well.

I was quite tired though all day, and as I mentioned in the post before, I felt that I wasn't getting enough calories.

I messed up and had some nuts/cheese and had really awful indigestion in the middle of the night - so I'm learning.

I think I"ll be able to work this out though - appetite must come back after awhile - I think Suzanne has a big appetite now no? I want to be able to enjoy my food. Right now meat without dairy seems a bit bleak - maybe that will change with practice?

Charles Wrote:
Glenice Wrote:
Charles, I am slowly reading through this thread and find it fascinating and am learning a lot. I am particularly interested in your statement about zero carbs repairing hormonal conditions in the pancreas. Is it possible to do this even despite Type 2 diabetes? My feeling is that one would have to drop injecting insulin altogether for it to happen.

Hi Glenice, welcome to our thread! I believe that Type 2 is reversible because if you don't supply any glucose phosphate, then over time your pancreas should secrete less insulin. Dr. Mary Vernon deals with this often and she reports that most of her patients no longer need insulin very quickly after changing their diet. You would want to work with a doctor because as you go to zero-carbs you would need to
adjust your dosage of insulin down to keep from getting too much. I would expect on zero-carb that your need for insulin would plummet very rapidly.

Insulin injections would certainly cause fattening and in the 20s, Taubes' research tells us that this is how they used to treat anorexics. Dr. Blake Donaldson regularly chastised his patients for "wanting an insulin shot to cover their Danish."

Again, if you remove the carbohydrates, then your need for insulin will disappear pretty quickly afterwards but work with a doctor to keep from overdosing on insulin. I'm sure Jimmy can hook you up with a low-carb doctor in your area or if you feel like taking a trip, it would be worth it to visit Dr. Vernon in Kansas!

Regards,

Charles

Charles, thanks for this. I am not in the USA but in the UK so unfortunately for me am not able to connect with any Low-Carb Doctors. Fortunately, my doctor while not really getting into my diet, is happy with my current numbers (HbA1c of 6.4, not good enough for me though) and allows me pretty much to do my own thing. I was originally taking around 150 units of Insulin daily, so I believe I am highly insulin resistant. My low-carb (10g) diet has enabled me to come down to around 40 units and I micro managed that myself by constant testing. Every couple of weeks or so I do hourly tests to see what is happening on a 24 hour basis, and would naturally do this if venturing to No Carbs until I get to whatever minimum amount of Insulin I can go to, hopefully off it altogether. Even at just 40 units, the weight has not budged, so I am keen to try something else.

On another note, I read through your PDF file "Adventures ... and am puzzled by the following paragraphs. What is your take on this, could it be correct:

"While meat eaters seem to average well in heath, we must in our conclusion draw a caution from the most complete modern example of them the Eskimos of Coronation Gulf, when he was anthropologist on my third expedition, that the two chief causes of death were accidents and old age. This puts in a different form my saying that these survivors of the stone age were the healthiest people I have ever lived among. I would say the community, from infancy to old age, may have had on the average the health of an equal number of men about twenty, say college students.

The danger is that you may reason from this good health to a great longevity. But meat eaters do not appear to live long. So far as we can tell, the Eskimos, before the white men upset their physiological as well as their economic balance, lived on the average at least ten years less than we. Now their lives average still shorter; but that is partly from communicated diseases

It has been said in a previous article that I found the exclusive meat diet in New York to be stimulating—I felt energetic and optimistic both winter and summer. Perhaps it may be considered that meat is, overall, a stimulating diet, in the sense that metabolic processes are speeded up. You are then living at a faster rate, which means you would grow up rapidly and get old soon. This is perhaps confirmed by
that early maturing of Eskimo women which I have heretofore supposed to be mainly due to their almost complete protection from chill — they live in warm dwellings and dress warmly so that the body is seldom under stress to maintain by physiological processes a temperature balance. It may be that meat as a speeder-up of metabolism explains in part both that Eskimo women are sometimes grandmothers before the age of twenty-three, and that they usually seem as old at sixty as our women do at eighty.

So, an all meat diet may not mean you will live longer? Obviously an answer could be, who indeed would want to live longer with the debilitating diseases that plague us these days. But I am curious to find out the truth of this matter. I guess if calorie restriction extends life than eating so many more as in No Carb could have the opposite effect. Anyway I am interested in your thoughts on this.

Thanks ever so for your insight and information, I am about to embark on yet another journey in the quest for some weight loss.

Kind regards,
Glenice

Hi Loops, I noticed I am eating less too, but I am not sure it is less calories. The fat is concentrated calories. This goes along with listening to our bodies, if we are not hungry, then we must not need more food. With no carbs our bodies are now using fat either dietary or stored. I know I have enough stored fat to keep going for days! LOL! Yesterday I just had ground beef, pork sausage (homemade, nocarb) cooked with butter & tallow for breakfast. I wasn't hungry until 8pm and all I had was 2 small chicken thighs wrapped with bacon and baked in butter. I couldn't eat the 3rd one. I am down another 1/2lb today.

I eat coconut oil off the spoon. It grossed me out at first, but then I realized it was no different than eating a spoonful of frosting. My coconut oil tastes like coconuts and therefore tastes like coconut frosting. I eat small bites and just let it melt in my mouth. I love it now.

I am not buying the all meat diet makes you live a shorter life. This study was done a long time ago and the eskimos live a very hard life. The whole bit about their increased metabolism speeds up aging is ridiculous. If that were true then that means all people with high metabolisms die sooner then people with slow metabolisms? It just makes no sense to me.

You women don't give some of us men enough credit. The Goodwill loves me. I've given away so many practically brand-new clothes over the past couple of years it's scary. I also have too-big underwear in my closet so I can identify with what you're saying!

Congrats on the weight loss and I'm so happy that things are working out so well for you.

Regards,
Hi -

I think for the time being I'm going to keep heavy cream in my diet. It's just too depressing for me to give it up! I'm also a bit of a believer in the Optimal Diet, although I'm not sure I agree with the carb allowances. Anyway that is for the other thread!

It could be just the cheese that does me in. In the past I've been able to lose a bit of flab by eating huge quantities of fat (including cream, tallow, butter) and trying to keep protein at a reasonable level and carbs low. But it gets old FAST trying to keep protein to this level - especially when I go out to eat and there's well a bit old steak waiting for me. I mean, how do you eat out when protein is restricted? They won't serve you a bucket of cream.

ahhhhhhh the different options. Salmon is for lunch and ug - I just haven't got the appetite for it right now - even cooked in lots of butter. I wonder what else I can snack on (no cheese no cheese!). I just had a big mug of tea with cream and feel a bit more energy.

Loops Wrote:

Charles - 1/4 pound of meat, even if fatty, is so little calories. I know you don't count calories, but it would be interesting to see how much you eat?

What we're talking about here is metabolic fuel, not calories as they are related to a bomb calorimeter. You've got the 1800's low-fat /BMR stuff stuck in your head and you're trying to reconcile it with low-carb. I understand that.

First, the 2,000 calorie recommendation is as meaningless a stat that there is. This figure came as a result of Keys and Benedict's studies on conscientious objectors to World War II. They put the results of these studies in a large set of books called the "Biology of Human Starvation." These men were fed low-fat diets of approximately 1600 calories where 70% were carbohydrates. These men went through Hell. It got so bad for them psychologically that they were always starving. Some people even started hacking off body parts. Check this out:

Here's an example of a typical dinner menu:

Quote:
The meals were designed to approximate the food available in European famine areas, with a heavy emphasis on potatoes, cabbage, and whole wheat bread. **Meat was provided in quantities so small that most men would swear in later years that none was included at all.** (Emphasis mine.)

One of the three dinners included the following:

**SUPPER #2**

185 grams of bean-and pea soup (made with 5 grams dried peas, 16 grams of dried beans, and 15 grams
255 grams macaroni and cheese (made with 130 grams wet macaroni, 12 grams lard, 108 grams skim milk, 2 grams flour, and 35 grams American cheese)

40 grams rutabagas

100 grams steamed potatoes

100 grams lettuce salad (80 grams lettuce, 10 grams vinegar, 10 grams sugar)

The relatively bulky 255 grams of macaroni made that particular meal an anticipated favorite among the volunteers. The wet macaroni served was roughly the amount required to fill a coffee mug about three-quarters full.

Over the twenty-four week starvation part of the study, the subjects not only lost a considerable percentage of their body weights, but suffered a number of problems as well. As the time wore on the men thought ceaselessly about food, they became lethargic, they were cold all the time, they became depressed, they developed bleeding disorders, their ankles became edematous, and some developed more serious psychological disorders. (Emphasis mine.)

The men in this study consumed macronutrients in the following amounts daily: protein 100 gm, fat 30 gm, and carbohydrate 225 gm. If you express these intakes as percentages, you come up with 25.5% protein, 17.2% fat and 57.3% carbohydrate.

Average energy intake of the subjects in the experiment: 1570 calories per day.

So basically, they came up with 2,000 calories in order to keep you from hacking off body parts and losing your mind. This is why when people come here saying that they only eat 1300 calories makes us all cringe and we relentlessly urge them to eat more.

The slow-down in metabolism comes from providing fuel that your body cannot use. However, we know of other studies that demonstrate that with the correct diet, 1800 calories is more than enough. Bistrian and Blackburn's studies showed that it's possible to eat 1800 calories of fat and protein and not be hungry, have feelings of well-being, have stronger immune systems, and overall satisfaction; whereas, if you eat 1800 calories of a balanced diet, you'll find yourself constantly hungry and psychologically unbalanced.

The number of calories is not the issue. What is important is your hunger. Your hunger is your body's way of telling you how much food YOU need to eat. It's really irrelevant how much I or some other person needs -- it's all about how much YOU need for your body at your size and at your weight. Just eating to get yourself above some calorie figure is wrong because you are overfeeding yourself.

Obviously, I can lift weights and run half-marathons so there must not be too much wrong with my metabolism, wouldn't you say? That's just more proof, albeit anecdotal, that you have to rely on your own hunger to tell you how much to eat.

It makes sense too when you think about it. I mean, what isolated, non-diseased population worries
about how many calories are in their food? It's just not natural to count calories. We're not machines, we are homeostatic creatures with long term fuel supplies. Our bodies do many things with our food and we don't use 100% of the energy found in food. I don't think anyone really knows how much we actually use although there are many theories. I submit that it's irrelevant.

The bottom line, once again, eat to appetite. Don't eat when you're not hungry and only eat when you are. Drink water and lose that salt shaker!

Also, I agree with the notion that fat is good, but you shouldn't have to go through all these extreme measures to add fat to your food. If you like coconut oil in water, have at it. I couldn't imagine....

I don't add anything to my meats. I just try to enjoy the natural flavors in the food. You may find that with all these additions, you end up eating more of it than you would without it. If I add mustard to hamburger patties, I can eat several. If I don't use mustard, I can't eat nearly as many.

It all comes down to hunger.

Loops Wrote:
The reason I bring this up, is because yesterday after eating a lot of pork ribs (which was great and made me feel very good) - I got to the evening and was acutely aware that even though I didn't have a big appetite (well, for more meat anyway) I hadn't eaten anywhere close to the normal amount of calories I would ingest - or that I need. But I couldn't bring myself to eat more fat meat, so I did falter and had some cream and a few nuts.

The culprit here was hyperinsulinemia and your own mind, not hunger. You should have ignored this and went to sleep with a full stomach. This is the problem I have with dairy, seasonings and sweeteners. Sure, they don't have many carbs or calories, but they make you eat more than you otherwise would. When you "couldn't bring yourself to eat more fat meat" that should have been your clue that you were finished!

Loops Wrote:
This is what worries me - I would of course like to get ripped like Suzanne or yourself, but I am wondering if doing the all meat thing simply reduces one's appetite and thus ingestion of calories continually and that this could be really bad for me in the long run.

This is exactly the point. When you ate a high-carb diet, you were never really satisfied so you continued to eat more and more carbohydrates, just like the people in the starvation study. In Ethan Sims overfeeding studies, he found that he could feed inmates 10,000 calories a day of mostly carbohydrates and guess what? They were still hungry at night before they went to bed! This is a problem.

When we say "calories don't count" we don't mean literally that they don't count. We're saying that they are not the proper measure to use when reducing weight. What's important is the quality of those calories that one ingests because if they are of poor quality, this will cause you to eat more calories than you actually need. Obesity is a hormonal drive to fatten caused by overconsuming carbohydrates. Yes, calories count in that regard.

However, to lose weight, it's not about "creating a negative caloric balance" in your brain. It's about creating a negative fatty acid balance in your fat tissue. You do that by cutting esterification which causes fatty acids to back up there.

Loops Wrote:
It is true for me, that if I have no option but to eat meat and non-dairy fat (with inclusion of butter) I naturally drastically reduce my calories - but I feel kind of a bit hungry or like something is missing (calories)- but then I really can't eat anything because the only thing allowed is meat and the idea of that makes me feel really like not eating.

Good! Go with that...

Loops Wrote:
Does that make any sense?

Yes, it makes perfect sense. Now, I have to ask you the same question. Eating less than your hunger is bad for your metabolism and it has nothing to do with the arbitrary 2,000 calorie limit. Please lose this number from your mind. Loops' number is quite a bit lower than this. Just eat fat and protein and lose the dairy. You'll lose weight and all will be well.

Regards,

Charles

Sambezious Wrote:
Hi Penny!

Have you thought about making the chocolate bark with the coconut oil?? It's a chocolaty treat and it's a simple way to get in your fat.

Just an idea!!!

Take care,

Sam

I'm afraid, Sam. I'm very afraid. LOL

Remember my debacle with the oopsie rolls? Well, I tried to make those again a couple weeks ago and still no success. I just keep expecting them to be like regular carby rolls I guess and the outcome is just not tasty or appealing to me. It turned me off the whole concept of any kind of roll or low carb breading... ever!

I just canNOT ruin my love for chocolate. I just might jump off a cliff. (kidding...but not) lol

Glenice Wrote:
On another note, I read through your PDF file "Adventures ... and am puzzled by the following paragraphs. What is your take on this, could it be correct:
[...]
The thing to do then, probably, is to go on as you have been doing, but adding to your mental equipment, if it be a novelty, the idea that several at least of the disadvantages of a meat diet are compensated for by advantages"

Hey Glenice. We've talked about this a couple times, but I've been thinking on this the last couple of day. First of all, I'm not quite yet ready to concede Stefansson's speculations about the all-meat diet.

MAC related the story that:

Quote:
In the book Life w/o Bread by Lutz (a 40 year LC doctor in Germany) there is a bit credited to Herodotus about a meeting between a Persian delegation and an Ethiopian king in the 5th century B.C.

The Ethiopian king was given some wine and found it delicious. The king inquired of the Persian king the greatest age obtained. The Persians told about wheat and making bread and that they did not live beyond eighty.

The Ethiopian king replied that he was not surprised that anyone eating DUNG would die so soon and they would die younger if not for the wine.

The Persians then inquired of how the Ethiopians lived and the king replied most live to 120 years and that they ate boiled meat and drank milk.

A similar argument is made about Masai, that they have a low life expectancy, which is about 60 years. The thing about the data is that it's all an average. If someone died at birth and someone else lives until 90, then the average is 45. They are very poor and they, like the Inuit, lived in harsh conditions. On the other hand, they didn't start collecting these data until much later and the Westernization of the Inuit had already begun in Stefansson's day.

Personally, I'm not too concerned with it. I don't buy the argument that people make that something that is healthy in the short term is somehow harmful in the long term. And by inflection, something that is unhealthy in the short term (carbs) are somehow life-saving in the long term. In America, our life expectancy is so high because of the sheer number of people which helps the average. It's still a fact that symptoms of or relating to the metabolic syndrome is responsible for the majority of deaths and they are horrific.

Moreover, in America, we have become very good at treating the symptoms of metabolic syndrome. We have heart attacks and live to tell about it. Just think how long the Inuit and Masai might have lived with the correct diet and modern medicine?

If I can live until 60 and not have any of the diseases of civilization, I'll take it, although I don't concede the point just yet. My great-grandmother lived to 94 and my grandmother lived to 75 with diabetes. I like my chances if I can avoid the diabetes. And even if not, I'll still be running half-marathons right before I go!
Regards,

Charles

RE: Zero Carb / Meat and Water - poo123 - 08-05-2008 09:26 AM

Penny, the coconut oil I bought was in the vitamin isle at walmart, I am still looking for a eat off the spoon type. Mixing it with water was a little rough but I did choke it down. Right now I will be cooking with it and take it from there. I would like to find the ones that people say they eat it like frosting.

Charles, I am glad your undies are too big TOO !!!

I am really happy too that things are going so well.. thanks alison

RE: Zero Carb / Meat and Water - poo123 - 08-05-2008 09:28 AM

nyteez, what coconut oil are you eating that it tastes like frosting. Mine is from walmart and I can barely gag it down. alison

Look at one of your local health food stores and see if you can find some Barleans' Extra Virgin Coconut Oil. It has become my favorite. There's just something about the taste and texture that makes it at least slightly more palatable for me. It's worth the extra couple bucks and if you like it you can buy it at VitaCost.com near the same price of the Rexall.

Barlean's makes some of the highest quality dietary oils in the nutrition world. Check them out on the web. I don't work for them or anything, I just happen to be a fan of their oils.

RE: Zero Carb / Meat and Water - poo123 - 08-05-2008 10:06 AM

Thanks, I'll check it out....anything is better than what I had last night. Today I cooked my pork steak in coconut oil and it was good. My husband tried it and said it tasted like there was something wrong with it. He is no judge of taste. alison

RE: Zero Carb / Meat and Water - jeepifer - 08-05-2008 10:47 AM

Someone want to tell me why I'm suddenly craving corn chips??? (insert scratching head, befuddled smiley here)

Darn vending machines. 😞
RE: Zero Carb / Meat and Water - pennypritty1 - 08-05-2008 11:24 AM

jeepifer Wrote:

Quote:
if you get to where you're within 20 pounds of your goal, I think you have to listen a little closer to hear your appetite so you don't engage in an overfeeding experiment

That is EXACTLY where I am at. It is very easy to go from "Gee I'm hungry" to "I feel so stuffed!". After all those years of my hormones and appetite being totally out of whack, this really doesn't surprise me.

---

RE: Zero Carb / Meat and Water - travis t - 08-05-2008 11:41 AM

jeepifer
i don't know how this came to be, but i just had the same problem with craving carbs. It was so bad that i went out to the vending machine and got a mt dew. I used to drink about four 20oz bottles a day, but i quit cold turkey on dec 31 of last year. i haven't had a drop in 7+ months but here i am with one on my desk as i type this.
I just in the last week have dropped my extra salt on my meats and i don't feel the zip that i had the last several weeks. I don't know what to think. I haven't had any carbs in about three days so the salt may be a problem for me and i will put some back tonight and see how that goes.

RE: Zero Carb / Meat and Water - Daryl - 08-05-2008 12:30 PM

Daryl Wrote:
All valid points to bring up, Mike. Is the meat diet "stimulating", speeding up our metabolisms, leading to a bit shorter lives on average, while something like calorie restriction, slowing down the metabolism, extends it? That leads to the question, is the extra time worth it?

We lost power from Tropical Storm Doofus, errrr, Edourd, so I spent the morning reading, and thinking.

According to GC, BC, both Stefasson and Anderson saw a rise in their metabolic rate on the meat diet-- 7 percent for Stefasson and 5 percent for Anderson, while pursuing the Bellevue experiment.

But, Stefasson lived to 83 - though not entirely on a meat diet, although he did say "More than twenty-five years have passed since the completion of my first twelve months on meat and more than six years since the completion in New York of my sixth full meat year. All the rest of my life I have been a heavy meat eater, and I am now fifty-six."-- and Bear has lived into his mid-70s, and is still going strong as far as I know.

With the benefits of civilization, including advanced medical care, I don't think we're "condemned" to short lives on a meat diet, but I do think most would reap a lot of benefit from it, and need the medical care less, perhaps.

I don't think that they meant that it tasted like frosting but that the texture was a bit like it. The thing is that the texture changes depending on the temperature in the room. In the summer coconut oil will be in a mostly clear liquid state and in the winter it will be white and have a thick crystalline consistency that people like so much. Unfortunately, there is nothing you can do to change the texture unless you can change the temperature in your house to below 70 degrees. If you try to refrigerate coconut oil, it will turn hard as a rock and you won't be able to get it out of the container.

jeepifer Wrote:
Someone want to tell me why I'm suddenly craving corn chips???

I'd forgotten all about corn chips. I can't remember the last time I had one. Must be at least six years or more. I use to like them much better than potato chips or tortilla chips. It's funny that the longer you eat low carb, the more foods you forget even exist. They are non-foods to me now. I can see high carb foods in TV commercials and my brain doesn't even perceive them as edible. When I watch cooking shows on TV, and they use bread or pasta or some other starchy base, my mind instantly tries to think of some way to make the recipe without all the starchy fillers. I don't even see the bread or pasta.

---

RE: Zero Carb / Meat and Water - nyteez - 08-05-2008 12:46 PM

I did mean that it tastes like coconut frosting, just not as sweet. I do not like sugar, so the coconut flavor all by itself tastes really good to me. It was the consistency that bothered me at first not the taste, but
when I related it to the consistency of frosting it was easier to eat off the spoon. That frosting in the plastic jars tastes toxic to me, waaay to sweet. I get my coconut oil from Puritans Pride. They have 2 for one and 3 for one sales on it all the time. I could not cook a steak with it because the steak would taste like coconut! It is great in breads, but I don't make bread anymore.

Huh. I remember something (not by Charles, I don't think) about green olives or pickles getting rid of the sugar cravings.

The worst of it has passed, without me eating those evil things. I am sure it was a salt craving. The other thing I miss is crunch. Crunch and salt. *sigh*

But I feel too awesome right now to mess that up!!!

Sorry I keep butting in here. LOL Anyhow, you want to look for unrefined, extra virgin CO. Does yours taste coconut-y at all? FWIW, I ordered mine off of Amazon, two 16 oz jars, of Source Naturals, for a great price (and free shipping, no sales tax). I am not yet to the "eat it off the spoon" but I certainly don't dislike the taste. I'd better not -- I'm using it for a cleanser/moisturizer now! 😜

That's funny, I do the same thing (the cooking shows, that is). I keep muttering about them ruining it with the starch/sugar/etc. LOL

RE: Zero Carb / Meat and Water - Daryl - 08-05-2008 12:55 PM

Charles Wrote:
Just think how long the Inuit and Masai might have lived with the correct diet and modern medicine?

Exactly!
My experiment with arachidonic acid and itching seems to be showing that the AA is not a problem; sooo, the likelihood (spelling??) of attempting a meat diet may be in the cards for me. I've been on a very low carb diet since late 2006 anyway, staying under 25 carbs a day 99% of the time, to control my weight and diabetes, so taking the plunge shouldn't be too tough. Here is my sample menu:

MON
B- tuna salad
L- 2 hardboiled eggs and bacon
D- ribeye

TUES
B- pork chop
L- 2 HB eggs and bacon
D- chicken quarters

WED
B- salmon
L- 2 hb eggs and bacon
D- ribeye

THUR
B- tuna salad
L- eat out
D- chicken quarters

FRI
B- burger
L- 2 hb eggs and bacon
D- ribeye

SAT
B- salmon
L- 2 hb eggs and bacon
D- burger

SUN
B- burger
L- chicken or Golden Corral
D- cod and filet mignon

I already pretty much have my hunger under wraps; indeed, I rarely GET hungry. I'm at weight (153, down from 260), and the blood sugar is normal (stays in the 80s and low 90s, down from a fasting 339 in '06), so I'm doing this to see if it makes me feel better.
Charles Wrote:
Could be, but I think it has more to do with the body's changeover from not having to deal with glucose and the well-known adaptation period that all must go through. Dr. Stephen Phinney's studies on cyclists also bear this out and show that it doesn't matter who you are or what type of condition you're in, this adaptation period will happen and it's anywhere from two weeks to two months. I don't take any supplements whatsoever. I endured the first two weeks and woke up one day and felt as good as I ever felt.

Charles, you've been the topic of a few conversations on our Raw Paleo Diet Forum. I could have sworn that you said you took supplements on the old forum. I was quickly corrected. I see you don't now. Was that a false memory? If not, how long have you been without supplements? Eating cooked meat and fat, without organs seems to me that it'd be very difficult to get everything you need.

Thanks,
Craig

My Raw Paleo Diet Testimonial

RE: Zero Carb / Meat and Water - FormerDonutJunkie - 08-05-2008 12:59 PM

I don't see Stefasson and Anderson making a hard fast conclusion in regard to a higher metabolism being 'the' direct result of a somewhat shorter life expectancy. These were very intelligent anthropologists who realized the literally hundreds of variables which can directly effect life expectancy. The fact that heart disease and other related diseases were practically non-existent in these Eskimos speaks volumes about the positive effects of their all meat diet.

One thing is for certain. Study after study has proven that the low-fat regime is not the answer, even though the low-fatties refuse to admit failure. It's their hypothesis, their money stream, their power trip and they are not about to give it up. Neither has vegetarianism proven to be the answer to health, weight loss or maintenance. So, what's a fat boy to do? I'll take my chances with Stefasson and Anderson's experiences and make fatty meats the staple of my diet.

I think I'll go find me some 73/27 for dinner! 73/27...it's not just for breakfast anymore! 😇

RE: Zero Carb / Meat and Water - Charles - 08-05-2008 01:13 PM

Craig Wrote:
Charles, you've been the topic of a few conversations on our Raw Paleo Diet Forum.

That's scary! I'd check it out, but I just can't find the time. For now, I'm just stuck on this forum! 😞

Craig Wrote:

I stopped taking my multivitamin last summer at some point; but before zero-carb. It was probably when
I read GCBC the first time. There was enough there to demonstrate that they weren't needed but it was probably even before that.

Craig Wrote:
Eating cooked meat and fat, without organs seems to me that it'd be very difficult to get everything you need.

We've discussed this at length over here. The whole idea of "everything you need" is quite subjective and no one has proven that any supplementation is needed once you remove the dietary ingredients that cause you to lose nutrients.

As we learned in GCBC, deficiency diseases come as a result of carbohydrate-rich diets, not meat diets. Although it's difficult to determine the source of calcium and other nutrients in the Inuit diet, analyzations of bones consistently showed no deficiencies whatsoever as we've seen in Stefansson's books, specifically, *Not by Bread Alone*. This indicates that there is much more going on with our bodies then we currently understand.

Some Inuit ate caribou and gnawed bones (although none ate them all year and some went years between eating caribou), but some Inuit never ate caribou and only ate seal and whale meat. They each had perfect teeth and no deficiency diseases. That's enough for me!

Regards, and Welcome back to our forum!

Charles

suzanneyea Wrote:
Also, one difference between Charles and I, I love eating and still really enjoy my food, while Charles sees food more as fuel. I love food and eating. Now, there are times I have to pack a meal and sort of eat on the go and then, yes, my food is simply fuel and usually not that yummy.

Okay, I'm not a robot....😔 but I can't say I enjoy food in the sense that I watch them cook prime rib on television or savor every morsel and remember it from day to day. I do enjoy unseasoned ribs that fall off the bone, and the unique texture of skirt steaks, the tenderness of a porterhouse, the exquisite fat of a prime rib, the variety of a Brazillian steakhouse...see, I get it.

However, I don't associate food with occasions. For example, it doesn't disappoint me one bit if I come to visit your house and you don't have my favorite kind of meat on your table. I'll eat what you have or I won't. However, the point will be that I'm visiting you and enjoying your company and the food won't matter at all to the quality of the visit.

I had dinner with Jimmy and Christine Moore in Asheville, North Carolina a couple of months ago. I don't remember what I ordered, I'm sure it was a steak, but I remember the company and the conversation. The food was irrelevant.

See what I mean?
The food was irrelevant.

See, no matter how good the company, I have never felt that way, lol. I went out to dinner with some girlfriends the other night and all I had to report to my dh when I got home was about how much I hated my meal. I honestly had a hard time enjoying the company cause I was so upset about my dinner.

**RE: Zero Carb / Meat and Water** - caroline - 08-05-2008 02:10 PM

Suzanne,

I eat the coconut oil because I find it very helpful. there is nothing about it that makes me want to gag. I eat tons of fatty meat, eggs, butter, but I find that additionally eating coconut oil makes me feel better. It's not for entertainment, it's an extra boost for me.

for example, I have already had probably 3 big tablespoons of coconut oil in addition to meat eggs and butter. I notice that the more I eat, the better I seem to feel. It's easier to eat sometimes melted in water and I kind of like it now that I don't drink coffee.

FYI I notice that I am stronger with the added fat.

That's too bad. Even when we go on the cruise, I'm looking forward to meeting you all and giving many of you a hug because I've been struggling with you every day so much I feel like we're close friends. I've heard they have good meat on cruise ships, but even if they don't I'm going to have a terrific time because you folks will be there!

I'll be more excited about the speakers and the entertainment. Will there be good music? Is there good shopping in Cozumel or what will the views be like looking out at the ocean. Will there be a memorable sunset or will Jimmy dance on a table during his karaoke act. These things are what I associate with a cruise. The low-carb lifestyle, not necessarily the food.

**RE: Zero Carb / Meat and Water** - caroline - 08-05-2008 02:12 PM

fyi: the taste of coconut oil is completely dependent on the one you buy. there are ones that are smooth and almost sweet, ones that taste soapy, ones that are lumpy, etc. It's no different than wine, or cheese, or etc. One coconut oil is not the same as all the rest.

**RE: Zero Carb / Meat and Water** - suzanneyea - 08-05-2008 02:15 PM

I agree with you there Charles. I am looking forward to the people first and for most on the cruise. I can say food is the bottom of my list of things I cannot wait to do on the cruise.
Craig Wrote:
Thanks Charles for the quick response! I wish I had time to frequent this and other forums like I used to. Don't worry. Nothing bad is being said about you. Quite the contrary.
I'll relate this info if that's okay with you.
Craig
That's fine, Craig!

Poo123 Wrote:
The coconut oil I bought is fine on texture it has a light nice smell but there is really no flavor. I did get virgin and it is not refined but I will be on Amazon tonight buying another type, a few people have suggested puritians pride so I might give it a shot. I do believe I need to up my fats and this could do the trick. I don't mind using the one I have for my hair and skin. I think its a trial and error thing just like everything else. I have heard so many benfits of the oil that I would really like to give it a shot.....alison

Caroline Wrote:
If you dilute it in warm water, it doesn't matter one way or the other about the taste. I have a giant bucket that I bought b/c it was on sale and it tastes like soap. But when I dilute it in water (can be a small amount) you don't taste it. I eat it on the spoon if it comes from another brand that tastes better. Point being, even if you pick one that's not so good, you can still salvage it by diluting in water.
Way to go on your weight loss, Poo!

caroline Wrote:
  fyi: the taste of coconut oil is completely dependent on the one you buy. there are ones that are smooth and almost sweet, ones that taste soapy, ones that are lumpy, etc. It's no different than wine, or cheese, or etc. One coconut oil is not the same as all the rest.

my coconut oil is Nutiva Organic and I like it too. They are NOT all the same that is for a fact!
I am still bloated and my blood pressure is high I have normal pressure of 110/70 and lately it has been 140+/88+....does anyone have any ideas. I thought it was the antibiotics I was on so I took them for 2 days and went off them...I feel better than I did but my pressure is higher FOR ME and i have had a headache for 3-4 days consistenly.
I have been under 10 carbs I think for sure...I have cream in my coffee and have had a few nuts when I think the headache might go away. I am not a wuss...I had a metal rod through my arm a week ago and was moving boxes the nest day...however, I am frustrated because even on REGULAR Atkins, I never had these problems. I WILL say that my IBS seems to be 'cured' and I have had a TON of energy despite my headache which is consistent and right between and above my eyes. Any advice? Anyone go through this?
RE: Zero Carb / Meat and Water - caroline - 08-05-2008 03:23 PM

Hi Amy,

I do notice that too many nuts bloat me, and coffee also seems to bloat me. Now when I say bloat, it is not dramatic. My stomach is just flatter without. I'm not so good with all the blood pressure and other things. Wendyoh seems to have a lot of ideas about all these things. Maybe you can ask her.

Hope your arm is feeling better...

---

RE: Zero Carb / Meat and Water - Kristi31 - 08-05-2008 05:32 PM

So yesterday afternoon, I had a pretty bad headache and constantly felt thirsty. By late evening, the headache and thirst were gone but I had a little difficulty breathing (felt like anxiety) which only lasted about 30 mins. I was pretty tired last night and slept about 10-11 hours. Still tired a little today. I feel better now. I started having carb cravings yesterday evening and it got really bad today (along with very dry mouth). However, I wasn't hungry for fat or meat. Cravings are much diminished now. I ate at around 11am and did not get hungry until about 7pm. My evening meal was no more than 3 ounces of ground beef with a couple of thin slices of pork belly. My ketones are second to highest. I think my body is finally adapting to burning fat as the excess protein (or lack of fat) before was preventing my body from using fat (and ketones) as a main fuel. I'm on my way!!! Yea baby, Yea!!!, as Austin Powers would say. 😊

My skin is great (wow!) and much less hair is falling from my scalp when I run my fingers through my hair. Still no bloating. My brain is a little foggy but there are also moments when my focus is very sharp. No other news to report.

I am sticking with raw meat only and water. Nothing else, not even salt.

I've been re-reading Not By Bread Alone (thanks Charles!) but the later version and it's cool to read all the updates. I find I'm assimilating the information much more this time around. Interestingly, caribou tongue which was much liked by the Inuits and probably Indians as well is much fattier than beef tongue. I had bison tongue (raw) a few times and it was delish, don't know about it's fatty content though. Bison liver is yummy too! Oh, and I tasted caribou once, the backside plus the lower leg marrow which is all soft and creamy...out of this world. The taste of wild caribou is truly exquisite although wild hare is totally the opposite...yuk!

FormerDonutJunkie Wrote:
What amazes me is the satiety factor eating 73/27 ground beef. Steak has always been a staple with me but I just never realized the power of 73/27! Quite possibly the best value of low-carb.

Okay, I have looked high and low and I can't find any ground beef labelled this way. Maybe we don't do it like that in Ontario. All the ground beef (in grocery stores, anyway) is just labelled lean. So if I ask a butcher for ground beef, what should I ask for? Is this 27% fat?

poo123 Wrote:
Things are going quite well. And this is probably too much info but my undies are too big!!!!!!Yeah (Sorry for that last bit, but I am sure the girls know how cool that is!!)

My best moment on my weight loss journey was when my weight hadn't moved, at all, in about two months...but suddenly, all of my undies were too big! Congrats poo!

Loops Wrote:
Right now meat without dairy seems a bit bleak - maybe that will change with practice?

I can honestly say I relate to this, and that it does get better. I cave now and then, but it does get better. It's a lot like quitting smoking - for awhile, you feel like something is missing. Then one day, you don't.

Charles Wrote:
However, I don't associate food with occasions. For example, it doesn't disappoint me one bit if I come to visit your house and you don't have my favorite kind of meat on your table. I'll eat what you have or I won't. However, the point will be that I'm visiting you and enjoying your company and the food won't matter at all to the quality of the visit.

I had dinner with Jimmy and Christine Moore in Asheville, North Carolina a couple of months ago. I don't remember what I ordered, I'm sure it was a steak, but I remember the company and the conversation. The food was irrelevant.

I vehemently agree! I can't tell you how freeing it is to not obsess over food. It's there, I eat it, I savour it, I enjoy it, and I move on. Talk about freedom. I was afraid that I was losing my passion for food - but then I realized it was obsession, not passion. This from a gal who used to get so upset if her favorite dishes weren't being served at dim sum that she'd snap at her BF and get teary. Seriously.

Update: Today I experienced what can only be described as a...well, cleansing. Unexpected and interesting. Good thing I work from home. I've read other ppl who said that they had the same reaction when going vlc/meat & water, so I'm not worried about it. My system had some junk to clear out.

thank you very much..IT is getting there. They were supposed to take the stiches out today and said no, wait a few more days😢
THe bloat is really not in my belly, low low carb has eliminated that...it is more in my shins, feet, fingers and face..and i am bordering a pretty bad migraine for a while now. And my blood pressure has been high(for me) I feel it.

RE: Zero Carb / Meat and Water - aim in Fla*working - 08-05-2008 06:55 PM

I cannot find 73/27 ground beef either!
My blood work results:

Total Cholesterol: 217
LDL: 154
HDL: 51
Trigs: 58

This is the notes from the Dr....."Low Fat Diet, try weight loss, increase exercise, recheck lipids in one year.
ugh...lets see....NO to the low fat...yes to the weight loss-I am trying...yes to more exercise...and yes to the recheck.
Three agrees, and one Not a chance it H E double hockey sticks.

edited to add...I weighed in at 215 this AM...

Did he not notice your great trig/HDL ratio or those by themselves? All he looked at was your total cholesterol and recommended a low fat diet. At least he didn't recommend statins.
thank you very much..IT is getting there. They were supposed to take the stiches out today and said no, wait a few more days 😞

Me too - I drink carbonated mineral water. There's just something satisfying about the bubbles.

Funny aside: my mum used to live in Switzerland (German part), and ordering water at a restaurant got you uncarbonated mineral water. If you wanted carbonated, you had to order "water with gas"

This is true as well in South America. Agua mineral con gas or Agua mineral sin gas. With or without gas.

I also think the only reason I ever drink diet soda is for the bubbles. The more gas the better the seltzer:-)

RE: Zero Carb / Meat and Water - feckless - 08-06-2008 01:04 PM

I have just gotten a blood glucose meter from my doc. Is there a place in this forum or elsewhere that details what optimal readings would be when following this type of diet?
Also, I was shocked when she told me to take an iron supplement because my iron was low on my labs. WHAT?! i eat red meat at least twice a day! I am not going to go on an iron supplement because the reading was just a couple points below normal, but i thought that was very strange.

Good for you. I wouldn't take any iron supplement, of all things. Our bodies typically lower our serum iron when it is fighting off something or if there is too much of another nutrient. Either way, our bodies regulate iron and if it needs more, it will get it from the meat you eat.

Regards,
Charles

aha, i have had the flu for two weeks! so maybe that explains the low iron! i am monitoring blood sugar because of my severe hypoglycemia symptoms. no matter what results i get, i do not plan to take any treatment the doc advises and to stick with zero carb, but i thought the data would be interesting as far as seeing what is going on with my fasting and post meal blood sugar levels. i would like to know how to interpret them though. so i will search for MAC posts. and i will post any interesting results...

at almost three weeks ZC now my hypoglycemia symptoms are much better, except after caffeine when they go CRAZY. i know it's bad, but the lethargy is really intense and at some point i just need to do something so i can get my work done! i keep waiting for that energy to hit! i've lost 6 pounds. (i'm 5'6"/128)

thanks charles....

RE: Zero Carb / Meat and Water - travis t - 08-06-2008 01:55 PM
I feel so much better today than yesterday's little stumble (mt dew).
Sometimes i just don't get it as to why when things are going so well that i will sink myself. It's almost like i shouldn't be feeling this good so i will mess it up on purpose. I don't know if this makes any sense to anyone else but thats how i feel sometimes.

I'm going to try and stick with the foods that make me happy and those are my beloved coffee and the wonderfull butter that i put on my burger patties.

If you 'do' sweetener (which you do, since you drink diet pop) a shot of flavoured DaVinci syrup is nice in mineral water - fruit, cola or root beer. Or a bit of lemon/lime juice and some liquid stevia (or just lemon/lime).

I think the only difference between mineral and seltzer water is that seltzer doesn't contain minerals (minerals have been removed for a neutral flavour)?

People ask me all time, how do I stick to a zero-carb diet? You just explained it better than I ever could. I got tired of "sinking myself" and then having to pick up the pieces the next day and get back to work. Unfortunately, it's going to take several "sinkings" before it's over. They are all part of the plan.

One day, you'll decide that it's not worth it and you'll resist the urge to sink yourself. That will be the turning point and it's much smoother after that. It also helps when you get to your body's preferred weight and you get your six pack. You won't want to lose that, baby!!! 😊

Keep your head up!

Regards,

Charles

**RE: Zero Carb / Meat and Water** - [jeepifer](mailto:jeepifer) - 08-06-2008 02:41 PM

Sinking? I'm drowning here. *sigh*
I see my carb and sugar addiction like an alcoholic, I really cannot touch the stuff, super dangerous for my mental and physical health. It is that serious to me.

Dr. Atkins in DANDR Wrote:
"The 'just this one taste' rationalization is indeed the 'kiss of death' to the success of this journey to healthy living!"

This holds true for me every single time! I cannot do carbs in moderation, it's that simple! This is one of my favorite LC quotes and I have it plastered across the front of my fridge. The 'one' taste always leads to unending tastes for me.

feckless Wrote:

Quote:
These are the targets that will give you an A1c in the 5% range no matter how high your A1c is now. If you don't believe me, check out THIS PAGE of reports from people who have used these targets to dramatically lower their A1cs.

One hour after eating: under 140 mg/dl (7.8 mmol/l)

Two hours after eating: under 120 mg/dl (6.7 mmol/l)

If you can do better than this, go for it. Normal people rarely go over 120 mg/dl ever and are usually under 100 mg/dl at 2 hours after eating.

Hope that helps.

dey all -

today I've done pretty well with eating no cheese! This is the first day where I haven't been hankering
after it all day. I am still eating pork ribs, and tonight to celebrate my no cheese week (although I snuck in an oz yesterday) we are going out to eat at 'Tololo Beef' - which is a meat restaurant, where I will order, guess what...probably more pork ribs. If they don't have those, it'll be some kind of steak. They do a mean garlic mayonnaise, and I might indulge in that if they don't have butter. I did eat some deep fried broccoli today (tallow) - but it didn't set off my appetite or anything. I also had a bit of cream in some coffee - but hey, right now I'm just happy to be off the cheese. One addiction at a time!

Anyway I feel much better off cheese. That was actually the reason I wanted to quit it - it seemed to mess with my moods. I'm pretty convinced this is to do with the calcium content - but that is for another thread (dairy and calcium overload).

---

RE: Zero Carb / Meat and Water - waywardsister - 08-06-2008 06:31 PM

Yay Loops!!!!

---

RE: Zero Carb / Meat and Water - Loops - 08-07-2008 05:26 AM

hey I have a question though -

last night I was having some pretty scary appetite suppression. I mean - I was aware I needed to eat, but when we went out I could hardly eat any of my steak. It was very upsetting. Despite eating the broccoli at lunch (which was soaked in tallow) I just completely lost my appetite come the time we went out. In the end I came home and had some tea with cream and a few nuts because I had this gaping hole inside me but just couldn't bring myself to eat meat - not even pork ribs!

How does one get past this? Anyone have this? I'm aware it is symptoms of ketosis - but I've been on a very low carb diet for a long time and rarely got to this point - I did have it a little while into a diet that was high fat/low-mod carbs before but it went. I also had this when I was travelling and reduced to eating a big tub of pecans over a 24 hour period. I also did my tennis training yesterday morning - and since then had no appetite.

Thanks

Loops

RE: Zero Carb / Meat and Water - Loops - 08-07-2008 05:28 AM

Oh -

another thing I noticed since coming off cheese - and this is kind of gross so close your ears if you don't want to know! - Stools have firmed up something crazy. Isn't that weird? Most people get constipated from cheese but it seems to have the opposite effect for me. That's ok though. And I still take my magnesium so I wasn't expecting that one. Or maybe it was the broccoli.

---

RE: Zero Carb / Meat and Water - Kristi31 - 08-07-2008 05:36 AM

Loops,
Before reaching the "promised land", one must suffer a little. By that I mean, endure ketosis (like appetite suppression) until your body finally adapts to ketones. During that timeframe, you should stick to animal protein and fat, keeping fat intake high, between 75-85%, preferably over 80%. Eating nuts will prolong ketosis and the hardship. If you don't want to wait that long or prefer having a few carbs, then increase carbs and reduce fat a little, keeping protein at around 15-25%. Personally, I don't think there is no other way to go about it.

I get this on and off. Some days I'm hungry and want to eat, some days I'm not that hungry, or I start eating and realize I don't want to. If this is unusual for you, it might be cheese-related? Meaning that now you're without cheese (how dramatic - "I am without cheese") your system isn't irritated and is settling in?

Loops Wrote:

Congrats on the poundage! Yeah if you do have an addiction you might just be transferring it - is it the sweetener thing, or caffeine? I just bought diet pop too 😁but I like it now and then. Maybe go for the lemon/lime option first before you dive into the DaVinci?

Update: 113 this morning! Most of that is water (about 4lbs), but I know from experience that at least 1lb was actual fat. My usual 'hang' weight is 116, sometimes 114. Got a huge thing of ground beef from Costco and cooked some up with eggs, in bacon fat and butter, for brekkie (bc I felt hungry this morning). Yum. Made burgers last night too, and could only eat one. It's only 15% fat, but adding bacon fat really improves the situation!

RE: Zero Carb / Meat and Water - Loops - 08-07-2008 08:11 AM

Hi waywardsis -

thanks for the encouragement. This morning I had a lot of cream in some tea and BAM - brain fog extraordinaire! I don't get this reaction with butter thank goodness. Anyway that kind of nails it for me. No more!

I have more pork ribs waiting for me in the oven so all should go smoothly today. Congratulations on all your weightlosses. I seemed to have gained after my beef binge (excess protein?) but then lost a little - still nothing really and still at my all time high, but then I am cheating every now and again with nuts etc.

It's kind of hard to ignore the little voice in the back of my mind which says...well remember x and x, they did zero carb and gained (as I did, but I did eat a lot of cheese). Self experimentation is the only way. All I know is I felt quite good after eating more meat, although quite tired. I also have that little
voice which says - but don't you remember a year ago you were 5 kilos lighter and eating vegetables, cheese, cream etc. That's one thing I can't work out, and it IS a big doubt in my mind. Also when I hear about people starting to lose weight again once they INCREASED their carbs. What's with that?

Any ideas?

Cheers - just trying to reconcile stuff in my mind - once more I am not trying to dis this way at all.

Loops

RE: Zero Carb / Meat and Water - nyteez - 08-07-2008 08:15 AM

Well, it has been one week since eating just meat & fat. I have lost 5lbs! Finally broke thru 168 and am down to 167.

Loops: My appetite gets less & less every day. I think it is a good thing, as long as I feel good. I noticed about a month ago (before I cut out eggs & cheese and the occasional salad), that if I ate any vegetable even a small amount I felt very full and completely lost my appetite. I thought that was so weird, because I don't ever remember getting full on a vegetable. So it might have been that piece of broccoli you ate that made you lose your appetite.

I have dilemma today. I have a wedding to go to on aug 31st. I am inbetween a size 10 & 12 right now. Do I order the size 10 dress or the 12? I just know if I order the 12 I'll lose 10 more lbs and it will be too big and if I order the 10 I won't lose anything and it will be too tight. LOL! Well, I decided I am going to challenge myself and order the 10. That gives me 3 weeks, I'm just gonna do it! I have confidence ZC is going to work for me!

Loops Wrote:

another thing I noticed since coming off cheese - and this is kind of gross so close your ears if you don't want to know! - Stools have firmed up something crazy. Isn't that weird? Most people get constipated from cheese but it seems to have the opposite effect for me. That's ok though. And I still take my magnesium so I wasn't expecting that one. Or maybe it was the broccoli.

Definitely the broccoli. On my low-fat diet, it used to lock me up all the time to the astonishment of my doctor.

I'm glad you mentioned this. This is something that all zero-carbers should consider. When you are on zero-carb for a good while, your body stops producing the enzymes to deal with carbohydrates. Therefore, when you "cheat" you will actually store all those carbohydrates in your fat tissue longer until your body reproduces the necessary enzymes. Stefansson and Dr. Eades wrote about this. I find this for
myself as well. I am extremely sensitive to carbohydrates and if I eat just a little, I will gain 4 quick pounds and it will take about two or three weeks to finally lose them. This is why I don't cheat.

Dana Wrote:

RE: Zero Carb / Meat and Water - Loops - 08-07-2008 08:44 AM

Yeah get the 10 - I'm sure you'll fit into it!

---

RE: Zero Carb / Meat and Water - Loops - 08-07-2008 08:45 AM

Ok then - today is all meat. Fingers crossed I make it! It's so interesting that I can go zero carb with cheese (1g/100g) with ease, but just meat is proving a real challenge for me. Still - better a challenge than the ol brain fog.

---

RE: Zero Carb / Meat and Water - Kristi31 - 08-07-2008 09:05 AM

Loops,

be sure to eat lots of fat and not too much protein. Although this may be challenging, it gets better every day.

As to why some people lose weight when increasing carbs, I suspect it is because they were in a state where there wasn't enough glucose such that cell activity would slow down and where there wasn't enough fat such that they weren't ketone-adapted and cells could not use ketones for energy. The slowing down of cell activity would explain why some people stall or even gain weight...the solution: increase fat and decrease protein. As soon as carbs are increased, cells are provided more glucose, become more active and weight is lost. That would explain why increasing carbs somewhat helps some. However, too much of an increase, say above 50-70 grams could eventually make one gain weight.

I certainly don't buy this part. In fact, the guy that MAC quoted, who tried this only gained weight.

Just eat fat and protein and you'll be fine. No need to measure!
Charles,

TheBear, Stefansson and Hanson (Amazon guy who tried 3 types of pemmican) have consistently said that a diet composed of at least 75% fat calories (usually 80%) was either the norm or the best ratio for feeling good. Many of the meats we eat end up being much less than that today because of the low-fat dogma, compared to 50 yrs ago or even 100 yrs ago.

From personal experience, I can tell you I'm doing much better eating regular ground beef with extra pork belly than eating JUST prime rib, chuck or even shortribs. Perhaps, in your area, the meats are very fatty but not where I live.

In the end, what I'm saying is not to LIMIT protein but to eat at least 75% fat, the rest will take care of itself. That's all. Works for me!

Hiya -

the last time I was close to zero carbs, I did try to reduce protein and increase my fat intake (at the time through tallow and cream) - I did have a lot more energy and the scale edged down a bit - then bounced right back up again! However, I found it very difficult to restrict protein, although too much protein without enough fat left me feeling dire. So I agree with Kristi - I think it is of paramount importance to get enough fat, with or without carbs from vegetables etc.

Charles,

are there enzymes one can take that will boost the bodies ability to deal with carbs?

Kristi31 Wrote:

I don't dispute the basics of what they're saying I just don't think it's necessary to work out the ratios like this as it's very difficult to do. The meat we're talking about is actually more fatty than what we give it credit. For instance, Stefansson described it this way:

Quote:
We averaged about a pound and a third of lean per day and half a pound of fat (this is about like eating a two pound broiled sirloin with the fat such a steak usually has on it). That seems like eating mostly lean; but grow technical and you find, in energy units,
that we were really getting three-quarters of our calories from the fat.  
**That is what the scientists meant when they said at the end of our diet had proved to be not so very high in protein**

They weren't putting butter and mayo all over their beef either. No one has to sit around artificially trying to increase their fat intake.

If you looked up sirloin with the fat on fitday you would come back and tell me that it wasn't very fatty. However, we see from Stefansson's explanation that he considered it fatty protein. The best way is just to eat fatty protein as we've discussed and just watch your energy levels. It's not hard to tell.

This whole notion of ratios and percentages is just a level of sophistication that unnecessarily complicates things. None of these populations we've discussed spend too much time worrying about the ratio. They see a fatty piece and they eat it until they're tired of eating. No calculations, no nonsense.

Believe the Bear said eat the fat first and then the lean. If your still hungry eat some more lean. Have to go find this quote sometime.

**RE: Zero Carb / Meat and Water - Nicola - 08-07-2008 11:08 AM**

From the rawpaleo yahoo group:

A while back, I was fortunate enough to be pointed to more detailed info re Stefansson's all-meat Bellevue Experiment. Here are some pertinent excerpts from the link below:-

http://www.jbc.org/cgi/reprint/87/3/651

"The meat was usually cooked lightly and the bone-marrow eaten raw. Raw, frozen meat was requested as a variation but no method of freezing it was available."

also:

"The meat used included beef, lamb, veal, pork and chicken. The parts used were muscle, liver, kidney, brain, bone-marrow, bacon and fat."

So, given that Stefansson's diet was only short-term(1 sole year) and included a variety of organ-meats, plus even some raw animal food in the form of raw marrow, and given that his diet was generally lightly-cooked( ie boiled rather than fried) it is incorrect for zero-carbers to cite Stefansson's Bellevue Experiment, and subsequently claim that it's perfectly healthy for people to eat heavily-cooked muscle-meats and fat and nothing else, in the long-term
Loops Wrote:

These small variations don't tell us much of anything. Each time you give an example, there are carbs present. Cream has carbs. It says zero-carb on the label because that's for the serving size. If you drink more than the serving size, you will definitely get carbs.

Zero-carb is not something one can casually undertake while checking the scale every day. You would have to commit to this for a good six months of solid eating with no cheating to tell whether or not you can adapt to the way of eating or not. The Bear and Stefansson agree on this.

A very low-carb diet is close, but it's not zero-carb. If you have hyperinsulinemia, you may not be able to tolerate ANY carbs. It has nothing to do with others, it only has to do with what works for you and your body.

It's very natural to go up a few pounds and down a few pounds despite not changing anything in your diet. Weight is not regulated in your brain, only in your body. This is very important. You have to learn to trust your hunger first and foremost of you won't be successful on any diet.

If you're going to do it, then jump in with both feet and make it happen. If not, try Atkins Induction. It's a very solid plan and gives you some of the things you're missing. But just going zero-carb for a couple of months intermixed with some cheat days does not give a valid picture of zero-carb.

Too much fat brings nausea just as too much protein brings lethargy. There is a balance. However, for long term success, you don't have to walk around eating butter sticks and drinking coconut oil.

By the way, if you want a good coconut diet, eat whole coconuts and fish. The Tocolauans ate that for centuries and had excellent health.

Charles
When you eat the carbs, your body will make the enzymes, don't worry. I'm just saying that once you've gone zero-carb long enough, it will take you a little bit to process carbs.

Stefansson Wrote:
The first glucose "meal," when we were immediately off the meat, showed a poor sugar tolerance; but in a week or so we were back to where we had been before the meat year began.

I don't know how to make this process any easier.

RE: Zero Carb / Meat and Water - poo123 - 08-07-2008 11:29 AM

Well things are going well here. No cheating, and I am still losing in small amounts, but a loss is a loss... I think I am coming down with something that has been going around. I am eating plenty of fats and protein but I am really tired, and ache all over and some sore throat. We will see, but I have no desire for cheating. I really don't have any interest in food anymore. And that is really big for me since I was a chef and all. I do still cook for some clients but its getting harder and harder for me to do it. Well off to play with the kids, and get some homework done before school starts...alison

Fred Stare Wrote:
Stefansson has probably consumed more meat than any other person today. When I gave him dinner at the Harvard Club, Boston, it was roast beef with an extra serving of beef fat; at our home it was steak, with extra fat. Nothing else except Martinis and cheese. **Some of the fat is consumed first.** This sounds a little like the Du Pont-Hoiday-Pennington diet one read so much about a few years ago. In fact, that diet was the Stefansson regimen dressed up with a little "bedside manner" which is a half-hour morning walk and "absolutely no alcohol."

Stefansson Wrote:
Perhaps because lean meat had at the time a better press than fat meat, this was played up as a high protein diet; **and indeed it appeared high protein**, as we are aware from having spent a year, in 1928-1929, on its near equivalent, the Russell Sage diet, which served per day 28 to 30 ounces of lean, which, though they yielded only so per cent of our energy, still appeared to be a huge pile alongside the 8 or 9 ounces of the fat from the edges of our sirloins, which gave us 80 per cent of the calories. Actually, the main
energy sources of the Du Pont-Holiday diet are similar to what ours were at Bellevue, between lean and fat

RE: Zero Carb / Meat and Water - Kristi31 - 08-07-2008 11:39 AM

Charles,

Back in Stefansson's days, the meat was fattier such that the lean was fattier than it is today, more marbled with alot more fat on the outer part.

From The Land of The Fat, Stefansson write:
"Mrs. Seybold believes in varying meals a good deal, but allows her husband considerable fat meat. When she is away from home he has only two meals a day, noon and evening. At both he eats pork chops two inches thick, with at least three quarters of an inch of fat all the way around the outer edge of each. During one absence of his wife, every meal he ate for six weeks consisted of these chops." Much fattier than today, at least where I live.

I agree that counting unnecessarily complicates things and that one shouldn't have to measure things, similar to our ancestors and other more contemporary tribal people. Instead of stating percentages, I should have just said to increase fat if one experiences symptoms A and B, for example. I just observed that, in my case, upping the fat, which incidentally happens to represent about 80% of my calories, has helped me alot and I'm feeling alot better. Interestingly, others like Hanson, TheBear and Stefansson also cited that number, about 80%.

So, if anyone notices they don't feel quite up to par eating just meat, perhaps upping the fat could help solve the issue. That's all I'm saying in the end.

And based on my personal experience, the only fatty meat that does it for me is regular ground beef, no other cut. With a few slices of pork belly. I don't feel nauseous but quite satisfied after my meals such that I can eat once or twice daily without any problems.

FatGirlOnAtkins Wrote:
HEeeeyyyyy.... ya'll have given me an idea. I wonder if I could get off the diet soda if I tried mineral water... hmmm. *thinking aloud* I really just drink the soda for the bubbles, too. Thanks, you guys are awesome!

If you 'do' sweetener (which you do, since you drink diet pop) a shot of flavoured DaVinci syrup is nice in mineral water - fruit, cola or root beer. Or a bit of lemon/lime juice and some liquid stevia (or just lemon/lime).

I think the only difference between mineral and seltzer water is that seltzer doesn't contain minerals (minerals have been removed for a neutral flavour)?

that's a really good idea, waywardsister. I'm going to try that myself.
Stefansson wrote in his book the following:

"The second provision, that you must eat the whole beast, has, in my experience and observation, still less foundation than the first provision, if that be possible. Both Eskimos and northern forest Indians, and whites who live with them, have a clear mental picture of each animal they butcher, dividing the carcass then or later so that certain parts go uniformly to the dog team, the rest to the family. These divisions of the carcass vary from one species of animal to another but do not vary within the species, unless slightly by season.

The way in which Eskimos divide, for instance, a caribou between men and dogs has been described with some detail; here the fact is emphasized that the organ commonly spoken of as richest in vitamins, the liver, is nearly always given to the dogs—as are the sweetbreads and, indeed, all things from the body cavity except the heart and kidneys. The kidneys are usually given to children, somewhat as if they were candy. So far as I know the Eskimos of northern Alaska and northwestern Canada, and the forest Indians just to the south of them, the only condition under which they ate nearly or quite the whole caribou was in time of famine. Ceasing to give the dogs the parts which normally are theirs was that stage of a famine which immediately preceded the killing and eating of the dogs themselves.

So far as present knowledge goes, there is in ordinary red meat, or in ordinary fresh fish, without the eating of anything from the body cavity, enough Vitamin C, or whatever it is that prevents scurvy, to maintain optimum health indefinitely, with a cooking to the degree which we call medium. Certainly this is true if the meat is cooked in large chunks, as with both Eskimos and northern forest Indians, rather than in thin slices, which latter style of cooking may, for all I know, decrease the potency of the scurvy-preventing factor.

There is no intention to deny, of course, that cooking to medium will somewhat lessen the meat's antiscorbutic value. What is to be said is only that even with medium cooking there appears to be left over, in fresh red meat or fresh fish, an abundance if not a superabundance of all the vitamins and of all the other factors necessary for keeping a man in top form indefinitely."

From this I infer that, according to Stefansson and his experience, muscle-meat alone is enough, even if cooked somewhat. The Bear has also been living on almost exclusively muscle-meat for 47 years and supports the idea that muscle-meat alone is sufficient.

This to me makes sense because there would not be much organ to eat per person as one animal contains only one of each and there are many members in a group. Some would probably not have any organ at all for many days, if not, months. Some organs would also never be eaten by anyone, ever, like polar bear liver or caribou lungs. To rely on something that is more scarce as opposed to muscle-meat which is more abundant just doesn't make sense to me.

Loops Wrote:

hey all -

Thanks, you beat me to this. I was going to say the same thing. Another thing to consider is that there were some Inuit who never ate caribou and only ate fish. And those who did eat caribou, did not eat it every year. They may go a year or two without any of it and yet all of them were just as healthy as the next.

For every benefit some got from caribou (such as calcium), others apparently got the same benefit despite not eating the same things as evidenced by their bones.

**RE: Zero Carb / Meat and Water - Charles - 08-07-2008 12:14 PM**

The Fat of the Land Wrote:
There is no tendency to overeat of fat if you have fat every day (not necessarily at every meal); but there is danger of it after a shortage of fat. So far as memory serves and my records go, there is no corresponding tendency to overeat of lean to an injurious extent after one has been on an excessively fat regimen.

If the diet has been too lean, one is likely to overindulge in fat to a degree which causes vomiting within the next hour or two. This single gorging and its violent reaction apparently leave no bad effect; but a persistent overindulgence can produce discontents and difficulties that may last a day, or even several days. The best practice, in such case, would seem to be eating for two or three meals somewhat less than the appetite dictates, and of a meat that is chiefly or entirely lean. Another good way might be to go without a meal or two.

What this says to me is that it's tough to eat the same amount of fat each day. At some times, the fat will make you nauseous and you need to eat a little more lean. At other times, you'll eat lean meat and you'll have "fat-hunger" and want some more fat. At which time, you'll seek it out and likely crave some ground beef or pork belly.

This is why I say that just relying on ratios can be deceiving. It always depends on your own hunger and energy level. It's pretty obvious when you need more fat, and it's just as obvious when you need some more lean. They will just taste right to you and after you eat it, you'll think, "that hit the spot!"

Charles

Hi -

yes, most cheeses contain a large amount of calcium. This can be disputed - but I have read time and
time again that in order to absorb enough magnesium it's not a good idea to take in a lot of calcium. IMO magnesium is harder to get enough of from the diet. So I guess if you are relying from all your nutrients from meat, you don't really want to screw up the cal/mag (and also zinc) balance by eating loads of cheese. That's the way I see it anyway - could be wrong of course! In my experience this seems to be right.

RE: Zero Carb / Meat and Water - Loops - 08-07-2008 12:36 PM

Yeah I know Charles -

I'm getting there slowly.

RE: Zero Carb / Meat and Water - twilight - 08-07-2008 12:41 PM

Most of you have probably already seen this, but here's more z-c info: http://livinlavidalocarb.blogspot.com/2006/05/how-about-zero-carb-carniverous-diet.html

RE: Zero Carb / Meat and Water - nyteez - 08-07-2008 01:12 PM

I ordered the 10! Then went for a run. LOL! I have not been able to run for the past 2 months because I had fires burning all around me and it was too smoky to run. Now, I have to get back into running, if I wanna to fit into that dress. I normally run/walk/hike (I live in the mountains). I never had the endurance to run long distances. I was able to run longer today. That's weird, because I haven't really ran in 2 months.

All I know is this meat & fat diet makes me feel great!

I hate measuring & counting food! I add butter and or tallow to my meat because I feel better with more fat and I know I will get enough this way. When I feel myself getting full I know I have had enough fat. It is different each day, like Charles mentioned. My body don't need the same amount of fat each day. Every morning since last week I eat the same thing (about 1/3lb ground beef & homemade pork sausage w/ butter & tallow). Some days I get full faster and can't eat all of it.

Another thing about cheese, and I always thought this was my problem is the salt content. Cheese is high in salt. Just a thought.

RE: Zero Carb / Meat and Water - Charles - 08-07-2008 01:19 PM

Dana Wrote:

**RE: Zero Carb / Meat and Water** - suzanneyea - 08-07-2008 01:34 PM

I cannot fathom the thought of worrying about percentages and levels of fat and protein, even I do not have that much free time, and I have a lot, a lot of free time, lol. The meat in Quebec is pretty lean too and I eat a lot of steak and chicken. My protein level is high, my fat level various from 50 to 150 grams a day, but is usually around 70, my protein is always over 300. My thought when I buy meat is to buy meat that I enjoy eating and is the cheapest.

---

**RE: Zero Carb / Meat and Water** - Kristi31 - 08-07-2008 02:14 PM

Relying on fat-hunger just doesn't work for me, for some reason. When eating other "fatty" cuts of meat, I just don't feel good no matter how much I eat and never crave fat either. I need more fat but my body's signals aren't pointing me in that direction.

I upped my fat and what do you know?! I feel better, skin is smoother, etc...

I suspect that when I'm better adapted to fat, I will begin to feel those fat cravings if and when I don't consume enough. Right now, my body's signals are a bit fuzzy from eating all those carbs and junk all my life.

---

**RE: Zero Carb / Meat and Water** - Charles - 08-07-2008 02:30 PM

Thanks Charles! I only run for about 30 mins, then do weights for about 15mins. Do you think it is too much to do 5 days a week, or should I alternate running one day, weights the next?

I will definitely post a pic of me in the 10 dress! 😊

RE: Zero Carb / Meat and Water - C-Dunc - 08-07-2008 06:28 PM

Hello, all (and especially Charles Washington):

I've read this thread and Charles is indeed the prolific, and not at all superfluous or redundant, for there are some things that need to keep being said since the majority of the world does not get it.

I'm Chris Duncan (aka "C-Dunc") and I'm 32 years of age. I'm around 145 lbs and about 5'4." I sport a 4-pack and so I guess body fat percentage is around 12-14. I've read a lot about low-carb (30 gram ala Dipasquale's Anabolic Diet), moderate (Barry Sear's The Zone), Cyclic type low-carb ala Rob Faigin's Natural Hormonal Enhancement.

I did try the Anabolic Diet when I was around 20 years old. Back then, I started with a 14-day induction of mainly the fattiest cuts of meat (steak, ground beef), eggs, and cheese. I think it was around day 8 or 9 that I started to feel bad (i.e., lethargic, mentally foggy). But then one morning at 5 a.m. when my alarm went off, I quite literally jumped out of bed. I had new found energy and the brain fog (I guess the fog is due to the brain still transitioning from glucose to ketone usage) was gone, and in its place was some very cool mental clarity.

I ended up quitting the Anabolic Diet because I was getting some fat gain. I was starting to gain fat despite the virtually zero carb intake. After reading through this thread and Charles's responses, I suppose the fat gain could have been from the 2 day carb extravaganza (after the initial 14 and 2 it went to 5 and 2). It also could have been the enormous amounts of cheese that I ate during the 5 day low carb portion of the diet.

By the way, I am wondering what is the deal with the preoccupation with the scale/weight? Charles, let's say (hypothetically) that in order for you to eat to satiety and stave off hunger for 5-6 hours, you have to eat a little more. And then let's say that in the course of time, you find yourself at 170 lbs with more muscle and yet that six-pack of yours remains. So, you gained weight. Who cares, right? Another question I am curious to know the answer to, is that knowing your body, could you eat enough to get to 170-180 lbs on zero carb and still maintain the six-pack? For me personally, I don't care how much or little I weigh if there's no six-pack. And to further explicate, I know that health is the most important thing (as you've stated on this thread) regardless if one has a six-pack, but for some it's not cool to know that they are healthy (due to zero carbs), while they stare at that layer of fat covering their abs--is a layer of fat covering one's abs healthy?

Hopefully, I am not being too fragmented here.
Thanks in advance Charles,

Chris

**RE: Zero Carb / Meat and Water - C-Dunc - 08-07-2008 07:02 PM**

I'll just add here further, that I exercise with weights usually around 3-4 days a week (mostly 3 days). In the past couple of years, I've been cycling low carb with high--either 6 days of sausage patties and Monterey Jack cheese and one day of high carb, or one high carb meal on Wednesday night and a high carb day on Sunday; low carb days being the same, sausage and cheese. But with this thread fresh on my mind, I recall that these particular frozen sausage patties that I purchased at Walmart said that they contained 1 gram carb per patty, and in the ingredients was listed, "corn syrup solids." I remember eating a bunch of these patties with all the fat and YET I STILL was feeling extremely lethargic coupled with mental fogginess. I couldn't wait to get a little bit of carbs in order to lose the fogginess. But then, there were carbs in the patty, but not enough for the brain to function with glucose well...confusing. I guess my brain was not able to use ketones at all (not in ketosis) and not enough glucose from carbs. I'm guessing here, but it seems like some kind of "metabolic purgatory."

Anyways, I bought some ground beef today which is the highest of fat (i.e., not lean at all) and so I am ready to see what happens when I try more extreme form of what I have dabbled in the past. And that is, to use unadulterated meat (without corn syrup solids and other similar junk) and to completely 86 any carb cycling, post workout drinks (although most of the time I just ate meat and cheese post workout), and to even forego the use of cheese. Of course, the diet Coke will have to go--I only drank it to help with hunger because it wasn't time to eat yet.

-Chris

**RE: Zero Carb / Meat and Water - C-Dunc - 08-07-2008 07:40 PM**

Here is something that I found on the internet. A coach/bodybuilder (someone named "Thibideau") is being asked questions concerning energy, ketosis, etc. I was just thinking that there are many who would say, that while zero carb is good for fat loss (I don't care about weight loss), it is bad for gaining a significant amount of muscle mass. Anyways, I think that this is relevant to this meat and water thread. Obviously, from reading this thread, a 6 day zero carb meat and water/one day carbs would not work for those extremely carb sensitive individuals. I would love for Charles to comment on what "Thib" says, as I believe it will help benefit those of us who lift weights without carbs or will begin soon lifting weights without carbs.

Quote:

==Alright since your on your diet, you have one cheat meal a week, are you worried about not being in a ketogenic state after that meal, or does that meal not effect your ketones being use primarily as energy.

==

Thibideau (Thib): Okay, first of all it's not really a 'cheat meal'... as I will rarely eat crap. It's more of a higher carbs meal. It normally contains 100-150g of clean carbs.

YES it will take you out of a ketogenic state. But since it's only ONE meal (compared to two full days of high carbs for the Anabolic Diet and the Bodyopus diet) it is possible reach ketosis again within around 8-12 hours. I have my carbs meal as the last meal of a Sunday and train Monday morning. But Monday post-workout I'm normally back in ketosis.
With a traditional cyclical ketogenic diet like the AD and bodyopus it can take as long as 3 days to re-establish ketosis.

scheung wrote:
==At what point do you now when your in a ketogenic state. ==

Thib: You can use ketostic, but they are inaccurate as they only measure the ketones in your urine, i.e. those you don't use. If you use all the produced ketones for energy, you will not register as in a ketogenic state even if you are.

The only way to know, is that you are feeling psychologically good and have normal energy levels despite not consuming carbs.

matt_t2004 wrote:
== I was wondering why it is better to be in ketosis for fat loss. Is it that you use more fat for energy or is it that it is more muscle sparing while dieting. Also what materials helped shape your opinion on ketogenic dieting. I am wanting to learn more about it, and was just wondering what you would recommend? Thanks for the great forum. ==

Thib: You absolutely do not need to be in ketosis to burn a lot of fat. Any low-carbs diet will accomplish that.

The main difference is that once ketosis is established the diet is much easier to follow physiologically because the body, especially the brain, has less carbs cravings and less energetic up-and-downs.

Understand that the brain can only use ketones or glucose/carbs for fuel.

On a low-carbs diet where ketosis is not established there will be moments where the brain will lack glucose. When this happens it will try to fabricate new glucose (neoglucogenesis) via the breakdown of amino acids or by emptying the few glycogen stores you have left.

When this happens you will:

1. Run low on energy
2. Suffer from "brain fog", have a hard time focusing
3. You'll be irritable and basically feel bad.
4. You will crave carbs like crazy... the cravings are about as bad as a former smoker who has a nicotine craving.

When you are in a state of ketosis the brain has plenty of fuel to work with (ketones) so the above situation is much less likely to occur.

Now, some peoples WILL get carbs cravings even when in ketosis, but most of the time these cravings are psychological and not physiological.

Basically I follow 3 types of diets:
1. Ketogenic diet: to get into a ketogenic state most people will need to stay below 50g of carbs per day AND avoid consuming more than 20g of those carbs in one sitting. Some actually need to stay below 30g to enter ketosis while others can handle as much as 70-80g and stay in ketosis.

2. Low-carbs non-ketogenic diet: You do not have to be in a ketogenic state to burn fat optimally. You can be low-carbs without being in a ketogenic state and still burn fat as your primary fuel source.

HOWEVER if you are not in a ketogenic state AND are on a low-carbs diet, you WILL get more cravings for carbs because the brain can ONLY use carbs or ketones for fuel. If you are not in a ketogenic state, your brain can thus only use carbs for fuel and as soon as your blood sugar drops a bit you will get carbs cravings.

So a low-carbs/non-ketogenic diet is still effective for fat loss BUT it's harder psychologically and physiologically. However the benefit is that you can have a carbs spike post-workout which helps with recovery and muscle building. When using this type of diet I can go as high as 100-120g of carbs on workout days (50g being consumed post-workout and 20g during the workout) and I stay at around 50g on non-workout days.

3. "Zone type diet" where I consumed around 40% of my calories from protein, 30% for fat and 30% from carbs. This is my favorite form of muscle-building diet. When doing this type of diet I consume all three nutrients (in the mentioned ratio) at all meals, except for the post-workout meal which is protein + carbs only.

On this type of diet my nutrients intake is around:

- 0.25g of protein/pound at each meal
- 0.2g of carbs/pound at each meal (0.4g/pound in my post-workout shake)
- 0.12g of fat/pound at each meal (0g post-workout)

I modulate my caloric intake (depending on how fast I want to gain weight and how much fat gain I'm willing to accept) by adding or removing meals; the amount of nutrients per meal is pretty stable.

So during a lean gaining phase I may consume 5 meals + 1 post-workout meal which would come up to around:

1.5g of protein/pound (around 330g)
1.4g of carbs/pound (around 300g)
0.60g of fat/pound (around 130g)

If I want to put on size faster and am willing to accept gaining some fat I will go up to 8 meals per day which will give me:

2g of protein/pound (around 440g)
1.6g of carbs/pound (around 350g)
0.8g of fat/pound (around 175g)

My diet plan will be/is pretty repetitive. I do well on eating the same thing over and over, always have. I'm not a gourmet or food lover so I can tolerate bland food without a problem.

I will not do any cardio until my fat loss stalls. I don't have much to lose anyway since I currently stand
at 8% body fat. The president of the Quebec bodybuilding federation told me that in my condition I could be stage ready in 6 weeks. BUT I prefer to lean out a bit more slowly and stay lean for a longer period of time. I find that it tightens my skin more and gives me a better overall look.

However I will be careful about overdieting. Last time I dieted down for a competition I was 205lbs with striated glutes 6 weeks out of the show, but stepped on stage at 192 with much less definition because I lost too much muscle. This time, if I ever start to flatten out or lose strength I will add calories (mainly in the form of good fats) to my diet.

My "basic" diet plan will be as follow:

MEAL 1
3 whole omega 3 eggs,
1 scoop Grow! whey,
4 Flameout caps

MEAL 2 (post-workout)
2 scoops whey isolate,
10 caps Biotest BCAA's
20g glutamine
10-20g glycine
10g creatine

MEAL 3
200g turkey,
1 tablespoon fish oil

MEAL 4
2 scoops Low-Carb Metabolic Drive,
1 tablespoon natural peanut butter

MEAL 5
200g turkey,
1 tablespoon macademia nut oil

MEAL 6 (before bed)
3 whole omega 3 eggs*
1 scoop Low-Carb Metabolic Drive
1 tablespoon all natural peanut butter
* The eggs are mixed raw in the shake

RE: Zero Carb / Meat and Water - suzanneyea - 08-08-2008 02:55 AM

Hey C-Dunc,
Good to have you here. I use the scale at the gym to make sure my weight does not get too low, I am pretty much zero carb (coffee and cream in the am) and my weight can get pretty low without me being hungry or tired or even noticing really, so I jump on the scale at the gym to make sure I stay over 110. Also, are you in Quebec? I saw you refer to Quebec in your post and there are just not many other Quebecors on the boards. Welcome.
RE: Zero Carb / Meat and Water - abnormalslc - 08-08-2008 06:01 AM

Ladies and Gentlemen!...I am officially back at 212 this morning!

so I have lost 10 pounds since starting ZC....not even 3 weeks ago!

I cooked 2 ground sirloin patties this morning...and was stuffed after only 1!....so now I have lunch already made!
I don't think these have enough fat in them like the hamburger patties...so I cooked them in coconut oil!

Have a great day!

RE: Zero Carb / Meat and Water - deedum - 08-08-2008 08:33 AM

Quote:
I started Atkins induction 6 months ago and have gradually eliminated things from my diet. I think my body is just now getting used to ZC after 6 months.

I started Atkins almost 8 months ago and have gradually gone down to ZC and am just now feeling almost adapted! What an incredible lesson in patience.

I haven't been able to weigh myself (I use an industrial scale at the home of one of my private yoga students but they canceled Wednesday so I haven't weighed since the Wednesday before) but I have definitely lost weight in my abdomen since all my pants are fitting looser! This is the first time I have lost this weight since I've gained over a year ago!!!!

RE: Zero Carb / Meat and Water - waywardsister - 08-08-2008 09:17 AM

aim in Fla*working Wrote:
Charles,
are there enzymes one can take that will boost the bodies ability to deal with carbs?

I took digestive enzymes when I was healing from gluten damage, and they helped. Charles is right, your body will make them...but if you're going to be somewhere and you know you're going to eat, say, veggies and are worried about bloating, gas etc, they can help in a pinch. Not harmful AFAIK, but I wouldn't want to rely on them all the time.

Kristi31 Wrote:
Back in Stefansson's days, the meat was fattier such that the lean was fattier than it is today, more marbled with alot more fat on the outer part.

Ugh, I know. I can't find any ground beef not marked 'lean', and most grocery meats (and farmers market meats, etc) have very little to no fat on them. That's why I add fat. If I don't add, say, bacon fat to burger patties it's just dry and nasty.

Charles Wrote:
What this says to me is that it's tough to eat the same amount of fat each day. At some times, the fat will make you nauseous and you need to eat a little more lean. At other times, you'll eat lean meat and you'll have "fat-hunger" and want some more fat. At which time, you'll seek it out and likely crave some ground beef or pork belly.

This is why I say that just relying on ratios can be deceiving. It always depends on your own hunger and energy level. It's pretty obvious when you need more fat, and it's just as obvious when you need some more lean. They will just taste right to you and after you eat it, you'll think, "that hit the spot!"

That's been my experience too, Charles. This WOE (vlc) has really tuned me in to my body - I can finally speak it's language, you know?

Welcome C-Dunc!

**RE: Zero Carb / Meat and Water - feckless - 08-08-2008 11:13 AM**

i've been three weeks on my zero carb experiment. i am having very small amounts of cheese, sour cream and some eggs. so i guess i am probably more like under 5 carbs per day. my glucose monitor readings have been between 67 and 82, usually lingering in the low to mid seventies. i have measured pre meal, post meal, 1, 2, 3 hours later. after fasting for 9-12 hours overnight, etc.

the blood sugar seems to be staying in a pretty tight low range. i would like this range to come up as i feel better when it is in the 80s. i am hoping as my body adjusts to ZC, it will put out a bit less insulin and the level will rise. i have had to turn to lean meat a couple time when the blood sugar fell into the 60s and i was feeling really shakey and ravenous. lean meat brought it up into the 80s! my blood pressure is also low, that combo suggest adrenal insufficiency but don't know what to do about that.

i think the bear said his BS stayed around 100! does anybody else know what their average blood sugar is?

i am trying to stay 80% fat/20% protein, but i still feel nauseated, sometimes for a very long time, from a high fat meal.

Thank you for the welcome, and sorry about my blurred post. My final comments were these: "...lifting weights without carbs." That was the last sentence I wrote in the first paragraph. The remainder of the post I did not write, but was something I found (copy and paste) where various people were asking questions of a French bodybuilder/coach nicknamed "Thib." Quebec is where "Thib" is going to compete at in a bodybuilding show. I am originally from Utah, but I recently moved to Vermont 3 years ago. So, Vermont is where I live presently.

Last time I did an average, it was 87, I think.

RE: Zero Carb / Meat and Water - C-Dunc - 08-08-2008 04:02 PM

suzanneyea Wrote:
I am totally confused by your question can you re-phrase it?

Sure. I had a hard time trying to articulate the question, and your confusion is the fruit of my effort. Here I try again:

If you are eating until satisfied and hunger is what dictates when you do or don't eat, then why are you concerned about dropping below 110? If you end up at a slightly fluctuating 103, so what? Would not this new 103 be what your body says it ought to be?

Hopefully this one's better,

-C-Dunc

RE: Zero Carb / Meat and Water - suzanneyea - 08-08-2008 04:29 PM

I am 5 5 and I look pretty skeletal at 110 already, if I went to 100 I would look way too thin. I actually like how I look at 120, but that just isn't going to happen

RE: Zero Carb / Meat and Water - C-Dunc - 08-08-2008 04:49 PM

suzanneyea Wrote:

Okay. So then, perhaps in order stay above 110, there are times when you may have to eat either slightly above satiety and/or eat a bit more frequently than what hunger dictates. But from what I've read of the very well read Charles Washington, this would not be necessary and you should just keep eating the way you have, and keeping your eye on the scale.

RE: Zero Carb / Meat and Water - suzanneyea - 08-09-2008 02:49 AM

I am going to just keep eating until satisfied and deal with the "you are too thin" comments. I am pretty used to them by now. It is a good lesson for me, cause all those years when I was heavier and would see a really skinny woman I would just assume she had an eating disorder cause no one could be that thin naturally, lol. I am sure most people who see me think the same thing.
RE: Zero Carb / Meat and Water - Bill - 08-09-2008 05:57 AM

I was reading about Owsley (Bear) Stanley he has eaten only meat for like 40 years, but has had a heart attack and has cancer in his asofigus (can't spell it). Just wondered if there was any one who now's about this guy. And wonder why he would develope clogged arteries on a all meat diet?

As far as his esophageal cancer, it was probably related to long term passive smoke inhalation from exposure at the concerts and elsewhere.

RE: Zero Carb / Meat and Water - C-Dunc - 08-09-2008 06:45 AM

C-Dunc Wrote:
Hello, all (and especially Charles Washington)...

By the way, I am wondering what is the deal with the preoccupation with the scale/weight? Charles, let's say (hypothetically) that in order for you to eat to satiety and stave off hunger for 5-6 hours, you have to eat a little more. And then let's say that in the course of time, you find yourself at 170 lbs with more muscle and yet that six-pack of yours remains. So, you gained weight. Who cares, right? Another question I am curious to know the answer to, is that knowing your body, could you eat enough to get to 170-180 lbs on zero carb and still maintain the six-pack? For me personally, I don't care how much or little I weigh if there's no six-pack. After reading through some other posts by people (and again, especially Charles), it looks like it is not so much a matter of the scale as it is a matter of fat loss, leanness, and health.

I also wanted to state that I DO believe zero carbs (i.e., meat and water; Inuit-style etc.) does indeed
look like the optimal type of diet for fat loss. I still wonder about the building of additional muscle apart from the powerful anabolic hormone insulin though. But I think it was researchers like Volek and Forsythe that say if you eat enough, you can gain additional muscle mass without having to "spike insulin" post workout.

Anyways, I've been lifting weights since I was around 16 years old and so I will keep doing that. I will also experiment with what are the optimal types of fatty meat to eat while following the "eat to appetite; eat when hungry, don't eat when not hungry" protocol. Last night, which was the first day of meat and water, I was not hungry but man did I feel bad. And so I did eat this time when not hungry and I felt a little better. I wonder if I feel bad like this--with the mental fogginess and all, and all around feeling terrible--should I just ignore it and wait till I am truly hungry? Some say that while going through this kind of zero carb induction phase, that sometimes it helps the transition when you eat more. The idea is to eat more even if not hungry in order to help yourself through some initial lethargy, mental fogginess, etc.

C-Dunc,
Be patient with that feeling-real-bad thing. It took me 3-4 weeks to adapt to an all meat diet. I am a
fitness instructor and before I adapted it was killing me to teach my 3 kickboxing classes/week. I had no energy for weight resistance training so I stopped that. Now my energy has returned so I started the weight training again but I am finding out that I have to train differently. Less often with less reps. Charles found the same thing, he trains less now, needs more recovery time but his race times keep improving.

RE: Zero Carb / Meat and Water - poo123 - 08-09-2008 09:36 AM

Well just checking in. I am feeling better so thankfully it was just a small cold. Not losing weight on the scale but my clothes fit much better and I still feel great. I am glad my husband is still doing low carb and my 6 year old son now wants to eat everything I eat so we are getting him more into low carb because he really hates veggies and fruit. My daughter still only want tuna with mayo on low carb pita and milk, she also hate fruits and veggies. So just breaking the milk and some cookies and crackers I think it will be good. They really love cheese, and the dreaded juice boxes. I found at walmart an apple juice cocktail made with splenda and they love it. So All in all I think this family is doing wonderful and on our way to much better health. alison

No. Read the link I posted. Also, you cannot take a study of 1 and draw conclusions. The Inuit ate an all meat diet and did not suffer from heart disease.

Exactly! I read a blog post somewhere in the recent past of a guy who'd been 'trying' low-carb for a few weeks and was whining because he couldn't eat all his favorite 'comfort foods' like mac/cheese, mashed potatoes, etc. He was sinking into the 'Deprivation Mindset' even though he had lost some weight. Then he goes on to tell about someone he knew who'd done low-carb for a few months and had a heart attack, thus blaming it on low-carb. Basically, the guy was looking for an excuse to quit.

Problem is these people are 'head-hunters', looking for a way to 'kill' low-carb. They don't [want to] consider the fact that the person lived 40 or 50 years gorging on 'carbage' and likely trying to eat 'low-fat' at the same time. They deny the heart attack has any relation to all those years of really bad nutritional habits, blocking arteries and sending insulin levels through the roof year after year. A few weeks or few months of any nutritional lifestyle, good or bad, is not going to totally wreck your body, but they refuse to realize that. Their goal is to get on the 'kill low-carb' bandwagon, right or wrong, without any real study or research and see low-carb dead.

I've been fortunate in my 55 years so far and have had no serious medical problems other than some mild hypertension which has been controlled by a single med daily. However, my BP continues to come down the longer I'm on low-carb. And my cholesterol and triglycerides amaze the doctor and everyone else, for a 5'-8" guy who once weighed in at 288 pounds. But, if I did have something go wrong, I would in no way attribute it to low-carb. I would instead attribute the health problems to all the pies, cakes, cookies, donuts, pastries and other sugary, carb-laden treats I could lay my formerly carb stained fingers
on! Low-carb is the ONLY successful long term nutritional lifestyle I've ever been able to follow with any measure of success.

Funny, nobody ever bothered to say anything negative to me about my diet [diet? yeah right] when I was eating tons of carb-age every day. But when I start eating low-carb, suddenly folks feel like they need to rescue me from myself with their comments about "eating all that meat and eggs, especially all that bacon!" I just chuckle and say, "I'm really a vegetarian...I only eat animals that eat vegetables!" 😄

Long Live Low-Carb!

<td>Yes. The guy could still have hyperinsulinemia in spite of low carbing. Bear pointed out a study done on dogs where they dripped insulin into one artery and not on the mirror image artery. Think it was the carotid arteries. In any case, the dog developed atherosclerosis in the one dripped with insulin and the other stayed clean. So yes, just because you low carb does not mean you have reduced your risk totally. In addition, inflammation is supposed to be an initiator of atherogenesis as well. Gum disease can raise inflammation levels. You cannot draw conclusions from a study of 1.</td>

<td>Thanks for the encouragement, Deanna. I recall that when I was doing the Anabolic Diet, I could do high rep (15-20) squats on the Monday after a two day carb-up, while by Friday I simply could not do high rep squats, and so I would just take a bit heavier weight that kept me in the 6-8 range. And so I guess that while there is much negative with high carb/high insulin, it is possible to work out hard at the higher reps.</td>

For competitive athletes, how do you feel about a long term low-carb approach?

Charles Poliquin: If you're talking about energy system sports like kayak or speed skating, then I'd say that low-carb diets don't do well for these because of the demands on their glycogen stores, but those athletes tend to be insulin sensitive anyway.

Though an extremely low-carb diet would probably not be the perfect way to go for Olympic quality athletes, it's interesting that the one study that was done with high performance athletes and a ketogenic diet (a very extreme form of low-carb diet) showed that their performance returned to "normal" (which for them was world class) within a month of being on the diet, showing that adaptation takes place.

To the same question Poliquin answered, now here is Miss Forsythe's take:

Quote:
What say you, Miss Forsythe?

Cassandra Forsythe: No matter what diet an athlete follows, they have to eat enough energy to prevent their performance from suffering. A long-term LCD approach doesn't stop you from being a competitive athlete.

Many sports nutritionists tell us that in order to be successful in sports, we have to top off muscle glycogen stores by eating loads of carb foods. However, when you limit carbs, you use intramuscular triglyceride and stored body fat for energy. Once this transition has occurred, athletic performance (even competitive athletic performance) is sustained.

We just need to educate our athletes about the foods they can easily eat when following a lower-carb diet so that energy imbalances are avoided. Some believe that if an athlete follows a strict VLCKD, they also need extra electrolyte support (because of increase sodium and potassium losses in the first weeks of the diet change) and should give careful attention to fatty acid composition (ensure enough omega 3's to reduce inflammation).

For athletes that can get away with eating slightly more carbs due to their high activity levels, they don't
need to be so careful, but should ensure that the carbs they eat don't reduce their ability to use fat as a fuel. They can eat some "smart carbs" like sweet potatoes, extra fruit, and oatmeal, but they must keep fat and protein high. It's not necessary for them to consume 65% of their calories from carbs because they get more energy from the increased protein and extra fats.

Overall, as long as they eat enough calories, any competitive athlete can perform just as well eating less calories from carbs and more calories from protein and fat as they would eating a high-carb diet.

RE: Zero Carb / Meat and Water - C-Dunc - 08-09-2008 09:39 PM

Perhaps the following interview could be placed in another thread, but since this thread is the biggest and most intriguing thread going here, I decided to post it here. I think that what Dr. Volek says here has obvious and necessary implications--and thus what he says is very relevant to this thread's subject--for those of us who are embarking on this carb-less path with nothing but H2O and fatty meats in our Igloo coolers. I don't necessarily agree with all that Volek says, but obviously much can be gleaned from him:

Quote:
The New Low-Carb Guru
An interview with Dr. Jeff Volek
by Greg McGlone

On diet, I can say low-carbing it while training for powerlifting was very easy and effective for keeping lean. I rarely performed over six reps and so even though my glycogen stores may have been reduced, that type of exercise isn't taxing on glycolysis and acid base stress, so I never felt this was a hindrance.

JV: Low-carb has been my major line of research for the last ten years. Low-carbohydrate diets have been very misunderstood by most people and professional organizations. My research has focused more on clinical implications than exercise, although we have begun a study examining interactions of diet and training.

We do have a big problem with obesity in the U.S. and so this has driven my interest in areas specifically related to management of obesity, metabolic syndrome, and heart disease. The fact of the matter is that current leadership under the ADA, AHA, etc. has failed to prevent and is currently unable to curtail the epidemic of obesity and diabetes.

Rather than explore all possibilities that might help, they're specifically trying to reduce the options for diabetic patients even though their own publications admit that reduced carbohydrate improves glycemic control. Rather than trying to find anything positive that could be used from the numerous publications on low-carbohydrate, they ignore almost all of them and have a blanket condemnation.

I could go on and on surrounding the mythologies of low-carbohydrate diets, but suffice it to say reducing carbohydrates is a very healthy approach and the preferred method to treat obesity and metabolic syndrome. Reducing carbohydrates is far better than any drug to treat diabetes; it's like taking a hammer to the problem whereas other lifestyle and pharmaceutical interventions have minimal impact.

Perhaps one of the most important discoveries is that carbohydrate restriction has an underlying mechanism — fat is relatively passive and insulin controls the disposition of fat. Given the intimate connection between carbohydrates and insulin, you can see the focus has been on the wrong nutrient.

You are not what you eat; you are what you do with what you eat. Eat fat with carbs you get fat, but eat
fat with low-carbs and you get lean — and insulin is the switch that controls the fate of fat.

GM: In terms of carb tolerance and insulin sensitivity, how do you feel about the subject of the leaner one gets, the more carbs he or she can start to add back into his diet without worrying about fat gaining/regaining?

JV: I think you're right on. The reason you should start thinking about reducing carbs in the first place is that you want to lose body fat or you have metabolic problems associated with insulin resistance. If you're already ripped and have a high degree of insulin sensitivity you'll be able to tolerate more carbs.

I'd emphasize that there's a lot of heterogeneity among people in terms of how they respond to carbohydrates. Each person probably needs to dial in to their ideal carb intake that works for them at any given time. The point is to start thinking about carbs more than dietary fat as opposed to the other way around.

Basic biochemistry and metabolism would predict that carbs have a dominate effect on metabolism due to the close connection with insulin. Building on this notion, our research points to the idea that dietary fat plays a relatively passive role, and detrimental effects of fat will generally be seen only in the presence of high carbohydrate which, via insulin, determines the metabolic fate of ingested fat.

Again, in the real world, some people will need to restrict carbs more than others to kick into fat burning mode, and others will be able to tolerate more carbs without observing adverse effects.

GM: Are there some guidelines in terms of current levels of body fat and how many carbs — percentage or just straight up grams — that you could give us?

JV: Be wary of anyone who claims to have a magic formula for prescribing the precise amount of carbs... or any other nutrient for than matter. There's far too much variability to make these types of absolute recommendations. This is the foundation of personalized nutrition and in the bigger picture personalized health (the antithesis of public health).

We have the technology to measure a person's entire genome in a single blood sample and use that information to predict how they respond to various dietary interventions. We've done this in our studies and have made progress in understanding the genetic factors that contribute to variable responses to low-carbohydrate diets in weight loss, fat loss, and other health markers.

For now, most people won't have access to genetic testing and so the best advice I can give is to become an experimentalist. There are many ways to restrict carbohydrate, and you have to experiment with different approaches and monitor the results — just like a scientist would do in the lab. In the end, it doesn't matter what the science or the experts say; you should do what works best for you.

Most guys do much better on low-carb. So I think a logical default approach is to take your current level of carbohydrate intake and reduce it. A minimum of 20-30 gram reduction would be a good place to start and see what happens. Give it at least a couple weeks and if you don't detect a positive effect then reduce the carbs another 20-30 grams.

Others may prefer to go cold turkey and remove most of the carbs from their diet. There are no hard rules here other than to do experiments, observe your results, and make appropriate decisions based on those observations. The only way you can fail is to keep doing the same thing and not give different approaches a try.
GM: Cool. What's on the horizon for you project-wise?

JV: Adam Campbell and I are nearly finished with a book that we've been working on for quite awhile called the TNT Diet. For this book, we asked the question: what innovative tactics can be utilized to optimally enhance body composition? More specifically, what sensible procedures can be utilized to simultaneously build muscle and lose fat?

It's a program based on scientific research that shows men how to use Targeted Nutrient Tactics (TNT) to trade their fat for muscle. The philosophy of the book is heavily based in science and basic physiology, which unfortunately hasn't been part of mainstream diet recommendations.

One basic concept of human survival is the ability to maintain homeostasis or balance. For example, when you're cold you begin to shiver to increase temperature back to normal. A more relevant example might be when you restrict calories, your metabolism decreases to maintain energy balance. You see, in this case, homeostasis can work against you if weight loss is your goal.

We take advantage of the body's homeostatic responses that occur as a result of eating diets varying in composition to stimulate metabolic pathways to enhance body composition. Rather than promote moderation like most nutritionists, we put an emphasis on extremes in nutrient composition that cause the body to adapt in a more robust manner to maintain homeostasis.

What often occurs is that the body overshoots, and if the diet is manipulated in a synchronized and coordinated manner, you can exploit this phenomena to your advantage to achieve simultaneous muscle gain and fat loss. What we show is how you can effectively partition nutrients, that is, divert the calories consumed away from storage in fat cells and redirect them toward muscle tissue where they'll be used in anabolic processes.

On the research end, my plate is always full, but I'm always hungry so we're pushing a lot of different lines of research. We have some controlled feeding studies planned in both animals and humans where we'll be investigating the role of fat quality in a low-carbohydrate diet and the impact on a wide array of metabolic and cardiovascular markers.

We're continuing to refine our knowledge on ways to optimize the effects of low-carbohydrate diets through the interaction of resistance training and other dietary supplements. We're also pursuing some work on novel whey peptides that affect vascular function and the underlying biological mechanisms and how they contribute to optimal adaptations to resistance training.

GM: Sounds exciting, Dr. Volek. Any final words?

JV: I know there are a lot of guys out there who want to trade fat for muscle and look, feel, and perform better. If you're frustrated with your current progress, I highly recommend giving a low-carbohydrate diet a try.

In our most recent study we've seen several guys lose more than 20 pounds of fat and gain as much as 12 pounds of muscle in a 12 week period. The combination of carb restriction and periodized resistance training is potent. Using these two approaches as a foundation, you can begin to experiment with all sorts of modified versions to find the approach most suitable for you.

The body has a tremendous capacity to adapt to its environment, so provide the right stimuli and I can assure you that you can improve your body and your health.

GM: Interesting stuff, Jeff. Thanks for the interview!
Well I am doing good. I finally got the coconut oil thing. It was suggested to put a tad of sweetner and that did the trick for me. I put in 2 tablespoons in warm water with a very, very little bit of splenda and drank it down. It was really good. I am happy. alison

Hi C-Dunc! Thanks for posting the info.

Here's some more interesting running/zero carb info for you:

"Fat instead of Carb even for sprinters?" from LowCarb Muscle Forum:  

"My Experience on a Zero Carb Diet" from a MMA Forum:  
http://www.sherdog.net/forums/f15/my-experience-zero-carb-diet-749233/

Hello Chris, and welcome to our forum!

By the way, I am wondering what is the deal with the preoccupation with the scale/weight? Charles, let's say (hypothetically) that in order for you to eat to satiety and stave off hunger for 5-6 hours, you have to eat a little more. And then let's say that in the course of time, you find yourself at 170 lbs with more muscle and yet that six-pack of yours remains. So, you gained weight. Who cares, right?

Yes, I generally agree with this. The thing is, sometimes there are things going on that we're unaware of. This is the perfect segue to what I wanted to share today. I am 154.4 today, which is my lowest weight since I got out of the Navy in April 1995. Because I used salt and seasonings, I ate quite a bit more than I should have. In short, I think I was engaged in an overfeeding experimient. Don't get me wrong, I'm not jumping on the calorie bandwagon. I'm re-enforcing the need to follow one's hunger.

There are many things that we eat which will confuse our hunger. Carbohydrates are one of those things and a very bad one, but cheese and things like that can be too. For instance, I can eat two Hardees' Monster Thickburgers if you put cheese on them. If you remove the cheese, I can't eat but one of them and will struggle to finish it today. Also, if you eat meat which is too lean, you can eat more of it than necessary.

If I only eat meat on my zero-carb diet, I can probably make my weight climb to 158 but not much higher. I will continue to have my six pack, but I may need to wear pants with a 29 or 30-inch waist. My main fat tissue is in my thighs. They are the first things to grow when I put on weight and I can immediately feel it in my pants. My waist will stay small.
So to answer your question, it really depends on where a person primarily stores fat. If you store it in your stomach, then your six pack might not remain if you overfeed and gain four pounds. I would think it would still pretty much be there, but it really depends.

Chris Wrote:
Another question I am curious to know the answer to, is that knowing your body, could you eat enough to get to 170-180 lbs on zero carb and still maintain the six-pack?

I don't think I could eating the foods I eat now. To do it, I would have to add salt and dairy. I don't think my six-pack would be there at 170 or 180 though, but then again, if I really worked my abs in the gym throughout the overfeeding, perhaps it would.

Regards,

Charles

C-Dunc Wrote:
I would love for Charles to comment on what "Thib" says, as I believe it will help benefit those of us who lift weights without carbs or will begin soon lifting weights without carbs.

Honestly, I don't have too much to comment on regard Thib. Cycling in and out of the ketoadaptation zone doesn't sound like fun at all. The real benefits of zero-carb don't manifest themselves for a food couple of months after reaching ketosis. I don't find much beneficial about merely "being in ketosis."

He is interested in muscle building, which does not interest me. I have very lean muscle and I'm not at all puffy. It seems that in order to get bigger and really sculpt a bodybuilder's physique, one would need to do as Thib and incorporate this sort of regimen. I can't comment on the healthiness of such an approach because I don't know of a population that does this nor have I studied the life span of bodybuilders who do this.

I think that one can be sufficiently muscular while eating a proper diet and with moderate weight training they can look pretty spectacular. However, for competitions and the like, perhaps they would need to cycle which I don't recommend.

By the same token, to run marathons and qualify for the Boston Marathon, it may take some amount of carbohydrates to do that well. I don't think that's healthy so therefore, I would not be interested in running the Boston Marathon. The end does not necessarily justify the means, in my opinion.

Regards,

Charles

feckless Wrote:
i think the bear said his BS stayed around 100! does anybody else know what their average blood sugar is?

Sorry, feckless, I don't measure my blood sugar. It sounds like you should add more lean. The more I read Stefansson the more I want to make my own pemmican and just eat it. Either way, the suggested ratio seems to be 2 pounds of lean to 1 pound of fat. I'm going to get some pork fat or some beef tallow to make sure I can always observe this ratio. Then, if you have leaner cuts, you can ensure there is plenty of fat.

I also add bacon to my ground beef and don't waste much of the fat.

Regards,
Charles
suzanneyea Wrote:
I am going to just keep eating until satisfied and deal with the "you are too thin" comments. I am pretty used to them by now. It is a good lesson for me, cause all those years when I was heavier and would see a really skinny woman I would just assume she had an eating disorder cause no one could be that thin naturally, lol. I am sure most people who see me think the same thing.

I get this as well. My older boss exclaimed, "no grown man should have a waist below 30 inches!"
That's how far we've come as a society. But keep in mind, it's mostly fat people making these judgments. The biggest problem we Americans have is wearing the wrong size of clothes. If I wear too big clothes, I look skinnier. I have to make sure I avoid clothes that don't show off the physique.

Women seem to do this more intuitively than men. We don't always appreciate the difference between "straight fit" or "relaxed fit" or a "fitted shirt" versus a non-fitted one. These clothes are more expensive, but they make a huge difference in how we look in our clothes.

I agree with this. Of course, everyone forgets that Mamo Wolde won the marathon in 1968 and he ate a zero-carb diet. The right diet won't automatically guarantee athletic success but that's when we have to be grownups and make intelligent decisions. Which is more important? Fleeting athletic prowess or long-term health? My money is on the health every time.

Again, in the real world, some people will need to restrict carbs more than others to kick into fat burning mode, and others will be able to tolerate more carbs without observing adverse effects.

This is part of the problem even in the low-carb community. Whether you're ripped and fit is a very poor marker for the metabolic disorder. We need to understand that this same disorder is responsible for ALL the diseases of civilization. Obesity is just one of many. Because of this, one should NEVER increase carbs regardless of the "ability to tolerate more" without affecting weight or fitness level.
This is serious business and doesn't get nearly enough attention as it should.

Your welcome. One other thing I found the other day while reading snippets of GCBC was LPL or lipoprotein lipase. Page 397-399 of GCBC. LPL activity increases with weight loss on a calorie restricted diet and decreases in muscle tissue. What this says to me cut your calories and your body fights to get those calories back. Taubes was talking about negative energy balance diets here.

Thank you Charles!
I had never been to that forum before, but found that on a search and thought it was interesting.

I can't wait until more of you get into Not by Bread Alone. The history lesson is so very profound. When I first began to read, I was angry that I didn't learn more about the Hudson's Bay Company in History. Then, it dawned on me. We didn't learn this because the Revolutionary War was going on at the same time. Well, now that we're all independant (with apologies to our British readers) we have got to learn about the Pemmican wars.

This was all new to me but my wife tells me that in those sultry Western novels she reads, there is always a damsel in distress who is rescued by an attractive Indian man with pemmican. Who knew? Anyway, they had a very clear understanding back then of what was good health and what was not, unlike us today. The discussions on scurvy are also fascinating. We've also heard how fruits and vegetables were the cure but according to Stefansson, that was not always the case at all. In fact, more often than not, that particular cure did not help the poor sailors and explorers on their expeditions.

Stefansson's main claim to fame was that he demonstrated how you could "winter" over in the Arctic on meat and not get scurvy. We always have people going on and on about the healthy fruits and vegetables but they don't seem to know that fresh meat ALWAYS cured scurvy. The poor sailors knew it but they
had the wrong cooking process in mind. They would kill animals and then boil the animals and have the sick drink the broth. The problem there was that the sick people didn't have good teeth because the scurvy so weakened their gums that they could literally pull their teeth out with as much force as it took to dislodge a piece of meat.

However, if you got to the victim a little bit earlier, you could reverse scurvy with fresh meat. This is important to know because most of the world believes that those of us who adhere to the all-meat diet will get this -- although today they call it a "deficiency disease."

I also found it fascinating that just like today, people had cause and effect reversed as well. This was the first stage of scurvy:

Stefansson Wrote:
